The reaction between guanidine and amino acid esters. III. EMIL ABDERHALDEN AND HANS SICKEL. Univ. Halle. *Z. physiol. Chem.* 180, 75–89(1929); cf. *C. A.* 22, 1330, 1958.—The reaction whereby guanidine and esters of α -amino acids condense to form guanidino derivs. with liberation of NH_3 , e. g., the formation of creatinine from guanidine and sarcosine ester, was extended to include esters of diamino acids. Evidence in support of the assumption that the NH_3 liberated comes from the guanidine and not from the amino acid is the fact that $\text{H}_2\text{NC}(\text{:NH})\text{NHMe}$ and $\text{H}_2\text{NC}(\text{:NH})\text{-NMe}_2$ also react with amino acid esters although less readily, i. e., the guanidine must contain an unsubstituted amino group, but an alkyl or acyl substitution in the amino acid does not interfere. *Di-Me α,α' -diaminosuberate di-HCl salt*, which foams 212° and decomp. 270°, was obtained by passing HCl into the acid in MeOH. The failure of Neuberg and Neimann to obtain the Et ester by this method was not due, as they supposed, to the size of the mol. but to the insol. of the amino acid-HCl in EtOH. The free base, liberated by addn. of alkali, was extd. with Et_2O and the ext. treated with an excess of guanidine. The temp. rose from 0° to 70° with copious evolution of NH_3 . The condensation product, which darkens 260° and m. to a brown liquid 305°, is almost neutral to litmus and gives a strong Jaffé reaction. Its N content corresponds to that calcd. for the salt of 5,5'-tetramethylene- α,δ -di[2-imino-4-ketotetrahydroimidazole] with 5-[ϵ -carboxy- α -aminomethyl]-2-imino-4-ketotetrahydroimidazole. Lack of material prevented further identification. The ester of the analogous diaminovaleric acid (ornithine) cannot be obtained because of its immediate ring closure to an amino-piperidone, hence the stable Bz deriv. was employed. δ -Benzoylornithine was esterified to *Me dl- α -amino- δ -benzoylaminovalerate-HCl*, m. 128–30°, decomp. 162°. The base was liberated by alkali and extd. with CHCl_3 , the solvent evapd. and the residue mixed with guanidine. No reaction occurred at 0°, but at 15° there was evolution of NH_3 and spontaneous warming. The product, 5- γ -benzoylamino-propyl 2-imino-4-ketotetrahydroimidazole, m. 198°, gives the Jaffé and nitroprusside reactions and forms a *picrate* which decomp. 220°. Refluxing 7 hrs. with concd. HCl split off the Bz without opening the cyamidine ring. The free base remaining after extrn. of the BzOH with Et_2O and removal of HCl by $\text{Ag}_2\text{SO}_4\text{-Ba(OH)}_2$ could not be crystd. but was converted into a cryst. *dipicrate*, m. 230° (decompn.). By alkali hydrolysis the ring was opened up and the product, which no longer gave the Jaffé reaction, was converted into a cryst. *picrate* (decomp. 212° and again 305°), from which the free base *isoarginine* (α -guanidino- δ -aminovaleric acid) was liberated by Ag_2SO_4 and Ba(OH)_2 . This isomer of arginine, after neutralizing to pH 6.6 with H_2SO_4 , was treated with press juice of dog liver previously tested for the enzyme arginase. No cleavage occurred in 16 hrs., as shown by the absence of any increase in amino N as detd. by the Van Slyke method. The reaction between asym. dimethylguanidine and glycine ester was accompanied by a rise in temp. to 70°, but very little NH_3 was liberated and the yield of cyamidine, although sufficient to give the Jaffé reaction, was too small for isolation and analysis. Most of the guanidine was recovered unchanged, also some Curtius biuret base and a small amt. of glycine anhydride. The rise in temp. was evidently due to an acceleration of the ester condensation through the influence of the guanidine deriv. Monomethylguanidine reacted in the same way with glycine ester, but to a somewhat greater extent as shown by the evolution of more NH_3 and a more intense Jaffé reaction. The greater part of the original guanidine was recovered unchanged, along with some biuret base and glycine anhydride. Iso-amylguanidine, α -naphthylguanidine and acetylguanidine did not react sufficiently with glycine ester to give the Jaffé reaction, and only with the 1st of these could a trace of NH_3 be detected. Et hippurate and guanidine gave a small yield of *hippuryl-guanidine*, m. 183°. *picrate*, decomp. above 320°. No cyamidine was obtained as shown by a negative Jaffé reaction. Substituted guanidines are thus less reactive than guanidine itself toward amino acid esters. Acetylglycine Et ester and guanidine reacted with rise in temp., but yielded only the *guanidonium salt of acetylglycine*, m. 105–10°.

Ammonium picrate and its possible use in the preparation of creatinine. ISIDOR GREENWALD. Harriman Research Lab., Roosevelt Hosp., N. Y. *J. Biol. Chem.* 81, 73-5(1929).— NH_4 creatinine picrate apparently has a real existence as a compd. but on account of its ready dissociation into its components it is difficult to obtain in a pure condition. The formation of this compd. may be used to advantage in increasing the yield of creatinine obtained from creatine. Nearly all of the 20% of the calcd. yield that is lost in the usual method of prepn. can be recovered by the technic which is described.

A. P. LOTHROP

Mercury compounds of purine derivatives. I. ROSENTHALER. Univ. Bern *Arch. Pharm.* 266, 694-6(1929).—A hot soln. of caffeine and $\text{Hg}(\text{OAc})_2$ in hot dil. AcOH yield after a period of 2-3 days *acetatomercuricaffeine*, $\text{C}_8\text{H}_7\text{N}_4\text{O}_2\text{HgOAc}$, needles softening 255° , decomp. somewhat about 280° , but not m. up to 300° , sol. in 900 parts cold H_2O , more readily in hot H_2O , difficultly sol. in alc., sol. in caustic alkali, aq. NH_3 , carbonates and bicarbonates of the alkali metals. From the aq. soln. KI ppts. *mercuricaffeine*, $(\text{C}_8\text{H}_7\text{N}_4\text{O}_2)_2\text{Hg}_2$, needles not m. up to 340° , difficultly sol. in both cold and hot H_2O .

W. O. F.

Action of trimethylamine and other bases on acetobromocellobiose. GÉZA ZEMPLÉN AND ZOLTÁN BRUCKNER. Tech. Hochschule Budapest. *Ber.* 61B, 2481-6(1928), cf. *C. A.* 22, 2742.—After reading the earlier paper of Z. and B., Ohle informed them that from the products of the reaction of PhNMe_2 with acetobromoglucose he had isolated Me_3PhNBr , i. e., that MeBr is split off in the reaction. In view of the possibility that a similar process might have occurred in their own reaction they studied the latter more thoroughly and found that the earlier preps. on decompn. with alkalis and distn. gave NHMe_2 and not NMe_3 , and furthermore that the end product is obtained in much better yield by working at room temp. in CHCl_3 instead of at higher temps. in alc. and that under these conditions Me_4NBr can be isolated as a by-product. Finally, NHMe_2 gives with acetobromocellobiose (I) the same base as does NMe_3 and $\text{Me}_3\text{NH.HBr}$ can be isolated from the mother liquors. These results show that MeBr is in fact split off in the reaction between NMe_3 and I and that the product is a *heptaacetylcellobiosidodimethylamine* (II) having the structure given in the earlier paper except that NMe_2 should be substituted for NMe_3 . From the reaction mixt. of I with NEt_3 in CHCl_3 at room temp. could be isolated only quite impure heptaacetylcellobiose and the mother liquors contained only NEt_3 with no NHEt_2 , showing that in this case no alkyl bromide is split off. With NHEt_2 was obtained a cryst. N free substance (III) which absorbs two Br atoms in CHCl_3 . Piperidine gives *heptaacetylcellobiosidopiperidine* (IV) which seems to take up 2 atoms of Br from CHCl_3 but when the reaction mixt. is worked up the cryst. *end product* (V) contains only 1 atom of Br, showing that substitution of a H atom and not addn. has taken place; the HBr formed was detected in prepg. V. II (3-4 g. from 10 g. I), m. $198-9^\circ$ (decompn.), $[\alpha]_D^{20} -10.51^\circ$ (CHCl_3). Hexaacylcellobiosene (III) (2.5-3 g. from 10 g. I), m. 125.6° , $[\alpha]_D^{20} -19.78^\circ$ (CHCl_3). IV (1.5-2 g. from 5 g. I), m. $215-20^\circ$ (decompn.), $[\alpha]_D^{18} -15.28^\circ$ (CHCl_3). V, m. $132-3^\circ$ (decompn.).

Sulfuric esters of carbohydrates. ERICH GEBAUER-FÜLNEGG, WM. H. STEVENS AND ERNST KRUG. Univ. of Princeton and Univ. Wien. *Monatsh.* 50, 324-7(1928).—Cotton, treated with ClSO_3H in the cold and kept 24 hrs., gives chloroglucose tetrasulfate, hygroscopic crystals (cf. Claesson, *J. prakt. Chem.* 20, 18(1879)). If the reaction mixt. is slowly added to Ac_2O , α -pentaacetyl-*D*-glucose may be sepd. by pptn. with NaCl or AcONa . Dextrose, similarly treated, gives the same product. AcCl or AcBr , however, gives β -acetochloroglucose, while AcI is decompd. If the reaction of cotton and ClSO_3H is interrupted after 2 or 5 hrs., small quantities of octaacetylcellobiose or tetraacetylglucose, resp., can be sepd.

Highly polymerized compounds. XIV. Constitution of dicyclopentadienes. H. STAUDINGER. Univ. Freiburg i. B. *Ann.* 467, 73-5(1928); cf. *C. A.* 23, 822.—A theoretical introduction to the following abstr. and polemical against Diels and Alder (*C. A.* 22, 1144).

C. J. WEST

Constitution of dicyclopentadienes. FRANZ BERGEL AND ERNST WIDMANN. *Ann.* 467, 76-91(1928).—Evidence is offered which is considered to render untenable the structures suggested by Diels and Alder (*C. A.* 22, 1144) for dicyclopentadiene derivs. and to confirm the 1,2-addn. structures suggested by Staudinger (*C. A.* 20, 2091). The interconversion of the 2 isomeric acids $\text{CH}_2=\text{CH}.\text{CHCO}_2\text{H}$ (I), m.

200° (decompn.), and (II), m. 133.5° , obtained by the oxidation of ketotetrahydro-

dicyclopentadiene (III) and dihydrodicyclopentadiene glycol, resp., with HNO_3 (Wieland and Bergel, *C. A.* 20, 384), has been investigated by the method of Hückel and Goth (*C. A.* 19, 1857). CH_3N_3 converts I into its *di-Me ester*, m. $72.5-3^\circ$, which by hydrolysis with MeOH-MeONa yields a product, m. 170° , from which petr. ether, b. $90-115^\circ$, exts. an acid identical with II; the residue, m. 178° , gives an ester, b. 120° , which yields only resinous products on hydrolysis. II is obtained in 70–80% yields by oxidation of dihydrodicyclopentadiene with a slight excess of KMnO_4 in Me_2CO ; CH_3N_3 gives a *di-Me ester*, b. 134° , which with MeONa gives a compd., m. 110° . Oxidation of III with KMnO_4 in dil. NaOH gives an acid, m. 232° (60% yield); *di-Me ester*, m. $77.5-8^\circ$; with MeONa this gives the acid $\text{C}_{10}\text{H}_{14}\text{O}_4$, m. 178° . Mild hydration of tetrahydrodicyclopentadiene dioxide by boiling with very dil. HCl converts it into the hygroscopic sirupy glycol, $\text{CH}(\text{OH})\cdot\text{CH}_2\cdot\text{CH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CHOH}$, which does

$\text{CH}(\text{OH})-\text{CH}\cdot\text{CH}-\text{CHOH}$

not react with BzCl , $p\text{-O}_2\text{NC}_6\text{H}_4\text{COCl}$, etc. BzO_2H in CHCl_3 transforms ketodihydrodicyclopentadiene into *ketotetrahydrodicyclopentadiene oxide*, b. 145° , m. 115° (80–90% yield); dil. HCl gives the glycol, yellow sirup. Oxidation of these products and their parent substances under various conditions yields amorphous acids, the composition of which agrees moderately well with that of the expected tetra- CO_2H acid. Catalytic reduction of cyclopentadienebenzoquinone gives the *tetrahydro deriv.*, m. 246° ; *tetrahydrodicyclopentadienebenzoquinone*, m. 251° ; *monoxime*, m. 247° . C. J. WEST

New theories of organic structure, the study of high polymer compounds. KURT H. MEYER. *Naturwissenschaften* 16, 781–93(1928); *Z. angew. Chem.* 41, 935–46(1928).

A review.

B. J. C. VAN DER HOEVEN

Tetra-araban and its relation to tetragalacturonic acid, the chief component of pectin. FELIX EHRLICH AND FRIEDRICH SCHUBERT. *Univ. Breslau. Biochem. Z.* 203, 343–50(1928).—Tetra-araban can be derived from tetragalacturonic acid by the loss of 4 mols of CO_2 : $\text{C}_{24}\text{H}_{32}\text{O}_{24} = \text{C}_{20}\text{H}_{32}\text{O}_{16} + 4\text{CO}_2$. Since *d*-galacturonic acid and *l*-arabinose are very similar stereochemically it seems probable that in the plant the araban component of pectin is formed enzymatically through the splitting off of CO_2 from the 4 free CO_2H groups. S. MORGULIS

The relation between humic acids and lignin. W. FUCHS. *Brennstoff-Chem.* 9, 298–302(1928).—Lignin from various sources and humic acid as well are subjected to the action of various reagents to det. if their chem. behavior is similar. Products of nitration with 5 N HNO_3 , in particular, are compared and found to be very similar compds. "They are evidently isonitrosoketohydroxycarbonic acids of high mol. wt. and apparently have cyclic structure." Differences between lignin and humic acid nitro derivs. lie principally in the manner of N linkage. The N content of the lignin derivs. is highest and the reason is not entirely clear. The mol. wt. detd. in acetone ranged from 1410 to 1765 for fully methylated nitro derivs. of lignin and that for the corresponding humic acid compd. was 1535. MeO , $\text{C}=\text{O}$, HO and CO_2H groups are detd. J. D. DAVIS

Ring-closure of the γ -ketodicarboxylic acid esters. I. Condensation of phoronic acid ester. N. J. TOIVONEN. *Ann. acad. sci. Fennicae A28*, 12 pp.—Heating phoronic acid ($\alpha,\alpha,\alpha',\alpha'$ -tetramethyl- γ -ketopimelic acid) (I) 0.5 hr. at $200-250^\circ$ gave the dilactone. The di-Et ester m. 33° (cf. Pinner, *Ann.* 247, 110(1888), 125°). The mono-Me ester made by heating the dilactone with MeONa in MeOH , addn. of H_2O and pptn. with HCl , m. $105-6^\circ$. To 1 mole of I di-Me ester (II) in Et_2O was added 2–5 moles of MeOH -free MeONa , let stand 1 hr., heated 1 hr. on a water bath and finally for 1 hr. at $140-50^\circ$. The residue was extd. with dil. H_2SO_4 , filtered, dried and washed with Et_2O . Soln. in Na_2CO_3 and pptn. with acid gives 1,1-dimethylcyclopentane-3,5-dione-4-isobutyric acid (III); yield 70%. As an alternative procedure II was dissolved in abs. MeOH with 1.5 moles MeONa . After 10 hrs. refluxing the solvent was distd. at 105° . The residue was dissolved in H_2O , extd. with Et_2O and the ester pptd. with HCl . The yield of III methyl ester (IV), m. 172° , was 75%. By sapon. of IV in alc. NaOH , III was obtained. Condensation of I di-Et ester was also carried out but the product was not purified. III from 60% AcOH sublimes 120° , m. 252° (decompn.). By titration in 50% alc. with NaOH III is almost completely and IV completely enolized. III is not changed by boiling with strong KOH or HCl . III did not form a semicarbazone, oxime or phenylhydrazone. IV boiled in 5 parts Ac_2O for 4 hrs. followed by distn. of the Ac_2O gave the enol-lactone (V) b. $151-2^\circ$, m. $75-80^\circ$. V is apparently a mixt. of 2 forms as shown by the indefinite m. p.

It takes up H_2O readily to form **III**, sublimes easily and dists. with steam to give **III**. T. finds that another γ -ketonic acid ester than the β,β -dialkylated type can form a condensation product (cf. C. A. 18, 967), probably because this takes place more quickly than lactone formation.

FOSTER DEE SNELL

A new spiro- β -lactone: The β -lactone of 1,1-dimethylcyclopentane-3,5-dione-4-hydroxy-4-isobutyric acid. N. J. TOIVONEN. *Ann. acad. sci. Fennicae* A28, 9 pp.—In 10 g. of dimethylcyclopentanedioneisobutyric acid (cf. preceding abstr.) in 25 cc. AcOH was suspended 9.7 g. AcOK and 7.75 g. of Br_2 in 30 cc. of AcOH added drop by drop. In the absence of AcOK more Br_2 will react. Careful addn. of H_2O pptd the β -lactone of 1,1-dimethylcyclopentane-3,5-dione-4-hydroxy-4-isobutyric acid (**I**). Filtered, washed (yield 7–9 g.) and crystd. from AcOH it m. $133-4^\circ$ (decomph.). In titration 1 mole of NaOH reacts readily, a 2nd only slowly. This product of reaction of 1 mole of NaOH could not be isolated for a detn. of which ring was more readily opened. To 10 g. of **I** suspended in 20 cc. of H_2O was added 100 cc. of 5% NaOH with cooling, probably forming a hydroxyketonic acid. After standing overnight the soln. was acidified with HCl, pptg. the hydroxydilactone (**II**), m. $155-6^\circ$ (yield 4.4 g.) Also 4.2 g. of an impure mixt. of isomers (**III**), m. $136-40^\circ$, having the same compn was recovered. The behavior toward NaOH titration is similar to **I**. **II** or **III** in AcOCl after standing overnight and vacuum evapn. of the excess reagent gave the *Ac deriv.*, m. $128-9^\circ$. The Me ester is oxidized in the same way as the acid but is difficult to purify. **I** heated to its m. p. or treated with $CH_2(CH_2)_4NH$ liberates CO_2 .

This new type of β -lactone is most closely related to that of 4-diphenylcarboxymethyl-quinol (cf. Staudinger, C. A. 2, 2224; 5, 2625).

FOSTER DEE SNELL

Pyrogenic decomposition of 1,1-dimethylcyclopentane-3,5-dione-4-isobutyric acid and its 4-hydroxy- β -lactone. A. Effect of heat on dimethylcyclopentanedioneisobutyric acid. N. J. TOIVONEN. *Ann. acad. sci. Fennicae* A28, 15 pp.; cf. preceding abstr.—On heating 1,1-dimethylcyclopentane-3,5-dione-4-isobutyric acid reaction starts at $250-60^\circ$ and then falls to 220° at which temp. the principal reaction takes place. It was finally heated at $240-50^\circ$ until evolution of gas had ceased. One mole gives the following yields in moles: $0.94-1.23 H_2O$, $1.01-1.06 CO$, $0.2-0.3 Me_2CO$, $0.01-0.04 CO_2$. The reaction suggested is $2C_{11}H_{16}O_4 = 2H_2O + 2CO + Me_2CO + C_{17}H_{22}O_3$ (**I**). The residue contains 2 isomers. The enol-lactone (cf. 2nd preceding abstr.) was also isolated. By boiling the residue with NaOH soln. these are hydrolyzed to acetone and 1,1-dimethylcyclopentane-3,5-dione (**II**). By fractional crystn. of **I** were obtained the isomers, prisms, m. $213-4^\circ$ and flakes, m. $233-4^\circ$. Oxidation of **II** with NaOCl gave $HO_2CCMe_2CH_2CO_2H$. Boiling the isomers from **I** in alc. MeONa gives isopropylidenebisdimethylcyclopentanedione (**III**) (cf. Vorländer, *Ann.* 309, 348(1899)). **III** in cold alc. acidified with HCl on addn. of H_2O gives the isomers of **I**. B. Effect of heat on the β -lactone. *Ibid* 12 pp.—The β -lactone of 1,1-dimethylcyclopentane-3,5-dione-4-hydroxy-4-isobutyric acid (**I**) is easily decompd. by heat, ultra-violet light or secondary amines. When heated to $130-5^\circ$ the heat of reaction may raise the temp. to about 230° . It was finally held at 140° for 3 hrs. From 1 mole there was obtained approx. 1 mole of CO_2 and 1 of residue (**II**), $C_{20}H_{28}O_4$, with 0.068 mole of H_2O . **II** titrated with alkali as a monobasic acid, m. $144-6^\circ$. Dissolved in NaOH soln. and pptd. by AcOH, $C_{16}H_{20}O_6$ (**III**) was obtained, monobasic. **II** in alc pptd. by H_2O gave **III**. The H_2O is lost at $80-90^\circ$ to give **II**. Persistent boiling with alkali decomp. **II** or **III** to 1,1-dimethylcyclopentane-3,5-dione (**IV**) and acetone. **I** heated at 230° formed much $C_{17}H_{22}O_3$. **II** heated at 230° goes partially to $C_{17}H_{22}O_3$ and **III** goes completely. (Of the enolic forms of **II**, $CO.CMe_2.CH_2.CO.CHCMe_2C(CMe_2(OH)).CO.CH_2.CMe_2.CO$ (**A**) \rightleftharpoons

$CO.CMe_2.CH_2.C(OH).CH.CMe_2.C.CO.CH_2.CMe_2.CO$ (**B**), the ease of removal of water

and lack of color with $FeCl_3$ point to **B**. Decolorization of $KMnO_4$ and Br_2 is to be expected with this formula as well as hydrolysis to **IV** and Me_2CO and decompn. to $C_{17}H_{22}O_3$.

FOSTER DEE SNELL

The course of ester condensations of cyclopropane-1-carboxylic-2-acetic acid esters. I. Condensation of α -tanacetonedicarboxylic acid esters. N. J. TOIVONEN. *Ann. acad. sci. Fennicae* A28, 25 pp.—Di-Me α -tanacetonedicarboxylate (**I**) was prepd. from α -thujaketonic acid with NaOCl. **I** condensed in MeOH with 1.1–1.2 mols. of NaOMe (cf. C. A. 6, 1595; 13, 424) gave the Na deriv. of Me 1-isopropyl-1-cyclopentene-3-one-4-carboxylate (**II**). The vacuum dried crude **II** in 15 parts of H_2O at 0° by addn. of AcOH and PhN_2Cl gave quant. the *hydrazone*, yellow, m. $179-80^\circ$. The cold soln.

f II without evapn. was mixed with 3 moles of cold MeI, and refluxed 5–10 hrs. to disappearance of the alk. reaction. After distn. of the excess MeI, cold H₂O was added, the oil dissolved in ether, washed with NaHSO₄ and Na₂CO₃ soln. and dried with CaCl₂. By distn. at 14 mm. the first fractions show unchanged I and β -tanacetonedicarboxylic acid ester (III). The acid by-product extd. is mainly III. The 142–3° fraction is *Me 4-methyl-1-isopropyl-1-cyclopentene-3-one-4-carboxylate* (IV), d_4^{20} 1.0415, n_D^{20} 1.4764, M_D 53.15. IV was shaken with 8% NaOH, the soln. satd. with CO₂ and the neutral part extd. with Et₂O. The acid was pptd. at 0° by HCl, dried and washed with C₆H₆; heated quickly, it m. 86–87° (decompn.). IV in alc. in the presence of Pt sponge is reduced by H₂ in 10–15 hrs. to *Me 4-methyl-1-isopropyl-3-cyclopentanone-4-carboxylate* (V). The reduction is easier in the presence of colloidal Pt. It b₁₂ 119–21°, m. 152–3°, d_4^{20} 1.0165, n_D^{18} 1.4528, M_D 52.60. Sapon. of V in the same way as IV gave the acid, m. 94° (decompn.). IV was shaken with NaOH soln., acidified with H₂SO₄, refluxed and distd. with steam. Et₂O extn. of the distillate gave *4-methyl-1-isopropyl-1-cyclopentene-3-one (methyltanacetophorone)*. (VI), b₁₇ 99–101°, b. 216–20°. VI is better pptd. from the steam distillate as the semicarbazone (VII), crystallized and converted to VI by boiling with concd. (CO₂H)₂. VII, m. 151°. By the same treatment of V or hydrogenation of VI in the presence of colloidal Pt is obtained *4-methyl-1-isopropyl-3-cyclopentanone* (VIII), b₁₄₈ 135–6°, b₇₄₇ 192–3°, d_4^{20} 0.8862, $n_D^{19.0}$ 1.4413, M_D 41.74. Semicarbazone, m. 175–6°. Oxime, m. 93–4°. Oxidation of VIII with KMnO₄ to the keto acid followed by NaOCl gave β -isopropylglutaric acid (IX), isolated as the Ag salt. This was decompd. with H₂SO₄ and extd. with Et₂O. Oxidation of VIII with CrO₃ in AcOH gave β -isopropyl- γ -acetylbutyric acid identified as the oxime and semicarbazone. Further oxidation with NaOCl gave IX. From 64.2 g. of I by MeONa condensation, methylation, sapon., decarboxylation in H₂SO₄ and hydrogenation in the presence of colloidal Pt, there were obtained 25 g. of VI, 22 g. of VIII, 2.2 g. of an unidentified undistillable product and 11.4 g. of an acid mixt., mainly III. I heated at 250° shows a reduction in polarization (100-mm. tube) from 144.9° to 2.8° in 24 hrs. Sapon. with NaOH gave the acid from III, m. 117–9°. This was converted to III, b₁₄ 140°, $d_4^{20.9}$ 1.0351, $n_D^{22.2}$ 1.4602, M_D 56.75. III was condensed with MeONa in the same way as the α -ester, reaction taking place less readily, and converted to the same phenylhydrazone as the α -ester. III with MeI gave an ester which when sapond. gave an acid identical with that from IV. By decarboxylation VI resulted. The conclusion is reached that II is $\text{H}_2\text{C}.\text{C}(\text{C}_2\text{H}_5).\text{CH}.\text{CO}.\text{CHCO}_2\text{Me}$ and

the theory advanced that the usual ester of III is *trans* and of I *cis*. F. D. S.

X-ray investigation of polymerized cyclopentadienes. J. HENGSTENBERG. *Ann.* 467, 91–94(1928); cf. *C. A.* 22, 4289.—Debye-Scherrer diagrams of tri-, tetra- and polycyclopentadienes have been obtained and the distances between the planes for about 9 lines are tabulated. In every case the distance between the strongest reflecting planes is the same (5.3 A. U.). The largest values for tri- and tetracyclopentadienes are 7.7 and 10.5 A. U., resp., the difference, 2.8 A. U., being the size of the cyclopentadiene ring without double linkings, whence the value 2.45 A. U. is obtained for each of the other rings. By sublimation of tetracyclopentadiene small (0.1 mm.) laminas are obtained from which by x-ray and optical examn. it is deduced that the crystal is orthogonal and either hexagonal or pseudohexagonal. With an assumed unit cell and the known d., 1.23 g./cc., it is found that the unit cell contains 2 mols. Thus, although the tri-, tetra- and polycyclopentadienes have different lattices, the mols. are all the same size (2.8 A. U.) in 1 direction, in agreement with the structure suggested by Staudinger. C. J. WEST

Reduction of cyclohexanone isoxime (α -keto-hexamethylenimine). ADOLF MÜLLER AND PAUL BLEIER. *Univ. Wien. Monatsh.* 50, 399–402(1928).—Wallach (*Ann.* 324, 292(1902)) stated that the reduction of $\text{CH}_2(\text{CH}_2)_4\text{CO.NH}$ gave $(\text{CH}_2)_6\text{NH}$; later

(*Ann.* 343, 45(1905)) he stated that the reduction product was $\text{C}_6\text{H}_{11}\text{NH}_2$. Repetition of the work, using 30 g. oxime, 1500 g. abs. EtOH and 150 g. Na gives 6.7 g. (18%) of $(\text{CH}_2)_6\text{NH}$, identified as the HCl salt, m. 236–7° (cor.), and the *p*-MeC₆H₄SO₃ deriv., m. 76.5° (cor.). C. J. WEST

Carbohydrates. VI. Derivatives of 1-aminoglucose. PERCY BRIGL AND HELMUT SPLEER. *Landw. Hochschule Hohenheim. Z. physiol. Chem.* 180, 38–63(1929); *C. A.* 21, 418.—Analogues of disaccharides, with the 2 hexose components joined through N instead of O, may be obtained from 1-aminohexoses. For the reactions here described the starting point was 1-aminoglucose prepd. according to Ling and

Nanji (*C. A.* 17, 1433). Acetylation of this aminoglucose by treatment in the cold with Ac_2O and pyridine, addn. of CHCl_3 to the reaction mixt. and shaking with aq. NaHCO_3 , yielded a cryst. mixt. which, by redissolving in CHCl_3 and addn. of ligroin, was sepd. into the main product, *1-aminoglucose pentaacetate* (I), m. $159-60^\circ$, $[\alpha]$ 16° , and a small amt. of *α -diglucosylamine octaacetate* (II), m. $216-7^\circ$, $[\alpha]$ 87° . Treatment of I in AcOH with NaNO_2 effected no change, but anhyd. ZnCl_2 in Ac_2O converted it into *diglucosylamine nonaacetate* (III), m. 192° , $[\alpha]$ -9.2° . Sapon. by NH_3 in MeOH removed 4 Ac groups from I, leaving *1-aminoglucose monoacetate* (IV), which begins to darken at 230° and decomp. 257° , $[\alpha]$ -23° . During a 5-6 hr. warming at $75-80^\circ$ in pyridine I condensed with anhyd. glucose, and addn. of Ac_2O to the mixt. with careful exclusion of moisture then caused a gradual sepn. of II, the sepn. finally being facilitated by exposure to atm. moisture. By sapon. with NH_3 in MeOH 3-4 hrs. at room temp. and concn. of the soln. over H_2SO_4 , II was converted into *α -diglucosylamine* (V), which after crystn. from MeOH-McAc decomp. $167-8^\circ$, $[\alpha]$ 85.1° . On reacetylation by Ac_2O in pyridine V reverted to II. Isomeric with V is *β -diglucosylamine* (VI), which crystals with 2 H_2O and m. $102-3^\circ$, with decompn. at 125.6° , $[\alpha]$ 20° . This was obtained by refluxing aminoglucose with abs. MeOH whereby 2 mols. condense with liberation of NH_3 , and pptn. of the product with Et_2O . Hydrolysis by 0.5 *N* acid splits it quant. into NH_3 and glucose. Acetylation by Ac_2O in pyridine at 0° , followed by treatment with NaHCO_3 and evapn. of the CHCl_3 soln. converted it into *β -diglucosylamine octaacetate* (VII), amorphous, softens $135-40^\circ$, solidifies and m. $190-2^\circ$, $[\alpha]$ 7.6° . This has an intensely bitter taste. By sapon. with NH_3 in MeOH it reverted to VI. Both II and VII when heated with Ac_2O and ZnCl_2 yielded III, the 9th Ac group replacing the H of the NH. When dry N_2O_3 was passed into an Et_2O suspension of II, *α -diglucosylnitrosamine octaacetate*, m. $204-5^\circ$ (gas evolution), $[\alpha]$ 80.4° , was obtained. This gave an intense blue color with Ph_2NH in 50% H_2SO_4 . Treatment with hot EtOH removed the NO, and sapon. with NH_3 in MeOH at room temp. removed Ac; the free nitrosamine, however, could not be obtained cryst., but it was readily reacetylated to the octaacetate without rearrangement to the β -isomer. Sapon. of the acetate followed by benzoylation with BzCl and 15% NaOH converted it into *α -diglucosylnitrosamine octabenzoate*, which sinters 198° and m. 202.3° (gas evolution), $[\alpha]$ 81.1° . Both the Ac and Bz derivs. when heated with Ac_2O and ZnCl_2 gave off N gas and yielded, resp., *α -pentaacetylglucose* and *1-acetyl-2,3,4,6-tetraacetylglucose*, m. $159-60^\circ$, $[\alpha]$ 78.9° . The isomeric *β -diglucosylnitrosamine octaacetate*, m. $218-20^\circ$ (gas), $[\alpha]$ 12.5° , may be obtained by treatment of VII with N_2O_3 , or from the α -deriv. (II) by treatment with AcOH and NaNO_2 . The α - and β -amines (V and VI) are mutually convertible, their aq. solns. showing strong mutarotation, which, however, reaches its final equil. only very slowly. The same phenomenon is observed with the α - and β -acetates (II and VII) in CHCl_3 in the presence of AcOH or an org. acid. Like wise, the double m. p. of the β -acetate (VII) indicates a rearrangement to the α form.

A. W. Dorr

The benzene theory. HEINRICH LOEWEN. *Z. Elektrochem.* 34, 760 (1928) -- A structural formula for benzene must satisfy a great no. of distinctly different variables simultaneously, such as the electronic nature of the chem. bond; the fact that increasing the no. of bonds between C atoms does not increase the stability of the union; that when C is triple bonded and holds H, this H will be replaceable by metals; that *o*-, *m*-, and *p*-disubstituted benzenes are physically and chemically different; that C_6H_6 is composed of 6 CH groups which are equiv. The formula must indicate the differences between aliphatic and aromatic properties and show why alicyclic compds. do not have aromatic properties, and indicate the ready conversion of quinoid to benzoic forms and the reverse change. A thoroughly satisfactory formula must account for the lack of optical activity in the *o*-, and *m*-disubstituted benzenes and must show that 3 and only 3 disubstituted products of any given sort are possible. The formula must satisfy the known relationships between C_{10}H_8 and larger mols. with condensed rings, and C_6H_6 , and must explain the differences in the behavior of the rings in the monosubstituted naphthalenes, where one ring functions aromatically and the other shows aliphatic characteristics. L. presents Bragg's space formula for benzene (*C. A.* 17, 1172) and prefers one with 4 of the ring C atoms in 1 plane; a 5th above this plane, and the 6th, para to the one just mentioned, below the ring plane. This does not conflict with x-ray measurements. That C_6H_6 gives maleic anhydride, L. does not regard as insurmountable, contradictory evidence, feeling that the detn. of the configuration of *cis-trans* isomers rests on a none too secure basis. A favored configuration, existent in $(\text{CH}_3\text{CO}_2\text{H})_2$, absent in malonic and glutaric acids, and not the mere proximity of CO_2H groups, is necessary for the formation of a cyclic anhydride.

The elucidation of conjugated unsatn. is considered the real key to the C_6H_6 problem. A conjugated system of C atoms approximates a cyclobutene, and may be regarded as approx. $\frac{2}{3}$ of a hexagonal ring. The plane projection of L.'s formula is the simple hexagon, which is still the best representation of C_6H_6 . G. ALBERT HILL

Diphenylamine from chlorobenzene and aniline. P. P. KARPUKHIN. Kharkov Tech. Inst. *J. Chem. Ind. (Moscow)* 5, 1106-7(1928).— Ph_2NH can be prepd. according to the equation $PhCl + PhNH_2 = Ph_2NH + HCl$, using NaOH to bind the HCl formed. 46.5 g. aniline, 66 g. PhCl and 40 g. soda-lime are heated in a steel autoclave 7 hrs. at 300° , after which the mass is dild. with 800-cc. water, neutralized by HCl, whereupon aniline dissolves and Ph_2NH seps. as an oil which solidifies overnight and can be filtered off. The yield is 10.5 g. Ph_2NH , viz., 12.3% of the theoretical. When operating with 37 g. aniline, 44 g. PhCl and 40 g. soda-lime, the Ph_2NH yield is 23.1-25.3% of the theoretical after heating under pressure at 320° , 32% at 360° , 41% after heating 34 hrs. at $360-370^\circ$ in a steel autoclave. Thus, the higher the reaction temp. the greater the Ph_2NH yield, but the quantity of aniline lost by decompn. also increases with the temp. The same relationship, but to a considerably lesser extent, is observed by prolonging the duration of heating. As the presence of metals has a detrimental effect on the reaction, some expts. were tried in sealed glass tubes, instead of autoclaves, and in this case the yields obtained were 60% of the theoretical after heating at 300° , and 72% after heating at 320° , the decompd. quantity of aniline being considerably lowered. There is every reason to believe that, when operating with stirring, the yields would be greater still, but in absence of an autoclave provided with a stirrer, such expts. were not made by K. BERNARD NELSON

Identification of the reduction products of azodyes. IV. Classification and identification of compounds belonging to group B. SHIGEZO UENO. *Bull. Inst. Phys. Chem. Research (Tokyo)* 7, 467-505(1928), *Abstracts* 1, 43-5; cf. *C. A.* 23, 1339.—Class XVII. A drop of $FeCl_3$ in a suspension or very dil. aq. soln. gives a color reaction changing transitionally through red, violet and blue. The soln. contg. $CaCO_3$ gives a color on filter paper which turns blue when spotted with dil. HCl: 7-diamino-8-naphthol-4-sulfonic acid, 2,7-diamino-8-naphthol-6-sulfonic acid, 1,7-diamino-8-naphtholdisulfonic acids ($SO_3H.SO_3H = 2:4, 3:6$ or $4:6$), 2,7-diamino-8-naphthol-3,6-disulfonic acid. Class XVIII. A suspension in water or a very dil. soln. assumes 1 or 2 colors among violet, blue and green. The soln. contg. $CaCO_3$ gives a color on filter paper, by air oxidation, it turns green on spotting with HCl: 2-ethylamino and 2-dimethylamino-7-amino-8-naphthol-6-sulfonic acids, 2-phenylamino-5-naphthol-7-sulfonic acid, 2-phenylamino-7-amino-8-naphthol-6-sulfonic acid, 6,6'-diamino-5,5'-dihydroxy-2,2'-dinaphthylamine-7,7'-disulfonic acid. Class XIX. A suspension in water or a very dil. soln. assumes soon a blue color caused by oxidation by O dissolved in the water: 1,2,7-triamino-8-naphthol-4-sulfonic acid, 1,2,7-triamino-8-naphthol-6-sulfonic acids ($SO_3H.SO_3H = 3:5, 3:6$, or $4:6$), 2,7-diamino-1,8-dihydroxynaphthamene-3,6-disulfonic acid. Class XX. The free acids are difficultly sol. in H_2O . A suspension in H_2O or very dil. soln. assumes a pale brown color on adding $FeCl_3$. Add a small quantity of any compd. of this class in H_2O , add an excess of $NaNO_2$ soln. to it in the presence of ice, and a diazo compd. is formed, when this is added to an ice-cold NW acid or H acid contg. Na_2CO_3 , a red dye is produced: 2-[m- and p-amino-phenyl]amino-6-amino-5-naphthol-7-sulfonic acids. Class XXI. The free acids are difficultly sol. in hot or cold H_2O . Addn. of $FeCl_3$ to a suspension causes a dark brown color turning brown quickly. The suspension in water becomes immediately brownish black on adding HCl and $NaNO_2$ solns.: 6,6'-diamino-5,5'-dihydroxy-2,2'-dinaphthylurea-7,7'-disulfonic acid, 7,7'-disulfo-6,6'-diamino-5,5'-dihydroxynaphthamene-2,2'-diaminocarbonyl-2,6-diaminotoluene-4-sulfonic acid. Class XXII. The HCl salts are easily sol. in water slightly acidified with HCl. On adding the HCl salts to water, the free acids sep. out, spontaneously or on NaOAc soln. addn.: 1,3,6-triaminobenzene-4-sulfonic acid, 2,6-diaminophenol-4-sulfonic acid, 6-amino-1,3-dihydroxybenzene-4-carboxylic acid. Class XXIII. The HCl salts are easily sol. in H_2O . A very dil. soln. of the HCl salts becomes red with $FeCl_3$; this color does not change instantly, even by boiling: 1,3,4-triaminobenzene, 2,4,6-triaminotoluene, 2,4-diaminophenol-4,6-diaminoresorcinol. Class XXIV. The HCl salts are easily sol. in water. A very dil. soln. of the HCl salts gives immediately a blue color on adding $FeCl_3$. In most cases the color changes rapidly: 3,6-diamino-4-hydroxytoluene-4-aminoresorcinol-2,4,6-triaminophenol-2,4-diaminoresorcinol-4-aminopyrogallol. Class XXV. The HCl salts are easily sol. in H_2O . A very dil. soln. of the HCl salts assumes a brown color on adding $FeCl_3$: 2,4-diaminoanisole, 2-hydroxy-1,4-diaminobenzene, 1,2,4,5-tetraaminobenzene, 2,3,4,5-tetraaminotoluene, 2-amino-1-naphthol. Class

XXVI. The compds. which do not belong to any of the above mentioned classes 4-amino-1-naphthol-7-sulfonic acid, 2,6-diamino-5-naphthol-7-sulfonic acid, 2-amino-8-chloro-1-naphthol-3,6-disulfonic acid. ALBERT L. HENNE

Several sulfonic derivatives of non-saturated compounds. A. QUILICO AND E. FLEISCHNER. *Atti accad. Lincei* 7, 1050-6(1928).—In a previous paper (C. A. 22 1965), Q. found that aromatic compds. with an unsatd. side chain may be sulfonated by the use of $\text{NH}_4\text{SO}_3\text{H}$. In this way derivs. of styrene and isosafrole have been prepd. $\text{PhCH:CHSO}_3\text{H}$ is prepd. by heating 10 g. PhCH:CH_2 with 8 g. $\text{NH}_4\text{SO}_3\text{H}$ at 150° for 1 hr., when the whole solidifies. Excess PhCH:CH_2 is extd. with C_6H_6 and Et_2O , then the NH_4 salt is dissolved in H_2O , the NH_3 is neutralized, the small amt. of resins formed are extd. with Et_2O , and the product crystd. by cong. The $\text{PhCH:CHSO}_3\text{NH}_4$ chars $265-70^\circ$. The Na and Ba salts are also sol. in H_2O ; adding the calcd. amt. of dil H_2SO_4 to the Ba salt gives the free acid, m. $55-65^\circ$, chars 130° . $\text{PhCH:CHSO}_3\text{Cl}$, obtained quant. by adding PCl_5 to the dry Na salt, m. 85° . Heating this with NH_4Cl gives the amide, m. 140° . Oxidation with alk. KMnO_4 and then adding HCl gives BzOH . Fusion with HCO_2Na gives $\text{PhCH:CHCO}_2\text{H}$, which with KMnO_4 gives the odor of BzH . $\text{CH}_2\text{O}_2\text{C}_6\text{H}_4\text{CH:CMesO}_3\text{H}$ is prepd. by heating 16 g. of isosafrole with 5 g. $\text{NH}_4\text{SO}_3\text{H}$ as with the styrene deriv., (yield 8 g. of the NH_4 salt, chars 240°). The Na and Ba salts are formed as with styrene, as well as the free acid, m. $81-2^\circ$. The chloride, m. 86° , the amide, m. 180° ; oxidized with KMnO_4 it gives $\text{CH}_2\text{O}_2\text{C}_6\text{H}_4\text{C(=O)OH}$, m. 227° . $\text{CH}_2\text{O}_2\text{C}_6\text{H(OMe)}_2\text{CH:CMesO}_3\text{H}$ is prepd. similarly by heating 6 g. isosafrole with 2 g. $\text{NH}_4\text{SO}_3\text{H}$; yield 3 g. of NH_4 salt, very sol. in H_2O , as is the Na salt. The latter with PCl_5 gives the chloride as a colorless oil, and this with NH_4EtOH gives the amide, m. $179-80^\circ$. KMnO_4 (NaOH soln.) gives an acid slightly sol. in H_2O , m. 174° , identical with the apiolic acid of Ciamician and Silber. A. W. CONTIERI

Constitution of the *m*-xylenesulfonic acids. JAKOB POLLAK AND FRANZ V. MEISSNER. Univ. Wien. *Monatsh.* 50, 237-50(1928).—Previous work on the *m*-xylene sulfonic acids is critically reviewed. In combination with the work now described, it is concluded that the acid obtained by direct sulfonation of *m*- $\text{C}_6\text{H}_4\text{Me}_2$ (chloride, m. $128-31^\circ$; amide, m. $248-9^\circ$) is the 4,6-di- SO_3H (I), while the acid with a liquid chloride (amide, m. $223-4^\circ$), which accompanies the former in small quantity in the prepn. by certain indirect methods, is the 2,4-di- SO_3H acid (II). The recognition of II has been obscured by its ready transformation during the prepn. of the chloride into the chloride of I. The constitution of I is proved by its prepn. from 1,3,4,6- $\text{Me}_2(\text{HO})_2\text{C}_6\text{H}_2\text{NH}_2$ through the diazo compd. and by earlier work of P. It is now also confirmed by the formation of 1,3,4,6- $\text{Me}_2\text{C}_6\text{H}_2\text{Br}_2$ in small quantity by treatment of I with Br in H_2O at 60° and by the failure to brominate the chloride. When the chloride of I was treated with Br in Et_2O at room temp., the substance was recovered unchanged, accompanied only by a little 4,6-dibromo-*m*-xylene-2-sulfonyl chloride, formed possibly by displacement and migration of the SO_3H group, or, more probably, derived from 1,3,2- $\text{Me}_2\text{C}_6\text{H}_3\text{SO}_2\text{Cl}$ present as an impurity. Wischin's proof (*Ber.* 23, 3113(1890)) of the constitution by conversion into the 2,4- Cl_2 and 2,4-($\text{HO})_2$ derivs. of *m*- $\text{C}_6\text{H}_4\text{Me}_2$ is vitiated by the drastic nature of the reactions. The prepn. of the same acid by Pfannenstill (*Diss. Lund.* 1894) from both 1,3,2- and 1,3,4- $\text{Me}_2\text{C}_6\text{H}_3\text{SO}_3\text{H}$ is to be explained by migration of the SO_3H group in the former case. The possibility of such a migration, already demonstrated by Moody (*Proc. Chem. Soc.* 1888, 77), is now confirmed by the sepn. of 1,3,4- $\text{Me}_2\text{C}_6\text{H}_3\text{SO}_3\text{NH}_2$, m. $136-7^\circ$, as a by-product in the prepn. of 1,3,2- $\text{Me}_2\text{C}_6\text{H}_3\text{SO}_3\text{NH}_2$, m. $112-3^\circ$, through the chloride, from the 2- SO_3H acid, even when the latter has been regenerated from the purified amide. 1,3,2- $\text{Me}_2\text{C}_6\text{H}_3\text{SO}_3\text{H}$, of the constitution of which there is no doubt, was prepd. by debromination of the 4,6- Br_2 deriv.; it was also sepd. from the mother liquors of the 4- SO_3H acid prepd. by sulfonation of *m*- $\text{C}_6\text{H}_4\text{Me}_2$ by concd. H_2SO_4 at room temp. Further, Pfannenstill's liquid 2,5-($\text{SO}_2\text{Cl})_2$ deriv. (obtained solid, m. 85° , with difficulty) must be the 2,4-deriv., while his conclusion that the di- SO_3H acid which he prepd. by way of the 6-amino 4-sulfuric acid was a new acid appears to be erroneous, since his supposed 2 series of compds. Wischin's

HCl at 150° and, therefore, no migration has occurred in the 1st step. Debromination yielded a material which gave a mixt. of solid 4,6- and liquid 2,4-di- SO_2Cl derivs. which were sepd. and converted into the amides. 1,3,2,4- $\text{Me}_2\text{C}_6\text{H}_2(\text{SO}_2\text{Cl})_2$ was prepd. in best yield by treatment of 1,3,2- $\text{Me}_2\text{C}_6\text{H}_3\text{SO}_3\text{Na}$ with ClSO_3H at $89-90^\circ$ for 4 hrs. and the elimination of the 4,6-deriv. by crystn. from Et_2O . Reaction at 150° yielded the 4,6-deriv. only. The 2,4-deriv. yielded an amide, m. $223-4^\circ$, and its constitution was

proved by converting it into 1,3,2,4-Me₂C₆H₂Br₂ by bromination of the acid in H₂O at 70–80°. The occurrence of migration during prepn. of the chloride was confirmed by treating the acid obtained from the pure 2,4-di-SO₂NH₂ with PCl₅; fractionation of the product yielded the 4,6-di-SO₂Cl deriv.

C. J. WEST

Thermal decomposition of phenol. YOSABURO KOSAKA. Imperial Univ. Tokyo. *J. Fuel Soc. (Japan)* 7, 1219–39(1928).—Thermal decompn. of phenol was carried out in the same way as in the case of benzene (*C. A.* 23, 597), using silica and coke granules as catalysts. The decompn. products were examd. in a similar way except that the condensation products were fractionated after extg. the acid constituents with dil. alkali. The examn. of the decompn. products shows the existence of benzene, C₁₀H₈, anthracene, phenanthrene and undecompd. phenol. K. also considers that certain quantities of Ph₂ and C₆H₄Ph₂ would presumably be present. However, they were difficult to isolate and identify because of their small quantity. The free C was also examd. in the same way as in the case of benzene. The principle constituents of the gas were CO and H₂. The mechanism of the thermal decompn. of phenol is thoroughly discussed. Summary: Both catalysts gave similar results. The rate of decompn. is proportional to the temp., 6%, 52% and 90% of the sample was decompd. at the temp. of 700°, 800° and 850°, resp. The principle decompn. products were benzene, C₁₀H₈, anthracene, phenanthrene and small amount of water and probably Ph₂ and C₆H₄Ph₂ in small quantity. The amount of gas produced increased with rise in temp. The amount of free C also increased with rise in temp. The principle reactions which took place during the thermal decompn. between the temp. 700–850° can be shown by following equations: (1) 2PhOH = C₁₀H₈ + 2CO + 2H₂; (2) PhOH +

H. C₆H₆ + H₂O; (3) 3PhOH = C₆H₄ $\begin{pmatrix} \text{CH} \\ | \\ \text{CH} \end{pmatrix}$ C₆H₄ (or $\begin{pmatrix} \text{C}_6\text{H}_4 \cdot \text{CH} \\ | \\ \text{C}_6\text{H}_4 \cdot \text{CH} \end{pmatrix}$) + 3CO + CH₄ + 2H₂; (4) PhOH = CO + 3H₂ + 5C; (5) 2PhOH = 2CO + 3C₂H₄ + 4C; (6) 2PhOH = 2CO + 3CH₄ + 7C. The results of calcn. according to the above 6 equations show a good agreement with the exptl. figures observed.

Oxidation products of 4,4'-dichloro-2,2'-dinitrodiphenyl sulfide and disulfide. EUGEN RIESZ, A. LORENZ, CH. MYSCHALOW AND O. STRAKOSCH. Univ. Wien. *Monatsh.* 50, 263 8(1928).—Oxidation of [4,2-Cl(O₂N)C₆H₃]₂S₂ with 20 parts fuming HNO₃ 3 hrs. at 150° gives the sulfone(I), m. 176° (Blanksma, *Rec. trav. chim.* 20, 131(1901)). Oxidation of the sulfide in the same way gives the sulfoxide(II), yellow, m. 236°, which gives I on further oxidation. II is also obtained from the sulfide by oxidation with Cl in CHCl₃ or AcOH. While treatment of the disulfide with Cl in CHCl₃ yields 4,2-Cl(O₂N)C₆H₃SO₂Cl, in AcOH there results 4,2-Cl(O₂N)C₆H₃SO₂H, identified as the *amide* m. 138°, and the *amide*, m. 104°. The reaction of (PhNH)₂ with the chloride in equimol proportions yields (p-H₂NC₆H₄)₂HCl, (PhN:)₂, 4,2-Cl(O₂N)C₆H₃SO₂H, m. 108°, and unchanged chloride. The intermediate formation of a compd. of the type R'NHNR'(SO₂R) is assumed in this and the analogous reaction with 4,2-Cl(O₂N)C₆H₃SO₂Cl.

C. J. WEST

Derivatives of phenacyl sulfide. A. CHRZASZCZEWSKA AND S. CHWALIŃSKI. *Roczniki Chem.* 8, 432–43; French 443–4(1928).—*p*-Methoxyphenacyl sulfide, (p-Me-C₆H₄COCH₂)₂S, m. 88.8–9.3° (*dioxime*, m. 158–9° (decompn.)), is prepd. by adding warm alc. Na₂S (39 g. Na₂S.9H₂O in 250 cc. alc.), to boiling alc. p-MeC₆H₄COCH₂Cl (55 g. chloride in 150 cc. alc.) on a water bath during 2 hrs., boiling for 1 hr. more and sucking off the NaCl formed. The yellow filtrate gives on cooling and recrystn. colorless, odorless crystals insol. in water, hardly sol. in boiling ether, sol. in boiling alc., in toluene and acetone (73.5% yield). The *dioxime* forms small, colorless crystals, insol. in water, hardly sol. in cold toluene, sol. in ether, alc., boiling toluene and most easily in acetone. *p*-Bromophenacyl sulfide, m. 142.2–3.1°, is prepd. in an analogous way. The *dioxime*, m. 180–1.5° (decompn.). *p*-Chlorophenacyl sulfide *dioxime*, m. 150–0.5° (decompn.); *diphenylhydrazone*, yellow, m. 127–8° (decompn.).

JAROSLAV KUČERA

3,5-Dichlorophenetidine. G. BARGELLINI AND P. LEONE. *Atti accad. Lincei* 8, 399–404(1928).—Jaeger in 1875 found that nitrosophenol in Et₂O when treated with HCl gas, gave C₆H₃Cl₂(OH)NH₂ and that in MeOH and EtOH 2 substances not having phenolic properties were formed probably dichloroanisidine and dichlorophenetidine, resp., but did not specify the position of Cl atoms. B. and L. conclude that the formula must be 3,5,4-Cl₂(H₂N)C₆H₃OEt (I) because the product will not condense with aldehydes or give reactions typical of the NH₂ group. This is explainable by the stereointerference of the two *o*-Cl atoms, as the *m*-deriv., 2,6,4-Cl₂(H₂N)C₆H₃OEt (described in a later paper), gives these reactions. The following derivs. of I were prepd.: The Ac deriv., prepd. by adding 10 cc. of Ac₂O to 3 cc. I and recrystg. from MeOH, m. 130°. The di-

Ac deriv., obtained if the above mixt. is heated., m. 86-88°. Heating with NH_4OH reconverts it to the mono deriv.; while heating with 50% HCl or 25% KOH gives I again. With BzCl and I in Et_2O , is formed the *Bz deriv.*, m. 188°. Heated with $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$, I gives a condensation product, m. 193-4°. With $(\text{CH}_2\text{CO})_2\text{O}$ a similar condensation product, m. 137°, is formed. I can be readily diazotized by cold NaNO_2 . This product condenses readily with phenols and arylamines. However, it will not condense with $\text{C}_6\text{H}_4\text{N}_2\text{Cl}$ aryl aldehydes, KSCN and CS_2 . A. W. CONTIERI

2,6-Dichlorophenetidine. G. BARGELLINI. *Atti accad. Lincei* 8, 505-11(1928).—In a previous paper (cf. preceding abstr.), the formula of the dichlorophenetidine of Jaeger was given as the 3,5- Cl_2 compd. but in order to prove that the 2,6- Cl_2 structure cannot be right the latter compd. was prepd. in a way which made its structure clear. *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{OH}$ was chlorinated, the Cl going into the *o*-position to the OH , and *m* to the NO_2 group, thus giving 2,6,4- $\text{Cl}_2(\text{O}_2\text{N})\text{C}_6\text{H}_2\text{OH}$ (I); this was treated with EtI and KOH to give the *Et deriv.* and then reduced to the amine. This compd. must be 2,6,4- $\text{Cl}_2(\text{H}_2\text{N})\text{C}_6\text{H}_2\text{OEt}$, and as this is different from Jaeger's compd., the latter must be the 3,5- Cl_2 form. Three g. of the I with 5 g. CS_2 in EtOH when heated on the water bath 5 hrs., and then the CS_2 excess and EtOH distd. off, give the condensation product, $[\text{3,5,4-Cl}_2(\text{EtO})\text{C}_6\text{H}_2\text{NH}]_2\text{CS}$, softens 200° and m. 210°. With PhNCS is obtained a similar product, 3,5,4- $\text{Cl}_2(\text{EtO})\text{C}_6\text{H}_2\text{NHCSNHPh}$, m. 138-40°; with 2,4- $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{Cl}$ the product, $\text{Cl}_2(\text{EtO})\text{C}_6\text{H}_2\text{NHC}_6\text{H}_3(\text{NO}_2)_2$, m. 208-10°, with BzH the product $\text{Cl}_2(\text{HO})\text{C}_6\text{H}_2\text{N}:\text{CHPh}$, m. 99-101°. 3,5,4- $\text{Cl}_2(\text{EtO})\text{C}_6\text{H}_2\text{NH}_2$ with Ac_2O gives $\text{Cl}_2(\text{EtO})\text{C}_6\text{H}_2\text{NHAc}$, m. 176-8°. The azo compd. is readily formed and combines with arylamines, *i. e.*, with β -naphthol giving a bright red ppt., m. 171-3°. With piperonal the product, $\text{Cl}_2(\text{EtO})\text{C}_6\text{H}_2\text{N}:\text{CHC}_6\text{H}_3\text{O}_2\text{CH}_2$, is formed as light yellow crystals, m. 133-5°; with 2,4- $(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{Cl}$ the product, $\text{Cl}_2(\text{EtO})\text{C}_6\text{H}_2\text{NHC}_6\text{H}_3(\text{NO}_2)_2$, as golden yellow crystals, m. 160-2°. A. W. CONTIERI

Phenol and cresolsulfonyl chlorides. EUGEN RIESZ, FRITZ BERNDT AND GEORG HIRSCHMANN. *Univ. Wien. Monatsh.* 50, 328-34(1928).—The previously prepd phenol and cresolsulfonyl chlorides have been converted into anilides and, by the action of PCl_5 and a trace of POCl_3 at 120-40°, into the corresponding Cl derivs. 2,4- $(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{OH}$ gives an *anilide*, m. 205°, and 2,4- $(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_3\text{Cl}$, m. 88°. 2,4,6- $(\text{ClO}_2\text{S})_3\text{C}_6\text{H}_2\text{OH}$ yields the *anilide*, m. 247°, and 2,4,6- $(\text{ClO}_2\text{S})_3\text{C}_6\text{H}_3\text{Cl}$, m. 170-1°. 2,3,5- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$ yields an *anilide*, m. 154°, and 2,3,5- $\text{Cl}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$, m. 78°, whose *anilide*, m. 183° (Wynne and Bruce, *J. Chem. Soc.* 73, 731(1898) give 85° and 183°). 3,4,6- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$ gives an *anilide*, m. 185°, and 3-chlorotoluene-4,6-disulfonyl chloride, m. 125°. 3,2,4,6- $\text{HO}(\text{ClO}_2\text{S})_3\text{C}_6\text{HMe}$ gives an *anilide*, m. 235°, and 3-chlorotoluene-2,4,6-trisulfonyl chloride, m. 161°. Toluene-3,4-sulfonyl-6,6'-disulfonyl chloride yields, with $(\text{NH}_4)_2\text{CO}_3$ and NH_3 , the *diamide*, decomps. 300°, while heating with PhNH_2 opens the ring to give the *anilide* of 3,4,6- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$. 4,3,5- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$ gives an *anilide*, m. 129° (Anschütz and Cürten, *C. A.* 21, 3897, give 231°), and 3,4,5-trichlorobenzylidene chloride, m. 196°, which, on standing, isomerizes to *eso*-pentachlorotoluene, m. 218°. C. J. WEST

Constitution of cresol-disulfonyl chlorides. EUGEN RIESZ AND FRANZ PILPEL. *Univ. Wien. Monatsh.* 50, 335-40(1928).—The constitutions of the $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$ previously described (Pollak, Gebauer-Fülneegg and Riesz, *C. A.* 20, 1395) have now been verified. 2,3,5- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$ is hydrolyzed with 30% EtOH and then heated with 2 *N* HNO_3 , giving 2,3,5- $\text{HO}(\text{NO}_2)_2\text{C}_6\text{H}_2\text{Me}$. 3,4,6- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$ under the same conditions yields 3,2,4,6- $\text{HO}(\text{O}_2\text{N})_2\text{C}_6\text{HMe}$, but nitration with fuming HNO_3 gives 2-nitro-*m*-cresol-4,6-disulfonyl chloride, m. 183° (*anilide*, m. 212-5° (decompn.)), converted by heating with HCl at 160° into 3,2- $\text{HO}(\text{O}_2\text{N})\text{C}_6\text{H}_2\text{Me}$, b.p. 60-8°, m. 36°. Nitration in the 2-position is explicable only on the assumption that the SO_2Cl groups are initially in positions 4 and 6. 4,3,5- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$ yields on hydrolysis the di- SO_2H acid, m. 115°, converted by successive treatment with Ac_2O and PCl_5 into 4,3,5- $\text{AcO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$, m. 121°. The same acetate is obtained directly from 4,3,5- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$. When heated with PhNH_2 it yields the *anilide* of 4,3,5- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$, m. 129°, whose *Ac deriv.*, m. 105-10°. The constitution of 4,3,5- $\text{HO}(\text{ClO}_2\text{S})_2\text{C}_6\text{H}_2\text{Me}$ is sufficiently proved by its conversion into 4,3,5- $\text{HO}(\text{O}_2\text{N})_2\text{C}_6\text{H}_2\text{Me}$ by the usual method and the m. p. 231° observed by Anschütz and Cürten (*C. A.* 21, 3897) for the *anilide* is unexplained. C. J. WEST

The action of hydrogen peroxide on phenol and anisole. O. YU. MAGIDSON AND N. A. PREOBRAZHENSKII. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1926, No. 16, 65-8.—Continuing the work reported (*C. A.* 22, 3884) the authors used H_2O_2 in place of Na_2O_2 . The yield of $\text{C}_6\text{H}_4(\text{OH})_2$ was 38.6% when FeSO_4 was used as a catalyzer. The yield of guaiacol from the oxidation of anisole was meager—8-9%. There is a lot

of resinous material formed apparently from the condensation of guaiacol under the influence of the oxidizing agent. No Me ether of hydroquinone was detected.

J. S. JOFFE

Oxidation of toluene to benzoic acid by chromic mixture. O. YU. MAGIDSON AND V. I. MAKSIMOV. *J. Chem. Ind. (Moscow)* 5, 1102-6(1928).—A series of systematic expts. were carried out to det. the conditions increasing the yield (calcd. on the $K_2Cr_2O_7$ used up, rather than on PhMe) of BzOH in the reaction: $PhMe + K_2Cr_2O_7 + 4H_2SO_4 = BzOH + K_2SO_4 + Cr_2(SO_4)_3 + 5H_2O$. The app. consisted of a 1500 cc. Wulf flask, 2 necks being used for a stirrer and a thermometer, and one for the introduction of dichromate. The app. was immersed in a water bath maintained at 15-20°, which is below the temp. of the reaction inside the flask. *Operation:* Each expt. was effected by first placing in the flask 92 g. PhMe, then the corresponding quantity of H_2SO_4 and finally, with stirring, 300 g. finely powd. dichromate. Whenever catalyzers were used, they were previously mixed with the dichromate. After the last addn. of dichromate, the temp. was raised and the stirring was continued for another 1.5-2 hrs. to complete the reaction. The thick product of reaction was poured hot into a round-bottomed flask, steam-distd. for the removal of unchanged PhMe; after cooling, the BzOH was filtered from the alum soln., washed with water, dried and weighed, it usually was of 92-97% purity. The steam-distd. PhMe usually contained 3-5% BzOH. It was found that at the beginning the product of reaction is chiefly BzOH; later on the latter is partly destroyed to CO_2 . The drop in the yield at the end of the reaction is probably due to increased viscosity which interferes with efficient stirring. The reaction temp. has no great influence on the oxidation process, the slight increase of yield with the temp. apparently being due to the decrease of viscosity; however, the increase of temp. increases the speed of reaction. An excess of H_2SO_4 over the theoretically required quantity (70% H_2SO_4 being used) always increases the yield of BzOH, but it is apparently useless to operate with an excess of over 75%. The favorable influence of the excess of H_2SO_4 is probably due to the circumstance that it decreases the viscosity of the mass and thus facilitates stirring. If the H_2SO_4 used is of less than 65% concn., the reaction is exceedingly slow; if it is 80% or above, the BzOH obtained is partly resinified. Whereas the yield of BzOH (calcd. on the dichromate) is about 25% when operating with 60% H_2SO_4 , it reaches 37% with 65% H_2SO_4 , 50% with 70% H_2SO_4 ; for H_2SO_4 concns. above 70%, the yields begin to drop. As to the influence of an excess of toluene, only a considerable excess (100%) has some effect, raising the yield to 58%. *Catalyzers:* NaCl has no essential influence if introduced in very small quantities; larger quantities of it effect the complete destruction of PhMe to CO_2 . Fluorides, salts of Ni or Mn, Cr alum, infusorial earth, even in larger quantities, have but little influence on the nature of the reaction, and the same can be said of the voltaic arc. However, all these catalyzers increase the speed of the reaction. Fe salts were particularly efficient in this latter respect, Ni salts holding the 2nd place. *Conclusion:* The best yields obtainable are sufficiently high to make this process of toluene oxidation commercially profitable.

BERNARD NELSON

Resolution of *dl*-thyroxine. CHARLES ROBERT HARRINGTON. University College, London. *Biochem. J.* 22, 1429-35(1928).—H. proposes to call desiodothyroxine, "thyronine," the positions being numbered

so that thyroxine would be 3,5,3',5'-tetraiodothyronine. Formyl-3,5-diiodothyronine (I) was prepd. by warming 15 g. *dl*-3,5-diiodothyronine on the water bath for 3 hrs. with 100 cc 99% HCO_2H , evapg. under diminished pressure and warming the residual sirup for 3 hrs. with 50 cc. HCO_2H . The process was repeated, distn. of the HCO_2H leaving a cryst. residue. The latter was extd. with warm abs. alc., filtered, the filtrate boiled with charcoal, filtered and poured into an excess of hot water. The I crystd. out on slow cooling. It m. 207°; found, I 46.0, N 2.4; calcd. 45.9, N 2.5%. I now combined with *l*-phenylethylamine, the acid was then recovered from this salt combination, the HCO group removed by hydrolysis with HBr and the resulting optically active diiodothyronine iodinated. The *l*-thyroxine is about 3 times as active physiol. as the *d*-compd.

BENJAMIN HARROW

Some derivatives of thyroxine. JULIUS NICHOLSON ASHLEY AND CHARLES ROBERT HARRINGTON. University College, London. *Biochem. J.* 22, 1436-45(1928). The prepn. of the following are given: 3,5-Diiodothyronine Me ester-HCl; 3,5-diiodothyro-

nine Me ester; chloroacetyl-3,5-diiodothyronine Me ester; chloroacetyl-3,5-diiodothyronine; glycyl-3,5-diiodothyronine; glycylthyroxine; α -bromopropionyl-3,5-diiodothyronine Me ester; α -bromopropionyl-3,5-diiodothyronine; *dl*-alanyl-3,5-diiodothyronine; thyroxine Me ester-HCl; thyroxine Me ester; chloroacetylthyroxine Me ester; chloroacetylthyroxine; glycylthyroxine; α -bromopropionylthyroxine Me ester; α -bromopropionylthyroxine, alanylthyroxine; *N*-acetylalanylthyroxine Me ester; *N*-lactylthyroxine; 3,5-diiodothyronamine.

BENJAMIN HARROW

Preparation of aminosalicylic acid from nitrososalicylic acid. V. G. GULINOV. *J. Chem. Ind. (Moscow)* 5, 1019-21(1928); cf. *C. A.* 22, 3648.—The Cu-nitroso salt of salicylic acid may be used for the prepn. of aminosalicylic acid either by direct reduction with Na_2SO_3 , or by first transforming it into free nitrososalicylic acid or its Na salt, and then reducing it. The objection to the latter method is that it requires the installation of special app., the consumption of NaOH and H_2SO_4 , and also a certain length of time. As to the method of direct reduction, it has hitherto been considered impracticable, as it leads to formation of a mixt. of 2,4,5-HO(H_2N)(HO_2S) $\text{C}_6\text{H}_2\text{CHO}$ and 2,4,3,5-HO(H_2N)(HO_2S) $\text{C}_6\text{H}_2\text{CHO}$, which it is difficult to sep. from one another. However, G. found that, by using a very large excess of Na_2SO_3 , the reduction of the Cu-nitroso salt can be made to yield only the disulfo deriv., and the method thus becomes very practical. 22.9 g. Cu-nitroso salt of salicylic acid is introduced into 60-70 g. anhyd. Na_2SO_3 (or the equiv. quantity of crystd. Na_2SO_3) in 300-350 cc. water and the mixt. is heated on a water bath till the disappearance of the Cu salt. (Prolonged heating of the reaction mixt. after the disappearance of the nitroso salt, or raising the temp. of reaction, lead to the formation of dihydroxydisulfobenzoic acid and to a decrease of the amino compd. yield.) As a result of the side-reactions: $\text{OC}_6\text{H}_3(\text{NO})(\text{CO}_2\text{Cu})$

+ $\text{Na}_2\text{SO}_3 = \text{C}_6\text{H}_3(\text{NO})(\text{ONa})(\text{CO}_2\text{Na}) + \text{CuSO}_3$; $\text{CuSO}_3 + \text{H}_2\text{O} = \text{Cu}(\text{OH})_2 + \text{SO}_2$; $2\text{Cu}(\text{OH})_2 + \text{Na}_2\text{SO}_3 = \text{Cu}_2\text{O} + \text{Na}_2\text{SO}_4 + \text{H}_2\text{O}$, all the Cu is recovered. The yield of the dissolved aminodisulfo compd. reaches 95% of the theoretical, but it is difficult to sep. the amino acid from the products of the reaction, and much of it always remains in soln. The latter circumstance, however, is not important, as the soln. of aminodisulfobenzoic acid can directly be used for the prepn. of azo dyestuffs, which is done as follows: The soln. is acidified by HCl, freed by ebullition from SO_2 , dild. to 1 l. and diazotized for 15 mins. at a temp. not exceeding 10° with a 20% soln. of 7 g. NaNO_2 . Then the weakly acid soln. of the diazonium salt is added to a soln. of the azo component (for which purpose phenol, cresols, resorcinol and β -naphthol can be used). The monoazo dyestuffs obtained are very fast, if applied by the use of Cr mordant.

BERNARD NELSON

Lichen substances. VI. Synthesis of divaric acid. ADOLF SONN (with J. BURKARD). *Univ. Königsberg i. Pr. Ber.* 61B, 2479-81(1928); cf. *C. A.* 22, 2746.—That divaric acid has the structure 2,4,6-Pr(HO) $\text{C}_6\text{H}_2\text{CO}_2\text{H}$ (I) has been confirmed by a synthesis analogous to that of orsellinic acid. Me α,β -hexene- α -carboxylate, NaOEt and $\text{AcCH}_2\text{CO}_2\text{Et}$ refluxed in alc. yield *Et propyldihydroresorcinolcarboxylate*, m. $85-7^\circ$, gradually decamps. on long standing; the fresh product with Br in AcOH gives *Et dibromopropylresorcinolcarboxylate*, 2,3,5,4,6-PrBr $_2$ (HO) $\text{C}_6\text{CO}_2\text{Et}$, m. $77-8^\circ$, and the free acid (from the ester in concd. H_2SO_4 at room temp.), m. $158-60^\circ$ (gas evolution), in excess of NaOH with H and Pd- CaCO_3 yields I, identical with the natural product.

C. A. R.

Monoacyl derivatives of quinic acid. III. Synthesis of 4-*p*-hydroxybenzoylquinic acid. KARL JOSEPHSON. *Univ. Stockholm. Ann.* 467, 287-94(1928) cf. *C. A.* 22, 2557.—Condensation of *p*- $\text{AcOC}_6\text{H}_4\text{COCl}$ and acetonequinide in CHCl_3 with $\text{C}_6\text{H}_5\text{N}$ gives 4-*p*-acetoxybenzoylacetonequinide, m. $166-7^\circ$, $[\alpha]_{\text{H}_2\text{O}}^{20}$ 11.9° (0.1940 g. in 5 cc. CHCl_3); sapon. with $\text{Me}_2\text{CO-HCl}$ gives 54% of 4-*p*-hydroxybenzoylquinic acid, m. $108-12^\circ$; $[\alpha]_{\text{H}_2\text{O}}^{20}$ -9.4° (0.2028 g. in 5 cc. H_2O). The Me_2CO deriv., m. $191-2^\circ$ (Karrer and Link, *C. A.* 22, 773, give $179-80^\circ$).

C. J. WEST

Condensation of benzohydrol with phenol and the cresols. PAUL SHORIGIN. *Tech. Hochschule Moskau. Ber.* 61B, 2516-9(1928).—It had been the action of Ph_2COH on *p*-cresol in $\text{AcOH-H}_2\text{SO}_4$ the Ph_2COH is reduced to PhCHO and the cresol simultaneously oxidized, probably to quinomethane. To det. whether the presence of 3 aryl groups is necessary for such a reduction of the carbinol, S. tested the behavior of Ph_2CHOH on *p*-cresol and found that the reaction proceeds quite smoothly but in another direction, 2 Ph_2CH residues entering the cresol nucleus, probably in the *o,o'*-positions to the HO group. Into PhOH three Ph_2CH groups are introduced, into *c*-cresol only 1, probably in the *o*-position to the HO group. *Dibenzohydryl-p*-

cresol (about 8 g. from 10 g. Ph_2CHOH and 6 g. *p*-*cresol*), m. 189–90°. *Benzohydryl-o-cresol* (about 20 g. from 15 g. Ph_2CHOH and 4.5 g. *o*-*cresol*), m. 139°. *Tribenzohydryl-phenol* (about 18 g. from 15 g. Ph_2CHOH and 3.75 g. PhOH), m. 166°. C. A. R.

2-Iodofluorene. A. KORCZYNSKI. *Bull. soc. chim.* 43, 346(1928).—Polemical against P. Chanussot (*C. A.* 22, 434).

BEN H. NICOLET

The closing of the fluorene ring in the di- α -naphthylmethane series. O. YU. MAGIDSON. *Trans. Sci. Chem.-Pharm. Inst.* (Moscow) 1926, No. 16, 33–50.—The reaction between $(\alpha\text{-C}_{10}\text{H}_7)_2\text{CHOH}$ (I) and cryst. H_3PO_4 is represented as follows: $2\text{I} \rightarrow [(\text{C}_{10}\text{H}_7)_2\text{CH}]_2\text{O} \rightarrow [(\text{C}_{10}\text{H}_7)_2\text{C}]_2$ (II) $\rightarrow 2(\text{C}_{10}\text{H}_6)_2\text{CH}_2$ (III). The speeds of the sep. phases of the reaction differ very little and as a result a mixt. of products is obtained: 65% III, 10% II and 25% of a difficultly separable mixt. of the two. When the reaction takes place *in vacuo* the II comprises the main product and III the by-product. This is substantiated by the fact that by boiling the II in glacial AcOH with Zn dust in the presence of HCl III is obtained. By heating it with H_3PO_4 in a combustion tube at 235–45° the reaction becomes more complicated: $4\text{III} + \text{II} = 2[(\text{C}_{10}\text{H}_6)_2\text{CH}]_2$ (IV) + $2(\text{C}_{10}\text{H}_7)_2\text{CH}_2$. The bisdinaphthofluorenyl (IV) is a very stable substance. This was also obtained by the reaction of Cu powder on $(\text{C}_{10}\text{H}_6)_2\text{CHBr}$ as well as by the action of I on $(\text{C}_{10}\text{H}_6)_2\text{CHMgBr}$. Ring closure is effected in $(\alpha\text{-C}_{10}\text{H}_7)_2\text{CO}$ as follows: $(\alpha\text{-C}_{10}\text{H}_7)_2\text{CO} + \text{PCl}_5 = (\text{C}_{10}\text{H}_7)_2\text{CCl}_2 + \text{POCl}_3$; $(\text{C}_{10}\text{H}_7)_2\text{CCl}_2 + \text{PCl}_5 = (\text{C}_{10}\text{H}_6)_2\text{CCl}_2$ (V) + $\text{PCl}_3 + 2\text{HCl}$. Also, $(\text{C}_{10}\text{H}_7)_2\text{CO} + 2(\text{COCl})_2 = \text{V} + 4\text{CO} + 2\text{HCl}$. The dinaphthofluorenone chloride (V) gives up its Cl for O by boiling it with AuOH in the presence of H_2SO_4 : $\text{V} + \text{H}_2\text{O} = (\text{C}_{10}\text{H}_6)_2\text{CO} + 2\text{HCl}$. The reaction with H_3PO_4 may be represented as follows: from 2 mols. of hydrol 1 mol. of ketone (xanthone) and 1 mol. of methane (xanthane) are formed: $2\text{R}_2\text{CHOH} = \text{R}_2\text{CO} + \text{R}_2\text{CH}_2$. In the case of Ph_2CHOH a small amount of $(\text{Ph}_2\text{C})_2$ is obtained. II, which is the analog of $(\text{Ph}_2\text{C})_2$ shows no characteristic properties of the double bond; it does not add Br or Cl. The same difference is apparent when PCl_5 acts on both hydrocarbons. $(\text{Ph}_2\text{C})_2$ gives Ph_2CCl_2 while II undergoes a new transformation into the dinaphthochlorofluorene: (1) $\text{II} + 2\text{PCl}_5 = 2\text{V} + 2\text{PCl}_3$; (2) $\text{V} \rightarrow (\text{C}_{10}\text{H}_6)_2\text{CHCl}$ (VI) + HCl . Fluorene ring formation also takes place when an attempt is made to det. the mol. wt. of II in camphor, whereby IV is formed at the expense of the camphor (which is reduced): $\text{II} \rightarrow 2\text{III}$; $2\text{III} + \text{O} \rightarrow \text{IV} + \text{H}_2\text{O}$. From V a green hydrocarbon, bisdinaphthofluorenylene (VII), was obtained with the aid of Cu. The reaction of $(\text{C}_{10}\text{H}_6)_2\text{CHMgBr}$ with xanthone does not give the corresponding tertiary alc., but IV: $2(\text{C}_{10}\text{H}_6)_2\text{CHC}(\text{OH})(\text{C}_6\text{H}_5)_2\text{O} + \text{O} = \text{IV} + \text{H}_2\text{O} + 2\text{CO}(\text{C}_6\text{H}_5)_2\text{O}$. IV, m. 338–43°, is difficultly sol. in boiling PhMe and xylene, insol. in alc., ether, acetone and C_6H_6 . V, yellow needles, m. 256–8°, easily sol. in CHCl_3 , hot C_6H_6 and PhMe. VII is a green powder, m. 308–10°, easily sol. in CHCl_3 , C_6H_6 , insol. in ether, alc. and benzene, sol. in concd. H_2SO_4 with cherry-red color. By treating V with Cu, $(\text{C}_{10}\text{H}_6)_2\text{CO}$ is obtained. With Br VII gives easily the di-Br substitution product $\text{C}_{20}\text{H}_{12}\text{Br}_2$. Spectroscopic analyses of VII were also made.

J. S. JOFFE

Derivatives of diphenyldiphenylene methane. JOSEF TURSKI and JULIAN DALINSKI. *Roczniki Chem.* 8, 281–9; French 289(1928).—By condensation of benzidine with HCHO tetraminodiphenyldiphenylenemethane, m. 159°, sol. in CHCl_3 , MeOH, PhNMe₂, PhNO₂ and pyridine, was obtained which could be hexazotized without forming an octazo linking. This new base proved to be of no use as an intermediate product for prepn. of azo dyes; however, its application for the prepn. of derivs. of triphenylmethane is possible.

JAROSLAV KUČERA

Triphenylmethyl *p*-tolyl ether. PAUL SHORIGIN and I. MAKAROV-SEMIJANSKII. *Mendeleev Inst. Moskau. Ber.* 61B, 2519–21(1928).—The ether had been obtained in prisms, m. 114°, from Ph_2CCl and *p*- $\text{MeC}_6\text{H}_4\text{ONa}$, while van Alphen, who prepd. it from Ph_2CCl and *p*-*cresol* in $\text{C}_6\text{H}_5\text{N}$ (*C. A.* 22, 1770), states that it exists in 2 forms, m. 81° and 95°, resp. The compd. has been prepd. anew by both methods (in a different lab. to avoid the possibility of inoculation by germs of the older prepn. which might still be present) and in no case was any other than the 114° form obtained. Only when insufficiently purified Ph_2CCl and not completely dry $\text{C}_6\text{H}_5\text{N}$ were used were products of lower m. p. obtained, probably because of the presence of Ph_2COH . That fusion with anhyd. ZnCl_2 gives Ph_2CH was confirmed but the quantity formed is much smaller than stated by v. A., being only 0.4–0.45 g., together with 3.5–4 g. Ph_2COH , from 6 g. of the ether, whereas according to v. A.'s equation, $3\text{MeC}_6\text{H}_4\text{OCPh}_2 \rightarrow 3\text{Ph}_2\text{CH} + \text{O}:\text{C}_6\text{H}_4:\text{C}(\text{C}_6\text{H}_5\text{MeOH})_2$, the yield of Ph_2CH should be about 70% of the ether used.

C. A. R.

Coupling reactions. JAKOB POLLAK and ERICH GEBAUER-FÜLNEGG. *Univ. Wien Monatsh.* 50, 310–23(1928).—Previous work on the coupling of diazonium

compds. with *o*-substituted PhOH, particularly 1-substituted β -C₁₀H₇OH, is reviewed. (With WILHELM SPECHT and KURT WINTER.) The coupling of *p*-O₂NC₆H₄N₂X with 1,2-Br₂C₁₀H₆OH or 1,2-ClC₁₀H₆OH does not immediately produce para-red by displacement of the halogen atom. The substances formed are brown in color and contain 85-90% of the amt. of halogen calcd. for the formula C₁₀H₁₀O₂N₂X (X = Br or Cl). The substances may be formed on cotton by the usual method and the browner shades produced are stable except to alkali. The substances are decompd. when recrystn. is attempted and para-red is probably sepd. ultimately. Similar results are obtained with 1,6,2-Br₂C₁₀H₆OH (on cotton only), 1,2,3-Br(HO)C₆H₄CO₂H and 1-bromo-2-hydroxy-3-naphthamide, m. 164°. The constitution of these products is uncertain but it is possible that both diazo-oxides and β -naphthoquinone derivs. are formed. 1,2-O₂NC₁₀H₆OH yields an unstable product which decomp. at the ordinary temp. No coupling takes place with the NO deriv. 1,2-MeC₁₀H₆OH couples readily. (2-HOC₁₀H₆)₂CH₂ couples slowly with *o*-O₂NC₆H₄N₂X on cotton, giving a shade different from para-red. In this and other cases the "abnormal" product of coupling seems to be stabilized on the fiber. (With RICHARD MICHEL and PAUL POLLAK.) Diazotized amines couple with thiol derivs. to form unstable diazo-sulfides (NO₂C₆H₄N₂SR) exclusively. These substances lose their diazo-N completely on attempting to recryst. them but are stabilized on the fiber. The diazo-sulfides obtained by coupling *o*-O₂NC₆H₄N₂X, PhN₂X and *p*-HO₂SC₆H₄N₂X with *m*-C₆H₄(SH)₂ and *p*-O₂NC₆H₄N₂X with 2,4-(HS)₂C₆H₃OH, 3,4,6-HO(HS)₂C₆H₂Me, 2-C₁₀H₇SH and 1,5-C₁₀H₆(SH)₂ are described. (With P. POLLAK and FRIEDRICH BECKER.) 1,5-C₁₀H₆(SH)₂, m. 119°, is prepd. by reduction of 1,5-C₁₀H₆(SO₂Cl)₂ with Zn and H₂SO₄ and sepd. by steam distn. Ac deriv., m. 187-9°; *di-Bz* deriv., m. 232°; *di-Me ether*, m. 150°. C. J. W.

α -Phenylcoumarin. G. BARGELLINI AND LYDIA MONTI. *Atti accad. Lincei* 8, 395-9(1928).—The following derivs. have been prepd. α -[4-Methoxyphenyl]coumarin, C₈H₄CH:C(C₆H₄OMe)COO, prepd. by heating together 5 g. *o*-HOC₆H₄CHO and

8 g. of *p*-MeOC₆H₄CH₂CO₂Na together with 50 cc. of (CH₂.CO)₂O for 30 hrs., and then dilg. with H₂O, faintly yellow, m. 142-4°, insol. in H₂O. α -[3,4-Methylenedioxyphenyl]coumarin, prepd. by heating 7 g. of *o*-HOC₆H₄CHO with CH₂O₂C₆H₃CH₂CO₂Na and 50 cc. (CH₂.CO)₂O, m. 170-2°, insol. in H₂O, shows a blue fluorescence in C₆H₆ and an intense olive-green color in H₂SO₄. The hydroxycoumarin prepd. by using 2,4-(HO)₂C₆H₃CHO in place of the *o*-HOC₆H₄CHO as above, m. 191 2°, sol. in C₆H₆ without color but with blue fluorescence. Satg. the Ac deriv. in EtOH with NH₃ (gas) and distg. off the EtOH gives the hydroxycoumarin, m. 238-9°, sol. in NaOH and NH₄OH, the latter soln. showing an intense green fluorescence; also sol. in C₆H₆ with blue fluorescence. The 4,6-dihydroxycoumarin is prepd. by heating 2,4,6-(HO)₃C₆H₂CHO with CH₂O₂C₆H₃CH₂CO₂Na in (CH₂.CO)₂O. *Di-Ac* deriv., m. 199°, gives with NH₃ the di-HO compd., m. 260° (decompn.). A. W. C.

Electrolytic reduction of cyclic acid imides to hydrogenated cyclic bases. ERNST SPÄTH AND FRITZ BREUSCH. Univ. Wien. *Monatsh.* 50, 349-56(1928). In the reduction of the imides according to Tafel, pure Pb must be used; the dimensions of the app. used are given. Usually 10 g. of the imide were suspended in 300 cc. 50% (by wt.) H₂SO₄ and reduced with 45 amps. for 4 hrs. at 18-20° and then 2 hrs. at 60°. The anode liquid was 200 cc. of 50% H₂SO₄. 3-Methylsuccinimide gives 32% of 3-methylpyrrolidine; the 3-Ph deriv. gives 40.3% of 3-phenylpyrrolidine, b₁₂ 120 2°; HCl salt, hygroscopic; picrate, m. 166°; the 3,4-diphenyl deriv., m. 198°, gives 1.2% of 3,4-diphenylpyrrolidine, b₁₄ 195-200°. Phthalimide gives 32% of dihydroisoindole, homophthalimide gives 15% of tetrahydroisoquinoline. Isatin gives 4% of dihydroindole. Naphthalic imide gives 15% of hydrobenzisoquinoline, m. 70°; picrate, m. 200° (decompn.). Quinolic imide, diphenic imide and malonic diamide could not be reduced. C. J. WEST

Syntheses by means of magnesylpyrroles. Series II. Note XII. Indophthalein. BERNARDO ODDO. Reale Univ. Pavia. *Gazz. chim. ital.* 58, 569-73(1928), cf. O. and Albanese, *C. A.* 22, 1775.—The reaction between 2-methylindylmagnesium bromide and *o*-C₆H₄(COCl)₂ (I) already described (cf. *C. A.* 19, 2823; 21, 241) was carried out between magnesylindole and I. I (2.5 g.) in anhyd. Et₂O added to a mixt. prepd. from Mg (0.6 g.), EtBr (2.8 g.) and indole (2.7 g.) in Et₂O, ppts. a cherry-red substance, which heated 0.5 hr., cooled and decompd. with ice, yields (1) an aq. layer with acid reaction; (2) a brown colored Et₂O layer, and (3) a dark red part insol. in water and in Et₂O. The aq. layer was extd. with Et₂O and the ext. added to the Et₂O layer. (2) *Et₂O* layer.—Evapn. of the Et₂O, extn. of the residual pitch with boiling ligroin, purification of the residue by repeated pptn. from its MeOH, EtOH or AcMe soln. by petr.

ether, and then by soln. in a min. of 10% NaOH, filtration and pptn. by acidification of the filtrate with dil. H_2SO_4 , yields *indolyndolidenephénylmethane-o-carboxylic acid*, $\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{CH}:\text{C}(\text{C}_6\text{H}_4\text{CO}_2\text{H})\cdot\text{C}:\text{CH}:\text{N}\cdot\text{C}_6\text{H}_4$ (II), dark red, m. 145° , sol. in aq.

alk. hydroxides and carbonates, and gives a violet soln. in concd. HCl. This latter soln. is decolorized by Zn dust because of the formation of the *leuco deriv.*, the color being restored by mild oxidizing agents, such as FeCl_3 . *Mono-HCl salt*, by treatment of II in anhyd. Et_2O with gaseous HCl. *NH_4 salt* of II, hydrolyzed by evapn. *Pb salt* of II, amorphous, by addn. of $\text{Pb}(\text{OAc})_2$ to the aq. NH_4 salt. No other metallic salts give ppts. Aq. AgNO_3 contg. NH_3 added to dil. alc. II ppts. an orange *compd.*, which gives a yellow soln. in a large excess of NH_4OH . PhN_2Cl added to II in aq. NaOH ppts a *coupled compd.*, brick-red. (3) *Insol. portion*.—Repeated crystns. from hot EtOH with water failed to yield a product with a const. m. p. (reached 226°). It was a brick-red powder, partially sol. in cold 10% alk. hydroxides. By means of the latter, there was obtained by filtration (1) an insol. substance (III) which composed the greater part, and (2) a soln., which acidified with dil. H_2SO_4 , pptd. II. III crystd. from C_6H_4 contg. a little EtOH , yields *indophthalen*, *i. e.*, the *lactoid form* of II, $[\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{CH}:\text{C}-]_2\text{C}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{O}$ (IV), brown-yellow. It is also obtained in

the same way by crystn. of the insol. product from the treatment of impure II with NaOH (*loc. cit.*). No *compd.* corresponding to methylketole yellow (cf. C. A. 21, 241) could be obtained from IV. C. C. DAVIS

Hydrogenation of α -methylindole. M. HADANO AND T. MATSUNO. *J. Pharm. Soc. Japan* 48, 904-19 (1924).—2-Methylindole, Pt black, glacial AcOH and H_2 gave as a main product *bz-tetrahydro-2-methylindole* (I), b_7 $103-4^\circ$, b_{764} $222-3^\circ$, d_4^{30} 1.0056; *picrate*, m. 141° ; *chloroplatinate*, decomp. $187-8^\circ$; *methiodide*, decomp. 195° ; *benzene-sulfonate*, m. $86-91^\circ$; HgCl_2 salt, m. $153-4^\circ$. *Octahydro-2-methylindole* was isolated as a by-product. Alk. reduction of I with Na and AmOH gave *2,3,4,5,6,7-hexahydro-2-methylindole* (II), b_5 90° , $b_{764.5}$ $220-1^\circ$, d_4^{20} 1.0144; *HCl salt*, hygroscopic; *picrate*, m. $150-1^\circ$; *chloroplatinate*, decomp. 196° ; *methiodide*, decomp. $196-7^\circ$; *benzene-sulfonate*, m. $90-1^\circ$; HgCl_2 salt, m. 152° . Further reduction of II, using Pt black or colloidal Pd as a catalyzer, was unsuccessful. The acid reduction of I with HI and P gave *2,3-dihydro-2-methylindole*, which on further reduction gave, as a result of ring rupture, *o-propylaniline*. NAO UYEI

Condensation of 2- or 3-methylindole and their hydro derivatives with aldehydes. M. HADANO. *J. Pharm. Soc. Japan* 48, 919-28 (1928).—Condensation of 1 mol. 2,3-dihydro 2-methylindole and 1.1 mol. Me_2CHCHO with dry HCl gave a *yellow oil* (I), b_5 $100-5^\circ$ (*oxalate*, m. 99° ; *picrate*, decomp. 147° ; *chloroplatinate*, decomp. $180-1^\circ$). Crystn. of I from dil. HCl gave an *orange-yellow compd.* (II) $(\text{C}_{13}\text{H}_{17}\text{N}\cdot\text{HCl})\cdot\text{PtCl}_2\cdot 7\text{H}_2\text{O}$ and a small amt. of a *yellow substance* (III) $(\text{C}_{13}\text{H}_{17}\text{N}\cdot\text{HCl})_2\cdot\text{PtCl}_4(?)$, decomp. $180-1^\circ$. Due to the small amt. of products obtained a further study was impossible, but II is probably the *3-isobutylidene-2,3-dihydro-2-methylindole chloroplatinate* of Liebermann and Paal (*Ber.* 16, 529) and I probably *isobutylidene-2,3-dihydro-2-methylindole*. Heating of 1 mol. *bz-tetrahydro-2-methylindole*, 1.7 mol. $(\text{MeCHO})_3$ and NaOEt gave a *yellow compd.*, b_{10} 93° , which is probably *ethylidenebis-bz-tetrahydro-2-methylindole*. Condensation of 3-methylindole and BzH was exactly carried out according to the method of Wenzing (*Ann.* 239, 241), *i. e.*, in presence of ZnCl_2 . Instead of W.'s *benzylidenediskatole*, m. $140-2^\circ$, a *bright yellow compd.* (IV), $\text{C}_{18}\text{H}_{15}\text{ON}$, m. 151° , which is probably 3-*phenylhydroxyethylindole*, was obtained. Heating of 2 mols. 2,3-dihydro-3-methylindole and 1.3 mols. BzH first at 140° for 0.5 hr. and then at 160° for 1 hr. gave 3-styryl 2,3-dihydroindole, m. $120-4^\circ$. NAO UYEI

Reactions of nitroso derivatives and unsaturated compounds. VI. Catalytic action of nitroso derivatives on *o*-nitro-substituted acetylenes. Behavior of *p*-nitroso-anisole. L. ALESSANDRI. Reale Univ. Perugia. *Gazz. chim. ital.* 58, 551-60 (1928); cf. C. 21, 2127.—In previous work it was shown that the reaction of PhNO (I) and *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{C}:\text{CH}$ (II) leads to $\text{HN}\cdot\text{C}_6\text{H}_4\cdot\text{C}(\text{O})\cdot\text{C}:\text{N}(\text{O})\text{Ph}$ (III) and

$\text{HON}\cdot\text{C}_6\text{H}_4\cdot\text{C}(\text{O})\cdot\text{CO}$ (IV), but the mechanism of the reactions was left unexplained (cf. C. A. 21, 2127). With the object of throwing further light on these obviously complicated reactions, the reaction of aryl nitroso derivs. and *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{C}:\text{CCO}_2\text{H}$ (V) was studied. The present paper describes in a general way this further research, without, however, exptl. data. With I and V, the reaction products included a trace

of III, a larger quantity of isatin and considerable IV, *i. e.*, the same products which were obtained from I and II. A considerable quantity of azoxybenzene was also obtained. Part of the V remained unaltered. The readiness with which V loses CO₂ with formation of II explains the identity of the products in the 2 cases. Therefore esters of V were studied. Independent of the solvent, I and *o*-O₂NC₆H₄C : CO₂Et (VI) react in a different manner from I and V, isomerization taking place with formation of C₆H₄C(:O).C(CO₂Et):NO (VII), the I acting as a catalyst and being recovered wholly

unaltered. The same isomerization has been noted with H₂SO₄ (cf. *Ber.* 14, 1741 (1881); 15, 780(1882)) and with C₆H₅N (cf. *C. A.* 10, 1334) as catalysts. Repeating the expts. with C₆H₅N, it was found that the yields are smaller than with I, and further more, with the latter there was isolated a hitherto unknown secondary *compd.* VIII, m. 121°, the highest yield of which was 15%. A similar result was obtained with I and *o*-O₂NC₆H₄C : CCO₂Me, the transformation being for the greater part into C₆H₄.C(:O).C(CO₂Me):NO, with a small proportion of a hitherto unknown

compd., m. 139°. Further expts. were made with VI and other NO *compds.*, including *p*-MeOC₆H₄NO (IX) and *p*-Me₂NC₆H₄NO (X). Both IX and X acted as catalysts with the same results as before, giving good yields of VII, with small proportions of VIII. Analysis of VIII corresponded to VI and VII in % *compn.* Since this secondary product was formed in all 3 cases, it does not contain residues of any of the 3 reagents. Since moreover I, IX and X also behave the same, the catalytic action probably resides in the NO group. Further expts. show that a good yield of VIII is formed from *p*-HOC₆H₄NO and VI, and its constitution is being studied. When VII in Et₂O is exposed to diffuse light at room temp. it is slowly transformed into a *compd.* different from VIII. This may bear some relation to the isomers of isatogen derivs. described by Ruggli (*C. A.* 13, 1473; 17, 3024) and Heller (*C. A.* 16, 2686). The possible *mechanism* of the catalysis and isomerization is discussed, attention being called in particular to the analogy between these reactions and those discussed by Pfeiffer (cf. *C. A.* 10, 1334). Under the catalytic influence of various reagents and of light, a NO₂ group in the *o* position to a lateral chain in a C₆H₄ nucleus changes readily to a NO group, oxidizing at the same time the lateral chain (cf. *Ber.* 34, 2041(1901); 35, 2715(1902)); Tanasescu, (*C. A.* 21, 533, 1110, 3901) and, therefore, by the action of C₆H₅N or of NO *compds.* an O atom in the NO₂ group of VI passes to the acetylenic C on the nucleus, leaving 2 valences of the other acetylenic C free, which are then satd with the latent valences of the NO, closing the isatogen ring:

The exptl. details of the research are to be published later, including further expts with other *compds.*

C. C. DAVIS

Pyrazole derivatives of the type of diketopiperazines. K. v. AUWERS AND E. CAUER. Marburg, Chem. Inst. *Ber.* 61B, 2402-11(1928).—In general, pyrazole-carboxylic acids (I) split off CO₂ above their m. ps. and change smoothly into the corresponding pyrazoles but in certain cases it was found that the reaction is not homogeneous, amorphous, high-melting substances being formed to a greater or lesser extent along with the pyrazoles; under certain conditions they are the sole products. These same *compds.* were likewise unexpectedly obtained in attempts to acylate certain I on the N. Their *compn.* and properties leave hardly any doubt that they are derived from a diketopiperazine-like mother substance HC≡C.CO.N.N:CH.

which they are formed depends in a remarkable way both on the structure of the original acid and on the nature of the reagent. According to the data in the literature, the simpler I show no tendency to form piperazines at high temps. but merely split off CO₂, although not so smoothly as the *N*-alkyl derivs. of the α-NH₂ acids, for on distn. there generally remains a small residue. The nature and position of the substituents seem to have but little influence; nucleus-methylated and -phenylated I of different structures seem to behave much the same. But whereas the introduction of an acyl radical into the α-NH₂ acids hardly changes the behavior of the latter, an acyl radical on 1 of the N atoms of a I generally greatly increases the tendency to piperazine formation. Below are the % yields of piperazine (piperazine + acylpyrazole = 100%) obtained from various substituted pyrazole-3-carboxylic acids having an acyl radical

(R) on 1 of the N atoms: 4-Me (R = EtO₂C) 20; 4-Me (R = *o*-O₂NC₆H₄CO) 60; 5-Me (R = *o*-O₂NC₆H₄CO) 90; 5-Me (R = Ac) 100; 4-bromo-5-methyl (R = Ac) 100; 4,5-Me₂ (R = EtO₂C) 50; 4-Ph (R = Ac) 100. The piperazines are obtained not only by superheating the preformed acylpyrazolonecarboxylic acids but often in the attempt to prep. the latter compds., and in general it makes but little difference if it is attempted to effect the acylation by heating with the appropriate acid chloride or by bringing the acid and chloride together in C₆H₅N. The structure of the pyrazole deriv. and the nature of the acyl residue are of even greater influence than the heating of the acylated acids. Below are given, resp., the substituent in the pyrazole-3-carboxylic acid, the acid chloride used and the yield of piperazine obtained by heating and in C₆H₅N: no substituent, O₂NC₆H₄COCl, little, 50; 4-Me, ClCO₂Et, 0, —; 4-Me, AcCl, 0, 0; 4-Me, O₂NC₆H₄COCl, 0, 5; 5-Me, AcCl, 5, 10; 5-Me, O₂NC₆H₄COCl, 95, 100; 4,5-Me₂, ClCO₂Et, — (by-product of unknown nature and 80% acyl deriv.), 4,5-Me₂, AcCl, 10, —; 4,5-Me₂, O₂NC₆H₄COCl, 100, 100; 4-chloro-5-methyl, O₂NC₆H₄COCl, 100, —; 4-bromo-5-methyl, AcCl, 10, —; 4-bromo-5-methyl, O₂NC₆H₄COCl, 100, 100; 4-Ph, AcCl, 0, —; 4-Ph, O₂NC₆H₄COCl, 100, 100; 5-Ph, O₂NC₆H₄COCl, 100, 100; tetrahydroindazolecarboxylic acid, O₂NC₆H₄COCl, 0, —. The last acid is also not anhydridized by SOCl₂ while the non-hydrogenated indazolecarboxylic acid is smoothly converted into a diketopiperazine by SOCl₂. Of all the chlorides hitherto used, SOCl₂ has proved best adapted to convert the I into diketopiperazines. There is nothing in the literature on the conversion of aliphatic α -NH₂ acids into diketopiperazines by acid chlorides. Glycocol with *o*-O₂NC₆H₄COCl at 135° vigorously evolved HCl and the product was completely sol. in Na₂CO₃, *i. e.* contained no piperazine. The reaction could not be carried out in C₆H₅N because of the insoly. of the glycocol. Boiling 3–4 hrs. with SOCl₂ also produced no change. Unlike the α -NH₂ acids, the I are chiefly acylated by boiling Ac₂O. Also, the esters of the I are completely stable at room temp. and on heating split off CO₂ without forming anhydrides. Et 3,5-methylpyrazolecarboxylate heated a long time at 180° gives no piperazine but some 1-ethyl-5-methylpyrazole, the Et group in part migrating to the N. In the pyrazole series diketopiperazines cannot be obtained from the *N*-ClCH₂CO derivs. of the esters with NH₂, the *N*-acyl derivs. being too easily saponified. Chem., the diketopiperazines derived from the I resemble those obtained from aliphatic NH₂ acids, alkalies split them even more readily than the aliphatic compds., 2–3 mins. boiling generally sufficing to decomp. them completely into the original I. In phys. properties they differ from the aliphatic diketopiperazines in their much smaller soly. and their very high m. p. *N*-[*o*-Nitrobenzoyl]-3(5)-pyrazolecarboxylic acid, sandy powder, m. 195–6°; diketopiperazine, light yellow. Et *N*-chloroacetyl-3,5-methylpyrazolecarboxylate, m. 127.5–9.5°; when heated at 180° it gives, along with 1-ethyl-5-methylpyrazole (picrate, m. 139–41°), a product whose picrate m. 126–8°; it is not 3,5-methyl-ethylpyrazole b₁₂ 118°, which was synthesized from AcCH₂COEt and N₂H₄, and forms a picrate, lemon-yellow, m. 137.5–9°. In another expt. was obtained 3(5)-methylpyrazole (picrate, m. 139–41°). As, in the decompn. of the above ester, 3(5)-methyl-4-ethylpyrazole might possibly be formed, an expt. was made to det. whether this last compd. is formed, along with 3(5)-propylpyrazole, by treating with N₂H₄ the crude product of the condensation of MeCOPr and HCO₂Et, but only the Pr deriv., b₁₂ 117° (picrate, m. 150–2°) was obtained. Diketopiperazine from 3,4(4,5)-dimethylpyrazole-5(3)-carboxylic acid and *o*-O₂NC₆H₄COCl, light brown, m. 285–6°. *N*-Acetyl-4-phenylpyrazole 3(5)-carboxylic acid, m. 162.5–4.5°. C. A. R.

Relative firmness of attachment of alkyls to nitrogen. K. v. AUWERS and W. MAUSS. Marburg, Chem. Inst. Ber. 61B, 2411 20(1928); cf. C. A. 22, 1355.—In the dialkylindazolium salts (I) used in the 2 earlier investigations the two N atoms are not equiv. and the course of the thermal decompn. of these salts depends not only on the nature of the *N*-alkyl substituents but also on their position. In the benzimidazolium salts, however, the N atoms, according to present views, are equiv. and the decompn. of such salts should depend only on the nature of the substituent. The mixed dialkylbenzimidazolium iodides (II) in general decomp. less easily than the corresponding I; a considerable part of the material generally resinifies and in the distillate there is regularly found, along with the cleavage products, more or less of the unchanged original substance which distills over unchanged or after transitor dissociation. For this reason the cleavage of these salts is not well adapted to detns. and only a few exploratory expts. were carried out. The methylethyl (III), methylbenzyl (IV), ethylpropyl (V) and ethylbenzyl derivs. (VI) were used. III gives pure ethylbenzimidazole exclusively or almost exclusively methylbenzimidazole (VIII) (in only 1 case was a little benzylimidazole (IX) also obtained), V pure propylbenzimid-

azole (X) and VI a mixt. of about 6 parts VII and 1 part IX. As found in the earlier work, and also by v. Braun by the BrCN and PCl₅ method, the firmness of attachment increases in the order PhCH₂ → Me → Et → Pr. Of *N,N*-dialkylimidazolium iodides, the methylethyl deriv. (XI) gives only ethylimidazole (XII), the methylpropyl deriv. (XIII) only propylimidazole (XIV), the ethylpropyl deriv. (XV) only XII (which was unexpected), while the ethylbutyl (XVI) and propylbutyl derivs. (XVII) decompd. in 2 directions, splitting off BuI as well as EtI and PrI, resp.; with XVI, the BuI split off predominated over the EtI, with XVII about equal quantities of BuI and MeI were split off. The deviation of XVI and XVII from the v. Braun rule may be due to the fact that with increasing wt. of the alkyl groups and with increasing temp. the difference in firmness of attachment decreases; at room temp. the difference is still large enough to be detected by the BrCN method but at higher temps. both radicals are so loosened that the decompn. can proceed in both directions. The behavior of XV, however, is contrary not only to the v. Braun rule but also to the results obtained with V in the II series, which was heated to about the same temp. That the relative ease with which homologous alkyl groups are split off from N does not always follow the same order is shown by the results by Lossen and by Collie and Schryver with the tetraalkylammonium chlorides, and v. A. and M. have also found that Et₃PrNI yields Et₂NPr and EtI while Pr₃EtNI gives Pr₂NEt and PrI; Et₃Pr₂NI decompd. to about the same extent in each direction. *1,3-Diethylbenzimidazolium iodide*, from benzimidazole and 3 mols. EtI in MeOH at 150–60°, m. 225–7°; *picrate*, yellow, m. 254–7°. VII, b₁₂ 160–2°; *picrate*, yellow powder, m. 219°. III, from VII and MeI or from VIII and EtI, m. 192–3°. IX, prepd. by H. DÜSTERDIEK from dibenzylbenzimidazolium chloride heated a long time *in vacuo* in a current of air 20° above its m. p., m. 115–5.5°; *pyrate*, yellow, m. 161–5°. IV, m. 158°. *1,3-Dipropylbenzimidazolium iodide*, m. 202–3° X, b₁₄ 170–2°; *picrate*, yellow, m. 204–6°. V, m. 171.5–2°. VI, m. 173.5–4.5° *1-Butylimidazole*, b₁₁ 114–6°; *picrate*, yellow, m. 79.5–81.5°. *Triethylpropylammonium iodide* (6.5 g. from 5 g. Et₃N and 1 mol. PrI on the H₂O bath), very hygroscopic, m. 255–6°. *Diethyldipropylammonium iodide*, m. 238–40°. C. A. R.

The stability of the double bond in dixanthylene. O. YU. MAGIDSON AND V. I. DAMASKINA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1926, No. 16, 51–3. From a previous investigation (cf. preceding abstract) it was shown that (Ph₂C:)₂ under the influence of PCl₅ breaks its double bond. The reaction is more complicated with [(C₁₀H₇)₂C:]₂, as shown. From this it was thought interesting to try the effect of PCl₅ on dixanthylene when a similar reaction would be expected:

This was proven to be the case by actual expt. The dixanthylene when treated with glacial AcOH at 200° gives xanthone. J. S. JOFFE

Some glyoxaline compounds. BERNARDO ODDO AND QUINTINO MINGOIA. *Reale Univ. Pavia. Gazz. chim. ital.* 58, 584–97(1928).—Pure MeI (28.4 g.) added to magnesylglyoxaline (I) (from 5.5 g. EtBr, 1.2 g. Mg and 3 g. glyoxaline after evapn. of the Et₂O), heated 20 hrs. on a water bath, cooled, decompd. with ice, satd. with CO₂, extd. with Et₂O, the ext. concd., hot satd. picric acid in Et₂O added, and the ppt. recrystd. from boiling water, yields *N*-μ-dimethylglyoxaline picrate (cf. Sieg, C. A. 18, 3059). In a similar way EtI and I yield, after fractional distn. of the evapd. Et₂O ext., *N*-μ-diethylglyoxaline, b. 218–20° (cf. Ber. 16, 490(1883)). Pure dry CO₂ passed into I heated 4 hrs., on a water bath, cooled, decompd. with ice, satd. with CO₂ until the basic Mg salt is dissolved, and extd. repeatedly with Et₂O or CHCl₃, failed to yield a CO₂H acid, only unaltered I being recovered. AcCl in Et₂O heated 20 hrs. on a water bath with I, cooled, decompd. with ice, the aq. layer sepd., neutralized with NaHCO₃, extd. with Et₂O, and the Et₂O liquors evapd., yielded no product, unaltered I being recovered from the aq. layer. Neither did Ac₂O nor AcOEt react with I under the same conditions, so that no Ac deriv. of glyoxaline could be obtained. This inability of glyoxaline to react with Ac compds. is attributed to a *mesohydric structure*. I (from 5.5 g. EtBr as before) heated 24 hrs. on a water bath with freshly distd. ClCO₂Et (5.4 g.) in anhyd. Et₂O, cooled, decompd. with ice, satd. with CO₂, the Et₂O and aq. layers sepd., the latter extd. with Et₂O, the Et₂O evapd. and the oil distd. *in vacuo*, yields *Et imidazolecarboxylate*, C₈H₈O₂N₂ (II), b₁₀ 135–8°. The structure is probably CH:CH. NH. C(CO₂Et):N, the reaction being analogous to that of magnesylpyrroles

and ClCO₂Et (cf. O., C. A. 19, 2492). *Picrate*, C₁₂H₁₁O₆N₃, from II in C₆H₆ and hot

satd. picric acid in C_6H_6 and crystn. from EtOH, light yellow, m. 182° . I (same quantity as before) and $COCl_2$ (2.5 g.) in C_6H_6 heated 24 hrs. on a water bath, cooled, decompd. with ice, satd. with CO_2 , the aq. and Et_2O layers sepd., the former extd. with Et_2O , the Et_2O liquors evapd., satd. picric acid in C_6H_6 added to the residual oil, and the ppt. recrystd. from EtOH, yields *diimidazolyl ketone picrate* $[NH:CH:CH:N:C]_2-$

$CO\ C_6H_5(OH)(NO_2)_2$. The free *ketone* is a thick brown-yellow oil. I (same quantity as before) and heated 24 hrs. on a water bath with freshly distd. $ClOCCO_2Et$ (III) (6.8 g.) and treated as before, with distn. *in vacuo*, yields *diethyloxalyldiaminoethylene*, $[EtO_2C:CONHCH:]_2$ (IV), lemon-yellow oil, $b_{82}\ 115-7^\circ$. $I + 2III + 2H_2O \longrightarrow IV + MgBrCl + HCl + HCO_2H$. Its picrate could not be obtained. No compd. with open chain could be isolated from the mother liquors. I (as before) heated 24 hrs. on a water bath with $ClOCCCH_2CO_2Et$ (V) (15 g.), cooled, decompd. with ice and satd. with CO_2 , yields (1) an intense red aq. portion and (2) an insol. dark red magma. *Insol. magma*.—Dissolved in EtOH, the EtOH evapd. and the residue fractionally distd. *in vacuo*, it yields *diethylmalonyldiaminoethylene*, $C_{12}H_{18}O_6N_2$, yellowish oil, $b_{101}\ 270^\circ$. *Water-sol. portion*.—Extn. with Et_2O , acidification with dil. H_2SO_4 of the residue, and steam-distn., yields a little HCO_2H . Evapn. of the Et_2O ext. leaves an oil which, fractionally distd. *in vacuo*, yields 2 fractions, (1) $b_{60}\ 105-7^\circ$, and (2) $b_{60}\ 107-10^\circ$. The $\%N$ of neither fraction, viz., 4.81–5.10%, corresponds to any compd. which could have been foreseen in the reaction. The reaction of I with III and V is not therefore analogous to the action of III and V with magnesylypyrroles or magnesylyndoles (cf. O., C. A. 6, 3125, 22, 1775). C. C. DAVIS

Opening of the glyoxalinic nucleus. II. BERNARDO ODDO AND QUINTINO MINGOIA. Reale Univ. Pavia. *Gazz. chim. ital.* 58, 573–84 (1928); cf. C. A. 21, 1263.—Further expts show that $BzCl$ is not peculiar in its ability to open a glyoxaline nucleus, a similar action being manifest with other acid chlorides, though not by all. $AcCl$ (as well as Ac_2O and $AcOEt$) was without action on magnesylyglyoxaline under the various conditions studied, including changes of temp. and of solvent. With magnesylyglyoxaline $ClCO_2Et$ and $COCl_2$ form compds. with closed nuclei, viz., $CH:CH:NH:C(CO_2Et):N$

and $[NH:CH:CH:N:C-]_2CO$, resp. On the other hand $ClOCCO_2Et$ and $ClOC-$

$CH:CO_2Et$ react with magnesylyglyoxaline to form open-chain compds., viz., $[EtO_2C:CONHCH:]_2$ and $[EtO_2CCH_2CONHCH:]_2$, resp. The product with the compn. $C_{10}H_{14}ON_2$ already described (cf. C. A. 21, 1263) was studied further. It m. $202-3^\circ$. It cannot be of the urethan type, for then it would be sapond. by alkalis, whereas it is not attacked even by boiling 0.5 N KOH, indicating a ketonic structure and a closed nucleus. Boiling 50% KOH does, however, decomp. it, with evolution of NH_3 . It is also formed from glyoxaline, $BzCl$ and NaOH (cf. *Ann.* 273, 352 (1893)). Heated in anhyd. Et_2O with Br, the ppt. washed with very dil. Na_2CO_3 , then with water and recrystd. from AcMe, it yields the compd. $C_{10}H_{14}ON_2Br_2$ (corresponding to the monobenzoylglyoxaline dibromide, $BrC:CBz:NH:OBz:N$), m. 255° . This bromination

leaves little or no doubt of the constitution of the benzoylated deriv. of magnesylyglyoxaline. C. C. DAVIS

Basicity of imidazole-4,5-dicarboxylic acid and its derivatives. Y. TAMAMUSHI. Tokyo Imp. Univ. *J. Pharm. Soc. Japan* 48, 851–63 (1928).—*Imidazole-4,5-dicarboxylic acid* (I), *methyl-* and *phenylimidazole-4,5-dicarboxylic acid* (II and III, resp.) as well as their acid and neutral Na salts were prepd. and their basicity was detd. by titration with 0.1 N NaOH using phenolphthalein as an indicator. The av. value of the titration was 72.35% of the calcd. value for I, 62.22% for II and 63.65% for III, showing that the 3 compds. are weakly basic in spite of their being dibasic acids. The equiv. cond. of a 0.5% soln. of the neutral Na salt of II was, $\Lambda = 60.33$, while its acid salt had $\Lambda = 23.88$. NAO UYEI

Behavior of triazoles towards mustard oils. PAUL FANTL AND HEINRICH SILBERMANN. *Ann.* 467, 274–87 (1928).—3-Methyl-5-amino-1,2,4-triazole and $PhNCS$ in 96% EtOH in the cold give 3-methyl-5-amino-1,2,4-triazole-2-phenylthiourea, which m. 137° , then solidifies and again m. $197-9^\circ$; if the reaction is carried out in boiling AmOH there results 3-methyl-1,2,4-triazole-5-phenylthiourea, m. $197-9^\circ$; the 1st isomer yields a *picrate*, golden yellow, m. 217° . 3-Methyl-1,2,4-triazole-5-allylthiourea, m. 125° , results in either hot or cold soln. $H_2NC(:NH)NHNH_2$, HCO_2 and $PhNCS$ in EtOH, heated on the water bath, evolve CO_2 , H_2S and NH_3 and yield 3-thio-4-phenyl-5-amino-1,2,4-triazole, m. 264° , which crysts. in octahedra or plates; *benzyl deriv.*, m. 172° ,

dibenzyl deriv., yellow, m. 137°; *tribenzoate*, m. 138°; none of these compds. react with PhNCS or $\text{CH}_2\text{:CHCH}_2\text{NCS}$. 3-Thiomethyl-4-phenyl-5-amino-1,2,4-triazole does not react with $\text{CH}_2\text{:CHCH}_2\text{NCS}$ but with PhNCS there results the compd. $\text{C}_{11}\text{H}_{12}\text{N}_4\text{S}$, m. 204°. PhNHC(:NH)NH₂·HCl and PhNCS in EtOH-KOH give phenylaminoguanidinphenylthiourea, m. 167°; the corresponding *allyl deriv.* (I), m. 128°; as a by-product of the latter there was isolated the compd. $\text{C}_{11}\text{H}_{12}\text{N}_4\text{S}$, pale red, m. 204° (decompn.); I, boiled with dil. EtOH-KOH for 2 hrs. gives 2-phenyl-3-allylamino-5-amino-1,2,4-triazole, m. 74°; with PhNCS there results 2-phenyl-3-allylamino-1,2,4-triazole-5-phenylthiourea, m. 192°; the corresponding *allyl deriv.*, m. 120°. 1-Phenyl-1,2,4-triazole-5-phenylthiourea, m. 128°. 2-Phenyl-3-methyl-1,2,4-triazole-5-phenylthiourea, m. 181°; *allyl deriv.*, m. 158°.

C. J. WEST

Remarkable formation of 2-aminopyridine. GEORG KOLLER AND HILDEGARDE RUPPERSBERG. Univ. Wien. *Monatsh.* 50, 436-8(1928).—Heating 6 g. 2-chloropyridine and 4.2 g. $\text{C}_6\text{H}_5\text{N}$ 7 hrs. at 200° gives 1.8 g. 2-aminopyridine; similarly 1.86 g. 3-methylpyridine and 2.26 g. 2-chloropyridine give 0.2 g. 2-aminopyridine. C. J. W.

Iodization of α -aminopyridine. O. YU. MAGIDSON AND G. P. MENSHIKOV. *Trans. Sci. Chem.-Pharm. Inst.* (Moscow) 1926, No. 16, 23-31.—By a prolonged treatment of *N*-methyl- α -acetamidopyridinium iodide with HI, *N*-methyl- α -pyridonimine-HI and black crystals, m. 144-6°, with a 72.6% I content, are obtained. Considering the latter as a periodide of an iodized deriv. of pyridine it was thought possible to iodize α - $\text{C}_5\text{H}_4\text{NNH}_2$ either with H_2O_2 in HI or with I in KI. At first a periodide is formed, which upon treatment with alkali gives an iodide. Its constitution was proven to be β -iodo- α -aminopyridine. The compd. is very stable, does not react with metals (Cu) and Ag salts (AgNO_3); it m. 129°. It was not possible to introduce a 2nd atom of I. β -Iodo- α -pyridyl nitramine (m. 189°) was obtained by working with mixt. of H_2SO_4 (90%) and HNO_3 (d 1.4). It was impossible to isomerize the nitramine to the C.H.N. (NH_2) NO_2 because of its property of decomp. The iodo- α -pyridone (m. 183-9°) was obtained by diazotizing the amino compd. in 20% H_2SO_4 . It is sol. in a weak alkali, in strong acids, alc. and soda. The β -iodo- α -chloropyridine may be obtained by diazotizing aminoiodopyridine in HCl (d. 1.19); it m. 99°, is easily sol. in alc. and ether, insol. in acids, does not give any picrates and has a strong odor resembling BzH . The direct iodization of α -pyridone leads to β -iodopyridone. Iodo- α -methoxypyridine is obtained by the reaction of NaOMe on α,β - $\text{C}_5\text{H}_2\text{NCl}_2$. The liquid, b. 231° (picrate, m. 147°), possesses a pleasant odor and is a weak base. The β -nitro- α -methoxypyridine is made from α -Ag- β -nitro pyridonate and contains MeI. It m. 110°, is slightly sol. in alc. and ether, has a pleasant iris smell. The β -amino- α -methoxypyridine is made from α,β - $\text{C}_5\text{H}_2\text{N}(\text{OMe})\text{NO}_2$ by reduction with Sn and HCl. By diazotizing and decomp. with KI β -iodo- α -methoxypyridine is obtained. All the steps in the procedure are described in detail.

J. S. JOFFE

Pyridine arylimines. II. Cleavage and migration of the aryl nitrogen complex. WILHELM SCHNEIDER AND KURT WEISS. Univ. Jena. *Ber.* 61B, 2445-51(1928), cf. C. A. 18, 3381.—For the deeply colored anhydro bases from aryl-substituted *N*-phenylaminopyridinium compds. had been established the structure of pyridine *N*-phenylimines, 1,2,4,6- $\text{C}_5\text{H}_2\text{N}(\text{:NPh})\text{R}_2$. The 2-methyl-4,6-diphenyl deriv. (I), it was shown, reacts with PhNCO, PhNCS and CS_2 in the desmotropic methylenedihydropyridine form, whereas its intense indigo-blue color would indicate a structure analogous to that of the 2,4,6- Ph_3 deriv. (II) for which a desmotropic formulation is not possible. II with PhNCO only forms a loose mol. compd. which easily dissociates with regeneration of the blue II. PhNCS and CS_2 , on the other hand, slowly react with II with non-reversible decolorization and formation, as has now been found, of 2,4,6- $\text{C}_5\text{H}_2\text{NPh}_3$; what becomes of the $\text{PhN} =$ radical split off has not as yet been established; only once with PhNCS were there obtained red needles, m. 152°. The PhN residue is more smoothly split off from II with H and Pt sponge or with Zn dust and NaOH, the products being $\text{C}_5\text{H}_2\text{NPh}_3$ and PhNH_2 . This easy reductive cleavage, which can also be effected with I, may be considered decisive proof of the pyridine imine structure of the I and II. Unlike the quite stable II, I in soln., especially on heating, undergoes change and is decolorized; from the colorless alc. soln. S. and W. have now isolated a cryst. colorless isomer (III) of markedly less pronounced basic nature, having the properties of a primary aromatic base (forms normal monoacyl derivs. and is diazotizable with HNO_2) and at the same time contg. the tertiary pyridine N atom, for it adds 2 mols. MeI and the resulting salt (IV) crysts. only with a very firmly held mol. of CHCl_3 and, from its ability to form a nitrosamine, must be a *methiodide-hydroiodide* of a methylated secondary aromatic pyridine, i. e., in the isomerization there is a further rearrangement of the methylene

form in equil. with I, the PhNH residue migrating from the pyridine N atom to the methylene C atom. As the NO deriv. of the Bz compd. of III changes into an indazole (V) with boiling C_6H_6 , the PhNH residue must be bound to the methylene C atom through the o-C atom to the NH₂ group and III must be 2-o-aminobenzyl-4,6-diphenylpyridine. It seps. in rhombic tables, m. 144°, and is best obtained by refluxing I. MeI in alc. with periodic addns. of NaOH until the blue-violet color at first produced disappears permanently, and then heating with Zn dust until the dark brown soln. has become a light yellow-brown; yield of crude product, about 50%. It is sol. in very dil HCl but not in concd. HCl (apparently because of the formation of a difficultly sol HCl salt). *Mono-HCl salt*, from III in C_6H_6 with dry HCl or concd. aq. HCl, cryst. powder, m. 256°, practically insol. in H₂O but sol. in the presence of a little HCl, converted by concd. HCl into a resinous mass which crystals on rubbing and dissolves on diln with much H₂O. *Picrate*, m. 202°. The diazotized soln. couples with PhOH to an orange-red, with R and G salts to red and light red, with α - and β -naphthols to dark red and brick-red azo dyes; with NaOH it gives pink flocks which give a negative Liebermann nitrosamine test. IV, $C_{27}H_{27}N_2Cl_3I_2$, yellow, m. 158° (decompn.), insol. in boiling $CHCl_3$ when it has once sepd., decompd. by hot MeOH, EtOH or H₂O, does not lose its $CHCl_3$ in vacuo at 110°; when diazotized in concd. HCl, pptd. with NaOH and taken up in Et₂O it gives a positive Liebermann test. *Ac deriv.* of III, m. 172°. *B-deriv.*, m. 123°. V, $C_{24}H_{17}N_3$, yellow, m. 228°. The micro-analyses were done by A. Schotte.

C. A. R.

Derivatives of pyridine and quinoline. A. BINZ AND C. RÄTH. III. New Synthesis of 2-aminonicotinic acid and its behavior towards nitric acid. C. RÄTH AND G. PRANGE. Landw. Hochschule Berlin. *Ann.* 467, 1-10(1928); cf. C. A. 21, 2902. —Directions are given for 2 methods of prepn. of 2,5-diaminopyridine; the action of CuCN on the diazo soln. gives 50% of 2-amino-5-cyanopyridine, b₁₅ 240-50°, m. 163-4°, which is hydrolyzed by boiling with 3 parts of HCl in a sealed tube 5 hrs. at 160° to 2-aminopyridine-5-carboxylic acid (I) which crystals with 2 H₂O; *nitrate*, light brown, m. 242° (decompn.). I (20 g.) in 100 g. H₂SO₄, shaken until soln. results and then treated with cooling with the calcd. amt. of HNO₃ in an equal vol. of H₂SO₄, gives 25 g. 2-nitroaminopyridine-5-carboxylic acid (II), decomp. 233° (explosive); *Na salt*. Reduction of II with Sn and HCl gives I. Heating 25 g. II in 125 g. concd. H₂SO₄ 1-1.5 hrs. at 100° gives 15.2 g. 2-amino-3-nitropyridine-5-carboxylic acid (III), m. 300-1° (decompn.); it also results from the nitrate of I by heating 2 hrs. at 105°; reduction with Sn and 30% HCl gives 50% of 2,3-diaminopyridine-5-carboxylic acid, which crystals with 1 H₂O. I (4 g.) in 20 g. concd. H₂SO₄, nitrated with 3.5 cc. HNO₃ (d. 1.35) and the reaction product warmed 2 hrs. at 100°, gives 2.5 g. 2-hydroxypyridine-5-carboxylic acid, m. 302°. Heating this in Na₂CO₃ with I and KI gives 2-hydroxy-3,5-diiodopyridine, m. 261-2°. Warming 2 g. III with 40 cc. 10% NaOH for 15-20 mins. gives 1.6 g. of the *Na salt*, reddish brown of 2-hydroxy-3-nitropyridine-5-carboxylic acid, m. 277° (decompn.). I and KI transform this into 2-hydroxy-3-nitro-5-iodopyridine, yellow, m. 247-8°. IV. Pyridine-3-arsonic acid. A. BINZ, C. RÄTH AND J. GANTE. *Ibid* 11-16. 2-Chloropyridine-5-arsonic acid and N₂H₄. H₂O in H₂O, refluxed for 3.5 hrs., give 76% of 2-hydrazinopyridine-5-arsonic acid (I), pale yellow, does not m. 240°; with AcCH₂CO₂Et in H₂O there results pyridine-5-arsonic acid-2-[3'-methyl-5'-pyrazolone]. I and p-O₂NC₆H₄CHO in EtOH contg. a little HCl give p-nitrobenzaldehyde-2-pyridylhydrazone-5-arsonic acid; p-NH₂ deriv., yellow; the last 3 compds. have no m. p. Oxidation of I in 5% HCl with 10% H₂O₂ gives 11-2% of pyridine-3-arsonic acid (II), m. 112-3°; *Cu salt*, bluish green, amorphous. Reduction with SO₂ in concd. HCl gives 20% of pyridine-3-arsine dichloride, pale yellow, begins to decomp. 137°; reduction in SO₂ gives the oxide, amorphous, begins to decomp. at 187°. Oxidation of I with H₂O₂ and reduction with H₃PO₂ gives 3,3'-arsenopyridine, light yellow, does not melt. Reduction of II with Zn gives pyridine-5-arsine, light brown, begins to decomp. 102°.

C. J. WEST

Asymmetric nitrogen atom. LVI. Rearrangement velocities of stereoisomers which contain at the same time asymmetric nitrogen and carbon atoms, a parallel to true auto-racemization of nitrogen-active ammonium salts. E. WEDEKIND AND G. L. MAISER. Forstl. Hochschule Hann.-Münden. *Ber.* 61B, 2471-9(1928); cf. C. A. 22, 4527. The 1-menthyl N-alkyltetrahydroisoquinolinium iodide-acetates had been isolated in 2 stereoisomeric forms (+ - and - -). The initial member (N-Me) of the series was obtained in only 1 form (because of the great lability of the Me group the isomer is exceedingly unstable); the 2 N-Et and N-Pr isomers are about equally stable and no rearrangement was observed, but in the iso-Pr series distinct stability differences appear and are more or less marked in the higher homologs (Bu, iso-Bu,

iso-Am, etc.). Branching of the chain or marked increase in mol. wt. materially decreases the stability of I form, and the velocity of rearrangement into the stable form depends on the nature of the solvent. Hitherto no exact kinetic measurements have been made and no general relationship between the rearrangement velocities and the nature of the medium had been established. The object of the present investigation was to obtain such information, the labile *N*-iso-Pr compd. (I), m. 146–8°, being used for this purpose (contrary to the statement in W. and Ney's paper it is the more easily sol. and reactive or α -form which m. 146–8°, the 161° or β -form being the more difficultly sol. one). The rearrangement was effected in MeOH and EtOH; H₂O could not be used because of the low soly. of the I, and in Me₂CO and CHCl₃ no rearrangement occurs. It had recently been found that active *N*-methylallyltetrahydroquinolinium iodide (II) also does not auto-racemize in Me₂CO and it would seem that the auto-racemization in CHCl₃, which had been shown to be due to spontaneous decomph., cannot be produced by a simple stereochem. transformation. The rearrangement of β -I in MeOH at 25° is strictly monomol. and *k* (av. value 0.0050) shows no drift; the velocity of the rearrangement is about 10 times smaller and the temp. coeff. (2.31 for 25–35°) only slightly higher than for the auto-racemization of II. The nitrates (III) corresponding to the I undergo no rearrangement in any solvent, showing, in analogy with the optical behavior of II, that the presence of a halogen as anion is necessary for rearrangement. Both the rearrangement of the I and the racemization of the II are reactions which proceed spontaneously with liberation of energy; the influence of the different solvents is exerted exclusively on the velocity of these reactions and can therefore be included in the large class of contact or catalytic processes. As the individual salts (even those belonging in a homologous series) show a sp. behavior towards I and the same medium, no generalization as to the action of the solvent can, as a rule, be deduced. The betaines obtained from menthyl *N*-alkyltetrahydroquinolinium iodide acetates by a kind of auto-sapon., whereby the menthyl group is split off, leaving a betaine with a + or – rotation depending on whether the original substance was of the type (N + C –) or (N – C –), lose this rotation even in Me₂CO but markedly less rapidly than in alc.; they are the only N-active compds. which undergo racemization without contg. halogen. β -I, $[\alpha]_D$ –18.45° (Me₂CO), does not change in MeOH. α -I, $[\alpha]_D$ –39.25° (Me₂CO), changes in MeOH to about the value for β -I, and on evapn. the residue, m. 161°. Mol. wt. of α -I in freezing *p*-toluidine 480.0, of β -I, 529.0. β -III, m. 153–5°, $[\alpha]_D$ –20.3° (MeOH); α -III, m. 125–7°, $[\alpha]_D$ –66.0° (C. A. R.

Mercury derivative of isoquinoline. II. T. UKAI. Kumamoto Pharm. Coll. *J. Pharm. Soc. Japan* 48, 877–8(1928).—In paper II (C. A. 22, 3166), it was stated that the chloromercuriisoquinoline (I) obtained by the action of Hg(OAc)₂ on isoquinoline probably has its –HgCl group in position 5 or 8. A further study, however, showed that this is not the case. I and a calcd. amt. of Br, gave a monobromoisoquinoline (II), which was isolated as the HNO₃ salt, m. 179°. The free base, m. 40°. II was proven to be the *py*-bromoisoquinoline of Edinger and Bossing (*J. prakt. chem.* 43, 191) showing that the –HgCl group is on the pyridine nucleus. NAO UYEI

Morphine alkaloids. VI. Thebaizone and other product of ozonolysis. HEINRICH WIELAND AND LYNDON F. SMALL. Bayr. Akad. der Wissenschaften, Munchen. *Ann.* 467, 17–52(1928).— α -Thebaizone (I), obtained by the ozonolysis of thebaine has formula I if the Schopf-Robinson formula for thebaine is accepted; concd. H₂SO₄

produces a deep red halochromism; the color disappears on diln. with H₂O; in HCl, I reacts with *p*-O₂NC₆H₄NHNH₂, giving an amorphous yellow ppt., sol. in NaOH with a red color. The neutral soln. of I in dil. HCl or a suspn. of I in H₂O is colored with fuchsin-H₂SO₄ but no color reaction occurs in a slight excess of HCl; the color is destroyed by addn. of 0.1 N NaOH and by excess of I. I also reduces NH₄OH-AgNO₃ in the cold. NH₂OH gives an amorphous ppt., sol. in H₂O and giving a color reaction with FeCl₃, which appears to be a hydroxamic acid. The III salt of I, m. 185–7°; the HCl salt ppts. from a 4 N HCl soln. I and Br in dil. HCl give a yellow perbromide, converted by excess Na₂CO₃ into the Br deriv. of I, m. 147°, the Br probably entering the ring x. I and 30% H₂O₂ in AcOH, 48 hrs. in the cold, give thebaizonedicarboxylic acid, m. 189–90° (decomph.), the ester group being hydrolyzed. Hydrolysis of I with 0.334 N Ba(OH)₂ in the cold gives 50% of thebaizonic acid (II), decomps. 235°; this shows the usual aldehyde reactions with fuchsin-H₂SO₄ and

$\text{AgNO}_3\text{-NH}_4\text{OH}$; reduction with Al-Hg gives an amorphous product which shows neither acid nor aldehyde reactions. CH_3N_3 reacts with the acid but not with regeneration of I. I and concd. HCl , heated 1 hr. at $95\text{--}8^\circ$, give the HCl salt, m. 210° (decompn.) (also obtained by the action of excess N HCl on II), of *hydroxydihydrothebaizonic acid* (III), decomp. $230\text{--}40^\circ$, the free acid being liberated by MeOH-MeONa , while TIOH gives the compd. $\text{C}_{18}\text{H}_{23}\text{O}_7\text{N}$, decomp. $231\text{--}5^\circ$, contg. an addnl. mol. of HCl and yielding an HCl salt, decomp. 260° . Catalytic reduction of I with Pt oxide in MeOH opens the O bridge, leaving the 8-14 double linking unattacked, and yields the phenolic deriv. *dihydrothebaizone*, m. about 140° , giving a brown color with FeCl_3 and the aldehyde reaction with fuchsin- H_2SO_3 ; the *methiodide*, m. $239\text{--}40^\circ$ (decompn.), whose *Ac* deriv. decomp. 250° . Reduction of I with Al-Hg in moist Et_2O gives 67% of *desoxythebaizone* (IV), m. 147° (decompn.) (also obtained in poor yield with Zn and HCl), which retains the O bridge but has no aldehydic properties. IV is reduced catalytically after hydrolysis with N HCl to *dihydrodesoxythebaizonic acid*, m. $163\text{--}5^\circ$ (decompn.), isolated as the HCl salt, m. $236\text{--}7^\circ$ (decompn.). The Hofmann degradation of the methiodides of these various compds. has been investigated. I yields a *methiodide*, decomp. $250\text{--}5^\circ$; TIOH gives *des-N-methylthebaizonic acid* (V), amorphous, whose *methiodide* decomp. $250\text{--}5^\circ$ and HCl salt m. 270° (decompn.). The *methiodide* of III, m. 163° (decompn.), eliminates only MeOH on treatment with alkali, since treatment with MeI gives the original methiodide. Reduction of IV with Pt oxide in MeOH gives a yellow oil; MeI gives *dihydrodesoxythebaizone-MeI*, m. $175\text{--}7^\circ$, crystallizes from H_2O with 1 H_2O ,

m. $148\text{--}52^\circ$; with TIOH this yields *des-N-methyldihydrodesoxythebaizonic acid* (VI), m. $195\text{--}7^\circ$ (decompn.), which crystallizes with 2 H_2O and yields a *methiodide*, crystg. with 1 H_2O and m. $156\text{--}8^\circ$. Dihydroxydesoxythebaizonic acid, heated with MeI , gives a compd., $\text{C}_{37}\text{H}_{48}\text{O}_8\text{N}_2\text{I}\cdot\text{H}_2\text{O}$, m. $217\text{--}8^\circ$ (decompn.), which, by decompn. with TIOH and further treatment with MeI , yields the simple *methiodide*, m. $167\text{--}8^\circ$ (decompn.). By short heating at 200° , I is converted into β -thebaizone (VII), m. 151° (probably stereoisomeric about the 8-14 double linking), which yields the same IV by

reduction with Al-Hg but by reactions similar to those applied to I it yields *hydroxy-dihydro-β-thebaizonic acid*, m. 230° (decompn.), whose HCl salt decomp. 280°; *EtH ester*, decomp. 220°. The action of O₂ upon VII in dil. HCl yields *isodihydrothebaizonic acid* (VIII), m. 248-9° (decompn.) (HCl salt, decomp. 130°; *methiodide*, m. 179-80°), and *isodihydrothebaizone*, m. 103-5° (*methiodide*, m. 147-8° (decompn.)). Reduction of VIII with H and Pt oxide in H₂O gives the *tetrahydro deriv.*, m. 230-5° (decompn.). The action of O₂ on chlorocodide yields *chlorocodizone* (IX), m. 104°, whose HCl salt m. 212° (decompn.) and whose *methiodide* is oily; reduction with Zn and AcOH gives *deoxycodizone*, m. 161°; HCl salt, m. 223-4° (decompn.). The action of hot MeOH-KOH on IX for 15 min. yields *anhydrocodizone*, m. 110°; longer treatment (1 hr.) yields 2 N-free substances, C₁₅H₁₂O₄, m. 88° and 159°, for which the structures X and XI are suggested, the phenol yielding a *Me ether*, m. 105-8°. Alc. AcOK converts IX into a substance C₂₈H₁₉O₂N, m. 189°.

C. J. WEST

Synthesis of berberine-like bases from compounds of the type of tetrahydropapaverine. ERNST SPATH AND ERICH KRUTA. Univ. Wien. *Monatsh.* 50, 341 (1928). —Condensation of tetrahydropapaverine with methylal and HCl according to Picot and Chou (C. A. 10, 1191) yields 46% of norcoralydine (I), m. 151.5-2.5° (P and C give 80-5% yield and a m. p. of 157-8°); using twice the calcd. amt. of HCHO there results 69% of I. Tetrahydropapaveroline and HCHO give a product, which, after treatment with CH₂N₂ in MeOH, yields 15% of a mixt. of about equal amts of I and tetrahydropalmatine.

C. J. WEST

Chemistry of natural resins and resin acids. FR. BALÁŠ. Charles' Univ., Prague. *Časopis Československého Lékárnictva* 7, 320-38 (1927); 8, 6-8, 27-31, 47-50 (1928). —The following compds. were isolated from the oleoresin of *Pinus palustris*: cryst. C₂₁H₃₄ (probably heptacosane) in 0.7% yield, m. 60°, b₁₂ 270°, b_{0.4} 197.5°, d₄²⁰ 0.7729, [α]_D 0; a tricyclic diterpene, C₂₀H₃₂, b₁₂ 192-5°, n_D¹⁸ 1.5106, [α]_D 8.4° (in 0.6% CHCl₃ soln.); a diterpene alc., C₂₀H₃₄O; a resene, a fragile, amorphous mass, m. 117°, [α]_D +16.1° (in 2% CHCl₃ soln.), mol. wt. 798-830; *d*-pimaric acid (I), m. 213°, [α]_D 79.3° (in 0.57% EtOH soln.); *l*-pimaric acid (II), m. 150°, [α]_D -280.4° (in 1% EtOH soln.); amorphous acids ("sapin acids"), m. about 100°, [α]_D -10.7° (in 1% EtOH soln.). From the oleoresin of *Pinus maritima* the following compds. were isolated, cryst. C₂₁H₃₄, m. 68.5° (probably hentriacontane); a bicyclic sesquiterpene, C₁₅H₁₄, b₁₂ 120-3°, n_D¹⁷ 1.5011, [α]_D 8.8° (from this were prepd. a nitrosochloride, m. 166.7° (decompn.), and a nitrosate, m. 165°); a bicyclic sesquiterpene alc., C₁₅H₂₀O, b₁₂ 133-8, d₄^{19.6} 0.9695, n_D^{19.6} 1.5071; a tricyclic diterpene, C₂₀H₃₂, b₁₂ 188-92°, d₄^{21.6} 0.9576, n_D^{21.6} 1.5252; a diterpene alc., C₂₀H₃₄O; resene, m. 112°, [α]_D 5.2° (in 2% CHCl₃ soln.), mol. wt. approx. 825. I adds 1 mol. of Br₂; on further bromination it yields HBr. I yields a nitrosite, C₂₀H₃₀O₂N₂, m. 79-80° (decompn.), and an alc., *d*-pimarol, C₁₅H₂₀CH₂OH, m. 93°, [α]_D 96.5°; the latter on hydrogenation yields dihydro-*d*-pimarol, C₁₅H₂₂CH₂OH. Dry HCl acting on I in glacial AcOH causes no isomerization but yields 3 well defined mono-HCl salts, m. (decompn.) 232°, 184° and 125°, resp. Oxidation of I with alk. KMnO₄ yields chiefly 2 isomeric dihydroxy-*d*-pimaric acids, C₂₀H₂₈(OH)₂CO₂H, m. (decompn.) 239° and 224° resp.; the latter yields diacetate, m. 235°. The "oleosylvic acid" isolated by Schulz from the oleoresin of *Pinus palustris* consists of a mixt. of I and abietic acid (III). Mixts. of I and III may be separated (1) by fractional crystn., (2) by means of their NH₄ salts, (3) by fractional (4) by fractional crystn. of the salts formed with org. bases. Contrary to reports, II is easily oxidized by atm. O₂ in daylight. A dibromide, m. 108°, was obtained from II, but this may be a deriv. of III, formed by isomerization. II Me ester, m. 64° [α]_D -233.5° (in 4.5% MeOH soln.), d₄²² 1.0387, n_D²² 1.5243; Et ester, b_{0.4} 182-4°, d₄^{18.6} 1.0189, n_D^{18.6} 1.5196; iso-Pr ester, b_{0.4} 202-3°, d₄²⁰ 1.0242, n_D²⁰ 1.5239; iso-Am ester, b_{0.4} 205-6° d₄²¹ 1.0066, n_D²¹ 1.5195. I Et ester, m. 53°, [α]_D 60.25° (in 2% in 1

EtOH soln.), $d_4^{18.5}$ 1.0149, $n_D^{18.5}$ 1.5134. III Me ester, $b_{0.2}$ 167–9°, d_4^{22} 1.0370, n_D^{22} 1.5263; Et ester, $b_{0.2}$ 170–4°, d_4^{20} 1.0223, n_D^{20} 1.5250. Me dihydro-*l*-pimarate, m. 88°, $[\alpha]_D$ 30.80° (in 1.2% MeOH soln.). Dihydroabietic acid; Me ester, $b_{0.1}$ 180°, $d_4^{17.5}$ 1.0314, $n_D^{17.5}$ 1.5169. Tetrahydro-*l*-pimaric acid; Me ester, m. 99°, $[\alpha]_D$ 13.45° (in 0.8% MeOH soln.); Et ester, $b_{0.2}$ 168–70°, $[\alpha]_D$ 10.85° (in 1.3% EtOH soln.), d_4^{19} 1.0029, n_D^{19} 1.5002. Tetrahydroabietic acid; Et ester, $b_{0.4}$ 178–80°, $[\alpha]_D$ 14.31° (in 1.0% EtOH soln.), d_4^{19} 1.0001, n_D^{19} 1.5002. The refractivities of the non-hydrogenated acids indicate the presence of 2 double bonds; hydrogenation causes considerable depression of the mol. refractivities. The action of glacial AcOH satd. with HCl upon dihydroabietic acid (m. 145°) at room temp. yields no HCl salt, but does yield an isomeric acid, m. 180°, $[\alpha]_D$ 120.6°, which shows satn. toward Br₂ and KMnO₄ and does not yield retene on dehydrogenation with S. The cryst. acid, C₂₀H₃₀O₂, of sandarac (called sandaracopimaric acid by Tschirch and Wolff) is optically active ($[\alpha]_D$ –18.8° in 1.6% EtOH soln.).

WILLIAM J. HUSA

Phlorhizin and quercitrin. GÉZA ZEMPLÉN, ZOLTÁN CSÜRÖS, ÁRPÁD GERECs AND STEFAN ACZÉL. Tech. Hochschule Budapest. *Ber.* 61B, 2486–97(1928).—From the work of many investigators phlorhizin (I) has been assigned the structure 3,5,2-(HO)-*p*-HOC₆H₄CH₂CH₂CO)C₆H₄OC₆H₁₁O₆, only the position of the glucose residue being arbitrary; no proof has as yet been brought forward that this residue is in the *o*- and not the *p*-position to the C:O group. Fischer and Nouri synthesized the aglycone, phloretin (II), from phloretinic nitrile, *p*-HOC₆H₄CH₂CH₂CN (III), and phloroglucinol (IV), but the yield was poor and moreover they used, to obtain the III, a phloretinic acid (V) prepd. by the cleavage of I with Ba(OH)₂. Wishing to synthesize I from materials not derived from I itself, the authors attempted to *p*-nitrate PhCH₂CH₂CO₂H (VI) directly but found it considerably more practical to convert VI into the nitrile by the Ph(CNS)₂ method, nitrate this to *p*-nitrophenylpropionitrile (VII), reduce VII with Sn and HCl to the amino compd. (VIII) and decomp. the diazonium salt of VIII. The resulting III was treated with IV and dry HCl and the ketimide-HCl thus obtained was decompd. with H₂O, giving II. All attempts to condense III in the same way with tetraacetylphlorin (IX) or II with acetobromoglucose (X) failed. In the last case the isolation of a glucoside is rendered difficult by the fact that the X has 3 free HO groups in II with which it can react so that several isomers may be formed and thus interfere with the crystn. of the products. On treating heptaacetylphlorhizin (XI) with AcOH HBr at room temp., however, it is decompd. into X and triacetylphloretin (XII), which has only 1 free HO group, presumably at the same position where the glucose residue was previously attached, but all attempts to condense XII and X, with elimination of HBr, failed; the rotatory power of the reaction mixts. pointed, to be sure, to the presence of a *l*-rotatory substance but in no case could I be isolated. Heptaacetylquercitrin (XIII) with HBr-AcOH gave acetobromorhamnose and a tetraacetylquercetin (XIV) which with X in the presence of quinoline and Ag₂O yielded an acetylated quercetin glucoside XV; this from its synthesis should be identical with the Ac deriv. of isoquercitrin but it has not yet been possible to isolate the free glucoside. Ph-CH₂CH₂CN (1.8 g. from 10 g. VI), b. 132–5°; 13.1 g. slowly added to cold HNO₃ (d. 1.48) gives 10.2 g. VII, m. 79.5°. VIII (6.9 g. from 88 g. VII), yellowish oil, 6 g of which gives 1.4 g. III. XI (about 16 g. from 10 g. I with Ac₂O and NaOAc or C₆H₅N), colorless powder, $[\alpha]_D$ –41.33° (CHCl₃), –35.86° (alc.), reducing power after sapon. with alc. alkali and hydrolysis with boiling 5% HCl = 18.22% glucose. XII (6 g. from 18 g. XI), m. 188.9°. XIII (155 g. from 100 g. quercitrin with Ac₂O-NaOAc), powder, $[\alpha]_D^{24}$ 165.6° (CHCl₃), reducing power after hydrolysis = 23.5% glucose. XV (7 g. from 6.2 g. XIV), $[\alpha]_D$ –30.1° (alc.), reducing power before hydrolysis = 19%, after hydrolysis 35.79% glucose (another prepn., extd. with boiling H₂O and pptd. from AcOH with H₂O had a reducing power = 10.87% glucose before hydrolysis and showed $[\alpha]_D$ –28.3° (alc.), –38.5° (CHCl₃)).

C. A. R.

Chrysanthemin and asterin. ROBERT ROBINSON AND RICHARD WILLSTÄTTER. *Ber.* 61B, 2503–4(1928).—The chrysanthemin and asterin which had been isolated from *Chrysanthemum indicum* L. and *Aster chinenensis* L., resp., differed somewhat in properties (dy. in alc. and in dil. acids, cryst. form, etc.) but, as has been found in numerous cases, traces of impurities suffice to materially influence the soly. relations and cryst. forms of anthocyan derivs. R. and W. have now been able to obtain asterin in purer form than before and they find it is identical in all respects with chrysanthemin.

C. A. R.

Remarks on the communication of T. Malkin and M. Nierenstein. "Cyanidin."

groups undergo change to the lactam structure. The failure of ring III to rearrange is a property common to numerous other bile acids, in some of which ring I has been opened up by oxidation. It is now shown that those derivs. with an oxime group on ring III give a blue color with HNO_3 , while those without an oxime in this position give only a yellow or brown color. Furthermore, the failure of the oxime in ring III to rearrange is shown by the fact that NH_2OH can be split off by hydrolysis, whereas the lactam structures in rings I and II of the isoximes yield no NH_2OH . A. W. DOX

Amyrins. I. Dehydrogenation of amyrin. OTTO BRUNNER. Univ. Wien. *Monatsh.* **50**, 284-90(1928).—The mixt. of the 2 isomers was used, since isomerism probably disappears on dehydrogenation. When heated with S a violent reaction takes place with foaming and carbonization; dehydrogenation takes place smoothly by heating with Pd charcoal at 290° for 100 hrs. and finally at 320° for 24 hrs. The fraction, b_{12} $120-50^\circ$, yields a picrate, m. $131-2^\circ$, of an oily hydrocarbon (C 91.43, H 9.20, mol. wt. 179); the fraction, b_{12} $150-90^\circ$, yields a picrate of a hydrocarbon, m. 87° (C 90.97, H 10.36, mol. wt. 197). The higher-boiling fractions yielded no cryst. compd. C. J. WEST

Ergosterol of yeast. III. FRITZ REINDEL. Tech. Hochschule, München. *Ann.* **466**, 131-47(1928); cf. *C. A.* **22**, 1593.—(With H. WASENEGGER.) The Bz deriv. of α -ergosterol (I) m. $118-20^\circ$ (not $130-1^\circ$ as previously reported). Oxidation with CrO_3 in AcOH at 70° gives 1.1 g. α -ergosterone (II) from 2 g. I; II, m. $131-3^\circ$, $[\alpha]_D^{25}$ 38.8° (c 6.2, CHCl_3); the phenylhydrazone, m. $127-8^\circ$ (decompn.), and oxime are difficult to cryst.; II is best characterized by the ketazine, m. 225° . A by-product of II is the compd., $\text{C}_{28}\text{H}_{48}\text{O}_3$, m. $219-21^\circ$ (see below), benzylidene deriv. of II, m. 162° . Reduction of II in Et_2O or AcOH with H and Pt gives I. Passing dry HCl into II in CHCl_3 for 0.5 hr. gives β -ergosterone, m. $149-51^\circ$, $[\alpha]_D^{25}$ 37.1° (CHCl_3 , c 1.051); oxime, m. $214-6^\circ$; no condensation product was obtained from BzH. (With A. DETZEL.) Oxidation of allo- α -ergostanol (III) in AcOH with CrO_3 at 90° gives 34% of allo- α -ergostanone (IV) and 26% of a dicarboxylic acid, $\text{C}_{27}\text{H}_{48}\text{O}_4$, m. $217-9^\circ$, α_D 22.8° (CHCl_3 , c 1.754); di-Me ester, m. $81-3^\circ$. Heating the acid at 265° for 3 hrs. gives 71% of a ketone, $\text{C}_{27}\text{H}_{48}\text{O}$, m. $125-6^\circ$, $[\alpha]_D^{25}$ 107.7° (CHCl_3 , c 2.91); oxime, m. $215-6^\circ$. Reduction of IV with Pt and H gives a mixt. of III and a sterol, $\text{C}_{27}\text{H}_{48}\text{O}$, m. $206-7^\circ$, not pptd. by digitonin, $[\alpha]_D^{25}$ 4.04° (CHCl_3 , c 4.21); Ac deriv., m. $144-5^\circ$. (With A. FRÖHLICH.) Oxidation of I in hexahydrotholuene with KMnO_4 gives the compd., $\text{C}_{28}\text{H}_{48}\text{O}_4$ or $\text{C}_{28}\text{H}_{46}\text{O}_4$ (V), m. $199-201^\circ$, $[\alpha]_D^{25}$ -24.4° (CHCl_3 , c 2.088), which contains 3 active H; di-Ac deriv., m. $148-52^\circ$, α_D 5.46° (CHCl_3 , c 2.382), which contains 1 active H. Di-*p*-nitrobenzoyl deriv., m. 197° (decompn.); on sapon. this gives the compd., $\text{C}_{28}\text{H}_{40}\text{O}_3$ or $\text{C}_{28}\text{H}_{38}\text{O}_3$, m. $217-8^\circ$, catalytically reduced to a compd., m. $131-2^\circ$ (4H_2). Catalytic reduction of V gives the compd., $\text{C}_{28}\text{H}_{48}\text{O}_3$ or $\text{C}_{28}\text{H}_{46}\text{O}_3$, m. $235-8^\circ$, whose di-*p*-nitrobenzoyl deriv., m. 212° (decompn.), from which the original compd. is regenerated on sapon. Oxidation of the acetate of I gives the compd., $\text{C}_{27}\text{H}_{44}\text{O}_4\text{Ac}$, m. $174-5^\circ$. C. J. WEST

Constitution of cantharidin. F. V. BRUCHHAUSEN AND H. W. BERSCH. Univ. Münster. *Arch. Pharm.* **266**, 697-702(1929).—After reference to Gadamer's work on the constitution of cantharidin, expts. are described looking to the synthesis of this compd. and a clearer view of its constitutional make-up. Taking advantage of some recent work by Diels and Adler (cf. *C. A.* **21**, 1813) relative to the condensation between conjugated double-bonded compds. and those possessing a single double bond, the authors condensed furan with maleic anhydride to a dehydropotocantharidin:

which on reduction with Pd charcoal in a special app. under pressure yielded a product (II) standing in close genetic relationship to cantharidin, since it is shown that the latter on heating at about 280° with Pd asbestos decomps. in part into furan and maleic anhydride. The product (dehydropotocantharidin) Δ -4-3,6-endoxotetrahydrophthalic anhydride, $\text{C}_8\text{H}_6\text{O}_4$, m. 118° , is obtained quant. by the above indicated condensation. While crystallizable from both AcMe and alc., long heating with the latter is inadvisable owing to the possibility of ester formation. On continued fusion at 130° furan escapes, finally leaving a residue of maleic anhydride. Reduction with H under pressure leads to the formation of 3,6-endohexahydrophthalic acid, $\text{C}_8\text{H}_{10}\text{O}_6$, m. $117-20^\circ$ (loss of H_2O and formation of the anhydride, $\text{C}_8\text{H}_8\text{O}_4$). W. O. E.

Cleavage of phenolsulfonic acids and the purification of phenols by the sulfonic acid separation method (BRÜCKNER) **21**. Complex compounds of Au with mercaptanic

Sodium potassium bismuth tartrate. CHEMISCH-PHARMAZEUTISCHE A.-G. BAD HOMBURG. Ger. 469,554, July 26, 1923. A complex tartrate of the formula $\text{C}_{12}\text{H}_8\text{O}_{20}\text{Na}_2\text{K}_2\text{Bi}_2$ is prep'd. by dissolving 2 mols. of freshly pptd. $\text{Bi}(\text{OH})_3$ in a conc'd aq. soln. contg. 1 mol. each of Na and K bitartrates and Na K tartrate. The product is crystd. out or pptd. by addn. of org. solvents.

Hydrocarbon synthesis. I. G. FARBERIND. A.-G. Brit. 293,572, July 13, 1927. Mixts. comprising C oxides and H, preferably under pressure, at elevated temps., are passed over a catalyst contg. Fe or Co, at a velocity less than that required for producing liquid hydrocarbons; olefinic gases may thus be formed. Examples are given of the use of Ni-Cr and Fe-Ag alloys as catalysts.

Polymerizing olefins. F. HOFMANN and M. OTTO. Brit. 293,487, April 8, 1927. See Fr. 632,768 (*C. A.* 22, 3417).

Alkylene oxides. T. GOLDSCHMIDT A.-G. Brit. 293,763, July 11, 1927. A chlorohydrin soln. and an alkali or alk. earth soln. or suspension are passed continuously through a still along a path of considerable length which may be provided by baffles in the still. An app. is described.

Reduction of oxides of carbon. I. G. FARBERIND. A.-G. Fr. 643,784, Nov. 12, 1927. Org. O compds., alone or mixed with hydrocarbons, are obtained by reducing oxides of C under reduced, ordinary or slightly raised pressure at a temp. below 300° and using as catalyst Fe to which small quantities of alkalis or alk. earths or their compds. are added. Examples are given in which Fe oxide wetted with KOH or NaOH soln. is reduced with H, and a mixt. of CO and H contg. 40% of H is passed over it at 200° . A brownish yellow oily liquid contg. 10% of O and an aq. soln. having an acid reaction are obtained.

Monocyclic ketones. LEOPOLD RUZICKA (to M. Naef & Co.). U. S. 1,702,842, Feb. 19. In the prepn. of monocyclic ketones having more than 9 ring members, such as 3-methylcyclopentadecanone, Zr salts of polymethylene dicarboxylic acids, having more than 10 C atoms in a normal chain, the COOH groups of which are linked to the end C atoms, such as 3-methyltetradecane-1,14-dicarboxylic acid, are heated (suitably *in vacuo* at $300-500^\circ$). U. S. 1,702,844 specifies the use, instead of Zr salts, of salts of metals such as Al belonging to the third group of the periodic system. U. S. 1,702,843 specifies heating Ti salts. U. S. 1,702,845 specifies similar use of Yt salts. U. S. 1,702,846 specifies use of La salts. U. S. 1,702,847 specifies use of didymium salts. U. S. 1,702,848 specifies similar use of salts of rare earth metals such as those of erbium and Ce. U. S. 1,702,849 specifies uranyl salts. U. S. 1,702,850 specifies prepn. of alkyl derivs. of like monocyclic ketones by heating the Th salts of alkyl derivs. of the polymethylene dicarboxylic acids. U. S. 1,702,851 specifies like use of salts of metals belonging to the fourth group of the periodic system such as salts of Ce. U. S. 1,702,852 specifies heating Ce salts of the dicarboxylic acids to form the monocyclic ketones.

Solid diazo compounds. I. G. FARBERIND. A.-G. Fr. 644,563, Oct. 4, 1927. Monodiaz compds., obtained from *p*-aminoazo compds. not contg. sulfonic or car-

boxylic groups, but contg. an alkyloxy, aralkyloxy, or aryloxy group in the position *o*- to the amino group, are sepd. in the solid form as halides, sulfates, or metallic or arylsulfonic double salts. In examples, NaCl is added to the diazonium chloride obtained by diazotizing *p*-nitrobenzeneazo-3-amino-4-methoxy-1-methylbenzene. The diazonium chloride isolated in cryst. form is washed and dried. KBr is added to diazotized *o*-chlorobenzeneazo-2-amino-1,4-dimethoxybenzene. The diazonium bromide is obtained. Several other examples are given. Cf. C. A. 23, 614.

Alcoholates. CORNELIS DELSMAN. Dutch 18,941, Nov. 15, 1928. Multivalent alcoholates of alkali metals (glycolates, etc., no sucates) are prepd. by evapn. at reduced pressure of the aq. soln. of alc. and the alkali metal hydroxide.

Aminophenol derivatives. WILHELM TRAUBE and EMIL HELLRIEGEL. Fr. 643,724, Nov. 10, 1927. *N*-alkylated aminophenols are prepd. by desulfurizing thioureas of aminophenols, transforming the hydroxyarylcyanamides obtained or their alkali metal salts, either alone or in the presence of solvents with alkylating agents, and sepg. in known manner the cyanogen group from the hydroxyarylalkylcyanamides obtained. In examples, *p*-aminophenol hydrochloride is heated in aq. soln. with KCNS in excess, whereby *p*-thiocarbamidophenol is produced, which is dissolved in KOH soln. and heated with lead acetate. PbS is pptd., and *p*-hydroxyphenylcyanamide, m. 265° is pptd. on neutralization. This compd. is alkylated by CH₃I or Me₂SO₄, the Me group becoming attached to the N. The CN group is removed by heating with 10–20% H₂SO₄ or HCl. The Et compd. is prepd. similarly. *m*-Hydroxyphenylthiourea is desulfurized with oxide of Pb, giving *m*-hydroxyphenylcyanamide, m. 137°, which is further treated as described above. Cf. C. A. 22, 3170.

Guanidine derivatives. SCHERING-KAHLBAUM A.-G. Ger. 466,879, Aug. 5, 1925. Addn. to 463,576. It is found that the method of Ger. 463,576 (C. A. 22, 4130) for the manuf. of aminoguanidines yields alkylene diguanidines when applied to the higher diamines. Examples are given describing the prepn. of (1) hexa- and deca-methylenediguanidine sulfate from methylisothiourea sulfate and NH₂(CH₂)₆NH₂ and NH₂(CH₂)₁₀NH₂, resp., and (2) *N,N'*-diethylethylenediguanidine from *S*-methylisothiourea hydrochloride and EtNHCH₂CH₂NHEt.

Diisopropyl derivatives. I. G. FARBENIND. A.-G. Brit. 293,703, July 7, 1927. Diisopropylbenzaldehyde is made by treating diisopropylbenzene with CO₂ in the presence of AlCl₃ and Cu₂Cl₂, with or without gaseous HCl; or by treating cuminic aldehyde with isopropyl chloride dissolved in CS₂ in the presence of AlCl₃; or by treating cuminol with CO₂ in the presence of AlCl₃ and Cu₂Cl₂. Reference is also made to the production of diisopropylacetophenone and isopropyl hydratropic aldehyde. Diisopropylbenzalacetone is made by alk. condensation of acetone with isopropylbenzaldehyde. Diisopropylbenzoic acid is made by oxidizing the corresponding aldehyde and its esters also may be prepd. Diisopropylbenzyl alc. is made by "chemical or catalytic" reduction of the aldehyde and its acetate is made by acetylation. Diisopropyl cinnamic aldehyde and its homologs are made by condensing diisopropyl benzaldehyde with acetaldehyde and its homologs and the corresponding hydrocinnamic aldehydes also may be made. Various of these products may be used as *perfumes*.

Derivatives of arsine oxides. ÉTABLISSEMENTS POULENC FRÈRES, and CARL OETSCHLIN. Fr. 643,911, Apr. 15, 1927. Org. arsine oxides are treated with S. compds. in which the S is joined directly to a C atom. In examples, aminophenylarsine oxide in NaOH soln. is mixed with an NH₃ soln. of thioglycolamide. The compd. obtained on neutralizing is NH₂C₆H₄As(SCH₂CONH₂)₂. If thioethanol is used, NH₂C₆H₄As(SCH₂CH₂OH)₂ is obtained. If K xanthogenate is used, NH₂C₆H₄As(SSCOC₂H₅)₂, m. 85°, is obtained. Hydroxyaminophenylarsine oxide and thioglycolamide give *m*-NH₂*p*-OHC₆H₃As(SCH₂CONH₂)₂. *p*-Hydroxy-*m*-acetylaminophenylarsine oxide and glycerol-monothiol give CH₃CONH(OH)C₆H₃As(SCH₂CH(OH)CH₂OH)₂. *p*-Hydroxy-*m*-acetylaminophenylarsine oxide and K-xanthogenate give *m*-CH₃CONH(*p*-OH)C₆H₃As(SCSOC₂H₅)₂, m. 115°. Hydroxypropyldiarsine acid is reduced with SO₂ in the cold and monothioglycerol is added, giving (CH₂OHCH(OH)CH₂S)₂AsCH₂CH(OH)CH₂As(SCH₂CH(OH)CH₂OH)₂.

Derivatives of 2,3-hydroxynaphthoic arylides. BRITISH DYESTUFFS CORPORATION, LTD. (Joseph B. Payman and Harry Wignall). Fr. 643,954, Sept. 13, 1927. See U. S. 1,663,725 (C. A. 22, 1597).

Chlorine derivatives of 4-nitro-1,3-xylene. I. G. FARBENIND. A.-G. Fr. 644,573, Oct. 10, 1927. 2,6-Dichloro-4-nitro-1,3-xylene and the 2- and 6-monochloro compds. are obtained by treating 4-nitro-1,3-xylene with the required amt. of Cl in the presence or not of a solvent and a catalyst. In an example Cl is passed into 4-nitro-1,3-xylene contg. SbCl₅ or FeCl₃. The product which crystallizes first consists mainly of the 2-

chloro compd. and it may be sepd. from the 6-chloro compd. by fractional crystn. If the chlorination is continued the 2,6-dichloro compd. is obtained.

Furfuryl mercaptans. INTERNATIONALE NAHRUNGS-U. GENUSSMITTEL AKT. GES. Fr. 644,137, Nov. 17, 1927. See Brit. 286,152 (C. A. 23, 154).

Arseno compounds of the pyridine series. ARTHUR BINZ and CURT RÄTH. U. S. 1,702,334, Feb. 19. Therapeutic compds. are obtained by causing an As-contg. substance such as Na arsenite to react with the pyridine diazo compd. such as that of α -hydroxy- β '-amino-pyridine. The arsonic acid derived from the latter compd. forms colorless needles and decomposes at about 215° with foaming and charring. Purification may be effected in the case of the arsonic acids by reducing them to arseno compds. and then reoxidizing (suitably with H_2O_2). Cf. C. A. 22, 3668.

Hydrogenated naphthostyryls. I. G. FARBENIND. A.-G. Fr. 644,486, Nov. 25, 1927. Tetrahydronaphthostyryls are obtained by treating naphthostyryl, its homologs or substitution products, with H under pressure in the presence of a metallic catalyst. In an example 1,8-naphthostyryl in decahydronaphthalene is heated with H under 20 atm. in the presence of Ni. Large colorless crystals, m. 157°, are obtained, and by a second crystn. another compd., m. 164°, is obtained. The first compd. contains the addnl. H atoms in the 1, 2, 3 and 4 positions of the $C_{10}H_8$ nucleus where the CO is in the 1 position, and the second contains them in the 5, 6, 7 and 8 positions.

Aroylations and dye production. BRITISH DYESTUFFS CORP., LTD., H. M. RUMBURY and A. SHEPHERDSON. Brit. 293,924, April 26, 1927. Solns. for aroylating aromatic amino compds. are prepd. by interaction, in the presence of inert solvents of high b. p. such as $PhNO_2$, of an aromatic carboxylic acid such as benzoic acid with a compd. of the benzotrichloride type which forms the acid by hydrolysis. Examples are given of the production of benzoyl chloride, dibenzoyl-1,4-diaminoanthraquinone, dibenzoyl-4,4'-diamino-1,1'-dianthrime, and mono-benzoyl-1,4-diaminoanthraquinone.

Oxidizing aldoses to the corresponding monocarboxylic acids. CHEMISCHE FABRIK VORM. SANDOZ. Brit. 293,322, July 2, 1927. Oxidation of aldoses is effected by use of Cl and a small quantity of a Br or I compd. such as NaI or NaBr in the presence of aq. Na_2CO_3 and while maintaining the soln. just slightly alk. during the reaction. Examples are given of the treatment of lactose and glucose; the products may be sepd. as Ca lactobionate (double salt with $CaCl_2$) and Ca gluconate. Cf. C. A. 23, 606.

Arylthioglycolic acids. I. G. FARBENIND. A.-G. Fr. 644,319, Nov. 21, 1927. See Brit. 281,290 (C. A. 22, 3417).

Lactic acid. WILHELM KLAPPROTH. Fr. 644,314, Nov. 21, 1927. See Brit. 280,969 (C. A. 22, 3417).

Sulfonic acids. BRITISH DYESTUFFS CORP., LTD. and A. J. HAILWOOD. Brit. 293,781, April 12, 1927. *N,N*-Diarylsulfonylarylaminesulfonic acids are made by condensing arylsulfonic halides (2 mols.) with a sulfonated primary arylamine (1 mol.) or by condensing the *N*-monoarylsulfonylarylaminesulfonic acid with an equimol. proportion of an arylsulfonic halide. Examples are given of the condensation of Na sulfanilate with *p*-toluenesulfonic chloride in the presence of Na_2CO_3 and of the similar condensation of Na metanilate with *p*-toluenesulfonic chloride. The products may be used as *tanning agents* and as assistants in the prepn. of *dyes* and *pigments* in finely divided form.

Sulfonic acids. I. G. FARBENIND. A.-G. (Gerhard Balle and Karl Daimler, inventors). Ger. 469,482, Mar. 28, 1928. Addn. to 449,114. See Brit. 268,375 (C. A. 22, 1164).

Phthalic anhydride. ALPHONS O. JAEGER and FRANK A. CANON (to Selden Co.). U. S. 1,702,871, Feb. 19. The impurities in "oxidation phthalic anhydride" are selectively halogenated (suitably by use of MnO_2 and Cl) and the phthalic anhydride is then vaporized. Cf. C. A. 22, 4539.

Formaldehyde. I. G. FARBENIND. A.-G. Brit. 293,203, July 13, 1927. In making CH_2O from MeOH and air, the reagents are preheated separately by regeneration and then mixed at a temp. below the temp. of reaction. An app. is described. Cf. C. A. 23, 1142.

Acetaldehyde. HOLZVERKOHLLUNGS-INDUSTRIE A.-G. and O. FUCHS. Brit. 294,037, Nov. 14, 1927. In the catalytic oxidation of EtOH to produce acetaldehyde, the reaction products are dehydrated by cooling and then treated with an anhydrous (or substantially anhydrous) solvent for the acetaldehyde, e. g., EtOH which produces a mixt. which by adding a little inorg. acid and distg. yields diethyl acetal. Various other details and modifications are also described.

Hydrogen peroxide. OESTERREICHISCHE CHEMISCHE WERKE GES. Brit. 293,755, July 11, 1927. In concg. H_2O_2 soln. or distg. H_2O_2 from solns. of persulfuric acid or its

salts, the parts of the app. in contact with the heated liquid are formed of acid-resistant iron or similar metal and the parts in contact with the vapors are formed of ceramic materials, glass or silica. Various structural details of the app. are described.

Catalysts for the production of methanol, etc. THE IMPERIAL CHEMICAL INDUSTRIES LIMITED. Fr. 644,189, Nov. 21, 1927. Catalysts for the production of CH_3OH and other alcs. are prepd. by heating a mixt. of basic Zn and Cr carbonates. The mixt. may be obtained by pptn. of a soln. of Zn and Cr salts. The catalyst is preferably used as pellets. If alkali salts are present in the catalyst they are useful for the production of higher alcs. Cf. C. A. 23, 1227.

Thymol. RHEINISCHE KAMPFER-FABRIK GES. Brit. 293,753, July 11, 1927. *m*-Cresol is heated with propylene under pressure at a temp. below the decompn. temp. of thymol.

Thymol and menthol. SCHERING-KAHLBAUM A.-G. Brit. 293,874, July 15, 1927. See Can. 283,943 (C. A. 23, 611).

Chlorohydrins. T. GOLDSCHMIDT A.-G. Brit. 293,754, July 11, 1927. Olefins are converted into chlorohydrins by absorption in a stream of Cl water, preferably under pressure. An app. is described.

Benzonitrile and similar compounds. RALF B. TRUSLER (to Roessler & Hasselacher Chemical Co.). U. S. 1,702,711, Feb. 19. In the production of aryl cyanides, bromobenzene or other aryl halide whose substituent groups are inactive in the presence of the reaction materials under the prevailing conditions of the reaction, are reacted on with a metal cyanide such as AgCN in the presence of a catalyst comprising a bromide of Cu, Ni or Co.

Hydroxyaminobenzenes. I. G. FARBENIND. A.-G. Brit. 293,792, July 11, 1927. 4-Amino-1-hydroxybenzene and *N*-alkyl or hydroxyalkyl derivs. are formed by treating 4-amino-1-alkoxybenzene or the corresponding *N*-deriv. with H_2SO_4 . Examples are given of the treatment of 4-mono- and bishydroxyethylamino-1-ethoxybenzene, 4-amino-1-ethoxy- and methoxybenzene and 4-methylamino-1-ethoxybenzene. Cf. C. A. 23, 1143.

Oxyanthraquinones. H. W. HERWARD, J. THOMAS and SCOTTISH DYES, LTD. Brit. 293,328, Dec. 29, 1926. Aq. solns. of caustic alkalies are caused to act on β -alkyl- or β -carboxyanthraquinone, with or without an oxidizing agent such as NaClO_2 . Examples are given of the production of alizarin from β -carboxyanthraquinone and from β -methylantraquinone.

6,6'-Isopropylidenebis-*m*-cresol. SCHERING-KAHLBAUM A.-G. Brit. 293,863, July 14, 1927. 4,4'-Dimethyl-2,2'-dihydroxydiphenyldimethylmethane (which is obtained by condensation of *m*-cresol and acetone) is depolymerized by heating to about 250° or passing the heated vapor over a surface catalyst. The product may be fractionally distd. under reduced pressure.

Hexahydroaniline. I. G. FARBENIND. A.-G. Fr. 644,366, Nov. 22, 1927. See Can. 283,752 (C. A. 22, 4540).

***N*-Acetylarylsulfonamides.** I. G. FARBENIND. A.-G. (Wilhelm Hoch, inventor.) Ger. 466,519, Jan. 25, 1925. *N*-Acetylarylsulfonamides are prepd. by treating aryl-sulfonamides with Ac_2O . The prepn. of acetyl-*p*-toluenesulfonamide, *m.* 139° , is described by way of example. The products are useful as addns. to cellulose acetate.

1,3-Diamino-2-hydroxyanthraquinone. THE NEWPORT CO. Fr. 643,800, Nov. 12, 1927. The above is prepd. by nitrating 4-hydroxy-*o*-benzoylbenzoic acid to obtain 3,5-dinitro-4-hydroxy-*o*-benzoylbenzoic acid, which is reduced to the corresponding diamine, and the ring is closed with elimination of water by means of conc. H_2SO_4 .

2-*Bz*-1'-Dibenzanthronyl and its derivatives. I. G. FARBENIND. A.-G. (Arthur Luttringhaus, Heinrich Neresheimer, and Hugo Wolff, inventors). Ger. 468,475, Feb. 22, 1925. 2-*Bz*-1'-Dibenzanthronyl and its derivs. are prepd. by treating a mixt. of a *Bz*-1-halobenzanthrone and a benzanthrone not substituted in the 2-position with an alk. condensing agent under such mild conditions that further condensation leading to the production of dyes (isodibenzanthrones) is minimized or avoided. In the examples, (1) a mixt. of *Bz*-1-chlorobenzanthrone and benzanthrone is treated at $0-12^\circ$ in an atm. of N with PhNHNa in PhNH_2 suspension, 2-*Bz*-1'-dibenzanthronyl, *m.* 396° , is obtained; (2) 6- or 7-chlorobenzanthrone is substituted for benzanthrone in (1), 6- or 7-chloro-2-*Bz*-1'-dibenzanthronyl, *m.* above 360° and about 360° , resp., being obtained; (3) 6-methylbenzanthrone is substituted for benzanthrone in (1), 6-methyl-2-*Bz*-1'-dibenzanthronyl, *m.* above 360° , being obtained; (4) a mixt. of *Bz*-1-chlorobenzanthrone and benzanthrone is treated at $10-15^\circ$ in an atmosphere of N with KOH suspended in toluene; 2-*Bz*-1'-dibenzanthronyl is again obtained. Cf. Brit. 255,277.

Perylene. COMPAGNIE NATIONALE DE MATIÈRES COLORANTES ET DE PRODUITS CHIMIQUES. Ger. 469,553, Dec. 19, 1923. See Brit. 208,721 (C. A. 18, 1504).

Tetraglucosan. JOHANNES KERB. Ger. 468,454, Nov. 21, 1924. See Brit. 243,348 (C. A. 20, 3697).

Trimethylamineglycol monoborate. K. LÜDECKE. Brit. 293,438, July 8, 1927. This compd. is prepd. by adding H_3BO_3 to an aq. soln. of trimethylamineglycol, concg. *in vacuo* and treating the sirupy product with solvents in which it is insol. such as acetone or dissolving in alc. and then adding acetone; alc. also may be included in the reaction mixt. and acetone afterward added.

Sodium calcium lactate. ERNST RUPPIN. Ger. 467,937, May 8, 1924. A stable solid product is prepd. by neutralizing a soln. of $CH_3CH(OH)COOH$ with eqtiv. amts. of NaOH and $Ca(OH)_2$, or with a small excess of $Ca(OH)_2$, and evapg. the soln. until the product contains about 27% H_2O , at which point it sets to a solid crumbling mass.

Combinations of lecithin with amino acids. L. GUERCI. *Ann. chim. ap.* 18, 495-503(1928).—When lecithin from eggs was added to pancreatic ext., whether in water or EtOH soln., and the mix. kept in a thermostat at 37° an increase in acidity was noted. This was not due to fermentation as even boiled pancreatic ext. showed the same effect. Apparently, there is a combination of lecithin with the NH group in the amino acid present in the pancreatic juice with consequent increase in acidity. Lecithin is known to form adsorption compds. with many substances such as I, Br, hematin, glucose, Cd, Mo, Hg, FeI_2 and $FeBr_2$, as well as with citric and glycerophosphoric acids. A similar adsorption compd. may be formed with amino acids.

A. W. CONTERI

Synthetic preparation of the main constituent of bones and teeth. TH. GASSMANN. *Z. physiol. Chem.* 178, 62-6(1928).—The main constituent of bones and teeth is a phosphatocalcium carbonate of the formula

Synthetically it may be prepd. through the action of sunlight in the presence of natural ice water which contains small amts. of P in sol. oxide form. The method consisted in covering 1 g. dry CaO from marble with 10 cc. filtered natural ice water, allowing the mixt. to evap. in sunlight, exposing the residue 3 days to atm. CO_2 , adding 1.5 g. CaO and 3 g. Na_2HPO_4 dissolved in 15 cc. natural ice water, evapg. as before, boiling with distd. H_2O and filtering. The residue after drying at 110-20° is heated on the water bath with 15 cc. glacial AcOH, evapg. and washed with abs. EtOH. The CO_3 in the above formula may be replaced by Cl_2 by heating with $BaCl_2$, yielding the mineral apatite. The natural and artificial phosphatocalcium carbonate are apparently identical in compn. and properties. A study of its combining power with org. substances should throw some light on Ca metabolism and bone diseases.

A. W. DOX

Uricolysis. I. K. FELIX, FR. SCHEEL AND W. SCHULER. Univ. München. *Z. physiol. Chem.* 180, 90-106(1929).—All mammals except man and anthropoid apes break down uric acid into allantoin and CO_2 . The reaction occurs in several successive stages, probably oxidation, hydration and loss of CO_2 . The enzymes responsible for this process are present in the liver. In the expts. here described, a dry powder obtained by dehydration of fresh hog liver with MeAc and Et_2O was used in the proportion of 1 g. per 100 mg. uric acid. At 37° and pH 9.9 the reaction is complete in 5 hrs. The activity of the prepn. is destroyed by boiling, and the reaction greatly retarded by cooling the mixt. to 23°. For the destruction of uric acid there are 2 pH optima at 8.9 and 9.9-10.0, resp., and for the splitting off of CO_2 the optimum is 9.9. The uricolytic enzymes thus manifest their greatest activity in the region of strong alk., a characteristic they possess in common with another hepatic enzyme, arginase. It is not likely, however, that such high alk. occurs in the living cell, where physicochem. conditions

probably displace the optimum toward the neutral side. In the region of the 1st optimum the uric acid disappears completely, as shown by a neg. test with the Folin reagent, while only 20% of the theoretical amt. of CO_2 is liberated. Each mol. of uric acid consumes 1 atom of O. This O consumption in the presence of liver prepn. is so readily detd. that it might be made the basis of a method for detg. uric acid. After the oxidation stage the production of CO_2 at p_H 9.9 is independent of the presence of O, since it readily occurs in an atm. of N. Oxidation and loss of CO_2 are thus shown to be 2 sep. processes. Regarding the 3rd process, the taking up of H_2O , no data are yet available. The similarity of the biol. oxidation of uric acid to that by alk. KMnO_4 suggests that both probably proceed via the same intermediate product, uroxic acid. However, it was found that liver powder does not liberate any appreciable quantity of CO_2 from the K salt of uroxic acid at various p_H values. A partial sepn. of the oxidizing and decarboxylating components of the enzyme system was effected by extg. the liver powder at p_H 8.9, whereby an ext. rich in the oxidase and relatively poor in the decarboxylase was obtained. For measurement of O consumption an app. similar to the app. for catalytic hydrogenation was used. A. W. DOX

The enzymes of leucocytes. I. Proteases of the gastric mucosa. RICHARD WILSTÄTTER AND EUGEN BAMANN. Bayer Acad. München. *Z. physiol. Chem.* 180, 127-133(1929).—The gastric mucosa contains 2 enzymes which are not secreted with the gastric juice, viz., erepsin and a proteinase whose optimum activity is at p_H 3.5-4.0. Both are less easily extd. than the pepsin. For the proteinase which is active at slightly acid reaction the name *cathepsin* is proposed. It is believed that cathepsin and erepsin occur as leucocyte enzymes in the gastric and intestinal mucosae, an assumption which is in agreement with histological observations on the accumulation of leucocytes in these tissues. The liberation of cathepsin from dried prepn. of mucosa is favored by slightly alk. reaction. Glycerol exts. of fresh mucosa show greater activity toward gelatin at p_H 4 than at p_H 2, i. e., a preponderance of cathepsin over pepsin. For the erepsin the optimum p_H is 8.0, and at p_H 5.0 the activity is completely suppressed. The increase in amino N observed at p_H 4 is therefore not due to peptone formation by pepsin and subsequent peptide cleavage by erepsin. Tests for trypsin were negative. Direct drying of the mucosa leads to complete destruction of the erepsin, but if the tissue is dehydrated by org. solvents an ext. may be prepd. several months later fully as active as the fresh material. Gastric erepsin in aq. soln. is very unstable, especially with acid or alk. reaction, but the addn. of glycerol to the neutral soln. renders it quite stable. Examn. of normal gastric juice revealed no trace of erepsin. Specimens of neutral gastric juice, on the other hand, from hospital patients, showed considerable ereptic activity. These abnormal specimens had only feeble peptic activity but strong tryptic action, due probably to contamination with pancreatic and intestinal secretion and the presence of cells. A. W. DOX

The red pigment of heart and skeletal muscle. RUDOLF SCHÖNHEIMER. Univ. Freiburg. *Z. physiol. Chem.* 180, 144-8(1929).—Uroporphyrin and coproporphyrin cannot be obtained by chem. treatment of the blood pigment. They belong to another series of porphyrins and are characterized by their wider distribution in nature, not only in human urine and feces and more especially under certain pathological conditions, but also normally in bird feathers, yeast, etc. Since the identity of the blood pigment with muscle pigment has not been established, the latter was examd. as a possible source of uro- and coproporphyrin. By the Mörner procedure hemin was prepd. from beef hearts in a yield of 100 mg. per kg. With N_2H_4 or $(\text{NH}_4)_2\text{SO}_4$ it gave the hemochromogen spectrum, and the Takayama reagent yielded hemochromogen crystals. By treatment with AcOH , HI and red P it was converted into mesoporphyrin. This porphyrin was identical with mesoporphyrin prepd. from blood hemin, as shown by m. ps. of the Et and Me esters and mixed m. ps. with the corresponding prepn. from blood. Hemin prepd. from the skeletal muscles of a dog yielded a mesoporphyrin whose Et ester was also identical with that from blood. Other hemins are not known to occur in the animal organism, and at any rate are probably not present in sufficient amt. to account for the formation of uro- and coproporphyrins. These porphyrins are probably formed by direct synthesis and not from the breakdown of hemin. A. W. DOX

Actinic measurement of solar ultra-violet light and some correlations with the erythema dose. FRED O. TONNEY, PAUL P. SOMERS AND WILLIAM C. MARTI. Dept. of Health Labs., Chicago. *J. Preventive Med.* 2, 493-511(1928).—By the use of the Anderson and Robinson method (*C. A.* 19, 2453) originally designed for standardizing Hg quartz arc lamps, findings are reported in mg. of $\text{H}_2\text{C}_2\text{O}_4$ decomposed by the actinic effect of sunshine and also in % of the climatic max. for the Chicago district. This method gives highly consistent results in analysis of sunshine and does not require any

elaborate app. It is particularly well suited for field work and gave data which correlated approx. with the erythema reaction of the skin following exposure to the sun's rays. The position on the actinic scale at which definite erythema regularly began was in a narrow zone between the readings of 3.52 and 3.72 mg. of $C_3H_2O_4$ decomposed, or at about 50% of the max. climatic reading for the Chicago district. C. R. F.

Muscle phosphorus. II. The acid hydrolysis of lactacidogen. H. A. DAVENPORT AND JACOB SACKS. Northwestern Univ. *J. Biol. Chem.* 81, 469-77 (1929).—Hydrolysis of muscle by NH_4SO_4 at 100° for 1 hr. liberated an amt. of phosphate corresponding approx. to that liberated by enzymic hydrolysis. In stimulated muscles in which recovery had not taken place, the acid hydrolytic value was 20 to 30 mg. % lower than the enzymic. Lactacidogen is considered as made up of 2 P-contg. compds., only one of which is affected by stimulation of the muscle. Fresh CCl_3COOH muscle filtrates gave neg. color reactions for pyrophosphate. ARTHUR GROLLMAN

Biochemical studies on unknown unsaponifiable substance. I. The distribution of unsaponifiable substance in the animal body. EIKICHI IGARASHI. Tokyo Jikei-kwai Med. College. *Sci-I-Kwai-Med. J.* 47, No. 9, Eng. abstr., 1-2 (1928).—Detns. were made of the contents of fatty acid, cholesterol and unknown unsaponifiable substance of various tissues and organs of the rabbit. The unknown unsaponifiable substance was found present in greatest concns. in the nervous system and endocrine organs. Voluntary muscle contained less cholesterol and more unknown unsaponifiable substance than involuntary muscle. The ratios of fatty acid to cholesterol or to the unknown unsaponifiable substance are const. in organs of different animals. ARTHUR GROLLMAN

Phosphatases of mammalian tissues. II. Pyrophosphatase. HERBERT D. KAY. London Hospital. *Biochem. J.* 22, 1446-8 (1928).—The distribution of pyrophosphatase is similar to that of the orthophosphoric esterase (*C. A.* 22, 4543), but its zone of optical activity is p_H 7.2-7.8, as against p_H 8.8-9.3 for the latter enzyme. BENJAMIN HARROW

Ultra-violet absorption spectra of uric acid and of the ultra-filtrate of serum. FRANK C. SMITH. London Hospital Med. School. *Biochem. J.* 22, 1449-503 (1928).—Uric acid when dissolved in water shows 2 sharp bands, but when dissolved in Na carbonate, only one band is visible. This possibly indicates a tautomeric change in the mol. The selective absorption shown by serum ultra-filtrates is probably due to uric acid. A filtrate obtained from a pathol. case showed marked general absorption, differing from the filtrates of normal sera. BENJAMIN HARROW

Phosphate content and hydrogen ion concentration of the surface water of the English Channel and Southern North Sea, June 18-22, 1928. H. R. SEIWELL. *Nature* 122, 921-2 (1928).—For the English Channel, the av. phosphate content is 8.64 mg. P_2O_5 per m^3 and the av. p_H (cor.) is 8.03. The corresponding values for the southern North Sea are 3.44 and 8.11, resp., and for the Straits of Dover, 3.65 and 8.05. There appears to have been a greater photosynthetic activity in the surface water of the Southern North Sea than in that of the English Channel. ALBERT L. HENNE

Dehydrogenation of lactic acid. AMANDUS HAHN, E. FISCHBACH AND W. HAARMANN. Institut München. *Z. Biol.* 88, 89-90 (1928).—A mixt. of finely ground beef muscle, lithium lactate, semicarbazide, phosphate buffer and methylene blue was incubated at 38° for 2.5 hrs. Coagulable protein was sepd. by boiling and the filtrate evapd. to dryness on a water bath. The residue contained the semicarbazone of pyro-racemic acid. This was digested with 50% H_2SO_4 for $1\frac{1}{2}$ hr. at 50° , and the whole treated with anhydrous Na_2SO_4 , producing a dry powder which was extd. with ether for 3 hrs. Then the ether was evapd. in vacuum at 25° , the residue taken up with water and mixed with an HCl soln. of phenylhydrazine. After 24 hrs. in the ice chest the phenylhydrazine crystals of pyroracemic acid were collected and weighed. The presence of the lactate increased the yield from 8 to 87 mg. FRANCES KRASNOW

The carbon dioxide dissociation curve of nerve and muscle. WALLACE O. FENN. Univ. Rochester School Med. and Dentistry. *Am. J. Physiol.* 85, 207-23 (1928). The rate at which CO_2 diffused into nerves and muscles agreed with Fick's law of diffusion and is: for nerves 7.1×10^{-5} $cm.^3/min.$ and for muscle 11.7×10^{-5} $cm.^3/min.$ J. F. LYMAN

Simultaneous study of the constituents of the sweat, urine and blood; also gastric acidity and other manifestations resulting from sweating. VII. Amino acids. C. O. HAUGEN AND G. A. TALBERT. Univ. N. Dakota. *Am. J. Physiol.* 85, 224-8 (1928).—Sweat contained 1.57 to 4.76 mg. of amino acid N per 100 cc., or 15 to 50% as much as in the urine. There was no correlation between amino acid N of sweat, blood and urine. J. F. LYMAN

The viscosity of gum acacia solutions together with a determination of the viscosity constant of such solutions according to the formula of Arrhenius, $\log \eta = \theta C$. STEPHEN

WENT. Harvard School Pub. Health. *Am. J. Physiol.* **85**, 458-67(1928).—The viscosity of pure and impure gum acacia solns. (1 to 6%) at various p_H values and with the electrolytes of blood absent or present could be calcd. satisfactorily by the formula of Arrhenius, $\log \eta = \theta C$, where η = the viscosity of a H_2O soln., C = concn. of dissolved particles and θ = viscosity const. The law of Arrhenius could be applied to mixts. of plasma proteins and acacia and to human blood and acacia, but not to mixts. of human erythrocytes and acacia. In the presence of acacia colloids the dispersion of human erythrocytes was charged, but this change was prevented by the presence of human plasma. J. F. LYMAN

The toxic factor in bile. O. H. HARRALL AND A. J. CARLSON. Univ. Chicago. *Am. J. Physiol.* **85**, 591-606(1928).—Bile injected intraperitoneally was toxic, causing the death of animals within 24 hrs. when injected in sufficient amt. The toxic substance was not modified by boiling or freezing. It is diffusible. Bilirubin was not toxic, but sodium glycocholate and sodium taurocholate were toxic. The toxicity of bile salts probably depends on their destructive action on cell membranes. J. F. L.

The penetration of ultra-violet rays into live animal tissue. WILLIAM T. ANDERSON, JR. AND DAVID I. MACHT. Hanovia Chemical and Mfg. Co., Newark, N. J., and Westcott and Dunning, Baltimore, Md. *Am. J. Physiol.* **86**, 320-30(1928).—Live rabbit skin 12 mm. thick showed a transmission of 6 to 10% for wave lengths from 2537 to 3000 A. U. Dead skin was practically opaque to ultra-violet ray shorter than 3660 A. U. J. F. LYMAN

Action of carbon monoxide on hematin catalyses according to M. Dixon. H. A. KREBS. Kaiser Wilhelm-Inst. für Biol., Berlin-Dahlem. *Biochem. Z.* **201**, 489(1928); cf. *C. A.* **22**, 2581.—Reply to Dixon's criticism (*C. A.* **23**, 162) that CO represses catalysis by hematin only when this is aged. K. maintains that this inhibition occurs even in freshly crystd. hemin which was obtained in a state of extreme purity from pyridine- $CHCl_3$ -AcOH. S. MORGULIS

Inhibition of ferrocysteine catalysis by carbon monoxide. WERNER CREMER. Kaiser Wilhelm-Inst. für Biol., Berlin-Dahlem. *Biochem. Z.* **201**, 490(1928); cf. *C. A.* **22**, 2582.—Reply to Dixon's statement (*C. A.* **23**, 162) that CO does not inhibit the catalysis by ferrocysteine. It is pointed out that this inhibition depends on the ratio of the partial pressure of CO and O_2 , and does not occur until this ratio reaches a certain value. S. MORGULIS

Autocatalysis and growth. P. R. v. D. R. COREMAN. Div. of Chemistry, Cape Town, S. Africa. *Ann. Appl. Biol.* **15**, 613-22(1928).—The autocatalysis equation in the form, $\log x/(a-x) = K(t-t_1)$, expresses closely the changes that occur during the growth of the human infant, the cotton plant, and several varieties of grapes. The const k derived from $K = ka$ is not independent of environmental conditions. The equation $dx/dt = (k_1 + k_2x)(a-x)$ more suitably expresses changes in growth, in which k_1 is dependent upon external conditions and k_2 is a measure of the internal factors governing the growth processes. C. H. RICHARDSON

Studies on permeability of membranes. VI. Mensuration of the dried collodion membrane (calculation of dimensions and of relations to certain biological membranes). A. A. WEECH AND L. MICHAELIS. Johns Hopkins Univ. *J. Gen. Physiol.* **12**, 221-30(1928); cf. *C. A.* **22**, 4329.—The flat type of dried collodion membrane (Michaelis, Ellsworth and Weech, *C. A.* **21**, 3008) used in this study had a functioning area of about 30 cm.², a thickness of about 0.1 mm., and a volume of 87% collodion and 13% of pores (av.) The calcd. values for total pore area present evidence to show that a smaller mol. (acetone) probably utilizes in diffusing a much larger % of the total pore area than does a larger mol. (glycerol). Comparisons are made between the dried collodion membrane as a model for certain biol. membranes and the membrane of the red blood cell. The importance of small electromotive forces and very slight permeabilities are greatly exaggerated with such extremely thin membranes as those of red blood cells. C. H. RICHARDSON

Preparing the double salt of lecithin and cadmium chloride. ANGELO CONTARDI AND PIA LATZER. *Rend. istit. Lombardo sci.* 1927, 847-9.—From eggs: 25 yolks were extd. with acetone; the residue was treated with 95% alc. and a cold satd. alc. $CdCl_2$ soln. was added until complete pptn. The double salt prepd. was collected, vacuum dried at ordinary temp., extd. with ether for sepg. the satd. double lecithin fatty acid salt from the non-satd. fatty acid salt not sol. in ether, 36 g. of lecithin Cd salt (22.37% $CdCl_2$) being obtained. 1 no. of Cd lecithin was 45.68; 1 no. of the fatty acids prepd. with warm dil. HCl from the double salt 65.34. From pancreas: 500 g. of horse pancreas were cold-extd. with 95% alc., distg., reextg. with alc. and cold-pptg. with satd. alc.

CdCl_2 soln., filtering, washing and vacuum drying over H_2SO_4 . The Cd salt sometimes caused hemolysis of blood, contg. fatty acids, P and choline; in other cases it was not lytic and real lecithin was present. To the cold-extd. pancreas residue was added 95% alc., which was kept for 24 hrs. at 37° . From the alc. ext. was pptd. the double salt of CdCl_2 as indicated which was or was not hemolytic. The cold-prepd. Cd lecithin was entirely sol. in ether, while the warm-prepd. was only partly sol. The ether ext. was evapd. and the residue was dried in a vacuum under H_2SO_4 . I no. of Cd lecithin sol. in ether was 47.35; I no. of cold-extd. Cd lecithin 16/22; I no. warm-extd. Cd lecithin 16.67; I no. of lecithin fatty acids from the Cd lecithin sol. in ether warm-extd. 59.82, cold-extd. 39.83. From the brain: The lecithin was extd. from dry, pulverized, horse brains purified in acetone, with 95% alc., adding the cold satd. CdCl_2 soln., filtering, washing with alc. and ether and drying in a vacuum under H_2SO_4 . A double salt is prepd. with 21.1% CdCl_2 . I no. Cd lecithin 48, sapond. 68. R. SANSONI.

Action of the Ricinus lipase (castor oil enzyme) on cadmium lecithins and cadmium lysocytins. ANGELO CONTARDI AND PIA LATZER. *Rend. ist. Lombardo sci* 1927, 857.—The action of small quantities of the ricinus enzyme on Cd lecithins in physiol. soln. (1:100) has been studied at $36-7^\circ$. The reaction could only be suspended once when lysocytin was present, a test giving the hemolysis of blood. Other tests on Cd lecithin or egg yolk did not confirm the action of the ricinus lipase, that frees lecithin from the fatty acids. Operating on the Cd lysocytin the same result was obtained, but part of the soln. was decomposed as fatty acids were liberated, the soln. remaining always hemolytic even after several days. The ricinus lipase was without action on glycerophosphates and on phytin. R. SANSONI.

The influence of chemical reagents, especially of metallic salts, upon the tyrosinase reaction. SHIGEO TAKAOKA. Keio Univ. *Keio J. Med.* 8, 165-90(1928).—T. examd. the reaction of tyrosinase filtrate from potato juice and of the soln. obtained by removing starch from the potato juice, satg. with $(\text{NH}_4)_2\text{SO}_4$, and dialyzing the resulting ppt. The change in coloration differs greatly with p_{H} , so that the coloration alone cannot be made a criterion for estimating the power of tyrosinase. The first coloration (red) appears best at p_{H} 6.5, the second (black) at p_{H} 8; and when these p_{H} values are taken into consideration either the first or second color reaction gives no great difference in estimating the oxidizing action of tyrosinase. T. next examd. the effect of metallic salts upon the tyrosinase reaction. BaCl_2 and vegetable ash have no action. Among LiCl , NaCl , KCl , CsCl , MgCl_2 , CaCl_2 , $\text{Sr}(\text{NO}_3)_2$, CdCl_2 , ZnCl_2 , MnSO_4 , $\text{Ni}(\text{NO}_3)_2$, CoCl_2 , FeSO_4 , only ZnCl_2 accelerates the action. Of salts that shift the p_{H} value to the acidic side, e. g., BeSO_4 , HgCl_2 , CeCl_3 , AlCl_3 , FeCl_3 , the action is on the whole inhibited as the p_{H} value is changed from 6.5 to 8.0. Salts that shift the p_{H} value to the alk. side e. g., Na_2HPO_4 , NaHCO_3 , Na_2CO_3 , generally accelerate the second reaction of forming a black substance in the suitable range of p_{H} . The concn. of ash in the potato juice seems to have no direct effect upon the fermenting action. With oxidizing (KClO_3 , NaClO) and reducing (SnCl_2 , KCN , $\text{N}_2\text{H}_4\cdot\text{HCl}$ and $\text{NH}_2\text{OH}\cdot\text{HCl}$) agents, the dil. soln. of the former accelerates only the first coloration, while concd. soln. inhibits; the latter has a marked inhibiting action; alcs. are generally inhibiting; mono-amines show no accelerating or inhibiting action, while diamines, *m*-tolylidenediamine and *p*-phenylenediamine inhibit independently of p_{H} . Of the alkaloids, pylocarpine accelerates and brucine sulfate inhibits the first coloration, while morphine hydrochloride, quinine hydrochloride and *strychnine nitrate* accelerate the second reaction. T. concludes that there is no apparent connection between the chem. constitution of the reagents and their inhibiting or accelerating action upon the tyrosinase reaction. K. SOMEYA.

Disinfectants for preserving the amylase solution of *Aspergillus oryzae*. KOKICHI OSHIMA. Hokkaido Imp. Univ. *J. Soc. Chem. Ind. (Japan)* 31, 750-3; *Supplemental Binding* 31, 180-3B(1928).—The following kinds and quantities of antiseptics proved to be suitable for preserving the amylase soln. of *A. oryzae*: cresol (0.15-0.40%), lysol (0.5-2.0%), phenol (0.4-1.5%), thymol (0.05-0.20%), phenol + cresol (0.3% P + 0.1% C ~ 1.0% P + 0.2% C). Y. TOMODA.

Activation of Ricinus lipase by acids. SANNOJU MUKAI. Kyushu Imp. Univ. (Japan). *J. Soc. Chem. Ind. (Japan)*, 31, 759-65; *Supplemental Binding* 31, 182B(1928).—There is a Mg compd. in castor beans which inhibits the activity of lipase; acids used for the activation of lipase dissolve this Mg compd. The activated lipase, which had been previously treated with 0.05 N H_2SO_4 , showed nearly the same activity at p_{H} 3.5 and 6.8. Y. TOMODA.

Recent progress in the study of enzymes. M. SCHOEN. *Ann. brasserie et dist.* 1928, 21, 27 and 49; *Brewers' J.* 64, 491-2, 557-8 and 627-8.—A review of the results by absorption methods which have made possible a differentiation between the proper-

ties of the enzyme proper, and the accessory substances accompanying it. Purely chem. investigations have so far failed to reveal the mechanism of enzyme action.

PETER J. F. WEBER

The occurrence of complex carbohydrates in the blood. ERICH GABBE. *Verhandl. Physik.-Med. Ges. Würzburg* 52, 67-72(1927); *Ber. ges. Physiol. expil. Pharmacol.* 45, 652.—Ege contradicted the work of Lepine in which there was reported a complex carbohydrate in the blood, but he did not consider the p_H of the deposit in his study of emulsin. Therefore, emulsin was purified according to Willstätter, takadiastase added and the whole tested upon the addn. of acetate buffer mixts. When $p_H = 5.3$ there regularly appears an increase in the reduction power amounting to 30-40% of the initial value, the increase in the blood corpuscles alone amounting to as much as 100%. Dische and Popper's indole reaction is increased in the same degree. The substance which is split from the blood by takadiastase is pptd. by baryta water in 5-8% ethyl alc. or by 90% alc. alone. It is sol. in pyridine to which alkali or strong acid has been added and is hydrolyzed by 30% KOH. It has not yet been obtained free of protein. Its amt. is irregularly influenced by insulin and is not related to the sugar in the plasma. It appears to be related to the free sugar of the erythrocytes. The amt. of the substance is reduced by adrenaline.

R. C. WILLSON

The glycogen content of the blood. E. GABBE. *Verhandl. Physik.-Med. Ges., Würzburg* 52, 126-9(1927); *Ber. ges. Physiol. expil. Pharmacol.* 45, 653.—The estns. of the blood glycogen range from 0.1 to 9.0 mg. %. The reduction power of the blood is increased when the p_H is favorable for the activity of its amylase. With $p_H = 6.5$ and a 20 times diln. of the blood, the increase amounts to 20% of the initial value; in the erythrocytes it is twice as large and in the plasma smaller than in the whole blood. At the same time the Dische-Popper indole- H_2SO_4 reaction is increased in intensity. The blood amylase acts within 30 mins. against 12-15 hrs. in takadiastase. Similar differences were found in the action of different enzymes on liver glycogen. After a previous sepn. of the blood pigment by HCl, the glycogen can be isolated from the blood by means of the Pflüger method. The amt. is much larger than has hitherto been found, being 18-30 mg. %. In normal plasma a smaller amt. was found, about 20 mg. %; in pathological conditions, as diabetes, the proportion is inverse. The glycogen content of the blood is reduced only a little after heating for several hrs. to 37°; it appears to be present in a protective form, perhaps in the blood platelets. It is possible that protein-glycogen compds. play a role in the erythrocytes. R. C. WILLSON

The influence of ultra-violet irradiation on serum irradiated outside the organism. G. FRONTALI. *Riv. clin. pediatr.* 25, 661-8(1927); *Ber. ges. Physiol. expil. Pharmacol.* 45, 588.—Blood serum in air-tight quartz containers was irradiated for 15-60 mins. with a mercury-vapor arc lamp. Serum so treated showed an increase in the inorganic P and a decrease in the p_H .

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Detection of bile pigment in urine. L. VAN ITALLIE. Univ. Leiden. *Pharm. Weekblad* 66, 13-4(1929).—A simplification of the Huppert-Salkowski-Steensma test for bile pigment in urine consists in adsorption of the pigment on talc instead of pptd. CaCO_3 obtained by addn. of Na_2CO_3 and CaCl_2 to the urine. To 100-500 cc. of urine add 0.5-1.0 g. of talc and shake, then filter through cotton or paper. If the talc is not colored yellow the test is neg. If a yellow color appears, the test is confirmed by extg the talc with EtOH contg. HCl and treating the ext. with NaNO_2 , whereupon the green color of biliverdin appears.

A. W. DOX

Clarification and decolorization of urine. FISCHER AND HORKHEIMER. *Pharm. Ztg.* 74, 45-6(1929).—For purposes of polarization the authors recommend the use of relatively small quantities of animal charcoal (Carbo animalis Merck pro analysis), as 0.7 g. per 25 cc. of urine, whereby little or no perceptible loss of sugar will result.

W. O. E.

Method and apparatus for the demonstration of alcohol in urine. PAUL LIEBESNY. *Klin. Wochschr.* 7, 1959(1928).—The alc. is distd. from 1 cc. of urine into 5 cc. of a 0.04 N $\text{K}_2\text{Cr}_2\text{O}_7$ soln. in 50% H_2SO_4 . A special app. is used. This is described. The dichromate is reduced and a color change is obtained. The color is compared with that of a series of standards. The standards keep indefinitely. The ingestion of 0.5 cc. of alc. per kg. body wt. leads to the excretion of alc. so that 1 cc. urine contains about 1 mg. alc. after 1 hr. and 1.5 mg. after 2 hrs. A pos. reaction can still be obtained after 6 hrs. The ingestion of 0.25 cc. alc. per kg. body wt. cannot be detected by this method.

MILTON HANKE

Measurement of the p_{H} of urine under vital conditions. A. BECK AND H. J. LAUBER. *Klin. Wochschr.* 7, 2241-2(1928).—Detns. of p_{H} , as they are usually carried out on samples of urine, do not give accurate values because of the loss of CO_2 . Accurate values can be obtained if the urine is drawn from the bladder into a syringe through a catheter.

MILTON HANKE

Note on the extraction of an iron-containing pyrophosphate from muscles. O. MEYERHOF AND K. LOHMANN. Kaiser Wilhelm-Inst., Berlin-Dahlem. *Biochem. Z.* 203, 208-11(1928).—Muscle is extd. with a HgCl_2 -HCl mixt. After removal of Hg and then of the H_2S the ext. is neutralized with Fe-free NH_4OH and pptd. with the calcd. amt. of Ba acetate. The pptd. phosphates are dissolved in a few cc. 0.5 N HCl. One portion (1 cc.) is heated with N HCl in a fused tube at 100° for 10 mins. whereby all the pyrophosphate is hydrolyzed. The same is done with a second portion from which the Ba was removed with Na_2SO_4 . These samples were used for detg. P. The original soln. was analyzed for Fe before and after hydrolysis. The amt. of Fe found constituted 1-2% of the equiv. quantity of the pptd. pyrophosphate. S. MORGULIS

A new microchemical method for the determination of blood sugar. IWAO OGAWA AND KEIZO KODAMA. Aichi Med. Coll., Nagoya. *J. Biochem. (Japan)* 10, 1-4(1928). Blood is deproteinized with acetic acid and $\text{K}_3\text{Fe}(\text{CN})_6$, then boiled in the presence of Na_2CO_3 . In this process $\text{K}_3\text{Fe}(\text{CN})_6$ is reduced to $\text{K}_4\text{Fe}(\text{CN})_6$ in an amt. proportional to the sugar present. To the cooled soln. FeCl_3 acidulated with AcOH is added, producing a blue color (Prussian blue) which is compared to that formed in a standard. Solns. required: (1) 0.3% acetic acid; (2) 0.005 N $\text{K}_3\text{Fe}(\text{CN})_6$ made by dissolving 1.046 g. of the salt in one l. H_2O ; (3) 10% Na_2CO_3 ; (4) FeCl_3 made by dissolving 1.65 g. in a l. of 30% AcOH; (5) standard glucose (stock) made by dissolving a g. of pure glucose in 100 cc. satd. NaCl soln. Five drops of blood is collected in a small porcelain crucible contg. a trace of $\text{K}_2\text{C}_2\text{O}_4$ from which 0.05 or 0.10 cc. are measured with a pipet into a test tube contg. 5 cc. 0.3% AcOH, and the vol. is made up to 6 cc. with H_2O . One cc. of dild. (1:100) sugar standard is likewise measured into 5 cc. 0.3% AcOH. To both tubes after boiling for 3 min. in a water bath and cooling in running water 3 cc. of the $\text{K}_4\text{Fe}(\text{CN})_6$ soln. are added, and the deproteinized blood is now filtered. Five cc. of the clear filtrate and of the standard are now pipetted into clear tubes, made alk. by the addn. of 1 cc. Na_2CO_3 , and boiled in the water bath for 6 min. Upon cooling 1 cc. of the FeCl_3 soln. is added to each. In matching the colors in a colorimeter it is recommended to use the brown color screens. The calcn. is very simple, the reading of the standard reading of the unknown $0.1 = \text{g. glucose per 100 cc. when 0.1 cc. is used for the analysis.}$

S. MORGULIS

Studies on the behavior of cholesterol within the animal body. I. A method recommendable for cholesterol estimation in any kind of tissue. JINYE ONIZAWA. *Biochem. Inst., Tokyo Imp. Univ. J. Biochem. (Japan)* 10, 45-61(1928).—The method

is made up of 2 steps: the extn. of cholesterol from the tissue and its detn. in the ext. The first step is carried out by an improved Fex method. The tissue studied is finely minced and left standing for several hrs. with twice its vol. of 2% NaOH. The mixt. is now boiled on the water bath 30–60 min. until it is almost completely dissolved. On cooling this is transferred to a 250 cc. separatory funnel, and the beaker rinsed several times with small quantities of H₂O. Finally it is washed with 20 cc. acetone which is also poured into the funnel and its contents are thoroughly shaken. The beaker is now again washed with 100 cc. ether which is transferred to the funnel. After vigorous shaking to ext. the cholesterol the sepn. is allowed to proceed for 15–30 min. The lower layer is carefully drawn into another funnel while the ether is transferred to a larger separatory funnel, to which are also added the ether washings of the first funnel. The funnel is now once more rinsed with 100 cc. of ether which is poured into the funnel, to which the tissue liquid was transferred and the extn. of cholesterol is repeated. The process must be done twice, so that 300 cc. ether altogether is used for the extn. The combined ether exts. are washed with 5–10 cc. alk. H₂O in a separatory funnel and the funnel itself is rinsed with H₂O until a neutral reaction is obtained. After evapg. the ether, the residue is dried on a water bath and finally in an oven at 80°. This is now redissolved in pure ether and filtered through a Kumagawa-Suto asbestos filter. The residue left from the evapd. ether ext. while still warm is treated with about 10 cc acetone and after standing 4 hrs. is again passed through the asbestos filter. The soln. is again evapd. and the residue taken up in CHCl₃ or ether. This is a soln. of pure cholesterol and its esters which is made up to a definite vol. and is used in the next step for detn. This is made by pptg. the cholesterol (1–3 mg.) with a 1% digitonin soln. in 80% alc. After leaving this overnight the mixt. is transferred to a centrifuge tube with 80% acetone, kept 5–10 min. at 40–50° and, after centrifuging, the supernatant liquid is poured through a Szent-Györgyi asbestos filter. After washing twice with the 80% acetone the ppt. is stirred up with pure acetone and completely transferred to the asbestos filter, which is now washed 3 times with 5 cc. ether, then with acetone and several times with water and dried *in vacuo* at 105° to const. wt. The ppt. is then weighed on a microbalance. One mg. cholesterol is detd. with an error not exceeding 3%. To det. also the cholesterol esters the ext. is sapond. by heating this with satd. alc. NaOH for 6 hrs. on a water bath under a reflux condenser, at least 10 times the required amt. of alkali being used. The sapond. soln. is transferred with 100 cc. ether and the total cholesterol extd. by the procedure already described. Since the sapon. entails a loss of 2–3% the digitonin cholesterolide is multiplied by 0.25 (instead of 0.2431) to obtain the total cholesterol.

S. MORGULIS

A microchemical method for studying the chlorides in blood and cerebrospinal fluid. D. S. SCHEFER. State Univ., Rostov o/D. *Zhurnal expl. Biol. Med.* 10, 261–5 (1928).—One-tenth of a cc. of blood is measured with a pipet into a centrifuge tube contg. 3 cc. of a 1:3 diln. HNO₃. To this is now added 1 cc. H₂O₂. The tube is heated in a water bath to coagulate the proteins, and centrifuged. The liquid is poured off, and the residue is again treated with 2 cc. HNO₃. After centrifuging the supernatant liquid is added to the first. To the combined fluids are added 2 cc. 0.01 N AgNO₃; this is well mixed and again centrifuged. The supernatant fluid is poured off and is titrated with 0.01 N NH₄SCN. In analysis of cerebrospinal fluid the H₂O is omitted.

S. MORGULIS

How to make pharmacological experiments with very unstable colloids. L. SABBATANI. Univ. Padua. *Biochim. terap. sper.* 15, 150–5 (1928).—An app. is devised with the help of which very unstable colloids may be injected intravenously within a few sec. It consists of 2 burets contg. the solns. by the interaction of which the colloid is formed. The burets, which are of the same caliber, are connected with each other by a Y-tube whose 3rd arm serves as the mixing chamber. In order to procure thorough mixing a small elec. stirrer is provided. The soln. leaving the Y-tube enters the vein of the animal by a canule. With this app. it is possible to inject definite amts. of the colloid at a definite velocity. Expts. with colloidal Mn phosphate prepd. from MnCl₂ and Na₃PO₄ showed the usefulness of the device.

G. SCHWOCH

The proteolytic activity of the intestinal flora and its influence in regard to the diagnostic evaluation of the tryptic power of the feces. ITALO BETTONI. Ospedale Maggiore, Milan. *Biochim. terap. sper.* 15, 193–231 (1928).—An investigation to decide the question whether the clinical test for trypsin in the feces is influenced by the activity of the intestinal flora. Capri's method based on the liquefaction of gelatin was employed for detg. the proteolytic power of the specimen. In contrast to Alessandri, who had found that HCl present in a concn. of 0.18% at 38° inactivated the trypsin in 15 min., B. observed that in 1% solns. of different com. trypsin and pancreatin prepsns.,

the activity decreased at 38° in 2½ hrs. by not more than 2 tryptic units; in feces exts., no deviation from the original values was seen. When HCl in a concn. of 1.8% was allowed to act on trypsin solns. and feces exts. for 2½ hrs. at 38°, the no. of tryptic units originally present was reduced by 10-20 units. Contrary to Franke and Sabatowski, who found that by filtering feces exts. through Berkefeld filters the proteolytic activity disappeared, B. noticed that by centrifuging the exts. and then filtering them through Berkefeld filters, the activity was reduced, but did not vanish. When Chamberland filters were employed, the activity was not lessened though the filtrate obtained was sterile. The proteolytic ability of the exts. was not reduced after the majority of the bacteria had been removed by prolonged centrifuging. From expts. conducted to compare feces exts. greatly deprived of bacteria by means of prolonged centrifuging with exts. enriched in bacteria by the addn. of large nos. of bacteria that had been isolated from the same feces and grown on agar, B. concludes that within 2½ hrs. at a thermostat temp. of 38°, the presence of intestinal bacteria does not modify the proteolytic power of the feces. This power may reach a considerable degree, if cultures of bacteria are allowed to react on gelatin for at least 10-12 hrs. This activity cannot be dissocd. from the bacteria, because it is coupled with their propagation. In filtrates from these bacteria cultures, a small quantity of enzymes of bacterial origin is present. The proteolytic effect of these enzymes is negligible. G. SCHWACH

A microchemical method for determining urea in blood and other body fluids. V. PIOVANO. *Nat. Med. Pharmacol. Inst. "Serrano." Rass. clin. terap. sci. affini* 27, 458-66(1928).—P. discusses the methods in use for the blood-urea detn. and rejects all of them including Marshall's method, Folin's modification of the latter and the methods based on nesslerization. In the new method developed by him conversion of urea into $(\text{NH}_4)_2\text{CO}_3$ by means of urease takes place in a Van Slyke app. The $(\text{NH}_4)_2\text{CO}_3$ formed is decompd. and the CO_2 liberated is measured volumetrically. One to 2 cc. of the soln. to be examd., which may contain 0.5-2 mg. of urea, is adjusted to p_{H} 7; with blood, no adjustment is necessary. Then are added in succession: 1 cc. of 0.1 N $\text{MeHCOHCO}_2\text{H}$ in order to eliminate the preformed CO_2 ; 1 drop of bromothymol blue soln.; about 11 drops of 0.25 M Na_2PO_4 in order to readjust the p_{H} to 7, and 1 cc. of a special urease soln. After 15-20 mins., 2 or 3 drops of concd. $\text{MeHCOHCO}_2\text{H}$ soln. are added and the liberated CO_2 is detd. with the usual technic. The no. of cc. found are reduced for 0° and 760 mm. and the vol. obtained is multiplied by 2.005, which gives the mg. of urea present in the specimen. The urease soln. is prepd. by extg. 12.5 g. of defatted meal of soy beans with 100 cc. of 50% glycerol soln. and filtering. $(\text{NH}_2)_2\text{C:NH}$ in satd. solns. of a p_{H} ranging between 5 and 9 is not decompd. by urease. G. SCHWACH

Determination of I in org. combination, especially in thyroid gland (SMITH) 7.

C—BACTERIOLOGY

CHARLES B. MORREY

Bacteriophage in agriculture and the fermentation industry. G. RUSCHMANN. *Deut. Essigind.* 32, 434-8, 445-9, 456-9(1929).—A discussion of the subject from the time of its conception by d'Herelle down to the present, notably in its relation to medicine, fermentation and agricultural bacteriology or mycology. W. O. E.

Japanese tea enzyme. E. ARAUNER. Kitzingen a/M. *Deut. Essigind.* 33, 11-2(1929).—The nature of this enzyme (symbiotic combination of *B. xylinum* with *Pombe* yeast) is discussed and explained in connection with directions for prepg. a palatable beverage from infusions of tea. W. O. E.

Microbiological relations in aqueous solutions. KNUD C. BERTHESEN. *Statens Seruminst. Copenhagen. Pharm. Zentralhalle* 70, 37-44(1929).—A study of colony growth among the lower organisms (fungi, bacteria, etc.) in solns. of H_2BO_3 , NaBr, $\text{Na}_2\text{B}_4\text{O}_7$, and H_3PO_4 in connection with a special technic of infection and pure culture. Through numerous examples the extreme difficulties are emphasized which are encountered in attempts to identify individual types in colonial aggregates owing to the complete degeneration in the culture media studied. Culture expts. were carried out in various media, the most suitable being partially liquefied aq. agar with glucose, which

permitted direct microscopic and photomicrographic examn. The causes and effects of the appearance of the various colonies observed are discussed. W. O. E.

Bacterial oxidations by molecular oxygen. I. The aerobic oxidation of glucose and its fermentation products in its relation to the viability of the organism. ROBERT F. COOK and MARJARY STEPHENSON. *Biochem. J.* 22, 1368-86(1928).—*B. coli* oxidizes (using mol. O) glucose and some of its products of fermentation (lactate, pyruvate, acetate and formate). EtOH and AcH are not oxidized. *B. alkaligenes* does not oxidize glucose but oxidizes the products of fermentation. *B. sporogenes* does not oxidize either glucose or the products of fermentation. Oxidations by *B. coli* do not depend on living cells.

BENJAMIN HARROW

The splitting products and the dissemination of the fermentation sarcines (Sarc. ventriculi Goodsir, and Sarc. maxima Lindner). JAN SMIT. *Proc. Acad. Sci. Amsterdam* 31, 421-32(1928).—See *C. A.* 22, 2960.

E. H.

How can the fermentation test of Eykman be improved? A. J. VAN HOYTEMA. *Nederland. Tydschr. Hyg., Microbiol. en Serol.* 3, No. 2, 165-78(1928).—With the Eykman test there are also spore formers and streptococci grown; chiefly the latter spoil the test. On the addn. of secondary phosphate the quantity of gas formed increases with the amt. of phosphate and reaches a max. at about 1%; the max. amt. of gas is considerably greater than the amt. obtained in the normal Eykman liquid used as control, the sensitiveness of a 1% glucose, 1% peptone soln. contg. 0.1-2% K_2HPO_4 is almost as great as the ordinary Eykman soln., as the further dilns. were all negative; the fermentations with the addn. of 0.1 of about 1% phosphate apparently give a clear picture of the quality of the water the next morning, after being put in the night before. Expts. on the velocity of formation of acid and of gas by a fermenting pure culture of fecal coli in liquids contg. 1% glucose and 1% peptone Poulenc to which were added 0, 0.1, 0.5 and 1% secondary phosphate, and in the normal Eykman liquid show further that with 0.07% peptone the streptococci begin to interfere, whereas below 0.03% the lack of N nourishment begins to be felt. In order to improve the Eykman test, it is recommended to use a very small amt. of good peptone.

J. C. JURRJEES

Living bacteria as oxygen indicators. G. KOSTKA. *Mikrokosmos* 22, 6-11, 27-30 (1928).—The detection of the presence of free O_2 in very small amounts by chemical means is difficult and such methods are of little value for biol. work because they are either lacking in sensitivity or have a harmful effect upon the process under investigation. The reaction of living cells can be used for this purpose because of the property of positive or negative chemotaxis, especially the aerotaxis or oxygenotaxis of obligative aerobes and facultative anaerobes. A fresh brown bean (I) (*Phaseolus vulgaris* var nanus) or seed of other papilionaceous or fabaceous plants is placed in a test tube, filled with distd. H_2O , allowed to stand quietly at room temp. (fairly const. temp. to avoid convection currents in the liquid); after a short time the respiratory activity of I causes a rapid absorption of O_2 dissolved in the H_2O ; sol. products (*viz.* sugars and phosphates) begin to diffuse through the H_2O ; the motile bacteria (II) (*B. perlibratus*) which were naturally present on I begin to multiply, producing a turbidity surrounding I. The O_2 consumption of I after 24 hrs. at 20° causes II to move to a more favorable O_2 environment; the test tube now has a clear liquid at the top and immediately surrounding I; II will have formed a very thin layer which appears as a fine, white transverse line about 2-3 cm. from I after 48 hrs. Another method for detecting small amts. or the absence of O_2 depends upon the luminescent property of certain bacteria which can be obtained easily from fresh fish or meat and which luminesce in a concentration of O_2 as low as 0.0007%; the medium for their growth is a slightly alk. fish bouillon with 0.5% glycerol, 0.5% peptone and 3% NaCl; the culture is placed in small tubes with tight, ground stoppers and observations are made in the dark. N. A. LANGE

Schizosaccharomyces hominis non sp., the first fission saccharomyces pathogenic for man. T. BENEDEK. *Centr. Bakt. Parasitenk.*, I Abt., 104, 291-303(1927).—Three infections in the human subject with a peculiar fungus called the fission yeast of Lindner were studied. They can be demonstrated from the lesions by 40% KOH, and appear as oval, refractile, spore-like bodies. They grow on 8% glucose agar, where they are pleomorphic, appearing as oval yeast-like cells, elongated forms in chains, and filaments. They stain best with toluidine blue, methylene blue being too intense and neutral red too faint. They are killed at 90° in 15 mins. They lived for 22 months dried in a tube of agar. In culture they produce a very marked odor of butyric acid. They form no gas but much acid from glycerol, mannitol, glucose, levulose, galactose, sucrose, maltose, lactose, dextrin, inulin, or starch. Neither gas nor acid forms from dulcitol. No glycogen can be demonstrated in the cells at any stage.

JOHN T. MYERS

Atypical strains and variant occurrence in the paratyphoid group. LEONHARDT.

Der Hyg. Bakt. Lab. der Stadt Bochum. *Centr. Bakt. Parasitenk.*, I Abt., 104, 334-8 (1927).—No evidence of change of type of paratyphoid strains was found. The rhamnose reaction, toxicity for mice, and slime formation on walls of tubes were constant findings.

JOHN T. MYERS

The metabolic regulation of bacteria. ERWIN ZIMMERMANN. Univ. Freiburg. *Centr. Bakt. Parasitenk.*, I Abt., 104, 451-6 (1927).—In cultures of *B. coli*, *B. typhi murium*, and *B. suispestifer* in artificial media, the intensity of metabolism depends on the nature of the food. When growing, the organisms can utilize glucose, maltose or lactose, so long as the respective sugar is present in excess, and the rate of metabolism is independent of the concn. The osmotic tension of the sugar makes no difference. The amt. of sugar not used by the organisms was measured by the method of Aflihn. It is not possible to det. whether passive adsorption by the cells, or active storing of sugar introduced errors; or to measure the metabolism of resting cells.

JOHN T. MYERS

The production of modifications through "specific" means as a method of species characterization. E. KLIENEBERGER. Stadt Hyg. Univ.-Inst. Frankfurt a M. *Centr. Bakt. Parasitenk.*, I Abt., 104, 456-9 (1927).—Thirty-six strains of "paracolon" bacilli were isolated from feces and urine, which fermented dextrose but not lactose. Of these, 27 acquired lactose-splitting powers when repeatedly transferred on 1% lactose agar. This procedure will aid in distinguishing organisms from the bacteria which can never split lactose. These modifiable forms form a sep. group and are not degenerated colon bacilli.

JOHN T. MYERS

The antagonism of colon bacilli to anthrax bacilli. M. GUNDEL. Univ. Kiel. *Centr. Bakt. Parasitenk.*, I Abt., 104, 463-73 (1927).—Anthrax bacilli are antagonized by *B. coli* in artificial media both liquid and solid, the anthrax being killed. The antagonism can also be demonstrated *in vitro*. The mechanism is unknown. It may be due to chemical products of *B. coli*.

JOHN T. MYERS

The cultivation of the tubercle bacillus from various body products with the help of prior treatment with acid. H. SEELEMAN AND H. KLINGMÜLLER. Inst. der Preussischen Versuchs- und Forschungsanstalt für Milchwirtschaft in Keil. *Centr. Bakt. Parasitenk.*, I Abt., 104, 482-92 (1927).—Lubenau's egg medium is satisfactory after treatment with 10 to 15% HCl or H₂SO₄. However, animal inoculation gives a higher percentage of positives.

JOHN T. MYERS

A contribution to the cultural differentiation of Pfeiffer's pseudotuberculosis from similar bacteria of avian origin (*Bact. avicidum* and *Bact. gallinarum*). H. HAUPT. Univ. Leipzig. *Centr. Bakt. Parasitenk.*, I Abt., 109, 1-8 (1928). *Bact. pseudotuberculosis rodentium* forms acid from adonitol, which differentiates it from *Bact. avicidum* and *Bact. gallinarum*. Most strains also form acid from salicin. Its ability to ferment arabinose, adonitol, and salicin, and inability to ferment lactose, saccharose, or dulcitol distinguishes a rodent from a turkey or canary strain.

JOHN T. MYERS

The metabolism of paratyphosus B bacilli. O. HARTOCH, P. BENEVOLENSKII AND A. SMORODINTZEV. *Centr. Bakt. Parasitenk.*, I Abt., 110, 9-17 (1929). Some strains of *B. paratyphosus* B lack the power to assimilate NH₄ salts (sulfate, lactate, chloride, oxalate, and molybdate). This is of interest in studying metabolism and in tracing epidemiological relationships. These deficient strains, when grown on meat ext. media, produce some cells capable of utilizing NH₄, suggesting that such strains are adaptations. Attempts to restore this power to defective strains by mouse passage have failed thus far.

JOHN T. MYERS

Carbohydrate splitting by anaerobic bacilli. J. ZEISSLER AND L. RASSFELD. Bact. Untersuchungsamt der Stadt. Altona Elbe. *Centr. Bakt. Parasitenk.*, I Abt., 110, 24-44 (1929).—A detailed report is given of the fermentation changes caused by 200 different strains of 19 species of anaerobic bacilli for the following substances: glycerol, mannitol, dulcitol, isodulcitol, glucose, galactose, levulose, sucrose, lactose, maltose, inulin, and salicin. The reactions are valuable in differential diagnosis.

J. T. M.

The disinfecting powers of certain alkylphenols. I. Butylresorcinol. LEO F. RETTER, GEORGE VALLEY AND WAYNE N. PLASTRIDGE. Yale Univ. *Centr. Bakt. Parasitenk.*, I Abt., 110, 80-92 (1929).—The phenol coeff. of butylresorcinol lies between 19 and 25, depending on the purity of the preps. A 1:2000 soln. in nutrient broth destroyed *B. typhosum*, *B. paratyphosum* A, *B. coli*, *Streptococcus pyogenes*, and *B. aerogenes* (3 strains) within 3 min. exposure. The bacteriostatic limit for all Gram-negative organisms studied (except *V. cholerae*) was 1:2500, for the Gram-positive coccus forms 1:12000, for the Gram-positive rods 1:20000, and for *V. cholerae* 1:30000. Solns. of butylresorcinol adjusted to pH between 3.0 and 9.0 lost very little of their germicidal power on standing 28 days at room temp. On standing 16 months at room temp. the solns. more alk. than pH 7.0 showed more deterioration than those with a pH between 3.0 and

5.0. CaCO_3 did not materially affect the germicidal power on standing 30 days at room temp., but after 16 months deterioration was marked. The germicidal power was retained in the presence of alc. or glycerol for 277 days at 8°, 20° and 37°. It lost about 50% of its action in the presence of soap, but very little further change occurred after the initial drop. It lost practically all of its power in the presence of commercial peptone, gelatin, or 1% blood serum. In the presence of 10% serum there was a drop of 43%, but it retained a high degree of efficiency. It is non-toxic to rats in amts. up to 0.3 g. per day. Oral administration caused a rapid decrease of the aciduric bacteria from the intestine of the white rat. On continued administration an organism resembling *B. aerogenes* became rapidly predominant, and at times almost crowded out all other forms.

JOHN T. MYERS

The study of "resting" or non-proliferating bacteria. J. H. QUASTEL, Cambridge Univ. *J. Hyg.* 28, 139-46(1928).—If a suspension of *B. coli* is shaken with toluene or ether it is no longer capable of reproduction in the ordinary nutrient media and is apparently dead. However, it can give rise to a number of activations as the activation of formic, lactic, or fumaric acids rendering them capable of reacting with methylene blue, at rates not markedly different from those due to untreated organisms. There is no evidence as yet to prove that the reactions of the cell depend on its survival as a living unit. Lactic and α -hydroxybutyric acids behave as though one enzyme was activating both, whereas lactic and succinic acids behave as though there is a distinct enzyme for each. If *B. coli* is treated with toluene, the lactic acid enzyme which is as active as before to lactic acid has no effect on glycolic acid. This is explicable on the "active center theory." Toluene may act in one of 2 ways: a particular grouping may be destroyed, or the surface structure may be modified.

JOHN T. MYERS

The influence of temperature on bactericidal action. A. E. COOPER AND R. B. HAINES. Univ. of Birmingham, England. *J. Hyg.* 28, 163-71(1928).—Germicides may be divided into 3 main groups according to the influence of temp. on them. (1). Those unaffected by a temp. rise, chiefly chem. substances having reducing powers. (2). Those approximately doubled by a rise in temp. from 20° to 37°, phenol and alc. (3). Those increased by 10 to 20 fold by the same temp. rise, oxidizing agents. The effect of temp. on bactericidal action is different for *B. coli* and *B. fluorescens*, causing complex changes in selective action. The temp. coeff. for the process of protein pptn. by phenol is 2.2 per 10° rise in temp., and hence similar in magnitude to the coeff. for disinfection by phenol. This supports the view that the germicidal action of phenol is associated with its denaturing effect on the cell proteins. The temp. coeff. of the reaction between benzoquinone and glycine is the normal one, 2 for 10°, for chem. action, though its germicidal action may increase 20 times from 20° to 37°. The presence of certain inorg. cell constituents accelerates the velocity of reaction between quinone and glycine, but does not increase the temp. coeff. The bactericidal power of picric acid and KMnO_4 is greatly increased by temp. rise, and there would appear to be some other factor common to all these disinfectants associated with their high-temp. coeff.

JOHN T. MYERS

B. proteus infections. JOHN F. TAYLOR St. Thomas' Hosp., London. *J. Path. Bact.* 31, 897-915(1928).—The name *B. proteus* should be restricted to a well-defined group of organisms. They are non-spore-forming Gram-negative, pleomorphic bacilli which produce a spreading or creeping growth on solid media. They are proteolytic and hemolytic. They do not ferment mannitol, lactose, or dulcitol, but ferment dextrose and sucrose and occasionally maltose. True indole may or may not be formed from peptone water. In milk, a transient clot is formed which is very rapidly peptonized. *B. proteus* X 19 of Felix is distinct serologically but otherwise resembles closely the 53 strains studied.

THOMAS G. PHILLIPS

The chemical composition of spruce and fir wood at different seasons. ERNST GÄUMANN. *Flora* 123, 344-85(1928).—The chem. compn. of the wood of *Picea excelsa* and *Abies pectinata* was detd. every month for the period of one year. Specimens 50 to 60 cm. in diam. were selected each time. Sections ha-

tween 4 and 8 meters above the stump were used as the samples. These were sepd into heart wood and sap wood, the latter being carefully freed from bast. The heart wood and sap wood samples were analyzed separately. Numerous tables and graphs are included, showing the monthly variations in water, ash, protein, hexosans, xylans, methylpentosans, lignin, cellulose, fatty substances, resins and wax, water-sol. materials, and humin, expressed as percents of the fresh wt. pH values for the samples, also are given. The above components are discussed separately. The mature wood of these trees does not play the passive roll often ascribed to it but is affected by the general life rhythm of the tree; with the trunks of 120-year-old trees, growing under the climatic conditions of those examd. (Switzerland), the conception of a winter rest is correct only to a very limited degree; the living tree and especially its trunk must be regarded as more of a biological unit than one is often accustomed to think of it.

R. C. BURRELL.

Introduction to botanical microchemistry. I. FRANZ BUXBAUM. *Mikrokosmos* 22, 57-60(1929).—A general article of an elementary nature describing pptn. and color reactions, purity of reagents, appliances for microchem. work and a few of the more common microchem. tests.

L. T. FAIRHALL.

Hydrocyanic acid in Lotus. PAUL GUÉRIN. *Compt. rend.* 187, 1158-60(1928).—Of the 60 species of *Lotus* in France, some are eaten by cattle and because of the reported HCN content, particularly from arid countries, there may be danger from poisoning. *L. conimbricensis* Brot., *L. hispidus* Desf., *L. uliginosus* Schk., *L. villosus*, *L. siliquosus* Roth and *L. tetragonolobus* L. were entirely free from HCN. *L. corniculatus* contained 0.2 mg. per kg. There does not appear to be grave danger from *Lotus* poisoning in France. The work is being continued.

C. R. FELLERS.

Tyrosinase of *Beta vulgaris*. R. WEIDENHAGEN AND F. HEINRICH. *Z. Ver. deut. Zuckerind.* 1928, 499-538.—A modification of the Raper and Wormald method of tyrosinase detn. is used, which requires only one filtration, due to the high salt concn., and gives a water white soln. The values obtained by the modified method are in all cases higher than that of R. and W.'s. It is found that the tyrosine conversion by beet tyrosinase is not a reaction of the first order. The max. activity of tyrosinase was between pH 5 and 7 and for temp. between 20° and 30°. Buffer concn. should not exceed $M/6$ for phosphate solns. The lower the substrate concn. the greater the reaction velocity. Methods of purification are discussed. A complete bibliography is given.

E. A. FLETCHER.

Some preliminary observations on the coloring matter of citrus juices. M. B. MATLACK. *Am. J. Pharm.* 100, 243-6(1928).—The juice of the orange is contained in small juice sacs cellular in structure, contg. chromoplasts as is the case of the fruits with colored pulp. Those with colorless pulp (or almost colorless pulp) contain that which appears like groups of oily droplets or possibly elaidoplasts. The pulp of the common round orange or sweet orange is nearly a pure yellow as is also that of the 3 varieties of kumquat (marumi, magami and micwa). That of the satsuma, tangerine, mandarin (slightly lighter), calamondin, rangpur lime, and Sampson tangelo is deep orange red. The Indian red pummelo has red pulp and the pink grape fruit has pink pulp. The pulp of the following is practically colorless: lime, lemon, bitter orange, grape fruit, Siamese pummelo and citron. The chromoplasts all give the usual carotinoid reactions and bleach readily on exposure to air or more quickly by the use of H_2O_2 . They are colored by carotinoid pigments. On subjecting the Indian red pummelo and the pink grape fruit to the Molisch (*Ber. deut. bot. Ges.* 14, 18-29(1896)) microcryst. method it appears from results of observations that the principal pigment is lycopin. Similarly the king mandarin gave crystals which appeared very much like those usually ascribed to carotin. The satsuma gave spherites and filaments appearing very much like osazone crystals of the sugars. It appears that the pigments of the orange and the tangerine are carotin and xanthophyll. The ratio of the 2 pigments to each other detn. the color which the pulp presents. This is probably also true of other members of the *Citrus* genus which have like colored pulp.

W. G. GAESSLER.

Dynamics of the waxy gene in maize. II. The nature of waxy starch. R. A. BRINK. *Univ. Wisconsin. Biochem. J.* 22, 1349-61(1928).—The waxy (A) and non-waxy maize starches contain nearly equal proportions of α - and β -amylase. With malt amylase, (A) produce maltose. Malt amylase hydrolyzes common maize starch more quickly than (A). During the conversion to maltose with malt amylase, (A) forms intermediate products of a lower sp. rotatory power than does common maize starch. The latter, when highly purified, contains more than 12 times as much org. P as does (A) prepd. in the same way.

The clover tree (*Goodia lotifolia*) found to be poisonous. ANON. *Agr. Gaz.*

N. S. Wales 39, 885(1928).—The fresh plants contain 0.23% HCN. Loss of HCN occurs when the plants are dried. K. D. JACOB

An experimental examination of the evidence for the presence of phosphatides in the limiting surface of the living protoplast. F. C. STEWARD. Univ. of Leeds. *Brit. J. Exptl. Biol.* 6, 32-41(1928); cf. *C. A.* 22, 2185.—The evidence that phosphatides are present in the surface of the protoplast and can thence diffuse from the living tissue into distd. water is reviewed. Earlier expts. were repeated by leaching slices of seed potatoes in distd. water. These expts. were treated with basic $(\text{AcO})_2\text{Pb}$. No Et_2O -sol. unsapon. matter was present in the ppt. Leaching expts. in which the exts. were kept sterile developed no turbidity. Red beet roots and sugar beets were extd. under sterile conditions. The ppts. obtained with $(\text{AcO})_2\text{Pb}$ were freed from Pb and hydrolyzed but yielded no choline, glycerophosphoric acid or glycerol. Betaine was obtained in appreciable amts. from the filtrate. S. concludes that "phosphatides do not diffuse out into distd. water from healthy parenchymatous tissues." C. M. MCKAY

Ecology of germinating beets with respect to disease. V. STEHLIK AND F. NEUWIRTH. *Listy Cukrovar.* 47, 139-45(1928); cf. *C. A.* 23, 539.—*Phoma betae* infects from 97 to 100% of all beets seeds, but neither *Phoma betae* nor the remaining fungi are considered as the primary cause of disease (blight). Seeds soaked in a H_2SO_4 soln. do not resist the disease any better than seeds which were not treated at all or with distd. H_2O only. Sulfuric acid treatment is recommended for special cases only. Microorganisms are not considered the primary cause of disease in young beets for: (1) the organisms alone are not able to harm healthy beets, and (2) the same disease can be incurred by making unfavorable vegetative conditions in sterile media. The microorganisms are considered as facultative parasites whose virulence varies with internal plant changes which affects their sociology. The organisms attack weak beets, their virulence is increased by a saprophytic evolution, or a removal of one type of organism allows others to multiply more rapidly. The saprophyte or facultative organism may attack a beet in the infected state. *Phoma betae* attacks only the pathological cells; it produces a toxin which enters the cell by osmosis and reduces the resistance, and then enters the cell through extending fibers. The CO_2 content of soil is another important item, especially in poorly ventilated soils. FRANK MARESH

The growth of tobacco and brown root rot of tobacco as affected by timothy infusions of different ages. WM. L. DORAN. Mass. Agr. Expt. Sta. *J. Agr. Research* 36, 281-7(1928).—Evidence is presented in support of the hypothesis that brown root rot is the expression of injurious effects produced by chem. substances formed during the decompn. of org. matter, particularly the residues of slowly decomposing crops such as timothy. A. L. MEHRING

Mean summer or "optimum" temperatures in relation to chemical composition in the apple. JOSEPH S. CALDWELL. Bureau of Plant Industry, Washington, D. C. *J. Agr. Research* 36, 367-89(1928).—Ninety-eight varieties of apples belonging to 16 groups having supposed temp. optima of 52-67° F., grown under controlled conditions at the Arlington Expt. Farm near Wash., D. C., were studied over a period of 6 years. The contents of reducing sugar, sucrose, malic acid, tannin, non-tannin astringents and total solids were detd. in fruit produced during from two to six seasons for nearly all of these varieties. The compn. of the fruit was studied in connection with the climatic conditions of the years concerned. Mean summer temp. as a separate factor was found to have little influence in detg. the compn. The chem. characters of the crops of the low-temp. groups in the warmest and coldest years were exactly the opposite of expectation based on the assumption that temp. is the dominant factor in detg. compn. Years of closely identical mean summer temps. show considerable differences in the chem. character of the fruit. The compn. of the fruit of all varieties shows considerable variations from year to year. The direction and extent of these variations are detd. by the photosynthetic activity during the season. Climatic conditions favoring the attainment of high quality as measured by total sugar, sucrose, acid and astringency content in one group favor the same in all groups regardless of their supposed temp. adaptations and *vice versa*. All of the varieties showed a high degree of uniformity in their behavior. The compn. of the fruit showed no indications that any of the varieties were out of adjustment with the environment. A. L. MEHRING

Phosphorus distribution in grains. J. E. WEBSTER. Okla. Agr. Expt. Sta. *J. Agr. Research* 37, 123-5(1928).—Wheat, barley, yellow corn and oats contain H_2O , 8.68, 8.08, 8.48 and 8.23; fat, 2.33, 2.39, 5.25 and 4.94; ash, 1.77, 2.96, 1.50 and 3.99; total P, 0.43, 0.39, 0.35 and 0.35; phytin P, 0.30, 0.18, 0.29 and 0.19; lipid P, 0.028, 0.022, 0.035 and 0.029; and inorg. P, 0.021, 0.022, 0.012 and 0.015%, resp. Similar analyses are given for mung bean, soy bean, cowpea, kafir, white corn, darso and rye. No

relation was found between the total P and that of any of the P fractions, the phospholipin and fat contents nor the inorg. P and ash. In most cases the phytin P constituted more than half of the total P.

A. L. MEHRING

The influence of oxygen and carbon dioxide on the growth of *Ophiobolus graminis* in pure culture. HURLEY FELLOWS. Bureau of Plant Industry, Wash., D. C. *J. Agr. Research* 37, 349-55(1928).—The fungus causing take-all of wheat was grown on liquid and solid potato-dextrose media. In the liquid medium, growth diminished as the O concn. decreased. On the solid medium marked diminution occurred only when the O content was below 6%. A very small percentage of O greatly reduced growth but the organism grew in all concns. tried. It grew well in all concns. of CO₂ used but at 18% CO₂ some diminution occurred. The variations of CO₂ and O in arable soils are not great enough materially to affect this fungus.

A. L. MEHRING

The chemical composition of some species of pollen with special reference to constituents valuable as nutrients for bees. E. ELSER. *Tech. Ind. Schweizer Chem. Ztg.* 1928, 181-5, 197-200.—E. reviews the literature on the chemistry of pollen and gives the results of his own analyses made by microchem. methods. The pollen from Canterbury bell and spruce fir was analyzed and also various samples obtained from the baskets of bees. Pollen is relatively high in protein and fat. In attempting to find a substitute for pollen as a food for bees, it is necessary to consider physiol. factors as well as the chem. compn.

LAWRENCE P. MILLER

The electromotive forces in plants in potassium chloride solutions of different concentrations. KURT STERN and ERWIN BUNNING. Univ. Frankfurt a. M. *Biochem. Z.* 203, 400-8(1928).—In symmetrical cond. expts. the stimulated side of leaves is always galvanometrically negative whether the soln. is more or less concd. (0.1 N 0.01 N KCl) than the cell juice. Under conditions of asymmetry the stimulated region frequently tends to become galvanometrically positive, which, however, is only apparent, both leads being neg., with the one furthest away from the stimulated spot being more so than the other.

S. MORGULIS

Internal versus external toxicity in *Valonia*. A. G. JACQUES and W. J. V. OSTERHOUT. Rockefeller Inst. *J. Gen. Physiol.* 12, 209-19(1928).—Cells of *Valonia macrophysa*, which have been injected with MnCl₂ dissolved in cell sap, live only half as long as cells in which the same concn. of MnCl₂ is applied to the exterior. This is due to toxic action and not to injury accompanying injection of the cells. The simplest explanation of the results is that the inner cell layer is more sensitive than the outer, and as soon as the inner layer is sufficiently altered to become permeable to MnCl₂, the compd. diffuses out and attacks the outer layer. Another assumption is that the outer layer is permeable to MnCl₂ whereas the inner layer is not, and that the permeable layer is not injured by it. When the compd. is injected the inner layer is attacked at once.

C. H. RICHARDSON

The injection of sulfates into *Valonia*. L. R. BLINKS. Rockefeller Inst. *J. Gen. Physiol.* 12, 207-8(1928).—KCl and K₂SO₄ solns. were injected into the vacuole, *Valonia macrophysa*. The surviving cells tolerate the presence of these solns. SO₄ is not rapidly eliminated after introduction into the cell. The SO₄ occasionally found in apparently normal cells may have entered after temporary injury.

J. J. S.

The nitrogen content of growing cultures of *Mycoderma* and of *Saccharomyces cerevisiae*. LEO. M. CHRISTENSEN. Iowa State College. *Plant Physiology* 3, 61-9(1928).—The N content of cultures of *Mycoderma* and of *Saccharomyces cerevisiae* in molasses at various values of p_H was followed by 2 methods of analysis, the regular Kjeldahl and a modified Kjeldahl previously described (C. A. 23, 407). The modified method magnifies both the losses and gains in N. The max. losses and max. gains are not in all cases at the same p_H by both methods. Following the max. gain there is a loss in N. The N content of the cultures is dependent, therefore, upon p_H , time and method of analysis. The results indicate that neither method gives all the N at any given p_H or time interval. Conclusion: Results on N fixation are more likely to err on the neg. than on the pos., that is, there probably is more fixation than any available method indicates.

WALTER THOMAS

Germinative energy of lots of coniferous-tree seed, as related to incubation temperature and to duration of incubation. FERDINAND W. HASSIS. Johns Hopkins Univ. *Plant Physiology* 3, 365-412(1928).—The results of a comprehensive study on the germinative energy of pitch pine (*Pinus rigida* Mill.) and other coniferous seeds are presented. Seed lots may be classified in groups or categories, according to the different proportions of its individuals that are capable of germination under the influence of different

sets of temp. and duration conditions. For example, one lot of pitch pine seeds examd. may be considered as consisting of at least 3 different physiol. forms or types: (A) seeds capable of germination in 14 days or less at a temp. about 25° but not at a temp. about 43°, (A') seeds capable of germination at both these maintained temps. within 14 days or less, and (B) the rest of the lot not capable of germination in 14 days at any temp. These 3 categories appear to represent, resp., 65, 25 and 10% of this particular lot of seeds. Seeds of category (A) were permanently injured when incubated for a day or two at about 43° and failed to germinate subsequently when transferred to a temp. of about 25°. Seeds of category (A') germinated very quickly at about 43° but produced unhealthy seedlings, which grew but slowly even after being transferred to a temp. about 25°. The high temp. optimum is thus seen to favor quick germination of seeds of category (A') but apparently at the expense of subsequent vitality in the seedlings produced.

WALTER THOMAS

Osmotic pressure, osmotic value, and suction tension. WILLIAM A. BECK. Univ. of Dayton, Ohio. *Plant Physiology* 3, 413-40(1928).—Widely divergent views exist regarding the nature of osmotic pressure. *Osmotic pressure* is defined as the difference of pressure on soln. and solvent which produces a condition of equil., such that there is no tendency of the solvent to flow in either direction. The *osmotic value* of a given cell sap is the molal concn. of an agent which is in dynamic equil. with the cell sap. The osmotic value at incipient plasmolysis is symbolized by O_p , at normal by O_n , and at satn. by O_s . It is convenient to append the formula for the agent employed, e. g., $O_p(C_{12}H_{22}O_{11})$. For each osmotic value there is an equiv. *suction tension* of the cell sap. The *osmotic coeff.* of a salt is the ratio of the osmotic value of the cell sap, in terms of cane sugar, to the osmotic value of the same, in terms of the given salt. Thus, $i = \frac{O_p(C_{12}H_{22}O_{11})}{O_p(KNO_3)}$. The osmotic value of a cell may change under the influence of external factors. The osmotic value of neighboring cells need not be the same, even though they belong to the same tissue. The av. value for a given tissue is characteristic for that tissue. No regular gradient of O_p could be established in the direction of the streaming of the water in the plant. The *suction tension* (which is preferable to the term "suction force") represents the positive or negative pressure which causes the influx of water into the cell. The use of the term does not imply that the hydrostatic theory is adhered to. Its numerical value is given by the expression $S_s = S_c - W$, where S_c is the suction force of the contents of the cell and W the wall pressure. The suction tension of plants depends on the habitat.

WALTER THOMAS

Plant nutrition studies in relation to the triangular system of water cultures. HARRY F. CLEMENTS. Mich. State Coll. *Plant Physiology* 3, 441-58(1928); cf. C. A. 22, 1422. Scotch Beauty field peas were grown in the triangular system of water cultures as used by Shive (C. A. 9, 2396) and having an osmotic pressure of 1 atm. In two of the series of expts., the peas were grown under a long light exposure and in a third series under normal conditions of light. *Conclusion.*—Such criteria as length of plants, green and dry wts., highest ash content, highest nitrate content, and also their content of sol. carbohydrates, do not provide an adequate idea of the best balance of salts for the growth of plants. High nitrogen and high carbohydrate plants were found in areas at opposite sides of the triangle; but the best plants were found in the intervening area of the triangle. Shorter exposure to light changes the position occupied by the best cultures.

WALTER THOMAS

Anatomical material for the study of growth differentiation in higher plants. RAY BOUILLENNE. Univ. of Liege, Belgium. *Plant Physiology* 3, 459-71(1928).—B.'s studies on the "stilt" roots of the palm, *Iriarte exorrhiza* Mart., establish between 2 vegetative organs (roots and stems) anatomical correlations which appear to be due in part to the ontogenetic evolution of the plant. When both these organs are formed at the same time from connected meristems, the parallel variations of structure may be explained by the modifications of the physiol. conditions which surround the meristem in the course of development.

PHILIP B. HAWK

The tissue glutathione in experimental beriberi. PIETRO DI MATTEI. Univ. Rome. *Biochim. terap. sper.* 15, 366-75(1928).—The glutathione content of various organs of pigeons in different stages of beriberi was examd. The pigeons were kept on a diet of 25 g. polished rice and 0.90-1.30 g. shelled sunflower seeds per day, on which diet, as had been established in previous expts., they do not lose wt. and do not show any other symptoms than paresis and paralysis. The glutathione detns., carried out in the liver, heart, blood, kidneys, and the pectoral and limb muscles, were made according to Tunncliffe's method (cf. *C. A.* 19, 2217). It was found that the av. glutathione content of 8 pigeons killed in the state of paresis and 8 pigeons killed in the state of paralysis did not differ materially from that of 8 normal animals. I believes that the opposite results obtained by Randoin and Fabre (*C. A.* 21, 3657) are due to the fact that their pigeons were kept on a diet that led to undernutrition. G. SCHWACH

Fats of high vitamin content (Brit. pat. 293,777) 27. Vitamin-containing foods (Brit. pat. 293,735) 12. Treating oils, fats or emulsions with ultra-violet rays to produce vitamins or enzymes (Brit. pat. 293,255) 12.

F—PHYSIOLOGY

E. K. MARSHALL, JR.

Calcium content of bone cartilage. A. POLICARD. *Compt. rend.* 186, 1380-2 (1928).—Descriptions are given of the ash obtained by micro-incineration of the various layers of cartilage during the ossification of certain regions of the tibia. The probable sequence of the modifications which take place is discussed. B. C. A.

Calcium, inorganic phosphorus, and alkaline reserve of the blood of horses which have undergone various endurance tests. N. A. FEDOROV. *J. med.-biol.* 4, 84-92 (1928).—The blood-Ca of horses during fatigue (after trotting, galloping, or doing hard work) is subnormal but independent of the alk. reserve. The variations in Ca and P show an inverse relationship. B. C. A.

The heme compounds in nature and biological oxidations. M. L. ANSON AND A. E. MIRSKY. *Science* 68, 647-8(1928); cf. *C. A.* 23, 1428.—Heme is the Fe pyrrole complex which is joined to the protein, globin, in hemoglobin and may be prepd from its cryst. chloride, hemin. Heme is present not only here and there as a constituent of hemoglobin, but in the O-consuming tissues of animals and plants generally, and the heme compds. in nature are intimately concerned with the catalysts of biol. oxidations. Hemoglobin is to be regarded as a specialized and occasional deriv. of the universal heme. The equil.: hemochromogen \rightleftharpoons heme + nitrogenous substance, always occurs. If there is added to a hemochromogen contg. the unknown nitrogenous substance X, the known nitrogenous substance pyridine which has great affinity for heme, there results: X hemochromogen + pyridine \rightleftharpoons pyridine hemochromogen + X. By the addn. of enough pyridine, X is displaced and the reaction is driven to the right. Yeast contains heme. The study of the catalysis of biol. oxidations is now approached from the standpoint of the Fe-pyrrole complexes. Heme pigments have well defined spectra and their compds. with CO are sensitive to light. Hemoglobin is a specialized deriv. of the universal heme. C. R. FELLERS

Seasonal variations in the iodine and thyroxine content of the thyroid gland. EDWARD C. KENDALL AND D. G. SIMONSEN. Mayo Foundation, Rochester. *Minn. J. Biol. Chem.* 80, 357-77(1928).—Thyroid material, after alk. hydrolysis, may be sepd into acid-sol. and acid-insol. fractions. Of the I present in the latter fraction only 20 to 30% exists as thyroxine. There are many I compds. other than thyroxine, present in the thyroid, but no inorg. iodides except in goiters removed after administration of iodides. There is a 300% seasonal variation in the total I content of the thyroid. Of the I present in fresh hog thyroid, only 0.0 to 14% exists as thyroxine. Desiccated thyroid or iodothylin may contain no thyroxine. It is suggested that thyroxine must be converted to another form before it can exert its physiological activity. A. G.

Distribution of unsaturated fatty acids in tissues. III. Vital organs of beef. W. R. BLOOR. Univ. of Rochester. *J. Biol. Chem.* 80, 443-54(1928); cf. *C. A.* 21, 2021.—The lipide content of the organs of cattle varied greatly both for the same and for different organs. The phospholipide varied least, ranging within 30% of the av. value. The wts. of lecithin and cephalin in various samples of all tissues indicated an equimol. equil., or combination between these 2 substances. Their av. I nos. were also similar. The I nos. of the phospholipides of various organs were likewise very

similar. The mixt. of fatty acids obtained on saponification of the various fractions consisted of $1/2$ liquid, $1/4$ solid acids and $1/4$ unaccounted for. The unsatd. acids contained large amts. of a 4-bond acid but little 3-bond acid. The quantity of the 4-bond acid was greatest in brain tissue.

ARTHUR GROLLMAN

The highly unsaturated fatty acid of liver lipides. The preparation of arachidonic acid. J. B. BROWN. *J. Biol. Chem.* 80, 455-60(1928).—Arachidonic acid was the only highly unsaturated fatty acid present in appreciable quantities in the lipides of pig liver. It occurred to the extent of 2.0 to 7.7% of the total fatty acids, depending on the mode of calcn. Methyl octabromoarachidate, methyl arachidonate and arachidonic acid were prepd. and their properties described.

ARTHUR GROLLMAN

Blood urobilin. The urobilin content of normal human blood. Description of a method. M. A. BLANKENHORN. Western Reserve Univ. and Lakeside Hosp., Cleveland. *J. Biol. Chem.* 80, 477-85(1928).—By examn. in a dark room with an intense beam of light urobilin could be detected in all specimens of human blood examd. For detn. the fluorescence is matched against a soln. of neutral acriflavine of known concn.

ARTHUR GROLLMAN

Quantitative studies of β -oxidation. II. The metabolism of phenylvaleric acid, phenyl- α,β -pentic acid, phenyl- β,γ -pentic acid, mandelic acid, phenyl- β -hydroxypropionic acid and acetophenone in dogs. ARMAND J. QUICK. Cornell Univ. Med. College, N. Y. *J. Biol. Chem.* 80, 515-26(1928); cf. *C. A.* 22, 2970.—Phenylvaleric, phenyl- α,β -pentic and phenyl- β,γ -pentic acids when fed to dogs yield only BzOH conjugated with glucuronic acid and glycine in the ratio of 2:1. Mandelic acid is neither oxidized nor conjugated by the dog, but is excreted unchanged. Phenyl- β -hydroxypropionic acid is excreted largely unchanged but about 25% is oxidized to BzOH which is conjugated with glucuronic acid and glycine in the ratio of 1:1. Acetophenone, administered by mouth, is partially reduced to phenylmethylcarbinol which appears conjugated with glucuronic acid and partially oxidized to BzOH which is excreted as hippuric acid. **III.** The fate of phenylbutyric acid in depancreatized dogs. J. E. SWEET AND ARMAND J. QUICK. *Ibid* 527-34.—The depancreatized dog can oxidize $\text{PHCH}_2\text{CH}_2\text{CH}_2\text{COOH}$ to PHCH_2COOH and can conjugate the latter with glycine and glucuronic acid. This finding suggests the possibility that the diabetic organism can still oxidize a small amt. of $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOH}$. It is suggested, therefore, that this acid is combined with a carbohydrate group which prevents this oxidation. **IV.** The metabolism of conjugated glucuronic acids. ARMAND J. QUICK. *Ibid* 535-51.—Glucuronic acid does not alleviate insulin convulsions in mice. Menthol or mentholglucuronic acid, fed to dogs, is oxidized in great amt. Borneol and borneolglucuronic acid are similarly destroyed but to a less extent. Glucuronic acid monobenzoate, ingested by man, is excreted as hippuric acid in the urine. Ingested by dogs, it is partly excreted unchanged and partly oxidized. These results indicate that in the dog all the BzOH is first conjugated with glucuronic acid and that hippuric acid is secondarily formed.

ARTHUR GROLLMAN

Clinical calorimetry. XLIII. A comparison of the thresholds of ketosis in diabetes, epilepsy, and obesity. WALTER S. MCCLELLAN, HENRY J. SPENCER, EMIL A. FALK AND EUGENE F. DU BOIS. *J. Biol. Chem.* 80, 639-52(1928).—The threshold of ketosis was detd. on 6 men, 3 of whom received exclusive meat diets and the others very little carbohydrate. This threshold when calcd. for periods was found at the FA:G ratio of approx. 1.5 except for the obese subject for whom it was 2.4. This difference in the case of the obese subject is attributed to a greater efficiency in the utilization of fat. **XLIV.** Changes in the rate of excretion of acetone bodies during the twenty-four hours. WALTER S. MCCLELLAN AND VINCENT TOSCANI. *Ibid* 653-8.—Observations on the rate of excretion of acetone bodies were made on 3 men on an exclusive meat diet. The highest excretion occurred during the late afternoon and night while the lowest rate was in the forenoon.

ARTHUR GROLLMAN

The nature of blood sugar. OTTO FOLIN. Harvard Univ. *J. Biol. Chem.* 81, 377-9(1929); cf. *C. A.* 22, 2762.—A criticism of the methods and conclusions of Somogyi and Kramer (*C. A.* 23, 872).

The hydrogen-ion concentration of the blood of the mother and child during birth. HEINZ SIEDENTOPF AND WALTHER EISSNER. Universität-Frauenklinik, Leipzig. *Deut. med. Wochschr.* 54, 2145-7(1928).—At the time of birth, the p_H of the maternal blood is normal while that of the fetus is slightly acid, owing to the presence of org. acids other than CO_2 .

ARTHUR GROLLMAN

Studies of urea excretion. II. The relationship between urine volume and the rate of urea excretion by normal adults. EGGERT MÖLLER, J. F. MCINTOSH AND D. VAN SLYKE. *J. Clin. Investigation* 6, 427-65(1928).—**III.** The influence of

body size on urea output. J. F. McINTOSH, E. MÖLLER AND D. D. VAN SLYKE. *Ibid* 467-83.

Note on volatile sulfide from muscle. WM. ALEX. OSBORNE. Univ. Melbourne. *Biochem. J.* 22, 1312(1928).—If the muscle from a well-fed guinea pig was boiled immediately after killing, no volatile sulfide could be detected. When some hours elapsed between killing and removal of muscles, sulfide was detected. If the guinea pig was first starved for 48 hours and then the muscle immediately removed after killing, sulfide was detected.

ARTHUR GROLLMAN
BENJAMIN HARROW

Studies on colostrum. A. L. PROVAN. Univ. Coll., Aberystwyth. *Welsh J. Agr.* 4, 141-7(1928).—The av. compn. of colostrum from the second and third milkings, 12 and 24 hrs. after calving, of shorthorn cows as compared with the av. compn. of 185 samples of normal milk from cows of the same herd was as follows: total solids, 20.65, 16.68, and 12.63; fat, 3.31, 3.50, and 3.69; solids-not-fat, 18.26, 13.18, and 8.94; protein, 13.05, 8.15, and 3.41; ash, 0.937, 0.817, and 0.708; CaO, 0.2011, 0.1864, and 0.1646; P₂O₅, 0.3390, 0.3269, and 0.2324; K₂O, 0.1902, 0.2005, and 0.1952; and Cl, 0.1323, 0.1135, and 0.0962%, resp. The individual samples of colostrum from both the second and third milkings varied widely in compn., the greatest variations being in total solids, fat, solids-not-fat and protein. In general, the compn. of colostrum varied more than that of individual samples of normal milk from cows in the same herd. Analyses of colostrum at different periods after calving showed that there was a rapid diminution in the protein and chloride content while the percentages of CaO and P₂O₅ decreased more slowly. The large excesses of protein and chloride in colostrum from the first milkings are probably due to abnormalities in the milk gland and have no great significance in so far as the growth of the calf is concerned. The surplus of CaO and P₂O₅ on the other hand is probably connected with the needs of the growing calf and does not disappear as rapidly as does the surplus of the protein and chloride. The fat content of colostrum decreased with increase in age of the cow. The percentages of protein and of solids-not-fat were high after the first calf, decreased to a low level after the second and third calves, and increased to const. values for later calves. The percentages of ash and P₂O₅ reached a max. after the fourth and fifth calf. The CaO content increased with successive calves, while the chloride remained almost const. The colostrum of the Jersey cow contained more CaO, P₂O₅, and solids-not-fat than that of other breeds. The colostrum of Welsh Black cows was lower in protein and solids-not-fat than that of other breeds.

K. D. JACOB

Experiments on "acetone bodies." J. WEGIERKO. *Med. Doswiadczenia i Spoeczna* 8, 1-40 (Polish), 41-2 (French)(1928).—The hepatic glycogen has no influence on the accumulation of "acetone bodies." The resorption of albuminoid food by the depancreatized dogs was satisfactory and amounted to 29-74%; the resorption of fats, however, varied greatly (between 8 and 61%). No acetonuria was found in 9 dogs who had glucosuria and succumbed in 2-3 days. In one dog the quantity of acetone bodies in the urine increased on administration of fatty and amino acids. Dogs submitted to fasting and phlorhizinized had more marked acetonuria before than after pancreatectomy.

JAROSLAV. KUČERA

Influence of fatigue in the mountains and in the plain on the exchange of water in the organism. JERZY KAULBERSZ. *Med. Doswiadczenia i Spoeczna* 8, 315-34 (Polish), 335-6 (French)(1928).—The fatigue was brought about by marches and runs up and down stairs in high mountains (2865 m.) and in the plain. After the runs for some hrs. in the mountains the blood was always found diluted. The quantity of hemoglobin, red corpuscles, solid matter, proteins in serum and the density of blood were diminished. The relation solid matter/density remained unchanged in the whole blood and diminished in the serum. After one hr. of phys. strain the blood was found more concd. The quantity of hemoglobin, red corpuscles, proteins and the relation solid matter/density was higher. The loss of wt. was 1 kg. The quantity of fibrinogen was under normal and the secretion of urine diminished; its density increased. After 1-2 hrs. the concn. of blood again diminished and was diluted (secondary diln.). However, the quantity of proteins of the serum was found to be higher. It is assumed that this is due to the passage of proteins from the tissue into the blood. The considerations of Barbour that the primary and secondary diln. of blood during phys. march is a regulating function of the heat of the organism are confirmed.

JAROSLAV. KUČERA

Animal calorimetry. XXXVIII. The specific dynamic action of meat in hypophysectomized dogs. OLIVER H. GAEBLER. Cornell Univ. Med. College, N. Y. *J. Biol. Chem.* 81, 41-7(1929).—No marked change in specific dynamic action of protein was observed in a dog after the removal of the pituitary gland. The basal respiratory quotients did not indicate any change in oxidation of carbohydrate. The height

of specific dynamic action at a variable time after protein ingestion bore no quant. relationship to the concn. of the amino acids circulating in the blood. A. P. LOTHROP

Interfacial adsorption as a factor in the clotting of blood plasma. J. M. JOHLIN. Marine Biol. Lab., Woods Hole and Vanderbilt Univ. Med. School. *J. Biol. Chem.* 81, 99-113(1929).—"Clotting expts. which were carried out with the plasma of dog-fish and sand sharks showed that clotting can be induced by the contact of the plasma with substances which produce an adsorbing interface between the plasma and these substances. Such induced clotting was found to take place where the interface had been formed between plasma on the one hand, and air, Et_2O , CHCl_3 , BaSO_4 , kaolin, powd. soft glass, and powd. Pyrex glass on the other. No appreciable adsorption was found to take place at the interface between plasma and paraffin oil, and in these instances clotting could not be induced by the emulsification of plasma with paraffin oil. Following the emulsification of ether with plasma, the ether was found to contain a substance which retarded the clotting of plasma by cephalin. The different types of interfaces are not equally effective as adsorbing surfaces nor does the plasma of different individuals of the same species behave in a like manner. The action described in these expts. appears to be primarily that of the interfacial adsorption of a substance of the nature of an antiprothrombin, the removal of which leaves free in the plasma a substance which induces clotting. This point of view appears in harmony with Howell's explanation of blood clotting."

A. P. LOTHROP

Is there a relationship between the spleen and calcium metabolism? FRANK P. UNDERHILL AND ERWIN G. GROSS. Yale Univ. *J. Biol. Chem.* 81, 163-5(1929). -- An attempt was made to repeat the expts. of Hall and Ablahadian (*Cal. and Western Med.* 23, 289(1925)) upon the effect of splenectomy on Ca metabolism. Their results were not confirmed, due possibly to the fact that the expts. may not have been duplicated since the details of the work of Hall and Ablahadian are only incompletely described. Under the exptl. conditions employed removal of the spleen did not influence the level of serum Ca in rabbits and the serum Ca was not notably affected by intravenous injections of spleen nucleoprotein.

A. P. LOTHROP

The constancy of sugar in the sweat of a normal individual. G. A. TALBERT AND S. H. SILVERS. Proc. Am. Physiol. Soc., *Am. J. Physiol.* 81, 509(1927).—Sweat contained from 5.6 to 40 mg. sugar per 100 cc. In 20 cases there was a fall in blood sugar during sweating, in 6 an increase and in one no change.

J. F. LYMAN

The distribution of phosphorus compounds in the blood of certain mammals. HERBERT D. KAY. London Hospital. *J. Physiol.* 65, 374-80(1928).—The acid-sol. ester phosphate per 100 cc. corpuscles (phosphorus index) varies widely from one species to another; but is remarkably constant in health among individuals of a species. The values in mg. of P are: pig 97, rabbit 86, rat 73, guinea pig 63, man 53, dog 51, horse 49, cat 22, sheep 13.5, ox 10.5 and goat 10.3.

J. F. LYMAN

The identical source of work and heat in muscular contraction. W. HARTREE. Cambridge. *J. Physiol.* 65, 385-8(1928).—In the frog sartorius muscle (1) contracting isometrically and (2) doing work, the recovery heat was the same fraction of the initial energy in both cases. Conclusion: Both heat and work probably come from the same reaction, viz., the formation of lactate from its precursor.

J. F. LYMAN

The concentration and diffusion of inorganic phosphate in the living muscle. G. STELLA. Univ. College, London. *J. Physiol.* 66, 19-31(1928).—When frog's legs were placed in Ringer's solns. to which varying amts. of phosphate had been added inorganic phosphate diffused freely into or out of the muscle until equil. was established according to the ordinary diffusion laws. There was no evidence of a change in the permeability of the muscle fibers to phosphate. The inorganic phosphate concn. in resting muscle was in equil. with 8 or 9 mg. per 100 cc. of phosphate in the lymph, or in the Ringer soln. with which the muscle was in contact. In the fatigued muscle equil. occurred at 18 mg. per 100 cc., and in rigor muscle at 130 mg. per 100 cc. Because of possible membrane equil., adsorption or reversible combination part of the inorganic phosphate inside the muscle fibers may be incapable of diffusion.

J. F. LYMAN

The effects of breathing carbon dioxide and oxygen mixtures upon the carbon dioxide and oxygen tensions in the tissues. J. ARGVLL CAMPBELL. Proc. Physiol. Soc., *J. Physiol.* 66, i-ii(1928).—When O_2 contg. CO_2 was rebreathed by rabbits the presence of the CO_2 in no way prevented the entry of O_2 into the tissues. J. F. L.

Pituitrin and the chloride concentrating power of the kidneys. J. B. S. HALDANE. Proc. Physiol. Soc., *J. Physiol.* 66, x(1928).—Pituitrin in amts. sufficient to inhibit diuresis due to drinking water had no effect on the vol. of urine secreted after drinking 200 to 400 cc. of an 8 to 10% NaCl soln. Also the Cl content of the urine secreted after pitui-

trin injection and salt ingestion was not significantly different from that secreted after salt but without pituitrin.

J. F. LYMAN

Analysis of the acid-base equilibrium in urine. FRITZ MAINZER AND ANNA JOFFE. Städt. Krankenhaus Altona, Elbe. *Biochem. Z.* 203, 50-87(1928).—Expts. are reported which show that it is not justified to connect an increased NH_3 and acid excretion with the presence of an acidosis. The increased NH_3 and acid excretion in the urine is more a sign of the organism's tendency to save alkali observed under different conditions. The alkali-sparing tendency, measured by the quotient: $100 (\text{NH}_3 + \text{titratable acid bicarbonate}) / \text{total N}$ is considered the only true expression of the factual metabolic direction, is opposed to the alkali-sparing effect measured by the quotient $100(\text{NH}_3 + \text{titratable acid bicarbonate}) / \text{total base}$, all values being given in milliequivalents. The theoretical significance of the quotient of the sparing effect is discussed. The quotient permits a quant. comparison of urines of the same titrational acidity but of different p_{H} . In expts. with NH_4Cl and NaHCO_3 administration the practical value of the application of this quotient in the analysis of the acid-base balance is indicated. The bicarbonate in the urine received especial consideration as a factor in the acid-sparing and even in urines more acid than blood this sparing action already appears. The simultaneous variation in the elimination of a volatile base, NH_3 , and of a volatile acid, bound CO_2 , enable the organism to regulate the acid-base equil. through the kidney independently of the acid for excreting various substances, and in this connection the urinary p_{H} gains its importance. The method for calcg. the bound CO_2 in urine, and its dependence upon the urinary concn. are critically discussed, and a procedure is developed for the setting up of a complete balance of anions and cations in the urine. For this purpose the distribution of primary and secondary phosphate is calcd. with the aid of the 2nd dissozn. const. and a detn. of the equiv. base bound by the org. acid. It is suggested that the urine must contain not inappreciable amts. of unknown org. acids.

S. MORGENTHAU

Cerebral innervation of respiration. II. Periodic respiration and apnea. ROBERT SCHOEN. Med. Univ.-Klin. zu Leipzig. *Arch. expul. Path. Pharm.* 138, 339-71(1928).—Periodic respiration may be due to one of 3 causes: to disturbances in coordination of the respiratory center assocd. with injury to the brain stem; to the action of poisons which cause an initial paralysis and lead to a changed irritability of the respiratory center; and to influences, such as morphine intoxication and lack of O_2 , acting upon the cerebrum and thalamus.

G. H. S.

The relationship of carbon dioxide in the blood to asphyxia and the activity of the respiratory center: general considerations and observations on the new-born infant. HAROLD M. TRUSLER, ARTHUR E. GUEDEL AND JAMES D. GEORGE. *Anesthesia and Analgesia* 7, 303-8(1928).—The anoxemia of asphyxia at first stimulates and then depresses the respiratory center. O is a stimulant to the extent that it relieves the depression. Expts. show that the Van Slyke CO_2 detn. bears no direct relationship to the activity of the respiratory center. This exptl. work was confirmed clinically with mothers and new-born infants.

R. C. WILLSON

The influence of acetic acid on the gastric secretion. WLADIMIR FILINSKI AND VENCESLAS MERKERT. Univ. Varsovie. *Arch. mal. appar. dig. et mal. natrl.* 17, 990-1011(1927); *Ber. ges. Physiol. expul. Pharmacol.* 44, 655.—The influence of AcOH on the gastric secretion is manifest in 2 periods. In the first there is a reduced HCl secretion and an increase in the thin secretion so that the first samples removed from the stomach show a reduction in the gastric acidity. The copiously secreted mucous also plays a part in the diln. of the secretion. In the second period the AcOH stimulates the secretion of HCl . The secretion of pepsin which is first stimulated in the first period increases constantly to the end of the digestion period. The back-flow of duodenal juice into the stomach was not observed sufficiently often to ascribe any significance to it. AcOH given at meal time was well tolerated. A bitter fermentation (ascribed by Janowski to the back-flow of bile) was rarely observed. Copious salivary excretion was often observed, even when the AcOH was admitted directly into the stomach with a stomach tube. The authors assume that the salivary flow is to be attributed to the same type of reflex as is the secretion of the dilid gastric juice and that the AcOH exerts a similar influence on the whole digestive tract. This may also account for the appetite of patients with achylia or achlorhydria after they have received a small amt. of acid at meal time.

R. C. WILLSON

The secretion of kinase in an isolated loop of intestine. E. BOGDANOVA. *Russkij fisiol. zhurnal.* 9, 373-81(1927); *Ber. ges. Physiol. expul. Pharmacol.* 44, 657.—The studies show that the isolated loop of intestine is truly capable of regularly producing

kinase and that the central nervous system plays only a subordinate role in this production. The kinase was detd. according to the Sawic method. R. C. WILLSON

The serum content of the blood. BROCC-ROUSSEU AND G. ROUSSEL. *Sang* 2, 29-34(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 646.—The av. of several thousand detns. was about 60 cc. serum per 100 cc. of horse blood. R. C. WILLSON

G—PATHOLOGY

H. GIDEON WELLS

The behavior of the plasma chlorides in obstructive jaundice. I. S. RAVDIN AND M. E. MORRISON. *Arch. Internal Med.* 42, 490-9(1928).—Neither removal of the gall bladder nor ligation of the common duct affected the plasma chlorides, but a combination of both operations resulted in a reduction of the plasma chlorides.

J. B. BROWN

The parathyroid glands. Their relationship to the thyroid with special reference to hyperthyroidism. E. P. McCULLAGH. *Arch. Internal Med.* 42, 546-59(1928).—Mostly a review. Data are given showing blood Ca levels in hypo- and hyperthyroidism.

J. B. BROWN

Pancreatic function. II. The pancreatic activity in diabetes mellitus. S. OKADA, T. IMAZU, K. KURAMUCHI, K. HORIUCHI AND T. TZUKAHARA. *Arch. Internal Med.* 42, 560-75(1928).—The activities of pancreatic lipase, and amylase and trypsin were followed in 21 cases of diabetes. Seventy % of the cases showed a diminution of one or more of these enzymes. In 24% of the cases the activity of all 3 enzymes was abnormally low. However, the degree of disturbance in the external secretion and the severity of the diabetes are not necessarily parallel.

J. B. BROWN

A new clinical test for tissue thirst. WILLIAM A. THOMAS AND EDMUND ANDREWS. *Arch. Internal Med.* 42, 776-9(1928).—Normal human and dog serums when dialyzed against 0.01 N HCl swell 1-2%, 8% being the max. Serums from nephritic and edematous cases give a much greater swelling, due either to the presence in the blood of some foreign protein or to some change in the colloidal dispersion of the normal blood proteins. An app. is described for conveniently dialyzing a serum against the acid and reading the amt. of swelling.

J. B. BROWN

Atopy. Blood calcium and gastric analysis. LEO H. CRIEP AND WILLIAM S. McELROY. *Arch. Internal Med.* 42, 865-71(1928).—Blood Ca in various atopic conditions (asthma, hay fever, atopic rhinitis) is normal. Ca therapy in these cases produces no permanent increase in blood Ca. Gastric analysis shows frequent achlorhydria and hypoacidity.

J. B. BROWN

The resorcinol flocculation test for activity in tuberculosis. ADELAIDE B. BAYLIS AND WARD J. MACNEAL. *New York Post-Graduate Med. School and Columbia Univ. Am. Rev. Tuberculosis* 18, 843-7(1928).—The resorcinol test is without any claim to specificity in a bacteriological sense, but it offers some help in detg. activity or arrest of the tuberculous process. In the known tuberculous person it is a convenient and reasonably reliable method of measuring the state of activity of the tuberculous process, and it is in such cases that it would seem to have its greatest promise of usefulness. The simple test of Baylis is described and results with its use are recorded. It obviates the use of the expensive photometer of the Vernes test. 0.5 cc. of the 1.25% resorcinol soln. is gently poured on to 0.15 cc. of the patient's serum in a small tube, the mixt. is then rapidly passed from one tube to another and then back again, the container closed with a rubber stopper and allowed to remain in the room 4 hrs., and in the refrigerator overnight. In the morning it is again placed in the room without shaking and allowed to rest until the water of condensation has disappeared from the exterior of the tube. Reading by the naked eye is recorded as —, ±, to ++++ or atypical according to the quantity and quality of the sediment.

H. J. CORPER

The testicular allergic response (spermatocyte reaction) in guinea pigs for the diagnosis of tuberculous fluids. J. J. WIENER, JOHN E. BLAIR AND HENRY L. JAFFE. *Hosp. for Joint Diseases, New York City. Am. Rev. Tuberculosis* 19, 55-73(1929).—An attempt was made to apply Long's "Spermatocyte reaction" (testicular tuberculin reaction) to the diagnosis of body fluids suspected of coming from tuberculous foci. The test consists of the injection of 0.1 to 0.3 cc. of the suspected fluid into the testis of a tuberculous guinea pig, autopsy of the animal after 5 to 7 days, and histological examn. of the testis for a characteristic degeneration. The diagnostic value of the test is impaired by the fact that rarely a tuberculous fluid failed to give the typical reaction, and about 35% of non-tuberculous fluids (particularly fluids from cases of

malignant tumor) gave a reaction which was histologically indistinguishable from that given by a tuberculous fluid. Data obtained show that this is a toxic effect, which apparently cannot be eliminated by reducing the amt. of fluid injected. However with the exception of spinal fluids, if 0.1 to 0.2 cc. of the fluid from a suspected tuberculous focus, upon inoculation into the testis of a tuberculous guinea pig, produces no reaction as above described, the possibility of tuberculosis of that focus may be definitely ruled out.

The phenomenon of flocculation in syphilis and tuberculosis. ARTHUR VERNES. Inst. Prophylactique, Paris. *Brit. J. Tuberculosis* 22, 165-9(1928).—Sero-flocculation the study of which is based on the examn. of more than 23,000 sera, is for tuberculosis as for syphilis, the interpretation of an alteration of the blood, which is in direct relation with the degree and evolution of infection. The curve of the photometric readings descends after an artificial pneumothorax or after sanatorium treatment, and it rises with every exacerbation of the disease. These oscillations contrast with the non-variability of the cutaneous reaction. An illustration of the Vernes-Bricq-Yvon photometer is given and the technic of the serum reaction with resorcin detailed. H. J. CORPER

Considerations on the Abderhalden reaction based on 10,000 cases. V. KAFKA. Univ. Friedrichsberg in Hamburg. *Fermentforschung* 10, 256-63(1928).—More uniformly consistent results are obtained when the Abderhalden reaction is performed by the dialysis method than by the optical, refractometric, interferometric or other modifications. An experienced technician always obtains better results than one with less experience although with apparently flawless technic. A slight modification recommended consists in shaking each tube with 3 cc. of a mixt. of AmOH and CHCl₃ after adding the ninhydrin reagent and noting the occurrence of yellow color at the end of 0.5 hr. The term "Abbau" has been applied not only to the reaction between serum and substrate but also to the process in the organism whereby the serum is altered. It has been assumed that the organ which gives a pos. reaction is actually "abgebaut" in the organism. This is by no means certain, and it is therefore preferable to speak merely of pos. and neg. reaction. In interpreting a diagnosis on the basis of a pos. reaction, the possibility must be borne in mind that an organ which reacts may represent only a secondary factor, an object of least resistance toward metabolic products of abnormal constitution. In psychiatry and neurology the diagnosis is especially difficult because of lack of control tests before the abnormality developed. In the diagnosis of pregnancy it has been impossible to arrive at any est. of percentage accuracy because in a great many cases no records of the patients' subsequent history were available. Endocrine disturbances as diagnosed by the Abderhalden reaction cannot always be referred to a single organ, since the reaction produced by a given gland may represent a disturbed correlation of several glands. Then again it is difficult to distinguish between a process actually occurring and a mere constitutional abnormality. In epilepsy there is almost invariably a pos. reaction with brain cortex and thyroid, almost never with hypophysis or suprarenals, but frequently with sex glands. Interesting correlations are pointed out also in other types of disturbances. In general the Abderhalden reaction does not indicate a disintegration but rather a functional disturbance of an organ. A. W. DOX

Serum therapy. RUD. KRAUS. *Pharm. Monatshefte* 10, 4-6(1929).—An address briefly descriptive of present-day curative sera of established repute. W. O. E.

Crystals and pigments in living tissue. A. J. F. OUDENDAL. Med. School Weltevreden. *Mededeel. Dienst. Volksgezondheid Nederland.-Indie*, Pt. 1, 1-20(1925).—Various crystals usually in or in proximity of necrotic or diseased tissue are considered. *Cholesterol* and cholesterol esters were recovered in large quantities from spleen and thyroid tissue. They are especially abundant in the enlarged spleens of native Javans and are probably connected with blood destruction and lipid formation. The frequent occurrence of crystals and of yellowish brown pigments (Fe deposition) shows further that the origin of the crystals is in the blood. Giant cells often entirely surround the masses of crystals. The Fe-stains and pigments are often present in the liver and spleen and are associated with pathological processes. Crystals of *albumin* were found in the liver of a tuberculous native woman. These are identical to the so-called Charcot-Leyden crystals. Their genesis is likewise considered to be in the blood cells. *Malaria* appears to play a considerable part in the deposition of the various ferruginous pigments in the body and it is known that malarial patients often void ferruginous urine. Eosinophile-like cells contg. much Fe are present in large nos. in the spleen, intestinal walls, in sarcomas and abscesses of the liver. These are the cells from which the Fe cryst. deposits are probably pptd;—A series of 23 colored plates greatly enhances the value of the article. C. R. FELLERS

Effect of administration of alcohol upon the result of the Wassermann test in yaws monkeys. B. TANABE. Imp. Jap. Army and Bur. Sci. Manila. *Philippine J. Sci.* 37, 247-50(1928).—EtOH, administered either subcutaneously or by mouth in monkeys afflicted with yaws, caused a normally positive Wassermann reaction to become negative. When the test was repeated in from 24 to 48 hrs., positive results were again obtained. In several cases double plus reactions became entirely negative after the administration of 3 cc. of 95% EtOH. It is concluded that humans should not be examd. for the Wassermann test if alcoholic liquors have been recently ingested. Further proof is presented showing that the monkey with yaws reacts similarly to the human syphilitic and is a very suitable exptl. animal for research on this disease.

C. R. F.

Iodine metabolism in cases of primary thyreotoxicosis. (Primary Basedow's disease.) JOHAN HOLST, GULBRAND LUNDE, KARL CLOSS AND O. CHR. PEDERSEN. Univ. Oslo, Norway. *Klin. Wochschr.* 7, 2287-90(1928).—Normal blood contains from 0.011 to 0.016 mg. I per 100 cc. By extn. with alc., this can be divided into 2 fractions, namely: A, an alc.-sol. fraction (largely inorg.) equal to 0.007 to 0.012 mg. % and B, an alc.-insol. fraction equal to 0.001 to 0.004 mg. %. The alc.-insol. fraction contains the active principle of the thyroid gland. In primary Basedow's disease, the basal metabolic rate is increased, the I content of fraction B is increased and the thyroid contains but little I and colloid. Administration of I as Lugol's soln. leads to an enormous increase in the inorg. I content of the blood, a decrease in the I content of fraction B, and an increase in the I and colloid content of the thyroid. The basal metabolic rate is decreased.

MILTON HANKE

Is it possible, in general practice, to draw the same conclusions from a creatinine determination that one can draw from a determination of the residual nitrogen? A study of 1000 cases. FRITZ LICKINT. *Klin. Wochschr.* 7, 2341-2(1928).—The concn. of creatinine in the serum does not, in individual cases, parallel the residual N concn.

MILTON HANKE

The bactericidal power of cerebrospinal fluid and inflammatory and non-inflammatory exudates and transudates from the chest and abdominal cavity. PAUL V. GARA. Univ. Greifswald. *Klin. Wochschr.* 7, 2386-7(1928).—The cerebrospinal fluid does not usually contain substances that are bactericidal to Gram-pos. micro-organisms. This fluid was bactericidal in 2 cases, one of idiocy and one of imbecility. There is no relationship between bactericidal properties of the cerebrospinal fluid and the Wassermann reaction. Pleural and abdominal exudates of inflammatory origin are strongly bactericidal; transudates are not bactericidal.

M. H.

Supposed effect of tumor extracts on glucolysis. JOHN BROOKS AND MAURICE JOWETT. Univ. Liverpool. *Biochem. J.* 22, 1413-16(1928).—In contradistinction to Waterman (*C. A.* 20, 1664), the authors employing Warburg's methods (*C. A.* 22, 4644) have been unable to find any effect of tumor ext. on glucolysis.

B. H.

Metabolism in scurvy. II. The nitrogen absorption and retention of guinea pigs. HENRY L. SHIPP AND SYLVESTER S. ZILVA. Lister Inst., London. *Biochem. J.* 22, 1449-60(1928); cf. *C. A.* 22, 2771.—There is no disturbed absorption or retention of N during the early stages of the development of scurvy in growing guinea pigs.

BENJAMIN HARROW

Essential pentosuria. JULIUS A. ROSSEN. *Arch. Pediatrics* 46, 46-50(1929).—The urine of a male, age 13 years, contained 0.17 to 0.37% of non-fermentable sugar, and yielded a phenylosazone, m. 150°. Polyuria and its assocd. thirst were absent. The blood sugar, the sugar tolerance, and the basal metabolic rate (+3%) were normal.

JOSEPH S. HEPBURN

The pathogenesis of nutritional disturbances in infancy. XII. Experimental dehydration and glutathione. E. SCHIFF AND M. FUKUYAMA. *Jahrb. Kinderheilk.* 121, 1-6(1928).—The SH-contg. complex of biological importance is supposed to be glutathione, a dipeptide of glutamic acid and cysteine. In living tissues, at neutral or slightly alk. reactions, there is a continuous oxidation of the SH group, and as long as the tissue supplies H, a continuous reduction from S-S to SH. The Tunncliffe method for detg. the SH group was used to show the differences in glutathione content of the body tissues of normal young mice and of mice fed dry milk with a min. quantity of water. The amt. of SH in the liver is greatly reduced by dehydration. Parenteral injection of peptone, histamine, tyramine and killed bacteria was without effect on normal animals, but caused a still greater decrease of SH in dehydrated mice. The results indicate that in acute dehydration, the autooxidative processes of the body are diminished.

ELEANOR M. HUMPHREYS

Gaseous exchange studied on recovery after exercise in healthy and ill children. HILDE BRUCH. *Jahrb. Kinderheilk.* 121, 7-28(1928).—Four types of response to successive brief periods of alternate activity and rest were observed. (1) equal values of air-vol. and O use in successive periods of work, (2) recovery from the O deficit incurred in the first work period only after rest following the second work period, (3) progressive exhaustion with a step-like increase of the respiratory quotient in the following work periods, (4) excessively deep inspiration during the first work period, which preserves an O reserve for the next work period. ELEANOR M. HUMPHREYS

The mineral content and the acid-base equilibrium of the serum of infants. A NITSCHKE AND G. MEYER ZU HÖRSTE. *Jahrb. Kinderheilk.* 121, 111-22(1928).—The authors detd. the Ca, P, HCO_3 , Cl, Na, K and combined base in the serum of healthy and ill infants. The serum of normal infants contains less org. acid than does normal adult serum. In nutritional disturbances there often is a readjustment of the various acid-base factors which compensates for the depletion of the alkali reserve. In florid rickets there are no consistent changes. Some rachitic children have an org. acidosis, others an inorg. acidosis, while with others no abnormality is observed. The findings in tetany do not support the theory of a hyper-ventilation alkalosis, but in some cases an org. acidosis is present. Infants with rickets and tetany, treated with irradiated ergosterol, develop a distinct alkalosis due to a decrease of org. acids. The authors emphasize the fact that observations on changes of the alkali reserve alone give only an incomplete picture of the acid-base equil. ELEANOR M. HUMPHREYS

Alcoholic intoxication and oxygen. P. M. VAN WULFFTEN PALTHE. *Geneeskund Tijdschr. Nederland. Indië* 68, 597-611(1928).—Inhalation of O reacts favorably on acute alc. intoxication of man and animal. With very large amts. of alc. the effect is not so clearly demonstrable. In some cases it was possible, notwithstanding a fatal dose, to keep the animal alive. Difference between inhalation of pure O with O mixed with CO_2 could be detected with human beings but not with animals. Stopping the O treatment in the acute stage causes the return of the toxic condition to the same degree. Although it must not be concluded that alc. intoxication is caused by a lack of O, it is pointed out that in expts. with caisson workers, mountain sickness and flying, the lack of O causes conditions, which are quite similar to alc. intoxication. It is possible that there is a lack of O in the tissue cells, causing some conditions of alc. intoxication, but what causes this deficiency is hard to tell. J. C. JURRJENS

Serum albumin and antibodies. G. KAPSENBERG. *Nederland. Tijdschr. Hyg., Microbiol. en Serol.* 3, No. 2, 128-64(1928); cf. C. A. 22, 4169.—Results of investigations by K. and his co-workers have shown that the antibodies are linked to the globulin, and a new presentation is made of the constellation of the serum albumin. The opinion is defended, that the Wassermann- and the Sachs-Georgi reaction is an antigen-antibody one. A new theory is developed in relation to the origin of specific antibodies, produced after the parenteral administering of antigen. The antigens are broken down in the circulation. Parts of them enter the body cells. Here is the origin of a particular amino acid chain, called the primary antibody chain. This chain helps in forming the secondary antibody chains, which enter the circulation. K. gives 10 points in which he explains the advantages of the new theory over the side-chain theory of Ehrlich. J. C. JURRJENS

Studies on the behavior of the lactic acid of the blood. II. GIOVANNI MARGRETH. *Boll. soc. ital. biol. sper.* 3, 519-20(1928); cf. C. A. 23, 434.—Lactic acid was detd. in 23 cases of pneumonia. The values found were about equal to the normal when the disease took a regular course; when the disease was very grave followed by death, the lactic acid was above the normal. **III. Hepatic affliction.** *Ibid* 521-2.—Patients were fasted for 12 hours, the lactic acid was detd. and then 10 g. lactic acid administered by mouth. Lactic acid was again detd. at hour intervals. In all the patients including the controls there was an increase of lactic acid but this increase was more marked in patients with hepatic disorders. **IV. Cardiac diseases.** *Ibid* 522-3.—Lactic acid was detd. in 14 cardiac patients. In cases of minor involvement the content was about equal to the normal, but in severe cases with dyspnea there was a definite increase. **V. Tumors.** *Ibid* 523-4.—Fourteen cases of neoplasia of the digestive apparatus were studied. In 10, there was some increase, in 2, a fair increase, and in the other 2, a marked increase of lactic acid. PETER MASUCCI

Protein metabolism of normal and malignant tissues in vitro. FRITZ DEMUTH AND ILSEVON RIESEN. Kaiser Wilhelm-Inst. für Biologie, Berlin-Dahlem. *Biochem. Z.* 203, 22-49(1928).—Cultures of chicken sarcoma liquefy, very rapidly, the chicken plasma coagulum, which is changed thereby from a gel to a sol condition, and the fibrin network dissolves. Serum becomes freed from the fibrin threads. Cleavage products

unprecipitable by tungstic acid* are not formed in greater amts., but the question of the formation of higher cleavage products still needs elucidation. The liquefaction is an enzyme action. The enzymes of the embryo ext. or of the plasma can produce a similar result though only very slightly and very slowly. This reaction is greatly activated by substances present in small concn. in normal tissues but in comparably larger amts. in sarcoma tissue. These activators are heat stable and to a certain extent ultrafiltrable. The liquefaction produced by sarcoma tissue is not specific to sarcoma. Stomach and intestine epithelium, liver and spleen as well as fibroblastic cultures which have been in some manner injured produce liquefaction and also yield a boiled extract with liquefaction action. The liquefaction is associated with the death of cells. * Sarcoma cells are short-lived, and the ones which die and undergo autolysis liberate the heat-stable activator of fibrinolytic enzymes present in the embryonic extract and plasma. The activated enzymic process is stimulated by H, acetate and lactate ions, while Ca ions have an inhibitory effect. S. MORGULIS

Studies on the chemical nature of allergens. L. FARMER LOEB. Universitätsklinik, Charité, Berlin. *Biochem. Z.* 203, 226-36(1928); cf. *C. A.* 22, 4616.—Guinea pigs were sensitized specifically against aq. exts. of geese feathers. The exts. contained on an av. 0.4 mg. N per cc., of which about $\frac{1}{2}$ could be pptd. by colloidal Fe; they likewise contained substances which reduced Hagerdorn-Jensen's reagent; and gave pos. tests with sulfosalicylic acid, ninhydrin or Molisch's reagent. On adding abs. alc. the aq. ext. produced a ppt. which likewise produced a sp. sensitization. This alc. ppt. contained only colloidal N (precipitable by colloidal Fe) and only a trace of reducing substance; the sulfosalicylic reaction was pos. but the ninhydrin was neg. The filtrate has no sensitizing action. This filtrate gave a pos. Molisch reaction, contg. appreciable amts. of reducing substance; the sulfosalicylic reaction is neg. but the ninhydrin is pos. because all the N is in the form of mol. dispersed material. Guinea pigs were also sensitized against aq. exts. or ordinary pine pollen, or against its alc. precipitable fraction. S. MORGULIS

Physical chemistry of the cerebrospinal fluid and serum diagnosis by the Lange gold sol reaction. G. ERTSCH AND O. EINSTEIN. Kaiser Wilhelm-Inst. für phys. Chemie, Berlin-Dahlem. *Biochem. Z.* 203, 389-93(1928).—In the gold sol reaction of cerebrospinal fluid there are 3 components: the fluid whose action is unknown; the gold sol which is not clearly defined, and the NaCl soln. Such systems are characterized by lack of exactness and the dependence of the coagulation upon H-ion concn. This is thought to be the cause of irregularities in the practical application of the Lange's reaction so that it is possible to produce with normal cerebrospinal fluid flocculation curves observed only in progressive paralysis by the use of the proper gold sol, i. e., one which has been given the max. possible acidity; and by alkalinizing the sol flocculation will not appear even in a definite instance of paralysis. It is shown that a AuCl soln. can successfully be substituted for the gold sol. S. MORGULIS

The pathological physiology of the fat metabolism after splenectomy. S. LEITES. Inst. of Med. Ukrnauka, Charkow. *Zhurnal expil. Biol. Med.* 10, 285-91(1928); cf. 1. 22, 4616.—Following splenectomy the hydrolysis of neutral fats in the liver is disturbed, resulting in an increased alimentary lipemia. The hydrolysis of neutral fat in splenectomized dogs is partly transferred from the liver to the lungs. The destruction of "acetone bodies" is interfered with. Loading with fat, even when glucose is given simultaneously, leads to acetonemia in the splenectomized animals. The administration of glucose also calls forth a rise in cholesterol. S. MORGULIS

The application of the law of adsorption to phenomena of sensitization of erythrocytes to hemolytic sera. A. P. KONIKOV AND A. S. IZRALIMSKII. Chem.-Bacteriol. Inst., Tula. *Zhurnal expil. Biol. Med.* 10, 350-6(1928).—The combination of erythrocytes with amboceptor follows the law of physical adsorption only in the presence of high hemolysin concn. The exponent of the isotherm is between 0.22 and 0.35. In low concns. of hemolysin the purely chem. reaction between stroma and amboceptor predominates. It is suggested that the value of α in the adsorption equation ($C_1 = \alpha C_2^n$) may serve as a measure of the acidity of various sera. S. MORGULIS

The chemistry of sensitization of erythrocytes by amboceptors of specific sera. A. P. KONIKOV. Chem.-Bacteriol. Inst., Tula. *Zhurnal expil. Biol. Med.* 10, 357-66(1928).—The combination of erythrocytes with amboceptor depends upon the H-ion concn., the optimum being at pH 6.0-6.7. The combination occurs only in the presence of some electrolyte. The salt concn. is of importance and also shows a definite optimum. The nature of the salt is of less significance, but similarly active concns. are approx. equiv. The conditions existing in the process of sensitization are best interpreted on the assumption of an ionic reaction with the formation of a complex combina-

tion, schematically conceived as follows: stroma[®] + amboceptor[®] + MeR \rightleftharpoons

stroma $\xrightarrow{\quad R \quad}$ amboceptor—Me, where R is the anion of the salt.

S. MORGULIS

Electroosmosis as the principal factor in specific hemolysis. A. P. KONIKOV. Chem.-Bacteriol. Inst., Tula. *Zhurnal ekspl. Biol. Med.* 10, 368-83(1928).—The hemolysis of sensitized erythrocytes under the influence of complement occurs only in the presence of salts whose effective concns. are directly dependent upon their equivalence. This leads to the conclusion that the combination between complement and salt is purely chem. Osmotic pressure does not play a part in the sp. hemolysis. The optimum H-ion concn. for hemolysis is at $p_H = 7.0$. The relationship between hemolysis, H-ion concn., the nature and concn. of salt can be explained on the assumption that the complement concentrates on the surface of the erythrocytes where it forms a thick protein layer of an isoelec. point of $p_H = 4.7$. This creates between the cell contents and the surrounding complement layer, in accordance with Donnan's law, a potential difference and an elec. field. Water is driven electroosmotically through the stroma pores along the lines of force, causing a drop in the osmotic pressure within the erythrocytes and then hemolysis. This condition can be reproduced by means of a model. Partly dialyzed hemoglobin in a collodion bag is placed in a concd. isotonic serum albumin soln., whereupon water flows into the bag in spite of the isotonicity of the inner and outer soln.

S. MORGULIS

The hemopoietic effect of nuclear extractives in human anemias. N. W. JONES, B. I. PHILLIPS, OLAF LARSELL, AND H. T. NOKES. Univ. of Oregon. *Ann. Internal Med.* 2, 603-21(1929).—It is tentatively concluded that the hemopoietic stimulant, unknown as yet in compn., is an integral part of the cell nucleus. Hence the effect on blood production of various animal tissues depends on the amt. of nuclear substance. Liver is a better stimulant than pancreas or thymus but not as good as spleen. Washed nuclei of fowl erythrocytes is the best of all those tried. Kidney, sweetbreads, and spleen may be alternated with liver in the treatment of anemia.

JOHN T. MYERS

The dietetic treatment of diabetes mellitus. A restatement of the fundamental principles. L. H. NEWBURGH. Univ. of Mich. *Ann. Internal Med.* 2, 645-9(1929).—Some believe that diabetic arteriosclerosis bears a casual relationship to the diet of the patient. The evidence is insufficient either to prove or to disprove this. If there is a relationship, the fault lies in an excess of calories. The vascular disease is not caused by the metabolic products of fat except in so far as they may be a source of calories.

JOHN T. MYERS

Albuminuria and nephritis following injection of toxin-antitoxin, with a report of two cases. C. D. MERCER. *Ann. Internal Med.* 2, 667-8(1929).—Ten per cent of 125 apparently healthy children had albuminuria. Administration of toxin-antitoxin doubled the percentage in 125 school children. Urine examn. should precede immunization in all cases, and it should be given with caution at present.

J. T. M.

The biochemical relations of the diphtheria bacillus to the proteins of the animal body. (The question of the virulence factor and the partial antigens of the diphtheria bacillus.) V. N. KRISHANOVSKII. Volkskommissariat für Gesundheitspflege der Baschkirenrepublik in Ufa. *Centr. Bakt. Parasitenk.*, I Abt., 110, 1-9(1929).—Each protein fraction of blood serum which is pptd. by definite concns. of $(NH_4)_2SO_4$ is definite and reacts specifically with certain substances of the diphtheria bacillus both *in vivo* and *in vitro*. Albumin and fibrinogen react with certain substances and produce toxins. Albumin reacts with the toxigenic factor (Protoxin of Walbum), and fibrinogen with the virulence factor. The globulins react with other parts of the diphtheria bacillus, yielding substances which neutralize the toxins. The chemical affinity of diphtheria bacillus substances is stronger for globulins than for albumin.

JOHN T. MYERS

A new method for obtaining a specific high titer precipitating anthrax serum for diagnostic use. RAHEL ROSENBERG AND D. ROMANOW. Inst. f. wissenschaftl. und prakt. Veterinarkunde, Ukraina-Charkow. *Centr. Bakt. Parasitenk.*, I Abt., 110, 102-11(1929).—A safe diagnosis of anthrax can be made with the help of a pptg. serum of great specificity and high titer. A modification of Fudjiwar's antigen made as follows was used as the precipitinogen. Wash off a 12-hr. agar growth at 33-4° in 10 cc. of isotonic NaCl soln. Add 100 cc. of distd. water, 20 cc. of satd. NaCl soln., and 6 or 7 drops of 50% AcOH. Heat this mixt. for 20 to 30 min. in steam. Filter, wash the coagulum in alc. and dry it. Grind it thoroughly in a mortar with 2 cc. of isotonic NaCl soln., let stand about 10 min. and inject the supernatant liquid intravenously. Serum with a titer of 1:100,000 against organ or skin exts. can be obtained. It has no therapeutic value.

JOHN T. MYERS

A study of non-specific complement fixation with particular reference to the interaction of normal serum and certain non-antigenic substances. T. J. MACKIE AND M. H. FINKELSTEIN. Univ. of Edinburgh. *J. Hyg.* 28, 172-97(1928).—When a soln. of com. peptone is substituted for antigen in a complement-fixation test with the unheated normal serum of man, ox, sheep, horse, rabbit, and white rat, a definite fixation occurs both at 37° and at 0°. In the ox, sheep, horse and rabbit this property is partially stable at 55° but not with human or white rat. The property resides mainly in the carbonic-acid-insol. globulins of the serum. The same results follow when alc. dild. with several vols. of isotonic NaCl soln. is substituted for antigen. Marked complement fixation effects are obtained with the heated normal serum of the rabbit, ox, sheep or horse plus cholesterol suspensions, and particularly cholesterol-peptone, these effects occurring in parallel with those produced with serum plus alc.-saline, peptone solus., and the Wassermann antigens. Heated normal serum of the pig, white rat, guinea pig and human do not thus react. These results are closely related to the Wassermann reactions of normal animals. This reacting property is absent from rabbits for the first 2 to 3 weeks of life, and develops progressively thereafter. Certain alcs., Na oleate, tissue proteins, Na nucleinate and alc.-purified commercial peptone also fix complement in the presence of normal sera. Cholesterolization may increase the action of the agents beyond the summation effect.

JOHN T. MYERS

Observations on the reaction of the skin to oils and tars. C. C. TWORT AND J. M. TWORT. *J. Hyg.* 28, 219-27(1928).—A variety of carcinogenic substances were applied to the skin of mice. The resulting hyperplastic epithelium may, when the irritant is removed, recede or eventually become the site of a malignancy, although microscopically similar. Two agents may have equal power to produce acute hyperplasia but the tendency toward subsequent malignancy may be quite different. When a weak tumor producer is concd. by alc. or methyl sulfit, tumors are numerous but rarely malignant. Epithelial cells may acquire a certain tolerance. On the contrary they may be made hypersensitive to tar at certain stages. No sarcomas were observed.

JOHN T. MYERS

Tumors of the skin and mammary gland caused by pyrogenous products of cholesterol. E. L. KENNAWAY AND BASIL SAMPSON. Cancer Hosp. Research Inst., London. *J. Path. Bact.* 31, 609-12(1928).—The products obtained by heating cholesterol to about 800° caused epithelioma after repeated application to the skin of mice. An adenopapilloma of the mammary gland was induced in a rabbit. J. T. M.

The in vitro titration of *B. welchii* antitoxin by its antihemolytic power. J. H. MASON AND A. T. GLENNY. Wellcome Physiol. Research Lab. Beckenham, Kent, Eng. *J. Path. Bact.* 31, 629-32(1928).—Identical results are obtained for *B. welchii* antitoxin by antihemolytic titration *in vitro* and by antitoxic titration *in vivo* by intravenous injection into mice. The neutralization of hemolysin and of toxin by antitoxin is parallel.

JOHN T. MYERS

Histamine and infection. G. MARSHALL FINDLAY. *J. Path. Bact.* 31, 633-44 (1928).—It is suggested that the well-known relationship between injury and the localization of organisms in injured tissue is due to the liberation of histamine or a histamine-like substance which causes dilatation of the capillaries and increased permeability of the capillary endothelium allowing the local escape of organisms into the surrounding tissues. A 0.5% soln. of histamine acid phosphate was made in isotonic NaCl soln. and the p_H brought to 7.2 with NaOH, making the concn. of histamine base about 1:600. A control of phosphate buffer soln. of the same p_H was used. Rabbits were inoculated intravenously with 1 cc. of a 24 hour broth culture of *Staphylococcus aureus*. Immediately afterward 0.02 cc. of the histamine soln. was injected into the skin of the right flank and the same amt. of control into the left flank. Typical abscesses formed where the histamine was injected, from which staphylococci could always be isolated. Similar results were obtained with *Streptococcus hemolyticus* and the pneumococcus, the virus as of vaccinia, Rous sarcoma and fowl pox. Positive results were not obtained with tyramine or choline. It is not yet known whether the rupture of the defence mechanism by such substances as sol. Ca salts or Si can be correlated with the action of histamine on capillary endothelium. JOHN T. MYERS

The relation of agglutination by specific serum to agglutination by acid. J. A. ARKWRIGHT. Lister Inst., London. *J. Path. Bact.* 31, 665-70(1928).—There are 2 agglutinable substances in a culture of motile bacteria of the typhosus-salmonella group which are responsible for agglutination by acid at different zones of H-ion concn. These are probably identical with the flagellar and somatic antigens, resp., which react with the I and O agglutinating sera. The apparent affinity between otherwise dissimilar

species shown by serum agglutinations is confirmed by finding a similar resemblance as regards acid agglutination. In one phase of a certain type of salmonella the flagellar antigen, which appears in its behavior to serum to be identical with another species, shows the same identity when tested by the acid technic. Rough colonies are associated with a wide zone of acid agglutination. Supposed changes of *B. paratyphosus* to *enteritidis* may be thus explained by a change from smooth to rough colony form. The inagglutinability by serum of some strains of *B. typhosus* which was formerly attributed to a change in a single agglutinable substance, described as the loss of the ergophore group in the receptor, is better interpreted as the absence or poverty of the flagellar antigen and is associated with absence of motility. The absence of agglutination by serum postulates a more advanced suppression of the flagellar apparatus than is shown by failure to clump with acid.

JOHN T. MYERS

The action of immune serum on vaccinia and virus III in vitro. C. H. ANDREWS. Natl. Inst. for Med. Research, Hampstead, London. *J. Path. Bact.* 31, 671-98(1928).—The potency of antivaccinal serum as indicated by the number of minimal infective doses neutralized in the rabbit's skin could only be measured approximately, different titers being obtained on different animals. This was also true for virus III. Where in skin tests, neutralization of vaccinia occurred, there was no strict proportionality between the amts. of virus and antibody involved. Neutralization of vaccinia occurs readily in the skin, but cannot be satisfactorily demonstrated when intratesticular, intracerebral or intravenous inoculation is used. No *in vitro* absorption of vaccinia antibody by antigen was shown, since by filtration through an L2 candle, antibody could be recovered quantitatively from a mixt. of immune serum and an excess of virus, even after 24 hours contact, and the same was true for virus III. Active vaccine virus could be recovered from an incubated mixt. of virus and immune serum by absorbing the virus on kaolin or euglobulin. An inactive serum virus mixt. could be reactive by simple diln. with Ringer's soln. or normal rabbit serum, but this did not hold for virus III.

JOHN T. MYERS

Capillary permeability in acute uranium nephritis. CAROLINE WHITNEY. Washington Univ., St. Louis. *J. Path. Bact.* 31, 699-704(1928).—Capillary permeability can be tested by measuring the rate at which antibodies passively introduced reach the tissue fluids. The agglutinin titer of liver lymph may reach 50% of that of the blood in 10 mins. In the leg, the max. concn. of about 83% is not reached for 10 to 12 hrs. In U poisoning the rate of penetration of agglutinins into body lymph is greatly decreased, indicating decreased capillary permeability. This change occurs within 18 to 24 hrs., hence it is due to a direct effect on the capillaries and not to a secondary effect of kidney degeneration. The state of decreased permeability persists during the period in which it is possible to produce edema by the administration of excess fluid.

JOHN T. MYERS

Further experiments on the production of hyperplasia in the alveolar epithelium of the lung of the rabbit. J. S. YOUNG. Univ. of Leeds. *J. Path. Bact.* 31, 705-20 (1928).—Active manifestations of proliferation in the epithelial cells lining the marginal alveoli of the lungs of the rabbit can be produced by the intrapleural injection of an emulsion of liquid paraffin and bile salts, whereas liquid paraffin alone is ineffective. Similar changes follow the injection of 25 cc. of 4.3% NaCl, or 12.5 cc. of 2% CaCl₂, or 5 cc. of 9.94% SrCl₂, or 5 cc. of 3.3% AlCl₃ (0.75 N solns.). The epithelial reaction increases with the valency of the cation. The action of Ca ions is not inhibited by Na ions. The hyperplasia is transient, disappearing in 6 to 8 days. The hyperplasia occurs in marginal alveoli without evidence of trauma or necrosis. (Trauma or necrosis alone will cause hyperplasia.)

JOHN T. MYERS

The appearance of doubly refracting substances in formalin-fixed rabbit tissues. J. B. DUGUID AND J. MILLS. Welsh Natl. School of Med. *J. Path. Bact.* 31, 721-34(1928).—Doubly refracting substances appear in certain organs, notably the liver, of the human, rabbit and mouse. Fixation in HCHO delays and limits their appearance, but does not permanently prevent it. They do not develop in tissues fixed with perchloride of Hg, or in osmic acid, or in K₂Cr₂O₇. There is a slight development in mixts. of K₂Cr₂O₇ and HCHO. The development is dependent on the tissues being placed in an acid medium after fixation. The substances are considered to be fatty acids formed by hydrolysis of tissue lipoids. They have not been stained. Their distribution alters according to the treatment to which the piece of tissue has been subjected. The anisotropic substances of the suprarenal and of the liver are similar in their chemical reactions and are probably due to postmortem changes. Injections of cholesterol into the blood stream of rabbits did not affect the appearance or the amt. of the doubly refracting substances. Since these substances so readily develop after death they are probably of little importance as evidence of the state of affairs during life.

JOHN T. MYERS

The oxygen tension necessary for the mitosis of certain embryonic and neoplastic cells. G. PAYLING WRIGHT. Univ. College Hosp. Med. School, London. *J. Path. Bact.* 31, 735-52(1928).—In tissue cultures the lowest O tensions at which cell division takes place are: for chicken heart myoblasts, about 12 mm. of Hg; for Jensen rat sarcoma cells, about 6 mm.; and for mouse carcinoma "2146" cells about 3 mm. This corresponds to 1.6, 0.8 and 0.4% of O at atmospheric pressure. Sarcoma cells are not killed by many hours of complete deprivation of O. These expts. do not oppose the conclusions of Warburg on the glucolytic metabolism of neoplastic and other growing cells, but they indicate that this form of metabolism is incapable of completely replacing oxidative metabolism, being supplementary so far as growth is concerned, certain cell reactions requiring free O. There is a good bibliography. JOHN T. MYERS

The relationship between the bactericidal power of normal guinea pig serum and complement activity. JOHN GORDON AND ARTHUR WORMALL. Univ. Leeds. *J. Path. Bact.* 31, 753-68(1928).—Small amts. of NH_3 destroy the bactericidal power of normal guinea pig serum against *B. dysenteriae* (Flexner) and this loss is parallel with the destruction of hemolytic complement. This action is not due to any pH effects. Neutral NH_4 salts are without significant effects. When suitable amts. of *B. dysenteriae* are heated for 1 hr., added to normal guinea pig serum and the mixt. is incubated for 2 hrs. at 37°, loss of bactericidal power occurs with no appreciable decrease in hemolytic complement. This is attributed to the loss of an immune body present in the normal serum which can be restored by the addn. of serum that has been heated to 56° for 30 mins. NH_3 -treated serum and serum treated with dead bacteria, both of which have no bactericidal power separately, have full activity when combined; hence the two sera are deficient in different respects. When larger quantities of dead bacteria are used for absorption, all hemolytic as well as bactericidal power is lost by the serum, and it cannot be reactivated by 56° heated serum. The immune body concerned in the bactericidal process is not affected by the small quantities of NH_3 necessary to inactivate complement. Hemolytic complement and bactericidal complement have a similar chem. constitution and are probably identical. JOHN T. MYERS

Fixation of complement by *B. typhosus* and normal guinea pig serum: a contribution to the study of natural antibodies. ERNEST M. DUNLOP. Univ. and Western Infirmary, Glasgow. *J. Path. Bact.* 31, 769-95(1928).—Guinea-pig serum shows zonal fixation of its hemolytic complement in the presence of most strains of *B. typhosus* in isotonic NaCl soln. Different strains vary in this respect and 2 out of 22 strains did not show the phenomenon. It is explicable by the presence of a natural antibody in the serum, which resembles immune antibody in its ability to sensitize the organisms so that they can fix complement, but differs in its thermolability and comparative lack of specificity. It is sometimes more labile than complement. It can be removed by other organisms or by such agents as coal dust, charcoal, or powd. glass.

JOHN T. MYERS

Observations on the acid-base equilibrium in its relation to the cutaneous apparatus: the alkali reserve. FRANCO FLARER. Univ. Pavia. *Biochim. terap. sper.* 15, 232-54(1928).—The question whether a correlation exists between the acid-base equil. in the blood and the condition of the cutaneous app. was investigated. In about 60 patients suffering from various kinds of skin diseases the alkali reserve was detd. in the plasma according to Van Slyke. In 10 cases of acne and 9 cases of eczema, the av values for the CO_2 liberated were normal (61.5 and 61.3, resp.). In 16 cases of psoriasis, the av. value was slightly subnormal (52.4); some of these patients had previously received a treatment with an ointment contg. 5% *o*- $\text{HOC}_6\text{H}_4\text{CO}_2\text{H}$ for 1 or 2 days. In 30 other cases of various skin diseases the values found for CO_2 were normal, with a few exceptions. Application of *o*- $\text{HOC}_6\text{H}_4\text{CO}_2\text{H}$ in form of the ointment mentioned lowered the alkali reserve, the decrease being particularly marked in psoriasis. Irradiation by ultra-violet rays to the extent that erythema was produced caused a definite increase in the alkali reserve. Very numerous references. G. SCHWOCH

Chemical nature of the substances required for cell multiplication. II. Action of glutathione, hemoglobin and ash of liver on the growth of fibroblasts. LILLIAN E. BAKER. Rockefeller Inst. for Med. Research. *J. Expul. Med.* 49, 163-82(1929); cf. *C. A.* 20, 3707.—The ash of liver, hemoglobin and glutathione each exert a very slight beneficial effect on the growth of sarcomatous fibroblasts of the rat, or on the condition of their cells when cultivated in a synthetic medium. The addn. of all 3 of these substances, or of only glutathione and hemoglobin, to a mixt. of casein digest, glyceroll and nucleic acid gives a medium in which sarcomatous fibroblasts of the rat proliferate for a considerable time as rapidly as in embryo juice. The mixt. is not as adequate a nutritive medium as embryo juice, for after a time dead cells are found

surrounding the central fragment of the culture. It is suggested that glutathione and hemoglobin may function not only by regulating the respiration and oxidation-reduction reactions within the cell but also by regulating the oxidation-reduction potential of the medium. The growth of normal fibroblasts of the rat is also increased by the addn. of the above-mentioned substances to a synthetic medium.

C. J. WEST

Anaphylaxis with the type-specific carbohydrates of pneumococcus. OSWALD T. AVERY AND WM. S. TILLET. Rockefeller Inst. Med. Research. *J. Exptl. Med.* 49, 251-66(1929).—The type-sp. carbohydrates haptens of pneumococcus types I, II and III, when isolated in protein-free form, are devoid of the property of inducing active anaphylactic sensitization in guinea pigs. The bacterial carbohydrates of pneumococcus, of which the Type II and III substances are N-free, produce rapid and fatal anaphylactic shock in guinea pigs passively sensitized with the pptg. serum of rabbits immunized with pneumococci of the homologous type; the reactions induced are type-sp. In contrast to the pos. results with immune rabbit serum, there is a complete absence of anaphylactic response to pneumococcus carbohydrate in guinea pigs passively sensitized with antipneumococcus horse serum.

C. J. WEST

Study of pneumococcus autolysis. WALTHER F. GOEBEL AND OSWALD T. AVERY. Rockefeller Inst. Med. Research. *J. Exptl. Med.* 49, 267-86(1929).—Autolysis of pneumococcus is accompanied by proteolysis, which results in an increase in NH_2 and non-coagulable N, and by lipolysis, during which there is a liberation of Et_2O -sol. fatty acids. When exts. contg. the active intracellular enzymes are added to heat-killed pneumococci, lysis of the cells occurs and there is an increase in the non-coagulable and NH_2 N, comparable to the changes accompanying spontaneous autolysis. When these exts. are added to emulsions of the EtOH -sol. lipoids extd. from pneumococci an increase in Et_2O -sol. fatty acids occurs. Na desoxycholate in excess inhibits the action of pneumococcus protease; it does not inhibit the action of the lipase. When suspensions of pneumococci are cooled to 0° , a temp. at which the rate of enzyme action is greatly retarded, the organisms go into soln. rapidly when Na desoxycholate is added, but this process is not accompanied by lipolysis or proteolysis. It does not seem probable, therefore, that the "bile" soln. of pneumococcus is identical with the phenomenon of autolysis as ordinarily understood and measured. The relation of enzyme action to antigenic disoccn. is discussed.

C. J. WEST

A study of phosphorus absorption in normal and rachitic children. GEORGINA MURDOCH. Royal Hosp. for Sick Children, Glasgow. *Arch. Diseases in Childhood* 2, 285-301(1927).—The addn. of different amts. of acid Na phosphate to a Ca-poor diet effected in 8 rachitic and 3 normal children a definite increase in the serum phosphate. If Ca lactate were added to this high-phosphate diet the increased serum phosphate was reduced, particularly in the rachitic children. M. believes this reduction to be related to the pptn. of the PO_4 ions by Ca in the intestinal lumen. The phosphate absorption was further measured in 5 normal, 4 florid rachitic and 3 children recovering from rickets. NaH_2PO_4 was administered orally in 4 g. doses and the serum phosphate detd. at 30-60 min. intervals. The increase in the serum phosphate in both the normal and florid rachitic children moved within the normal limits. In the children recovering from rickets the serum phosphate was especially high.

R. C. WILLSON

Studies of the amino acids in the urine and blood, particularly in diabetes and Basedow's disease; role of the kidney. J. GOFFIN, RAHIER AND REGNIER. Hop. Basle. The hypoxelles. *Arch. mal. appar. dig. nutrit.* 17, 961-89(1927); *Ber. ges. Physiol.* Saint-Jean, Br. original 44, 772. Folin's colorimetric method was used. The values agree exptl. *Pharmakol.* Hyperamino acids 57-1122 mg. %; quotient amino N: total N, 0.5-1.64:100; in the blood, 41.5:100. It appears doubtful if a hyperaminoaciduria appears during liver insufficiency. In cachectic individuals the authors in contrast to many other authors observed a decrease in the values. The same contrast exists in the values found for pancreatic diabetic dogs, insulin reduces the amino acid elimination both in authors found normal values. In diabetes, the values are normal.

A. N. RICHARDS

A chemical and pharmacological classification of iron preparations. F. STARKENSTEIN. *Časopis Československého Lékárnictva* 8, 95-102(1928); cf. C. A. 22, 4644.—The therapeutic action of Fe is manifested only in simple ferrous compds. The Fe in complex compds. is also active but in a manner different from the sp. action of Fe. Ferric compds. are practically without therapeutic action. A stable FeCl_2 has been obtained in the prepn. "Ferrostabil."

WILLIAM J. HUSA

Continued administration of iodine and other salts. Comparative effects on weight and growth of the body. P. J. HANZLIK, E. P. TALBOT AND E. E. GIBSON. *Arch. Internal Med.* 42, 579-89(1928).—The administration of 1 mg. NaI daily to rats over 7' of the life span showed definite increases in weight and growth of the body on complete and deficient diets. CNS^- , Br^- , AsO_3^- , Ti^{++} and Mn^{++} in every case reduced body weight and growth.

J. B. BROWN

Effect of administration of medicinal iron on the iron reserve. C. S. WILLIAMSON AND P. EWING. *Arch. Internal Med.* 42, 600-6(1928).—Rats fed on a standard diet plus ferric citrate showed no increase in hemoglobin concn., and, after bleeding, did not recover any more quickly than the controls. Fe administered in this form cannot build up an Fe reserve capable of being converted into hemoglobin.

J. B. BROWN

Secretin not a hematopoietic stimulant. J. T. KING. *Arch. Internal Med.* 42, 763-75(1928).—Subcutaneous injections of secretin in rabbits cause a rapid and transient rise in red cell count. The rise is due to a concn. of the blood rather than to cell regeneration.

J. B. BROWN

Experimental uremia-uremic enteritis. M. H. STREICHER. *Arch. Internal Med.* 42, 835-45(1928).—Intravenous injections of large doses of urea into dogs produce all of the clinical features of uremia-uremic enteritis. The findings are: progressive acidosis, fall in protein of the blood, increased urine Cl, disturbance in the Ca/K ratio in the blood, rise in blood urea and albuminuria. The blood pressure rises to 200 mm. The kidneys show little histologic change.

J. B. BROWN

Changes in the alkali reserve in nicotine poisoning. S. W. WOLTER. *Odessaer Abt. des Ukrainischen Staatsinst. für Arbeitshyg. und Arbeitspathol. Arbeitsphysiologie* 1, 258-70(1928).—Dogs injected subcutaneously with 1% aq. soln. of nicotine gave from 7 to 26% lowering in the alkali reserve in $\frac{1}{2}$ to 1 hr. detd. by the Van Slyke app. Three of 4 women workers in a tobacco factory showed a decrease in the course of 3 hrs. work. In 2 men who smoked 5 and 7 cigarettes (inhaling), resp., in $\frac{1}{2}$ hr. there was a fall after 20 mins. The effects of the nicotine are ascribed to an increased formation of acid intermediary products.

T. M. CARPENTER

Variation of ionic equilibrium as a factor in pharmacological action. II. Calcium and convulsive drugs. L. SEREMIN. *Atti accad. Lincei* 7, 1056-61(1928); cf. C. A. 22, 631.—Rabbits were injected (in the auricular vein) with doses sufficient to produce convulsion of strychnine, nicotine, thebaine, cocaine, narcotine, hydrastine, laudanine, esotone, caffeine, pyramidone, and hydroquinone together with increasing amts. of CaCl_2 till the convulsive action was counteracted.

Substance	G. equiv. $\times 10^4$ /kg. rabbit used	CaCl_2 to prevent convulsion
Strychnine	51	1,270
Nicotine	722	> 163,000
Thebaine	1,340	4,000
Cocaine	2,100	> 344,000
Narcotine	5,890	25,000
Esotone	6,100	4,000
Hydrastine	6,400	75,000
Laudanine	24,500	4,320
Caffeine	39,100	5,300
Pyramidone	43,000	1,000
Hydroquinone	72,700	150,000

300,000 equivs. as above of CaCl_2 will produce death on intravenous injection quickly.

A. W. CONTIERI

Histophysiological and quantitative investigations on guinea pigs and rabbits on injection of lipoidal mixtures. A. BARCHIESI. *Atti accad. Lincei* 8, 419-3(1928).—Rabbits and guinea pigs were given injections for 15 days of totals of 1.5 g. lecithin and 0.6 g. lutein and cholesterol ethers in 37.5 g. serum and the change in wt. of various

organs was measured (comparing with controls of the same age, wt., etc.). The following changes in wt. were noted: liver —18.62, testicles +5.51, kidneys +6.21, stomach —2.12, lungs —5.63, heart +0.37, pancreas +0.76, gall bladder +1.06, brain +4.15, suprarenal glands +21.5%. B. believes that these lipoids from their special chem. nature (biol. catalysts) promote multiple and complex reactions. A. W. CONTIERI

Parenteral quinine therapy with observations on its effect in pulmonary tuberculosis. HARLAN F. NEWTON AND KURT HEINE. Eppendorf Hosp., Hamburg, Ger. *Am. Rev. Tuberculosis* 18, 563-9(1928).—Solvochin (pH 7.2-7.3) is a 25% aq. soln. of quinine in stable form, non-crystd. in the cold, and alk. to litmus. It is rapidly absorbed and eliminated, but it has practically no effect on chronic inflammatory disease of the lungs and bronchi. Transpulmin is a sterile soln. of basic quinine and camphor in ethereal oils, 1 cc. contg. 0.03 grain anhyd. basic quinine and 0.025 grain of camphor. One to 2 cc. may be given daily intramuscularly for 3 to 5 weeks. Parenteral therapy with Transpulmin was tried on 40 selected cases of pulmonary tuberculosis, excluding exudative cases in young and cavity cases. In 28 cases favorable effects resulted with Transpulmin alone and in the remaining 12 combined with tuberculin therapy. Quinine administered parenterally in large amts. is not excreted in clear pleural effusions complicating pulmonary tuberculosis. H. J. CORPER

A study of the adrenaline reaction in tuberculosis patients. W. F. PETERSEN AND S. A. LEVINSON. Univ. of Ill. and Munic. Tuberculosis Sanatorium, Chicago. *Am. Rev. Tuberculosis* 18, 616-25(1928). H. J. CORPER

Composite curves of cardiovascular reactions following adrenaline injections in tuberculosis patients. GEORGE E. DETRANA AND JOHN G. HILLEBRAND. Univ. of Ill. and Munic. Tuberculosis Sanatorium, Chicago. *Am. Rev. Tuberculosis* 18, 626-9(1928). H. J. CORPER

The treatment of pulmonary tuberculosis by antimony. PERCY MOXEY *Brit. J. Tuberculosis* 22, 173-9(1928).—"Collosol Antimonium (Crooke's)" was used in 30,000 intramuscular injections without ill effects. One cc. is given twice weekly. In pulmonary tuberculosis a gain in wt. results and other beneficial results are noted. H. J. CORPER

Increase in novasurol (salyrgan) diuresis by ammonium chloride. PAUL SAXL AND OTTO ERLSBACHER. Med. Univ.-klinik in Wien. *Wiener klin. Wochschr.* 42, 36-7(1929); cf. C. A. 20, 451, 3042; 21, 132.—The use of NH_4Cl is important when novasurol alone is ineffective. D. B. DILL

Pharmacological synergism of stereoisomers. DAVID I. MACHT. *Proc. Natl. Acad. Sci.* 15, 63-70(1929).—This is a preliminary account of expts. on plants and animals with the *dl*- and the *d*- or *l*- stereoisomer showing the synergistic effect of such mixts. The toxic or other effect from a selected dose of the mixed substances was approx. the same as that from an equal dose of the more active isomer. The substances tested include nicotine, epinephrine, camphor, hyoscyamine, hyoscine and the 2 pairs of optical isomers, quinine and quinidine, cinchonine and cinchonidine. Tests were made on cats, rats, rabbits, gold fish and *Lupinus albus* for the toxicity or blood pressure. H. C. HAMILTON

The experimental and clinical action of dodecamethyleneguanidine (Synthalin B). E. FRANK, M. NOTHMANN AND A. WAGNER. Univ. Breslau. *Klin. Wochschr.* 7, 1996-2000(1928).—Synthalin is decamethyleneguanidine. Synthalin B contains more methylene groups in its aliphatic chain than does synthalin. Sugar utilization in diabetics is enhanced about equally by either prepn. Synthalin B is, however, less toxic than synthalin. It is tolerated in cases where synthalin is not tolerated. The first dose of synthalin B usually has no effect upon sugar utilization. Its action is slow and the prepn. increases in effectiveness with repeated administration. The av. dose is 10 mg., 3 times daily. Synthalin B is omitted every fourth day. This dosage leads to the utilization of 30 to 50 g. sugar per day. Ill effects are seldom observed. In all other respects, this prepn. behaves exactly like synthalin. MILTON HANKE

Treatment of gonorrhea with gonoflavine. E. A. BURMEISTER. *Klin. Wochschr.* 7, 2051-2(1928).—Gonoflavine (diaminomethylacridinium chloride) is valuable in the treatment of severe cases of gonorrhea. MILTON HANKE

Changes in the titration acidity of urine after the peroral administration of strontium salts. RUDOLF HUMMEL. *Klin. Wochschr.* 7, 2053-4(1928).—The titration acidity of the urine is increased after the ingestion (human) of 3 to 6 g. $SrCl_2$ or $SrBr_2$. MILTON HANKE

Comparative experiments on the action of insulin and synthalin on the glycogen content of liver and muscle. P. RUBINO, B. VARELA AND I. A. COLLAZO. Montevideo. *S. A. Klin. Wochschr.* 7, 2186-90(1928).—See C. A. 22, 3702. MILTON HANKE

Colonic anesthesia with avertin. WILLIAM F. HONAN AND AUGUST SPIEGEL. *J. Am. Inst. Homeopathy* 22, 7-11(1929).—The narcotic (anesthetic) dose of avertin, $\text{CBr}_3\text{CH}_2\text{OH}$, is 0.1 to 0.15 g. per kg. of body wt., dissolved at a temp. of 40° in sufficient sterile water to make a 3% soln. and administered through a rectal tube into the lower colon. A 5 cc. portion of the soln. must give an orange-red color with 2 drops of Congo red soln.; a blue color indicates decompn. into HBr and CHBr_3CHO . The latter has a severe irritant action on the colonic mucosa. Anesthesia occurs in 5 mins. without a stage of excitement; complete relaxation usually develops in 15 to 20 mins. Otherwise it may be produced by increasing the dose by 0.025 g. or by a few drops of Et_2O . Anesthesia lasts 2 or 3 hrs.; the patient then awakes but usually immediately falls into a sound sleep lasting for 2 to 4 hrs. Slight cyanosis may occur, and the respiration drop to 16 or 18 per min. with a compensating increase in the respiratory vol. The blood pressure is influenced but little. Avertin is eliminated through the kidneys as its glucuronate, and, in traces, in the perspiration, but not in the feces or exhaled air. Overdoses produce marked decreases in blood pressure and even collapse. In animals, the lethal dose is twice the narcotic dose. JOSEPH S. HEPBURN

The use of plasmochine in malaria. A. LICHTENSTEIN. *Geneeskund. Tijdschr. Nederland-Indië* 68, 1002-9(1928).—Plasmochine can successfully combat tertian schizonts, tertian agametes and tropical agametes. In using quinine as well as plasmochine, the patient does not get rid of the fever simultaneously with the parasites. The fever leaves in most cases during the first 2 days, the parasites after 3 or 4 days. I. found that his patients got rid of fever sooner with quinine than plasmochine. Cyanosis caused by plasmochine was only observed with tertian cases. For combating malaria epulmones, plasmochine is not as yet to be recommended. J. C. JURRIJENS

Pharmacological observations on ferrous phosphate. MARIANO MESSINI. *Boll. soc. ital. biol. sper.* 3, 568-71(1928); cf. *C. A.* 22, 4135; 23, 891.—Colloidal $\text{Fe}_3(\text{PO}_4)_2$ was prepared by allowing FeSO_4 to react with Na_3PO_4 and stabilizing with gelatin; the concns. were 0.05 g. colloidal $\text{Fe}_3(\text{PO}_4)_2$ and 10 g. gelatin per l. The salt was injected intravenously into rabbits. The immediate m. l. d. was 0.0048 g. per kg.; the delayed m. l. d. was 0.0008 g. per kg. The symptoms were similar to those observed on injecting FeSO_4 . FeSO_4 was injected into the right jugular vein and Na_3PO_4 was injected simultaneously into the left jugular vein in stoichiometrical proportions. The results were similar to the injection of colloidal $\text{Fe}_3(\text{PO}_4)_2$. Satg. the soln. of Na_3PO_4 with CO_2 before injecting increased slightly the toxicity. The injection of Na_2HPO_4 followed at various intervals by FeSO_4 influenced the toxicity; at 0 time the toxicity was the highest; after 35 mins. it was reduced to the toxicity of FeSO_4 itself. FeSO_4 in small amts. was injected subcutaneously into guinea pigs. After varying periods of time the animals were killed, and H_2S was passed over the tissue at the site of inoculation. FeS was demonstrated. The tissue at site of inoculation was removed and dialyzed. P was demonstrated in the dialyzed tissue. Thus $\text{Fe}_3(\text{PO}_4)_2$ was formed at the site of injection. The results show that Fe salts when injected into the organism form $\text{Fe}_3(\text{PO}_4)_2$. PETER MASUCCI

Acridine derivatives in the treatment of diabetes. OTTO JUL NIELSEN. Staats-hospital, Sønderborg. *Acta med. Scand.* 69, 482-536(1928); cf. *C. A.* 23, 195.—The expts. were undertaken with the view that at least some conditions of diabetes may be of infectious origin. Trypaflavine and then septacrol (an acridine deriv. contg. 22.3% Ag) were used and in some diabetics this chemotherapeutic treatment seems indicated, but not as an adjuvant to other therapeutic measures. S. MORGULIS

Explanation of oligodynamic action. H. FREUNDLICH AND K. SÖLLNER. Kaiser Wilhelm-Inst., Berlin-Dahlem. *Biochem. Z.* 203, 1-13(1928).—A silver plate suspended in cond. water for several days goes into soln., as much as 2×10^{-4} g. per l. being dis-

solved from a piece 40 sq. cm. suspended in 100 cc. H_2O for 3 days. Algae take up Ag from such water, displaying thereby oligodynamic injury. A g. of dry algae contains 5×10^{-1} g. Ag. The effect is due to the presence of Ag ions, exactly as in a soln of $AgNO_3$. Ag ions are adsorbed by the walls of glass containers and may be given up again, for instance, to algae. Quartz does not have this effect on Ag. solns. S. M.

Biochemical properties of pyridine and quinoline derivatives. A. BINZ AND C. RÄTH. Landw. Hochschule, Berlin. *Biochem. Z.* 203, 218-22(1928).—Several arsenic derivs. of pyridine or quinoline were prepd. which manifest the relationship between chem. constitution and biol. action. A 2-hydroxypyridine-5-arsonic acid, in the form of its sol. di-Na salt, has good healing power but its max. dose is remarkably large. The max. tolerated dose is 30 times as great as that of atoxyl or 2.7 times as great as of trypanamide for mice. A 2-hydroxy-5-iodopyridine is another drug with a remarkably high tolerant dose, which unlike the previous prepn. has no effect on trypanosomes but is effective against staphylococci and streptococci. Other preps. were made wherein the OH group was replaced by a halogen (Cl, Br, I) which had no trypanocidal action but high toxicity. On the contrary, where the OH group remained in its position but the halogen was introduced in the ortho position the parasitotropic action increased with the atomic wt. of the halogen. Similar results were obtained with quinoline derivs. Unsubstituted quinoline-5-arsonic acid compds. had no chemotherapeutic action but the carbostyrylarsonic acid derivs. were markedly parasitotropic. S. M.

The effect of various heavy metals on the basal metabolism of guinea pigs. GREGGARD SOSTBERZ AND M. STEUBER. Landw. Hochschule, Berlin. *Biochem. Z.* 203, 385-8(1928).—Venesection and injection of Ringer soln. have no effect upon the basal metabolism. Injection of "Electroferrol" had no influence, but that of Collargol produced a definite rise in basal metabolism of 12% and that of Solganal of 20%. S. M.

Studies on phosphorus poisoning in rabbits. ATUSI HIRUYA. Med. Coll., Nagata J. *Biochem. (Japan)* 10, 63-95(1928).—In cases of mild intoxication the excretion of nitrogenous matter in the urine is somewhat increased, but as the intoxication progresses this decreases, and in very severe cases the total urinary N (after deproteinization) is reduced to one-half. The urea % of total N always decreases and that of NH₃ increases with the degree of intoxication. The non-urea N + ammonia N makes up more than 30% of the total N in the intoxicated animals. Following P injection the S excretion is always increased. In cases of severe intoxication the total S excretion is about normal but the neutral S fraction is greatly increased. The O consumption of the P-poisoned animals is decreased depending upon the degree of injury to the liver. With the progress of the intoxication the non-protein N of the liver increases parallel to the development of its hydropic condition, which is also paralleled by the increase in fatty substance. This, of course, is due to autolytic changes which cause a breaking up of the protein mol. into smaller fragments with the resulting rise in osmotic pressure of the liver cells and attraction of H_2O . The increase in fat content is due to a stagnation of fat mols. coming into the liver cells where their normal transformation is much retarded by the intoxication. The increase in cholesterol and cholesterol esters is likewise ascribed to a stagnation in the poisoned liver. The products of liver autolysis flood the blood stream, but the fat content of the blood remains within normal limits. When the kidney likewise is severely affected by the intoxication the non-protein N of the blood rises to very high values, while the blood sulfate, especially the ethereal sulfate, shows a greater and earlier increase. When the kidney damage is already present the excretion of N in the urine is greatly diminished. The functional damage to the liver is shown by the diminished percentage of urea N. Exptl. evidence is also offered to show that oxidation is more influenced in the qual. than in the quant. aspect.

S. MORGULIS

The inhibiting effect of splanchnectomy on the atropine glucemia. SHIN-ICHI KAWASHIMA AND YOSHIO IWANAGA. Imp. Univ., Tokyo. *J. Biochem. (Japan)* 10, 97-9(1928).—Hyperglucemia induced by atropine is definitely hindered by double splanchnectomy. This fact indicates that the hyperglucemia must be due to central irritation of the sympathetic nerves.

S. MORGULIS

Influence of ergotamine on the blood sugar content. GENTICHIRO EDA. Imp. Univ., Tokyo. *J. Biochem. (Japan)* 10, 101-14(1928).—In persons with a normal carbohydrate metabolism an injection of 0.25 mg. ergotamine never causes a definite lowering of the fasting blood sugar level. In expts. on dogs the injection of larger doses of the drug produces a lowering of the blood sugar 2-3 hrs. after the injection. However, even here the change was not sufficient to justify the conclusion that ergotamine is hypoglucemic in its action. On the contrary, in hyperglucemic diabetics or in depancreatized dogs ergotamine produced a marked lowering of the sugar level.

but it is suggested that this effect was really due to inanition. Alimentary hyperglucemia in non-diabetics is often inhibited after the injection of 0.25 ergotamine. In diabetics 0.3–0.5 mg. ergotamine inhibits more or less definitely the alimentary hyperglucemia. This effect, however, is frequently assocd. with unpleasant reactions. It is doubted if ergotamine should be considered an antidiabetic drug. S. M.

Studies in comparative biochemistry. IV. Behavior of aminobenzoic acid in the body of low animals. TERUMI KAMEI. Med. Coll., Nagasaki. *J. Biochem. (Japan)* 10, 189–95(1928).—In frogs feeding of 3 isomers of aminobenzoic acid regularly leads to the excretion of 20% of the unaltered acid in the urine. All attempts to find uraminobenzoic or aminohippuric acid were futile. In turtles the *o*-compd. is easily transformed and only 3% appear unchanged in the urine, while the *m*- and *p*-compds. behave just as in the frog. It is yet to be detd. whether the *o*-compd. forms a glucuronate in the turtle. S. MORGULIS

The combined action of potassium and bromine on the central nervous system of cold-blooded animals. A. A. LJUBUSCHIN. 2nd State Univ., Moscow. *Zhurnal ekspl. Biol. Med.* 10, 255–60(1928).—CaBr₂ has a greater inhibitory effect on the central nervous system than KBr or NaBr but is not as active as CaCl₂. S. MORGULIS

Influence of the actual reaction on the action of certain poisons. A. A. LJUBUSCHIN. 2nd State Univ., Moscow. *Zhurnal ekspl. Biol. Med.* 10, 277–83(1928).—The effect of strychnine on the central nervous system increases with alk., whereas a shift toward the acid side slows down the convulsions. A Ringer soln. of *pH* 7.8 contracts and of *pH* 6.4 dilates the vessels. The vasodilator action of caffeine is increased at *pH* 6.4 and diminishes at *pH* 7.8. Ringer soln. of *pH* 7.8 stimulates and of *pH* 6.4 inhibits the isolated frog heart. Strophanthin acts more strongly in the alk. than in the acid soln. S. MORGULIS

Action of sinigrin. C. MLADOVEANU. *Compt. rend. soc. biol.* 99, 747–9(1928).—Sinigrin (sinigroside, K myronate) is a hypertensive and non-toxic substance. L. W. RIGGS

Absorption rate of cocaine hydrochloride when injected subcutaneously into rabbits. HAKAN SANDQVIST AND WALDEMAR HÖK. *Svensk. Farm. Tid.* 32, 649–55(1928).—The animal was killed after a stated time (0–120 mins.) and the tissues adjacent to the points of injection (2) were removed and macerated. These samples were soaked in 96% EtOH for 12 hrs. and extd. 4 times with fresh alc., the residue being sepd. each time by centrifugation at 3000 r. p. m. The alc. was distd. at reduced pressure and the ext. taken up with 5 *N* HCl. The protein (and some fatty matter) was pptd. by adding 2 g. (NH₄)₂SO₄. The clear deproteinized fluid was extd. with CHCl₃, then neutralized with 2 *N* NaOH and the free alkaloid extd. with CHCl₃. When the cocaine was recovered in this way it came to 112–120% of the amts. known to be present when weighed but if the ext. was taken up with standard acid and titrated with 0.01 *N* NaOH [Me red + Me blue indicator] the recovery was 96–102%. The resorption of cocaine injected subcutaneously into rabbits is essentially a diffusion phenomenon, a monomol. reaction, and the rate is directly proportional to the concn. of the alkaloid in the solns. injected. A. R. ROSE

The behavior of sodium salicylate in the organism of the horse. ALESSANDRO BALDONI. Univ. Bari. *Biochim. terap. sper.* 15, 293–8(1928).—Twenty-five g. of *o*-HOOC₆H₄CO₂Na were given to each of 4 horses. The urine eliminated during the first 24 hrs. was collected, concd. and after acidification with H₂SO₄, its content of *o*-HOOC₆H₄CO₂H (I) and salicylic acid (II) was detd. quantitatively. The sepn. of the 2 acids was performed with the method used in former expts. (C. A. 9, 214). The amts. of II expressed in terms of I were more than twice as high as the amts. of I excreted as such. G. SCHWOCH

Emetic action of tervalent and quinquivalent antimony. ROSSARIO SATULLO. Pharmacol. Inst., Palermo. *Biochim. terap. sper.* 15, 338–51(1928).—The prepn. of OSbO₃CCHOHCHOHCO₂K (I) (cf. E. Meneghetti, *Minerva Medica* 8, 107 (1928)) has made possible a really exact comparison of the emetic action of Sb⁺⁺⁺ and Sb⁺⁺⁺, on account of the very similar structure of I and OSbO₃CCHOHCHOHCO₂K (II). Dogs were used. II has an emetic action about 50–100 times as strong as that of I. In further expts. S. showed that this effect is not due to a specific influence of Sb⁺⁺⁺. A soln. of II does not ppt. ox serum, while a soln. of I, which is more acid, gives a ppt. Solns. of II slightly acidified with HCl pptd. the serum and so did solns. of II adjusted by addn. of KOH to approx. the same *pH* as had the solns. of II contg. HCl. S. concludes from these expts. that solns. of I and II having the same *pH* also have the same pptg. action on proteins. This does not explain the difference in the emetic effect of I and II. Since in contrast to Sb⁺⁺⁺, a soln. of Sb⁺⁺⁺ gives a ppt. (SbOCl) upon

adding HCl to a concn. equal to that present in the dog stomach, and SbOCl administered to dogs produces vomiting. S. explains the different behaviors in the following way: Sb^{+++} when introduced into the stomach is pptd. as SbOCl, which is deposited on the gastric walls. In the immediate vicinity of these deposits, a strong Sb^{+++} concn. is created, which together with a strong H-ion concn. produces in the proteins of the gastric walls the chem. and physico-chem. changes that by irritation of the nerve-endings induce vomiting.

G. SCHWOCH

A case of poisoning produced by a shoe polish. ALESSANDRO JELMONI. Ospedale Maggiore, Novara. *Giorn. farm. chim.* 78, 10, 13-4(1929).—A 6 months' old child fell ill, showing symptoms of poisoning. The polish used for the child's shoes was found to contain EtOH denatured with MeOH, $PhNH_2$, tar and tar coloring matter. It is assumed that $PhNH_2$ was the cause of the poisoning.

G. SCHWOCH

Composition of the blood and cholesterol therapy. ENRICO DI POGGIO. Hosp. "Gustavo Morvillo" Naples. *Rass. clin. terap. sci. affini* 27, 323-40(1928).—In pernicious and other kinds of anemia, good results were obtained with the cholesterol therapy. When injecting *Coleolo Sero*, which is cholesterol oleate, for a longer period of time, the no. of erythrocytes and the hemoglobin increased, and the other constituents returned more or less to the normal level. The general condition of the patients was much improved.

G. SCHWOCH

The graphic method in studying the healing of wounds. A. CHIASSERINI AND L. FERRETTI. Univ. Rome. *Rass. clin. terap. sci. affini* 27, 384-407(1928).—A new, brief method for detg. the area of wounds is described. Periarterial sympathectomy of the femoralis did not accelerate the healing of wounds in the corresponding limbs of dogs and rabbits. Insulin when applied as an ointment of the compn. 0.25 g. ZnO, 7.50 g. lanolin, 15 g. vaseline and 5 cc. of insulin accelerated the healing; *Oncobasi* (Sero) had a similar effect.

G. SCHWOCH

Effect of parenterally introduced stimulating agents. I. Intravital decomposition of protein in the liver of the sensitized animal. R. WIGAND. Med. Klin. Königsberg. *Arch. expil. Path. Pharmacol.* 132, 1-17(1928).—Sources of error inherent in the method render it of questionable value for the purpose indicated. II. Biological action of parenterally introduced amino acids. *Ibid* 18-27.—Of the 11 amino acids tested tyrosine manifested a biol. action, in character resembling that assocd. with digestion products of *B. typhosus*. Apparently activity is related to the presence of the benzene ring although the latter is not solely and directly responsible. III. Histological changes in the liver. *Ibid* 28-30.—Following the subcutaneous injection of horse serum into specifically sensitized guinea pigs the liver parenchyma contained an abundance of cells undergoing mitosis.

G. H. S.

Treatment of acute intoxication by morphine. ERNST JOEL. Städt. Krankenhäuser Moabit, Berlin. *Arch. expil. Path. Pharmacol.* 132, 63-76(1928).—Atropine is of questionable value in the treatment of morphine intoxication, but lobeline exerts an effect upon the respiratory app. which shows the antagonism between morphine and lobeline.

G. H. S.

Protracted intravenous infusion of mice, rats and rabbits. HEINRICH K. KUNSTMANN. Univ. Würzburg. *Arch. expil. Path. Pharmacol.* 132, 77-83(1928).—With the app. described 2% gum arabic-Ringer solns. have been perfused, without the development of edema, for as long as 15 days.

G. H. S.

Effect of experimental phosphorus poisoning upon the digestive enzymes of the blood. M. FRHR. V. FALKENHAUSEN. Univ. Breslau. *Arch. expil. Path. Pharmacol.* 132, 106-17(1928).—Following P poisoning there is a very marked increase in the diastatic action of blood serum, a change in no way referable to an altered activating mechanism, to interference with urinary excretion, or to the appearance of bile in the blood stream. Since P poisoning exerts a like effect in depancreatized dogs, the pancreas is obviously not involved. It would seem that the liver is the organ concerned in the increased elaboration of diastase. The lipolytic action of the serum diminishes during P poisoning.

G. H. S.

Changes induced in the purine metabolism by insulin and synthalin. GERT TAUBMANN. Univ. Breslau. *Arch. expil. Path. Pharmacol.* 132, 124-8(1928).—Dogs given large doses of insulin exhibit an increased excretion of purines, which is quite independent of the changes in total N. By synthalin administration the allantoin is markedly increased.

G. H. S.

Combinations of soporifics. KARI, STEINMETZER. Univ. Wien. *Arch. expil. Path. Pharmacol.* 132, 172-92(1928).—A somewhat enhanced effectiveness was exhibited by mixts. of paraldehyde, chloral hydrate, veronal, chlorotone and luminal. Combi-

nations of agents acting upon the brain stem with those acting on the cortex showed a diminished toxicity.

Pharmacology of hydrocyanic acid in cold-blooded animals. I. Role of the pulmonary and skin respiration in changes in color of the venous blood after hydrocyanic acid intoxication. VLAD. M. KARASSIK. Leningrader Med. Inst. *Arch. expul. Path. Pharmacol.* 132, 193-204(1928).—The effect of injected NaCN upon the color of the blood is markedly influenced by the facilities for respiration. With functioning pulmonary respiration small doses of NaCN act effectively and promptly; with the pulmonary respiration excluded much larger doses are necessary to cause a comparable effect, and the change occurs more slowly. II. Influence of some physical and pharmacological factors on oxidation processes in hydrocyanic acid intoxication. *Ibid* 205-13.—Temp. modifies the reaction.

Pharmacology of narcosis: Narcotic breadth. L. LENDLE. Univ. Leipzig. *Arch. expul. Path. Pharmacol.* 132, 214-45(1928).—The higher alcs. are eliminated most quickly, and with them death takes place more promptly than with those alcs. which are eliminated more slowly. With the higher alcs. death is due to a primary toxicity, with the lower to secondary injurious effects. With the more slowly eliminated alcs. the quotient expressing the breadth of narcosis is greater than with the higher forms. In the alc. series primary toxicity increases with the length of the C chain. With mixts. of alcs. the quotient is not materially changed. With most of the alcs. the quotient of breadth of narcosis was 1.8, with propyl alc. 2.2, with avertin by either intraperitoneal or rectal administration about 1.7.

Effect of morphine upon blood vessels, in particular upon those of the lungs. A. LUISADA. Univ. Wien. *Arch. expul. Path. Pharmacol.* 132, 296-312(1928).—See C 1 22, 3231.

Pathogenesis and therapy of pulmonary edema and of asthma cardiale. A. LUISADA. Univ. Wien. *Arch. expul. Path. Pharmacol.* 132, 313-29(1928).—Adrenaline injected intravenously into rabbits produces an exptl. pulmonary edema, but this effect can be modified by treatment with substances which exert an effect upon the respiratory center. Thus, morphine is inhibitory; cardiazole, narcotine and caffeine favor the development of edema. Other substances, such as chloral hydrate, chloretone, papaverine, luminal, paraldehyde and pituitrin are also inhibitory. Further evidence of the influence of nervous mechanisms upon the production of pulmonary edema is afforded by the fact that section of the cervical cord is inhibitory. Substances, such as hypertonic sugar solns. and CaCl₂, which alter the permeability of the capillaries tend to aggravate the edema.

Mechanism of purine diuresis in dogs and its relation to water and salt exchange. A. M. PREOBRAZHENSKII. Veterinär-Inst. Charkow. *Arch. expul. Path. Pharmacol.* 132, 330-48(1928).—When the intake of fluid is reduced the administration of caffeine or theobromine modifies somewhat the excretory equil., both as to total amt. of urine excreted and the abs. amt. of NaCl excreted. Increased excretion induced by caffeine is not uniform or regular, but with theobromine diuresis is a const. effect and NaCl is increased. With a high fluid intake caffeine and theobromine exert effects detd. by the nature of the fluid ingested. With distd. water caffeine always increases urine output and Cl excretion, and the Cl of the blood is increased. Under like circumstances the effect of theobromine is less uniform and although Cl excretion is increased the blood Cl remains within normal limits. With isotonic solns. ingested caffeine causes a very prompt increased urine excretion with augmented NaCl content. NaCl in the blood is below normal. Similar, though less pronounced, changes follow the injection of theobromine. If the fluid intake is a hypertonic soln. the total output of urine is less than when distd. water is given, but the NaCl of the blood and urine are higher than under the other conditions.

Effect of thyroid upon the action of vegetative poisons. ERWIN SCHLIEPHAKE. d. Klin. Jena. *Arch. expul. Path. Pharmacol.* 132, 349-64(1928).—Simultaneous records of blood pressure and electrocardiograms showed that changes in the irritability of the vegetative organs were induced by choline and suprarenine. In dogs deprived of thyroid suprarenine reduced the irritability of the sympathetic, while the effects of choline were definitely increased, as was evidenced by its effect on the respiratory center. Normal conditions were in a measure restored by prolonged feeding of thyroid preps.

Pharmacology of some pyridylpyrroles and some compounds of 2-aminopyridine. ELIZABETH DINGEMANSE AND J. P. WIRAUT. Univ. Amsterdam. *Arch. expul. Path. Pharmacol.* 132, 365-81(1928).—The toxic action of 2-aminopyridine is outspoken, invariably causing convulsions when large doses are given. Prior to the onset of the

convulsive attacks manifestations of paralysis and loss in reflexes occur. In spinal cats the blood pressure is increased. The Ac deriv. causes similar effects in frogs, and large doses induce a cataleptic condition. Urethan and dibenzoyl combinations are less active, while pyridylpyrrole and the corresponding nicotyrine are effective much as is 2-aminopyridine. All of the pyridylpyrroles are anesthetizing, being more effective than cocaine. The effect on blood pressure is variable. 2-Aminopyridine always increases the blood pressure. Differences are manifest between the effects of the isomers of C-(2-pyridyl)-pyrroles, while the differences between the C compds. and its corresponding N-(2-pyridyl)-pyrrole are not marked. The N-methyl compds., the so-called nicotyrine, behave like the C-pyrroles. The action of 2-aminopyridine is weakened by the introduction of an acetyl or urethan group. 3-Aminopyridine affects frogs much as does the 2-compd. β -Nicotyrine or 3-pyridyl-N-methyl-2-pyrrole reduces blood pressure in cats, causes convulsions, and in large doses cardiac arrest. G. H. S.

Influence of pituitary (posterior lobe) substance on urine formation. KANEKI KISHI. Tokyo Imp. Univ. *Proc. Imp. Acad. (Japan)* 4, 244-7(1928).—The changes in urine output caused by the injection of pituitary (subcutaneous as well as intravenous) shows 4 stages: Antidiuretic and diuretic (which are of vascular nature) and the same 2 stages repeated. The total output of urine throughout the 4 stages is less than the original amt., i. e., an inhibition of the function of the kidney. The intrinsic and essential action of pituitary substances on the urine formation displays its real role in the 3rd stage (antidiuretic) due to the rise of a "H₂O-threshold" in the glomerular membrane. Urethan obscures the 3rd stage more than chloralose. The nature or mechanism of the 4th stage (diuretic) cannot be detd., whether it is due to the direct action of the prepn. or simply to the relaxation of the diuretic action of the 3rd stage. The pituitary substances possibly contain more than 1 active principle. C. J. W.

Studies of the pharmacological reaction of the veins. II. FUMIO SETA. Univ. Kyoto. *Folia pharmacol. japon.* 6, 205-21(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 839.—Continuing earlier work, S. studied the effect of 0.01 and 0.1% solns. of various pharmaceuticals on the marginal vein of the rabbit (Auitischkow's method) and the abdominal vein of the frog (S.'s method). Pilocarpine had no dilating action on both these veins, atropine practically none and scopolamine only a very slight action. Acetylcholine caused a rather marked constriction and physostigmine an even more intense constriction of the same two veins. Antipyrine, acetanilide, quinine and aconitine markedly dilated the veins; Na salicylate caused only a slight contraction in the rabbit's vein. Cocaine, eucaine-B, novocaine and alypine, all members of the cocaine group, relaxed the tonus of the veins; tropacocaine had no action. Chloral hydrate, veronal, sulfonal and neuronal widened both veins. Ethyl urethan provoked a vasodilation which was clear only in the vein of the frog. R. C. WILLSON

The pharmacological reaction of the gall bladder. JUNKICHI TOYOSHIMA AND TSURUMAKI RYUTARO. Imperial Univ., Kyoto. *Folia pharmacol. japon.* 6, 222-31(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 835.—When strips of the gall bladder of the calf are suspended in Locke soln. contg. serum of the calf, they show spontaneous movements after a certain time. Pilocarpine and acetylcholine always exert an exciting action on the strips, while atropine apparently has no effect. The action of adrenaline is not uniform, being partly exciting, partly paralyzing. Ba always excites, while papaverine and pituitrin always paralyze. Morphine at best has only a very slight exciting action. R. C. WILLSON

The cardiac action of ergotoxine. YOSHIO ODA. *Folia pharmacol. japon.* 6, 263-70(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 137.—Small amts. of ergotoxine (0.0001-0.0005%) produce an insignificant increase in the contraction of pieces of frog heart. Larger quantities of ergotoxine effect a reduction in contraction. Strophanthin is an antagonist to this action, but adrenaline is inactive. Acetylcholine and pilocarpine are synergists. R. C. WILLSON

The influence of opium on the carbohydrate metabolism. ARATA NOMA AND SASAI SHOICHI. Univ. Okayama. *Okayama-Igakkai-Zasshi* 39, 1092-100 (1927); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 69.—The action of several alkaloids on the sugar of normal rabbits was studied. Tincture of opium in subcutaneous doses of 0.5 cc. per kg. daily for 4 days caused a slight hyperglucemia in many animals on the first day; later the increase in the blood sugar varied and the hyperglucemia produced by the oral or rectal administration of sugar was clearly reduced. The sensitivity of the animal to insulin was reduced by opium. Liver glycogen decreased. Larger doses of opium (0.75-1.0 cc.) caused a definite hyperglucemia. Atropine had no effect on the blood sugar. Gynergen alone or in combination with atropine reduced the blood sugar somewhat. Gynergen suppressed the hyperglucemia produced by adrenaline. R. C. WILLSON

The peripheral action of yohimbine. MASASHI YAMAUCHI. Univ. Okayama. *Okayama-Igakkai-Zasshi* 39, 1789-1803(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 141.—Yohimbine in small amts. has a vaso-constricting action on the isolated uterus, the tubes, round ligament, vaginal wall and urinary bladder. In certain organs and in different proportions in the different organs, yohimbine and adrenaline are antagonistic. The action of adrenaline is in certain organs either reversed or allayed by yohimbine. Pilocarpine and Ba were not altered in their action by yohimbine. R. C. W.

Experimental studies of the conduct of the leucocytes against different artificially applied irritants. IV. **Studies with different inorganic substances.** Y. MATSUNAMI. Univ. Okayama. *Okayama-Igakkai-Zasshi* 39, 1890-1901(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 215.—Continuing earlier studies M. shows that the leucocytes react quite strongly against chem. irritants and that after the injection of metals (Au, Ag, Cu, Fe, Pb) the neutrophiles and eosinophiles increase to a greater extent than do the lymphocytes. The blood cells also react against alkalies, particularly the neutrophiles and eosinophiles. Against acids the lymphocyte reaction is strongest; against salts, the eosinophile one. R. C. WILLSON

Studies of the active constituent of Rhododendron hymenanthus Makino, "Rhodotoxin." I. **Chemical investigation and general pharmacological action.** MAKATO MAKINO. Univ. Okayama. *Okayama-Igakkai-Zasshi* 39, 2099-2112(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 720.—From the leaves of this plant M. isolated a cryst., neutral, N-free substance, rhodotoxin, $C_{31}H_{51}O_{10}$, m. 245° . It is very toxic. In frogs, mice and rabbits the toxin produces a depression and motor paresis. In cats and dogs nausea, vomiting and diarrhea appear. Finally in all the animals there are signs of poisoning and death follows through respiratory paralysis. R. C. WILLSON

The toxic action of ethyl alcohol on the blood vessels. V. GRABOVSKAJA-SCERBOVA. *Russ. Fisiol. Zhurnal* 9, 223-40(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 833.—The studies were made on the ears of freshly killed healthy rabbits. The ears were perfused at room temp. for 1-4 hrs. with Ringer's soln. under a pressure of 57 cm. H_2O and then the reaction of the vessels to adrenaline soln. (1:5-10 million) was detd. Then the ears were treated with alc. of a known concn. for a definite time and thereafter the adrenaline reaction was again detd. The studies showed that alc. concns. which can circulate in man are without influence on the ability of the vessels to contract under the action of adrenaline even though the procedure be of long duration. Only very long treatment with high concns. of alc. (8-12%) annuls the action of adrenaline. Alc. contg. small quantities of formalin has a much more toxic action than pure alc. No specific toxic effect on the smooth musculature and the sympathetic nerve endings in the blood vessels need be ascribed to alc. R. C. WILLSON

Narcosis with avertin (E 107) and its influence on the serum-calcium in the dog. HANS STIASNY. Tierartzl. Hochschule, Berlin. *Tierartzl. Rundschau*, 33, 871-5(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 714-5.—A rectal dose of avertin (tribromoethyl alc.) (0.8 g. per kg. and later 0.2 g. per kg., in olive oil) produces a good narcosis. In this condition, the serum Ca, detd. according to the method of Waard, decreases 7-13%. This is in accordance with the action of other anesthetics of the fatty series, as shown by Cloetta. Intraperitoneal administration of avertin was not studied. R. C. WILLSON

The influence of urotropine on autolysis. A. TRUFANOV. *Zhurnal exptl. Biol. Med.* 8, 582-90(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 114.—The checking of autolysis observed after urotropine administration in acid reactions is assigned to the action of $HCHO$ formed by disocn. In alk. reactions certain concns. (0.025%) of urotropine increase the intensity of the autolysis, while higher and lower concns. have an inhibiting effect. After the administration of urotropine the post-mortem autolysis of the liver in alk. reaction increases in comparison to the controls. R. C. WILLSON

Biochemical studies on pityrol (KOMATSU) 10. Review of pharmaceutical and pharmacological chemistry (BERLINGOZZI) 17.

12—FOODS

F. C. BLANCK AND H. A. LEPPER

The determination of formaldehyde in foods. F. CHERICI. *Ann. chim. applicata* 18, 504-8(1928).— CH_2O can be detected in foods as follows: Place 10 cc. H_2SO_4 (pure) in a test tube and add the substance under examn. (decolorize wine, etc., with bone black and take 20 cc.; take beer as it is; for meat, butter, sirups, jellies, etc., ext.

about 20 g. with boiling water, filter and use in the test). Then add 0.2 cc. EtOH (5%) soln. of gallic acid and partially mix the liquid. In the presence of CH_2O there results an emerald green band at the border of the liquids, with a blue band below it. This reaction will detect 1 part in $1/2$ million of CH_2O whereas $1/10,000$ is necessary as a preservative. None of the other preservatives gives a similar reaction, and while sugars give a light green band with a warm soln., when cooled they do not give any coloration. This is, therefore, a characteristic reaction.

A. W. CONTIERI

Report on cereal products to the association of Official Agricultural Chemists. J. A. LÉCLERC. Bur. Chemistry and Soils, U. S. Dept. of Agr. *Cereal Chemistry* 6, 78-83(1929).—This report includes the recommendations of the Referee and the action of the Association on Cereal Products including flour, baked cereal products and alimentary pastes.

L. H. BAILEY

Chemical composition and fertilizer needs of Italian rice. L. BORASIO. *Giorn. Riscultura* 18, 10(1928); *La Chim.* 4, 23-4(1928); cf. *C. A.* 22, 829, 1633.—Analysis of several Italian rices gave: humidity 11.40-15.08%, raw fat 1.42-2.13%, raw proteins 6.80-8.20%, ash 3.20-4.87%, raw cellulose 7.40-9.84%, non-N extractive substances 62.85-68.31%; the ash contains SiO_2 2.10-3.44, K_2O 0.25-0.32, Na_2O 0.09-0.13, MgO 0.15-0.23, sulfuric anhydride 0.04-0.07, phosphoric anhydride 0.58-0.71, CaO 0.04-0.09 for 100 parts rice. A good cultivation yields 7500 kg. of rice per hectare and 7500 kg. rice straw, extg. 122.25 kg. N, 75 kg. phosphoric anhydride, 93.75 kg. K_2O , 62.25 kg. CaO and 36 kg. MgO , requiring theoretically 596 kg. $(\text{NH}_4)_2\text{SO}_4$ (20.5% N), 500 kg. perphosphate (15% P_2O_5), 234 kg. K_2SO_4 (40% K_2O) and 62 kg. CaO . Less of the 1st is necessary as the grounds are rich in N (1.10-1.55 per 1000); the irrigation waters contain N, and cow dung is used, with strengthening cultivations. The quantity of K and phosphoric anhydride is not excessive as the irrigation waters are poor. The CaO is below the real need. The rice fields are acid, and must be neutralized, an excess of CaO being used for favoring the life of microorganisms, for the decompn. of org. substances and for the reduction of org. N into NH_3 , for eliminating harmful salts and for liberating K from clay. For satg. acidity 800-1000 kg. CaO are needed per hectare every 3-4 years; with argillous earths more.

R. SANSONE

Moisture in combined wheat. A. DAANE. Okla. Agr. Expt. Sta., *Bull.* 183, 1-15(1928).—Moisture is the most important single factor in the grade and condition of wheat. Excessive H_2O content may be due to immaturity, low places in the field, thick stands, lodged grain, rain and dew, high atm. humidity and weeds. Wheat contg. over 14 to 14.5% H_2O is likely to give trouble during storage.

C. R. F

The peptization of wheat-flour proteins by inorganic salt solutions. R. A. GORTNER, W. F. HOFFMAN AND W. B. SINCLAIR. Univ. of Minnesota. *Cereal Chemistry* 6, 1-17(1929).—There is a great variability in the amt. of protein that can be extd. from a given wheat flour by various solns. of equiv. ionic concn. There is an equally striking variability of the proteins of individual flours toward a single salt soln. The amt. of protein peptized by a single salt soln. will vary 100% in the extreme ranges for the various flours studied. These differences are not dependent upon the H-ion concn. but are detd. by (1) the ease of peptization of the proteins in a particular flour and (2) the specific properties of the particular anions and cations present in the salt soln. used. The salt-sol. protein fraction does not represent a mixt. of albumin and globulin, nor does it represent the non-gluten proteins. Some salts ext. only a part of the non-gluten proteins, whereas others ext. very appreciable amts. of the gluten proteins. Thus, 1.0 N KF exts. an av. of 69% of the non-gluten proteins, whereas an equiv. concn. of KI exts. 340%. The peptization of the wheat-flour proteins by inorg. salt solns. reveals the same sort of differences as does peptization with acid or alk. solns. It is believed that these differences are assocd. with the colloidal properties of the wheat-flour proteins which in turn are dependent upon heritable differences of the wheat varieties and upon environmental conditions under which the wheat was grown or that are involved in the subsequent harvesting and storage of the grain.

L. H. B

Relation of quantity of sodium sulfate to time of digestion in protein determination. C. G. HARREL AND J. H. LANNING. Bakeries Service Corporation, Jamaica, N. Y. *Cereal Chemistry* 6, 72-8(1929).—The weight of Na sulfate used in the protein detn. is a vital factor. For a given heat source, the time required for complete digestion can be varied by changing the ratio of Na sulfate to acid. Low-protein detns. can often be explained by failure to use sufficient sulfate when digesting with a given heat source and time interval. Data from a large no. of analyses prove the desirability of using a larger quantity of Na sulfate if Cu is the catalytic agent than if Hg is used.

L. H. BAILEY

Flour color tests. D. W. KENT-JONES AND C. W. HERD. Messrs. Woodlands,

Ltd., Charlton Green, Dover, England. *Cereal Chemistry* 6, 33-50(1929).—The observation of Visser't Hooft and de Leeuw that the Kent-Jones and Herd numerical method for the estn. of the color of flour gives results not in agreement with the Duboscq colorimeter was confirmed by the authors. The suggestion of Visser't Hooft and de Leeuw that this was due to a change of H-ion concn. of the soln. used for comparison because of the varying amts. of standard soln. used was found to be wrong; it is suggested that the discrepancy may be due to certain absorption effects of red and yellow light. To obviate the possible varying absorption caused by the Cochromate mixt., it is suggested that an acid chromate soln. be used, as apparently the absorption effects of chromate and dichromate ions are more nearly similar. For practical purposes, however, it is suggested that the numerical standard given by Kent-Jones and Herd (1927) is more useful. Little confirmation could be found of the criticism advanced by Visser't Hooft and de Leeuw concerning the extn. method employed in obtaining the alk. MeOH exts. Confirmation was obtained of the Visser't Hooft and de Leeuw statement that the colorimeter designed by Kent-Jones and Herd is less tiring to the eye than the Duboscq, and that this results in a closer agreement being obtained by various observers with this colorimeter than with the Duboscq.

L. H. BAILEY

Relation of hydrogen-ion concentration and buffer value to the baking quality of flour. I. E. A. FISHER AND P. HALTON. Research Assoc. of British Flour-Millers, St Albans, England. *Cereal Chemistry* 6, 18-33(1929).—With the two flours studied, a patent well known to English bakers, and a straight (72% extn.) imported from Canada, H-ion concn. was a factor of little importance in bread making and contributed little or nothing to loaf quality. With the patent flour, the fermentation was slightly hastened by the increased H-ion concn. of the dough, but this effect was not observed with the straight-run flour. The effects noticed as directly due to increased H-ion concn. were on dough toughness and on loaf flavor (taste), and even these effects were only pronounced with large increases, e. g., a fall of 0.80 in p_H . Acid solns. are produced during fermentation; after prolonged fermentation the smell of the dough or of the loaf is very "strong" and typically "acidic" in character. The observed ill effects on dough and on loaf quality cannot, however, in the light of the expts. described above, be due either directly or indirectly to the small increase in H-ion concn. actually observed. Many other chem. and colloid changes go on in a fermenting dough and all of them doubtless contribute something to the final product. Many of these changes must be of far greater importance as regards their effects on dough and loaf quality than any small change of H ion could ever be.

L. H. BAILEY

Effect of dry skim milk on the fermentation and hydrogen-ion concentration of doughs. J. L. ST. JOHN AND C. H. BAILEY. Agr. Biochemistry, Univ. Farm, St. Paul, Minn. *Cereal Chemistry* 6, 51-9(1929).—Production of total gaseous CO_2 in yeast-leavened doughs was increased when dry skim milk was superimposed upon the control formula. In this particular, its effect was greater than that of the fluid skim milk with which it was compared. Loss of gaseous CO_2 from such doughs was increased somewhat when dry skim milk was included in the formula. Rate of increase in the vol. or displacement of yeast-leavened doughs was practically the same, whether or not dry skim milk was included in the formula. Buffer action of dry skim milk was appreciable, as shown both by the initial H-ion concn. of the freshly mixed doughs and by the relative rate of change (in p_H) of control and milk-contg. doughs. In view of the observed accelerated fermentation rate in the presence of dry skim milk, it is possible that the greater stability of doughs contg. this material may be the consequence of the lower change in H-ion concn.

L. H. BAILEY

A method of measuring color in bread. EMILY GREWE. Bur. Dairy Industry, U. S. Dept. of Agr., W. K. Marshall, City Baking Co., Baltimore, Md., C. G. Harrell Baking Service Corp., Jamaica, N. Y. *Cereal Chemistry* 6, 60-8(1929).—A psychological method devised by A. H. Munsell, by which color is measured directly by the eye, is applied to testing the color of bread. The 3 attributes, hue, brilliance and chroma, are the basis of this system. The color of an object is measured by spinning 2 or more disks on a motor shaft at a high enough speed to resolve the colors of the disks into a single color. When the disks are placed on the shaft, they are overlapped by means of a slit so that parts of each disk are exposed at the surface. The proportion of the different colors of the visible portion may be adjusted until there is a perfect match between the object under test and the rotating disk. Color of crust and crumb of bread may be measured by means of this system.

L. H. BAILEY

A practical method of photographing bread. W. L. HEALD. The Larabee Flour Mills Co. Lab., Kansas City, Mo. *Cereal Chemistry* 6, 69-71(1929).—The app. con-

sists of a Sept camera mounted in a fixed position, two 9-in. Al reflectors, which focus the light from two 400-watt lamps upon the loaf, giving the same intensity of light each day regardless of natural light. The machine uses 35 millimeter neg. films with 250 exposures to the roll (17 feet of film) operating on a strong spring, and takes individual pictures. The cost of the roll ready to put into the camera is \$1.00. The developing and printing cost is \$4.20, making a total of \$5.20, or about 2 cents per print. An enlarger has been used in connection with the camera and exceptional results were obtained. The grain structure and general appearance are magnified to about the true size of the loaf. This brings out everything except the crumb color.

L. H. BAILEY

The inorganic constituents of milk. NORMAN C. WRIGHT, Hannah Dairy Res. Inst., Scotland, AND JACOB PAPISH, Cornell Univ. *Science* 69, 78(1929).—Spectrographic analysis of samples of cow milk from various parts of the U. S. and of Great Britain were made. The samples were milked into glass bottles, evapd. to dryness either in SiO₂ or Pt dishes and ashed at low temps. in a muffle furnace. Spectrograms of the ash were prep'd. with the aid of a quartz spectrograph by placing the ash in an arc between 2 pure graphite electrodes. Examns. were made between λ 2400 and 4600 Å. U. "Elements not previously identified but now found to be present in small but definite traces" were Si, B, Ti, V, Rb, Li and Sr. More than the usual amt. of Cu was found in a sample of dried milk. More than the usual amt. of Zn was found in a sample obtained from cows pasturing in the neighborhood of Zn smelters. J. A. K.

The treatment of milk by the process of V. V. Winter. V. V. WINTER, *Casopis Československého Lékárnicka* 8, 126-30(1928).—W. discusses the changes in compn. of milk brought about by partial or complete freezing. By fractional melting of frozen milk or by the addn. of lactose to certain portions of frozen milk, cow milk can be made to approach the compn. of human milk.

WILLIAM J. HUNSA

Methylene blue for the milk reductase test. D. W. STEUART, *Analyst* 53, 532 (1928); cf. *C. A.* 23, 215.—The use of a 0.02% soln. of pure methylene blue is advocated

W. T. H.

Relations of temperature and time of forewarming of milk to the heat stability of its evaporated product. E. F. DEYSHER, B. H. WEBB AND GEORGE E. HOLM, Bur. of Dairy Industry, U. S. Dept. Agr. *J. Dairy Sci.* 12, 80-9(1929).—Temps. up to 70° applied for 10 mins. decrease the heat stability of evapd. milk, while higher temps. increase it, if the milk is of good quality. Longer periods of forewarming at 95° also increase stability of good milk. Either process affects the body of the milk, making it impracticable. Homogenization of evapd. milk at pressures up to 4000 lb. per sq. in. has little effect. Heat stability was det'd. by the time required for coagulation at 120°.

AMY LEVESCONTE

Heat-resistant and heat-loving bacteria in their relation to the pasteurization of milk. ROBERT S. BREED, N. Y. Agr. Expt. Sta., *Bull.* 559, 1-19(1928).—About 20 species of thermophilic bacteria occurred in abundance in pasteurized milk. Their source is dust and dirt, dirty milk cans and animal hair and manure. During the pasteurization process the non-spore-forming, heat-resistant types largely survive, making it difficult to obtain a satisfactory % reduction in the no. of living bacteria present in the milk. On the other hand, the heat-loving bacteria find pasteurization temps. favorable for their growth and rapidly increase in no. While 30 min. is not long enough to permit small no. of thermophilic bacteria to increase noticeably, yet they find opportunity to grow in foam, milk-stone, dead ends and about gaskets until they may occur by the millions per cc. in the pasteurized milk where equipment is continuously operated for 3 or more hrs. Notable increases or decreases in total acidity may be produced as well as undesirable flavors. There is no evidence connecting these heat-resistant species with pathogenic conditions in man.

C. R. F.

Use of citric acid and sodium citrate in starter cultures. HUGH L. TEMPLETON AND H. H. SOMMER, Wis. Univ. *J. Dairy Sci.* 12, 21-36(1929).—Under ordinary conditions citric acid disappears from milk in 2 to 4 days. If the milk is allowed to stand longer, a new compd. forms giving the citric acid test. Addition of 0.2% citric acid or equiv. amt. of Na citrate to milk increases about 50% the volatile acidity produced with com. starters. It increases the total acidity only 10%. The flavor of cultures was improved by the treatment.

AMY LEVESCONTE

The production and grading of cream. W. DEMPSTER, *New Zealand J. Agr.* 37, 378-85(1928).—This is a general discussion with particular reference to the causes and prevention of undesirable odors and flavors that may occur in cream. K. D. JACOB

A study of gelatins and their effect on ice cream. P. S. LUCAS AND E. C. SCOTT, Mich. Agr. Expt. Sta., *Tech. Bull.* 94, 1-24(1928).—Viscosity of mix and of gelatin

sols, as detd. by the Bloom pipet, is not a reliable index of the effect of gelatin as a binder in ice cream. Jelly strength, as measured by the Hall gelometer, is a fair measure of gelatin value. If it were more sensitive, and if the technic were so perfected as to make checks on duplicate samples possible, this test could be recommended for practical uses. Jelly-strength tests of gelatin, as detd. by the Bloom gelometer, are very accurate indications of the effect of gelatin in preventing the melting of ice cream. Ice cream manufacturers should purchase and use amts. of gelatin in the mix in accordance with its jelly strength as detd. by the Bloom test. C. R. F.

Chemical control in the butter factory. Determination of the moisture and salt content of butter. A. A. RAMSAY. *Agr. Gaz. N. S. Wales* 39, 909-18(1928).

K. D. JACOB

The manufacture of margarine. P. S. ARUP. *Food Manuf.* 3, 544, 545(1928); 4, 29-31, 34(1929); cf. *C. A.* 22, 2626.—A. discusses the raw materials employed in the industry, the characteristics of the various kinds of fats and fat mixts., the control of cleanliness of the milk, the methods of using starters, the various questions arising out of the use of milk powders and coloring matters, the particulars of churning and dry cooling processes, water cooling, after-treatment of the cooled emulsion, and problems of the margarine emulsion.

J. A. KENNEDY

Slow development of acidity in cheese making. G. F. V. MORGAN AND J. CURLE. *New Zealand J. Agr.* 37, 305-8(1928).—Rapid development of acidity is desirable in the manuf. of cheese, slow-working curds usually yielding a product of poor quality. Investigation of a factory having trouble with slow-working curds showed that this was due to bacterial contamination after the milk had been pasteurized, and the fault was traced to the presence of *B. subtilis* in the vats.

K. D. JACOB

Temperature of wax for coating cheese. J. MURRAY. *New Zealand J. Agr.* 37, 375(1928).—When cheeses are immersed in wax at a temp. of 295-305° F. the wax becomes an integral part of the cheese which offers greater resistance to rough handling; the min. amt. of wax is used. Cheese waxed at lower temps. shows rupture of the wax when local pressure is applied. This is more noticeable when the waxing is done at 240° F. or less.

K. D. JACOB

The casein-splitting ability of dairy acids. CHR. BARTHEL AND W. SADLER. *Medd. Centralanstalt. forsoksvasendet jordbruks.* No. 343, Bakteriöl. avdel No. 49, 2-9 (1928). (Swedish with English Summary).—Commercial and other starters in chalked sterile milk during 2 months at room temp. did not form more sol. N than did pure cultures of strains of lactococci from such starters. But the former split off more amino acids than the latter. B. and S. emphasize the importance of lactococci in cheese ripening as it is in the form of starters that lactic-acid bacteria are added to the cheese milk.

O. A. NELSON

Effectiveness of sodium hypochlorite in sterilizing creamery equipment. E. L. FORTS. Okla. Agr. Expt. Station. *J. Dairy Sci.* 12, 51-9(1929).—The use of steam is expensive for sterilizing equipment, and chem. substances usually flavor the milk. NaClO is inexpensive and does not flavor the milk. A study was made of the effectiveness of washing the pump, pipes, filters and cooler with a brush and hot alkali, compared with the same treatment followed by brushing the equipment with a commercial NaClO prepn. Pasteurized milk, passed through the equipment with no NaClO treatment, showed an increase of 74.8% in bacterial count. The average increase was less than 10% when the NaClO treatment was given. Four different commercial brands were used, and the NaClO soln. was prepd. as directed on each package.

AMY LEVESCONTE

The mayonnaise emulsion. D. M. GRAY AND C. A. SOUTHWICK, JR. Hazel-Atlas Glass Co., Wheeling. *Glass Packer* 2, 17-41, 77-81(1929).—A mobilometer for the detn. of body or consistency of mayonnaise is described. The time in sec. required for the 500-g. plunger to fall the distance between 2 reference marks (18 cm.) on the plunger rod at 60°F. is taken as the consistency. The value increases considerably with temp. increase. Other factors remaining const., consistency decreases rapidly with increase in H₂O content of the mayonnaise. Cottonseed oil and glycerol of definite sp. gr. are used for checking results and comparing instruments. Stability of an emulsion has little, if any, relation to stability against freezing temps. but it should correspond with the ability of the emulsion to resist breakdown due to handling, transportation, or elevated temps. As consistency is decreased by repeated plunges by the mobilometer, the oil particles increase in size until a const. is reached. The no. of plunges required to reach this const. is a measure of the stability of the emulsion. Stability decreases somewhat with age, the rate of decrease becoming less until it approaches a const. value after approx. 72 hrs. This decrease is more pronounced at

37° than at 30° or at even lower temps. The use of the mobilometer will allow closer standardization of mayonnaise emulsions than has been heretofore possible. The figures are figured 28 emulsion photomicrographs.

C. R. F.

The zinc content of food vegetables. GABRIEL BERTRAND AND ROJE BENZON. *Compt. rend.* 187, 1098-1101; *Compt. rend. acad. agr. France* 14, 1303-7(1928).—Zn plays an important physiol. role, comparable to that of Fe, in living organisms. The Zn content of different plants as well as different parts of the same plant is extremely variable. E. g., peach mesocarp or beet leaves contained from 0 to 0.2 mg. per kg., bean seeds and pine nuts approx. 50, and hemp seed 82. In general there is less than 1 mg. per kg. of Zn in the pulpy portion of peaches, plums, apricots, mandarin oranges, strawberries, melons and in etiolated leaves; from 1 to 2 mg. per kg. in parenchymous roots such as carrot, turnip, radish, the flesh of orange, lemon juice, leaves of low chlorophyll content such as escarole, cabbage, romaine, in figs, raisins and chestnut; 2 to 3 mg. per kg. in celery, banana, cauliflower, salsify, sweet potato, tomato and Jerusalem artichoke; 3 to 4 mg. per kg. in rutabaga, asparagus, Japanese artichoke, date and forage beet. As the chlorophyll content increases, the Zn increases also. In carrot leaves and alfalfa, 4 mg.; radish leaves, 4.5; head lettuce, 4.7; cress, 5.6; spinach, 6.2; dandelions, 9.7; matured white potato, 4; mushrooms, 5.1-5.3; truffles, 2.8; vicia, 12.4; garlic, 10; onion, 13.1 in the watery tissues and 50 in the seed. In the grains, barley, sorghum, wheat, millet and rye contain 12-19 mg.; soy beans, 20; vetch, 23; lentils, 24.5; peas, 44.5; beans, 52.5; buckwheat, coconut and fresh almonds, 10; peanuts, 16; sunflower seed, 17; dried almonds, 18; dried nuts, 20; pine nuts, 55; hemp seed, 82.6; polished rice, 2; rice bran, 30; white wheat flour, 6-7; whole wheat flour, 10-15.

C. R. F.

Sampling apples in the orchard for the determination of arsenical spray residue. J. W. BARNES. *Ind. Eng. Chem.* 21, 172-4(1929).—As present in the arsenical residue on apples after treatment with PbHAsO_4 was detd. by the Gutzeit method. Total As was calcd. to grains, and wt. of apple to lbs., results being expressed in grains per lb. Relative areas were also given this consideration. Mathematical formulae are given for calcg. the area in terms of vol., and for detg. the relation between the probable error of the mean, the standard deviation, and the no. of individual fruit. As residue on apples ranged from 0.001 to 0.031 grains As per individual, and from 0.05 to 1.30 grains per 100 sq. in. of area of fruit.

FREDERICK G. GERMUTH

Preserving fruits and vegetables in the home. Results from experiments in canning, pickling and preserving. ETHEL W. HAMILTON. Can. Dept. Agr. Central Exptl. Farm, Ottawa. *Can. Dept. Agr., Bull.* 77, 1-54(1928).—A comparison is made of the comparative value for canning purposes of the 17 varieties of green beans, 11 sweet corn, 28 tomatoes, 7 asparagus, 15 peas and 18 plums. Similar comparisons are made in the value for apple sauce, jam, jellies and preserves of many varieties of black and red currants, crab apples, plums, grapes and berries. A score card is used for product evaluation.

C. R. F.

Studies in home canning. III. Heat penetration in meats and vegetables processed in glass containers. GAIL M. REDFIELD, P. MABEL NELSON AND GERTRUDE SUNDERLIN. Iowa State Coll. *Iowa State Coll. J. Sci.* 3, 7-28(1928).—Expts. were conducted on: beef round, beef suet, pork loin, pork sausage, green beans, spinach, asparagus, sweet corn and tomatoes in glass jars of quart size and of pint size, processed in hot water, in pressure cookers at 15 lbs. pressure and in an autoclave heated by high-pressure steam. Temps. were detd. by means of thermocouples sealed through the lids of the jars so that the junctions were at the center of the jar. Variation of water, bone, fat and lean meat and pre-cooking have but little effect on heat penetration into cans of meat. Larger size of jar, closeness of pack and high viscosity decrease the rate of penetration. Quart jars should be processed longer than pint jars as follows: tomatoes 10 mins., beans, asparagus and spinach 10-20 mins., beef 30 mins., pork 50 mins., and sweet corn 60 mins. Unless all air is allowed to escape from pressure cookers, the temp. may be below that indicated by the gage. Temps. below those indicated by the pressure gage were recorded by the thermocouple unless the petcock of the pressure cooker was left open for 7 mins. after the appearance of steam. A review of former work and 29 references are included.

F. E. BROWN

Food gelatin values relative to concentrations. M. BRIEFER AND J. H. COHEN. *Ind. Eng. Chem.* 21, 264-5(1929).—Exptl. data where a Bloom gelometer with 2 different sized plungers was employed are shown in curves. Within a certain range the jelly strength is a linear function of the concn., but as com. products do not contain food gelatin in these concns., the results have no value unless a relation can be shown to the useful concns. The straight-line portion of the curves begins at different concns.

with different grades. The higher the grade, the lower the concn. included in the straight-line part of the curve. Results indicate a better approximation of gelatin values at a 3% concn. basis than at the usual 6.67% basis. At concns. of 3% or less the p_H effect is marked. The present methods of gelatin testing should be brought out so that all grades are within the straight-line period or entirely out of it. The use of a 16 mm. plunger and 3-4% concns. causes the relative values of all grades closely to approx. the actual values assigned to them by experience and practical application.

W. H. BOYNTON

Artificial sausage skins. WALTER OBST. Altona-Bahrenfeld. *Kunststoffe* 18, 176(1928).—The author discusses the production of artificial sausage skins, and reviews patented processes for carrying out the manufacture of these articles. The articles are produced from ground intestinal scraps which are dissolved by organic acids to produce viscous solutions, which are either sprayed under pneumatic pressure into molds, or rotary forms are dipped into the mass, from which the dried skins are removed. The skins are hardened by formaldehyde, alum, tannin, etc. Care must be used in coloring the skins so that the colors employed will be absolutely fast and also will not color the contents of the skin when the sausage is cooked or smoked. B. HAMILTON

Iodine content of Pacific Coast sea-foods. NORMAN D. JARVIS. Univ. of Wash., Seattle. *Univ. of Wash. Publ. in Fisheries* 1, 239-50(1928); cf. *C. A.* 20, 1872.—Tiesler and Wells' modification (*C. A.* 18, 3438) of the Fellenberg technic was used to det. I in 42 species of edible Pacific Coast fish, shellfish and crustaceans. Shellfish contained the largest amts. of I, the range for abalone, clams, oysters and scallops being 3621 to 6875 p. p. m. dry basis. Crustaceans contained from 445 to 1456 p. p. m., marine fish from 515 to 1972, anadromous fish 698 to 1539 and fresh water fish from 35 to 158 p. p. m. All of the marine products form acceptable foods for I prophylaxis. Herring, shad or salmon roe was from 2.5 to 5 times as rich in I as the flesh. Salmon which had been canned, baked, boiled or fried retained substantially all of its original I content. The wider use of salmon and other marine foods in the human diet is advocated. C. R. F.

Specific effects of salt, nitrate and nitrite in inhibiting the growth of putrefactive anaerobes. C. R. MOULTON. Inst. of Am. Meat Packers, Chicago. *Glass Packer* 2, 86(1928).—Both NaCl and NaNO₂ tend to inhibit the growth and action of certain putrefactive anaerobes which cause meat spoilage. NaNO₂ is more effective than NaCl in preventing decompn. Especially in the case of canned meats and hams the treatment with nitrates may account for the successful preservation of the product which is given a heat treatment not likely to destroy all of the microorganisms which may be present. C. R. F.

Prevention of mold formation of soy by various organic reagents. KIYOSHI OTA. *J. Fermentation* 5, 914-26(1928).—Soy (100 cc.) was kept in a thermostat at 28-29° and the reagent to be tested was added; when no mold formed within 30 days, the agent was considered to be effective. C₆H₆ and naphthalene are very effective, but because of their odor cannot be used practically. Among other effective substances are aliphatic and aromatic acids, amines and alcohols, also quinones. Monobasic acids are generally effective, except formic acid, which is easily oxidized. If the above compds. are substituted with halogen, OH, NH₂, COOH, NO₂ or SO₃H, the reagent becomes ineffective. Esterification of acids makes them ineffective. K. SOMIYA

Mineral content of pasture. Phosphorus deficiency in some Wairarapa soils and pastures. B. C. ASTON. *New Zealand J. Agr.* 37, 242-4; *Trans. Proc. New Zealand Inst.* 59, 650-7(1928); cf. *C. A.* 23, 462.—Unfertilized pastures in this district were markedly deficient in P₂O₅, the percentage varying from 0.19 to 0.26 on the dry matter. The soils in this area also had a low P₂O₅ content. The pastures were not deficient in the other elements usually considered essential in animal nutrition. K. D. JACOB

Milk weed (*Euphorbia drummondii*) proved poisonous to sheep. H. R. SEDDON. *Agr. Gaz. N. S. Wales* 39, 777-82(1928).—H₂O exts. of as little as 1 lb. of air-dried milk-weed grown in the Brewarrina district, N. S. Wales, were fatal to sheep, postmortem exams indicating HCN poisoning. The dried plants were found to contain 0.085% HCN. Supplies of the plant from certain other localities were not toxic when tested in a similar manner and gave negative HCN tests. The dry plants, from which the toxic exts. were obtained, did not produce any ill effects when chopped and mixed with other dry food, 2 sheep consuming 22.5 lb. of the plants in 6 days. The conditions governing the production of the cyanogenetic glucoside in milk weed have not yet been detd. K. D. JACOB

The economic possibilities of rice grass (*Spartina townsendii*). III. Composition and nutritive value. FRANK KNOWLES. East Anglian Inst. of Agr. *J. Ministry Agr.*

35, 934-9(1929).—A poor grade of *Spartina* hay is similar in compn., apart from mineral matter, to poor meadow hay and is fully as digestible. The former contains no toxic substances. Feeding expts. were conducted on 12-months' old Border-Leicester Suffolk wether sheep, and a record was made of the quantities of feces and urine voided during this period. The animals were maintained in perfect health throughout a feeding period of two months. Comparative chem. analyses of *Spartina townsendii* and various grades of meadow grass are furnished. It might be worth while to consider making *Spartina* silage, for this would probably be better suited for stock than either the green plant or the hay, as a large portion of salt (the mineral compn. of this plant differs materially from that of meadow grass) would doubtless be expelled during the ensiling process.

FREDERICK G. GERMUTH

Carcass comparisons of mature and immature steers. M. T. FOSTER. Mo. Agr. Expt. Sta., *Research Bull.* 117, 1-28(1928).—Carcass studies of a 9-yr.-old steer and a 1-yr.-old steer included detailed comparisons of wholesale and retail cuts, cutting tests and a sepn. of the various cuts into lean fat and bone. The immature carcass contained a higher % of protein and H_2O and a lower % of fat than the mature carcass.

C. R. F.

Chlorination as a factor of safety in shellfish production (WELLS) 14. Sodium aluminate as a coagulant in chemical treatment of cannery waste waters (HOLMES, FINK) 14. HCN in *Lotus* (GUÉRIN) 11D. Japanese tea enzyme (ARAUNER) 11C. Extraction apparatus for fruit, etc. (Fr. pat. 643,763) 1. Sterilizing by action of metals and alloys (Brit. pat. 293,385) 13. Utilization of the stones from plums (SALOMONE) 13.

Experiences de laboratoires de moulins. Paris: Tripette & Renaud fils. 48 pp. HAMMER, BERNARD W.: *Dairy Bacteriology*. New York: J. Wiley & Sons, Inc. 473 pp. \$5.

RUSSELL, HARRY L., AND HASTINGS, E. G. *Outlines of Dairy Bacteriology*. Madison, Wis.: H. L. Russell. 238 pp.

Vitamin-containing foods. VITAMIN FOOD CO. Brit. 293,735, April 11, 1927. Dried yeast and cod-liver oil may be mixed with a substance such as Karaya gum in aq. soln. and the product slowly dried to form an air-excluding coating on the particles of the material, which is in granular form.

Treating oils, fats or emulsions with ultra-violet rays to produce vitamins or enzymes. T. D. KELLY. Brit. 293,255, Nov. 28, 1927. Oils, fats or emulsions for food or for external use are treated with β -rays and also with ultra-violet rays (preferably after the addn. of 5% or more of protein or amyloid products).

Food product from distillery yeast. ALBERT KAHN (to Soc. française des produits alimentaires azotes). U. S. 1,702,303, Feb. 19. Distillery yeast, with an addn. of 5-20% NaCl, and contg. no alc., is allowed to autolyze for 1-5 days at a temp. between 40° and that at which enzymes would be destroyed. The product may be coned and dried.

Apparatus for aerating or beating foods, etc. DALE G. STEELY (to W. F. Schrafft & Sons Corp.). U. S. 1,702,526, Feb. 19.

Preserving flour, grain, grain by-products, etc. RENE A. LEGENDRE. U. S. 1,702,735, Feb. 19. An alk. substance such as NH_3 or Na_2CO_3 is added so that the moisture in the material has a p_H of 7 to 10.

Vertical tube apparatus (heated by a water bath) for heat-treating flour, grain, etc. C. W. CHITTY, D. W. KENT-JONES and WOODLANDS, LTD. Brit. 294,001, April 26, 1927. Various structural features are described of an app., the tubes of which may be formed from or lined with Monel metal or Al or other non-corrodible material.

"Yeast-saving" composition for use in bread making. CHARLES B. HILL and MAURICE H. GIVENS (to Northwestern Yeast Co.). U. S. 1,702,259, Feb. 19. $(NH_4)_2SO_4$, $CaSO_4$ and $Ca_3(PO_4)_2$ are used together.

Cake and pudding mixtures. T. FANCETT. Brit. 293,752, July 11, 1927. Desiccated ingredients for making a cake or pudding are packaged in air-tight enclosures so that they may be prepd. for use by merely adding water. Examples are given.

Preserving egg whites or yolks separately or in mixture. M. D. C. MICHAUD and COMPAGNIE OLIVIER. Brit. 293,794, July 12, 1927. NaCl or sucrose (or both) are added, with or without addn. of lactic acid, and the product is evapd. until its water content is reduced to 10-30%. The product may be packaged in an atm. of N or CO_2 . Various details and auxiliary treatments are described.

Retort and system for cooking meat or other foods under pressure. EDMOND M. SIMONDS (to E. M. Simonds Devices Co.). U. S. 1,702,854, Feb. 19. The material is subjected to heat and pressure in satd. steam and heated by radiation from the retort walls.

Use of steam in sterile packaging of meat, fruit, etc., in glass containers. GUNTHER, FREIHERR ZU PUTLITZ. Brit. 293,809, July 12, 1927. An app. is described.

Preserving fruits and vegetables. H. G. ZELLNER. Brit. 293,341, April 4, 1927. Citrous fruits may be washed with NaOH soln. and with small quantities of CuSO_4 and KMnO_4 , rinsed and further treated with a soln. such as NaOH and Na_2S_2 together with small quantities of Na_2CO_3 and NaHCO_3 , CuSO_4 and KMnO_4 . An app. is described. • Cf. C. A. 23, 916.

Dehydrating vegetable substances. SUGAR BEET AND CROP DRIERS, LTD. Fr. 643,987, Oct. 28, 1927. Vegetable substances particularly root crops such as sugar-beet are dried in stationary or moving columns of relatively small thickness by passing air repeatedly through the substance, the pressure, vol. and temp. of the air being regulated to give the most efficient drying.

Apparatus for concentrating fruit juices. MIHIRAN K. SERAILIAN. Fr. 644,180, Nov. 21, 1927. The aromas are collected in an app. sep. from the coneg. app.

Chocolate. W. M. BROWNELL (to Schreiber Products Corp.). Brit. 293,718, Feb. 24, 1927. In the manuf. of chocolate or of chocolate-coated foods, melting of the chocolate and floating of the contained cacao butter to the surface are prevented or retarded by addition of a small proportion of malt extract powder.

Beverage from maté leaves. C. HORIX. Brit. 294,003, Aug. 25, 1927. An aq. infusion of maté leaves is filtered and cooled and passed through a vacuum chamber to remove the air, then carbonated and bottled, with or without adding a flavoringrup.

Food material from grasses, reeds, etc. V. P. H. I. W. D'OBRY. Brit. 293,779, April 11, 1927. Straw, cereal stalks, grasses, reeds, etc., are steamed under 5–6 atm. pressure for 2–4 hrs. "without addn. of water or chemicals" and the sepd. liquid product may be used as a *stock food* or "in the manuf. of sugar or spirits." The solid residue may be used for making *paper* or *cardboard*, or the entire admixed liquid and solid product may be used as a cattle food.

Food for animals. A. B. SCHREIBER. Brit. 293,989, July 27, 1927. Cereal by-products such as bran or chaff, screenings and alfalfa meal are finely ground and mixed with about 5% of cottonseed meal and then satd. with molasses in heated condition, formed into strings and cut to lengths and coated with addnl. cottonseed meal. Various details and modifications are described.

Stock feed. ARMAND F. PATIN. Fr. 644,232, April 26, 1927. Stock feed particularly for calves is made up of manioc flour 60, barley flour 20, oat flour 10, linseed oil cake flour 5, and bone flour 5 parts.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

The significance of the chemical industry for the political and world economy. HERMANN HUMMEL. *Chem.-Ztg.* 53, 2(1929). E. C. M.

The protection of scientific property. R. BRIGHTMAN. *Ind. Chemist* 5, 21–4 (1929). Interest in the protection of "scientific (or intellectual) property" has received much attention since the World War, and a draft convention prepd. for the League of Nations is now before various governments for consideration. Present copyright and patent laws do not protect theoretical or purely scientific discoveries. The present convention declares that authors of scientific discoveries should share in the material profits derived from the exploitation of such discoveries; to confer this right of participation in profits, such discoveries must be capable of practical utilization, and must give rise to new means of production, or to the adaption of known means to fresh purposes. This new right is not to be a right to monopoly of exploitation, but to free exploitation subject to payment of consideration. The relationship of research workers in a corporation to their employer and to each other comes in for attention. "Obviously the Convention constitutes a break with the habit of considering scientific property as a public well from which any one can draw at will."

W. C. EBAUGH

Accurate measurement of liquid in tanks. J. M. BRENNAN. *Chem. Met. Eng.* 35, 696–7(1928). —The pressure head of a liquid in a tank is measured by immersing an

open-end tube to the bottom of the tank. The top of the tube is connected to a manometer, and air is introduced to fill the tube and balance the head of the liquid. The manometer then indicates the head. A simple Hg-sealed compressor to force air into the tube is described; also Hg seals for the bottom of the air tube in the tank to overcome the difficulties encountered with viscous liquids, clogging of the air line, etc.

M. W. SKYMOUR

Use of rotating tubes for crystallization and evaporation. H. BARKHOLT. *Chem. Fabrik* 1928, 431-3.—The small crystals obtained in mech. crystallizers suffer commercially from the fact that adulteration is not so readily detectable by the eye as with large crystals. The crystal size obtained depends on the speed of rotation. Crystal forms of borax, Na_2S , and other salts so made are described and illustrated and costs discussed. An analogous app. forms an economical evaporator for the concn. of Na_2S soln., caustic soda, and the like, the thermal efficiency being very good. The two steps have been successfully combined in one tube with Na_2SO_4 and FeSO_4 .

B. C. A

High-temperature heating by circulation. ANON. *Apparatebau* 41, 13-7(1929).—Description, with 9 cuts, of the "Daqua" system of heating with H_2O up to 165° .

J. H. MOORE

The flow of gases through beds of broken solids. C. C. FURNAS. *Bur. Mines, Repts. of Investigations* No. 2904, 20 pp.(1928).—A brief summary of the exptl. work on this problem done at the North Central Expt. Sta. of the U. S. Bureau of Mines. Simple equations for first approximates are given, also complete and more complicated equations and numerous curves.

W. H. BOYNTON

Measurement and calculation of the pressure losses particularly in the Siemens-Martin furnace. WERNER HEIL. *Arch. Eisenhüttenw.* 1, 729-40(1928).—The measured and calcd. pressure losses in flue pipes and in Siemens-Martin furnaces are compared.

The equation (derived in part) used is: $\Sigma h = \Sigma \alpha \cdot \gamma^0 \cdot \frac{W^{1.924}}{d^{1.281}} \cdot l + \Sigma \gamma \cdot H^2 \cdot \gamma + \Sigma \frac{W^3}{2g} \cdot \gamma \left(\frac{F^2}{F_1^2} - 1 \right)^2 + \Sigma \frac{W^2}{2g} \cdot \gamma \left(\frac{l_1 + 273}{l + 273} - 1 \right)^2 + \Sigma H(\gamma_L - \gamma_0)mmWS$ ($\alpha = 100$

(for metallic flues), γ = sp. gr. of gas (kg./m.^3), w = gas velocity (m./sec.), d = flue diam. (mm.), l = gas flue length (m.), F = flow path cross-section (m.^2), H = height difference (m.), and γ_L outside air and γ_0 flowing material sp. grs (kg./m.^3). The γ -values for various passages in the furnaces are given, and approx. Blaschke figure of 0.5 for a 45° direction change. In technical flues the measured and calcd. pressure losses agree completely. In the furnaces investigated the deviation is considerable; it lies in friction and collision loss calcs. These losses are influenced by length of operation of the furnace. Fusion of the flow paths causes large deviation between the calcd. and pressure losses, especially in the hot furnace crown. The influence of viscosity is slight as compared to other furnace resistances. The total losses from the exchange flues to the hearth are (1) in the supply portion of the furnace 10-15% friction, 60-65% individual resistances, 25-30% acceleration, and (2) in the escaping portion 5-10% friction, 55-60% individual resistances, 30-35% sinking. A fan is recommended for introducing the combustion air, also dampers back of the air and gas chambers (for regulating the distribution of waste gases between the two). A survey of the literature is appended.

J. BALOZIAN

The detection of tar pitch in cable couplings and accessories. E. KENDSCHER AND PH. LEDERER. *Staatlichen Material-prüfungsamt, Berlin-Dahlem. Chem.-Ztg.* 52, 1014(1928).—The presence of coal-tar pitch in cable couplings and accessories is forbidden. The usual directions for detecting it call for the addition of diazobenzene chloride soln. to an ext. made by boiling 5 g. of the material with 20 cc. of N NaOH for 10 min. and then filtering. If pitch is present, a red color forms. Although rosin gives a negative test when treated as above, its oxidation products react differently. Therefore the following test is recommended: a 10 g. sample boiled with 40 cc. N NaOH soln., under a reflux condenser, for 15 min., cooled and filtered, yields a soln. a small portion of which is tested as above. If a positive result is obtained, the main portion is then treated with an excess of H_2SO_4 , the sepd. acids and phenols are extd. with Et_2O , and the free mineral acid is washed out with H_2O . The Et_2O is then evapd. and the residue boiled with 5-10 cc. of 10% NaOH soln. in a test tube until CO_2 is no longer evolved. The alk. soln. is extd. with Et_2O in a separatory funnel, the ethereal layer washed twice with H_2O , and then evapd. on the water bath. The residue is dissolved in a little cold N NaOH and then filtered. The filtrate is tested with diazobenzene chloride soln. and the appearance of a red coloration or a red ppt. indicates

the presence of tar pitch in the sample. The method was tested out on mixts. of asphaltum, rosin, and various kinds of coal-tar pitch, and showed that a tar-pitch content of 5% could be detected with certainty. W. C. EBAUGH

The utilization of the stones from plums. G. SALOMONE. *Giorn. de chim.* 22, 211(1928).—The large amount of plum stones collected in jam works has encouraged their utilization. From the internal portion is extd. a light yellow oil, with a smell and taste resembling that of peach kernels, and with a d. 0.915–0.921, sapon. value 180–198.5, I value 101–21 and thermic degree (Tortelli) 44–5. The oil is edible and can replace almond oil. The dry shells are a good combustible and their ash is rich in K. R. SANSONE

Industrial bromomethyl poisoning. ERHARD GLASER. Univ. Wien. *Deut. Z. gericht. Med.* 12, 470–4(1928).—Discussion and case report. FRANCES KRASNOW

Breakdown of solid insulators. W. WERNER. *Ann. Physik* [iv] 86, 95–128(1928).—A method is described for investigating the breakdown potential of various insulators. The substances used were mica, glass, rock salt, S, celluloid, etc. The breakdown potential was detd. for several thicknesses of each substance, except in the case of celluloid, when only one thickness was used. The expts. were carried out in oil at room temp. and in liquid air and liquid H. In general, the breakdown potential is considerably less in liquid air than in oil. Exceptions, however, are noted. The results when plotted on a graph between breakdown voltage and thickness give, for expts. in oil and in liquid air, straight lines, of which the equation is $U = ad + b$, where U is the breakdown voltage, d is the thickness of the dielectric, and a and b are constns. The discharge takes place first through the medium. Breakdown never occurs between the points of contact of the electrodes with the dielectric, although the field strength is greatest here. It is due not to the presence of ions in the insulator but to the fact that all substances contain gases. There is a good deal of evidence to show that the discharge is a gas discharge. At low temps. all substances become brittle, and it is considered that this brittleness has some connection with the lower breakdown voltage at the temp. of liquid air. The photographs of mica pierced by the discharge show the same lines as are obtained when a sheet of mica is gently punctured by means of a needle. Expts. were also carried out with dielectrics in a high vacuum. Previous results on the breakdown voltage of insulators are too low for dielectrics free from gases. B. C. A.

Electrical insulating materials from a chemical standpoint. W. H. NUTTALL. *Chemistry and Industry* 47, 1359–68(1928).—A review. J. BALOZIAN

Exothermic chemical reactions. SOCIÉTÉ CHIMIQUE DE LA GRANDE-PAROISSE (AZOTE ET PRODUITS CHIMIQUES). Fr. 33,339, Dec. 24, 1926. Addn. to 626,491. A quantity of gas greater than that which will react in contact with the catalyst is caused to circulate in the app. contg. the catalyst tube, and the excess is carried outside the app.

Catalytic reactions. SOCIÉTÉ CHIMIQUE DE LA GRANDE-PAROISSE (AZOTE ET PRODUITS CHIMIQUES). Fr. 644,266, Apr. 30, 1927. In exothermic catalytic reactions in which the gases are heated indirectly before reaction by the catalyst, the gases are made to pass along 2 or more distinct heating surfaces and the heat transmitted may be varied by varying the path of the gases.

Contact gas reactions. METALLBANK UND METALLURGISCHE GESELLSCHAFT AKT.-GES. Fr. 644,181, Nov. 21, 1927. In the prepn. of H_2SO_4 , HNO_3 and other compds. by contact reactions of gases, the gases are brought into contact with the contact substances by means of silent elec. discharges. The gases may be led across or against electrodes furnished with or composed of the contact substances.

Separating dust from gases. ASSOCIATED LEAD MANUFACTURERS, LTD. Fr. 644,083, Nov. 18, 1927. Dust is sepd. from gases by tubular filtering sacks disposed vertically and forming a conical surface narrowing toward the top, where they are held by a counterweight.

Liquefied gases. STUDIEN-GESELLSCHAFT FÜR GAS INDUSTRIE M. B. H. Fr. 644,367, Nov. 22, 1927. Gels, such as SiO_2 gel, are used for absorbing gas, *e. g.*, air which remains in transport reservoirs of liquefied air. The gel is cooled to the b. p. of the gas to be absorbed.

Increasing the oxygen content of air. ALFRED LOWITSCH. Fr. 643,823, Nov. 11, 1927. Air is passed through an annular space over a series of magnetic fields of fixed formation. The air is brought by a whirling motion into contact with the field. The enriched air may be used for industrial or health purposes.

Apparatus (with an auxiliary oxygen supply) for supplying oxygen for respiration by action of exhaled air on peroxides. HANSEATISCHE APPARATEBAU GES. VORM. L. VON BREMEN & Co. and DEUTSCHE GOLD- UND SILBER-SCHNEIDANSTALT VORM. ROSSLER. Brit. 293,832, July 13, 1927. Anhyd. Na perborate may be used as the source of the auxiliary O.

Fireproofing absorbent carbon, etc. N. C. DEAN. Brit. 293,962, June 18, 1927. Coke, vegetable C or other carbonaceous absorbent material for use in respirators, gas masks and the like is rendered fireproof by treatment with a soln. of an alkali metal tungstate to which an alkali metal phosphate is also preferably added. After drying, the material may be dipped in fused caustic alkali to make it absorbent of CO_2 .

Suppressing evaporation losses and fire hazards in storage tanks for volatile inflammable liquids. H. DOLLARD. Belg. 346,966, Jan. 31, 1928. Air is excluded from the storage tank, the pressure in which is kept above atm. pressure and is produced by the vapors from the stored liquid and by a gas which does not support combustion.

Introducing or eliminating substances from artificial products. SOCIÉTÉ ANON. POUR L'INDUSTRIE CHIMIQUE À BAËLE. Fr. 644,077, Nov. 18, 1927. Substances for chem. reactions are introduced or eliminated from artificial solid or liquid products with the aid of an elec. current. The process may be applied to the removal of catalysts from artificial resins, etc.

Reducing dyes or other substances to a state of fine subdivision. BRITISH DYE-STUFFS CORP., LTD., A. J. HAILWOOD and A. SHEPHERDSON. Brit. 293,896, April 11, 1927. Various substances such as indigo, indanthrone, 1-amino-2-methylantraquinone, wood charcoal and pyranthrone, are reduced to fine subdivision by stirring them in a liquid suspension (preferably of somewhat viscous consistency) with a powder of a harder material such as Fe, Zn, Cu or sand, suitably with the addn. also of a dispersing agent such as the product obtained by the "moderated oxidation" of sulfite cellulose lye with HNO_3 or Na lysalbinat or the alk. soln. of amidated sulfite cellulose pitch described in Brit. 286,808 (C. A. 23, 513).

Sterilizing by the action of metals and alloys. G. A. KRAUSE. Brit. 293,385, July 5, 1927. Metals such as Ag, Cd and Pd, which have sterilizing properties, are used in non-colloidal amorphous form, or mixed amorphous-cryst. form, or mixed amorphous-micro-cryst. form, for sterilizing *solids, liquids and gases* and for *medical purposes*. The action of the metals may be aided by employing heating and cooling devices, by the use of an elec. current, by exposure to rays and by imparting an intermittent or continuous motion to the substances. Various details and examples are given, among which is the *treatment of foods*.

Mercury boiler operation. A. J. NERAD (to British Thomson-Houston Co., Ltd.). Brit. 293,756, July 11, 1927. An admixture of Hg such as an amalgam with Pb is used to economize Hg. Structural features of the boiler are described.

Refrigerator. CHICAGO PNEUMATIC TOOL COMPANY. Fr. 643,754, Nov. 10, 1927.

Refrigerators. SOCIÉTÉ ANON. DES ATELIERS DE CONSTRUCTIONS MÉCANIQUES ESCHER WYSS & CIE. Fr. 33,319, Apr. 11, 1927. Addn. to 574,741. Me_2O is used as refrigerating material, and a mineral oil used for lubricating.

Absorption refrigerating machine. LUDWIG HIRSCH. Ger. 470,589, Mar. 12, 1924. Water is led continuously through a pipe traversing, in turn, the absorber and the evaporator.

Refrigerating apparatus of the absorption type. KARL A. WESSBLAD (to Electrolux Servel Corp.). U. S. 1,702,754, Feb. 19.

Refrigerating apparatus of the absorption type. S. K. D. M. VAN LIER. Brit. 293,525-6, May 18, 1927. Structural features.

Refrigerating plant of the reversing absorption type. JENS O. BOVING. Ger. 470,688, Aug. 11, 1927. See Brit. 276,088 (C. A. 22, 2420).

Refrigerating apparatus of the compression type. C. STEENSTRUP (to British Thomson-Houston Co., Ltd.). Brit. 293,394, July 5, 1927.

Refrigerating apparatus of the compression type. C. STEENSTRUP (to British Thomson-Houston Co., Ltd.). Brit. 293,772-3, May 18, 1926. Brit. 293,774 also relates to a gas compressor.

Refrigerating mixture. O. HANNACH. Brit. 293,581, Aug. 4, 1927. NH_4Cl 2, Na_2CO_3 3 and water 6 parts.

Vacuum refrigerating apparatus suitable for use with methanol as the refrigerant. A. EINSTEIN (to L. Szilard). Brit. 293,865, July 14, 1927. Structural features.

Heat-insulating material. CHARLES E. HITE (to Universal Gypsum & Lime Co.). U. S. 1,702,729, Feb. 19. A material suitable for use on pipes, boilers, etc., is prepd. from a hydroamylaceous paste such as aq. cornstarch paste and an acid such as H_2SO_4 , together with comminuted calcined gypsum contg. an impurity, e. g., a carbonate or silicate, which reacts with a portion of the acid for producing a "nascent salt" which facilitates setting of the compn. An app. is described. U. S. 1,702,730 specifies the manuf. of slabs, panels, blocks, etc., from similar ingredients, and also describes the app.

Heat and electric insulation. P. E. BASSET. Brit. 293,436, July 8, 1927. Phenols, cresols, guaiacol, thymol creosote and like compds. are caused to react on proteic residues such as those of breweries, distilleries or starch works in the presence of substances such as camphor, soda, potash, lime, H_2SO_4 , CaCl_2 , AlCl_3 , ZnCl_2 or $\text{Zn}(\text{OH})_2$, which may serve as catalysts; an example given also includes the use of formol.

Electric insulation. ELEKTRA-LACK-WERKE GES. SYSTEM KRONSTEIN. Brit. 293,293, July 2, 1927. Insulators are prepd. by applying liquid insulating compns. to a solid carrier of transparent viscose-like cellulose compd., substantially free from fibers, and drying and solidifying the coating (which may be formed from a rubber soln., varnish contg. linocyn or celluloid or a nitrocellulose compn.).

Insulating electric cables. RICHARD APT. U. S. 1,702,332, Feb. 19. Structural features of Pb and rubber coatings, etc., are specified.

Insulating electric cables, etc. SIDNEY G. BROWN (one-half to Telegraph Condenser Co., Ltd.). U. S. 1,702,993, Feb. 19. Layers of paper are used with interposed finely divided C.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Water consumption by cities and future needs. PAUL LHEUREUX. Dept. Pub. Wks., Besançon. *Science ind.* 12, No. 175, 69-73(1928).—Based upon data obtained from many cities and villages in France, cities of over 60,000 inhabitants have a mean per capita daily water consumption of 232 l., peak consumption 418 l.; future requirements (30 yrs.) are estd. to be 412 l. with peak consumption of 742 l. For cities with a population of 15,000-60,000 the consumption will be generally less (180 l., peak 324 l. per capita per day). In small villages contg. less than 3000 inhabitants the consumption is 135 l., peak consumption 190 l. C. R. F.

Factors contributing to quality of public water supplies. H. E. JORDAN. *Ind. Eng. Chem.* 21, 152-6(1929).—An unpublished rating distributes 100 possible points that a public water supply might have as follows: 30 to quality, 24 to continuity of surface and pressure, 11 to adequacy of fire pressure, 8 to adequacy of reserve capacity and the balance to small items relative to efficiency and good-will. After a discussion of the uses of public water supplies, standards of quality, etc., the 30 points of the total are divided as follows: on a 100% basis, 51% of quality can be assigned to safety, 20% to taste, 20% to chem. balance, 5% to appearance, and 2% to temp. E. B.

Water at central steam plants. Condensation and feed water. M. MARCHEIX. *Science ind.* 12, No. 175, 103-8(1928).—Automatic systems for operating distn., feed water heater, and condensation equipment are advocated. Workable and economical steam plant hook-ups are presented. No new data. C. R. F.

Treatment of water supplies for generators. P. DROVIN. *Science ind.* 12, No. 175, 100-2(1928).—The incrustation of pipes and boiler tubes by Ca and Mg salts in water is very serious in France. These are removed by distn. and base-exchange methods. Preheating to remove dissolved gases is also desirable. When hard water is used for steam generation an effective and economical procedure is the installation of com. distn. equipment. C. R. F.

Fresh water studies. I. Relative temperature, oxygen content, alkali reserve, carbon dioxide tension and p_{H} of the waters of certain mountain streams at different

altitudes in the Smoky Mountain National Park. EDWIN B. POWERS. Univ. of Tenn. *Ecology* 10, 97-111(1929).—It was found in field work done over a period of 4 years that the O contents increase and CO_2 tensions decrease with increasing altitude. The temp., p_{H} , and alkali reserve of the waters of mountain streams decrease with increasing altitude. Without aeration, perhaps, the actual CO_2 content increases; the alkali reserve increases and O contents decrease with aging—a process which is accelerated by direct sunlight. Floods or swells at higher altitudes cause high altitude water conditions to occur at lower altitudes during and following such disturbances. Rainbow trout inhabit the lower reaches of the streams, usually to the edges of the cut-over areas, while the brook trout prefer the upper reaches. These 2 species are affected in their distribution by the presence or absence of org. substances in soln. in the waters, and by the actual CO_2 tension which is increased by the liberation of CO_2 from the org. substances in soln. which takes place more rapidly in the sunlight than in the dark. C. R. F.

Surface and sub-surface waters of the Yakima and Klamath reclamation projects. C. C. WRIGHT. Bur. of Plant Ind. Wash. Agr. Expt. Sta., *Bull.* No. 228(1928).—The examn. of the 175 samples from the Sunnyside division and 25 from the Wapato division showed that in the great majority of cases neither the drainage water nor the ground water contained appreciably large quantities of dissolved salts, and that in every case where soil of alkali areas was sampled it was found to contain large quantities of sol. salts, especially in its surface layers. The drainage and underground water from normal productive land is equally as salty, if not more so, than that which came from distinctly alkali areas. The soil soln., in so far as it is represented by surface pools, varies widely with respect to its concn. in the alkali areas from which samples were collected. The range of salt content in the 25 samples from these salty localities is from 180 to 640 p. p. m. while the range in the 48 samples coming from normal areas is from 120 to 500 p. p. m. Most of the samples in both groups run between 250 and 500 p. p. m. C. R. F.

Conservation and control of ground water. CHARLES C. BROWN. *Municipal and Water Works* 75, 317-8(1928).—Most of the water supplies of the cities either on the Atlantic or Gulf coast of Florida are obtained from surface sources or deep wells tapping limestone substrata. Some of the surface water in the state is drained by sink holes which are probably the source of the water in the lower strata of limestone. The development of the country is adding to the pollution of the surface water. Conservation and protection of the underground and surface water sources in the state have therefore become an important problem. C. C. RUCHHOFF

Water supply from the Mulde Valley. HERZNER. *Gas u. Wasserfach* 71, 116-6, 1185-90, 1213-8(1928).—The water supply of a large number of German communities is obtained from the Mulde Valley. This system was partly completed in June 1926, and now supplies an av. of 100 l. per sec. and as high as 200 l. per sec. Details of the distribution system and computations of pipe size are given. The purification system removes the yellow color due to humins by means of an addn. of 30 g. per l. of alumina impregnated with H_2SO_4 , after which 18 g. soda ash per l. is added, whereupon 50% of all impurities are pptd. After settling, the water is filtered through a quartz sand filter (grain size 1.5 mm.) and then through a marble filter to remove CO_2 . R. W. RYAN

Variable Duty Water Works, Edmonton, Alberta. ANON. *Can. Eng.* 55, 777-82(1928).—The filtration plant has a capacity of 8 million g. p. d. The raw water obtained from the North Saskatchewan River is clear and has a max. hardness of 300 p. p. m. during the winter, and is softer but has a very high turbidity (max. 10,000) during the summer. The plant includes a Dorr clarifier and 4 agitator tanks for mixing the soda and lime. During the summer months the Dorr clarifier is used to remove the heavier suspended matter before the application of the coagulant. During the winter months when the Dorr clarifier is not used for pre-sedimentation it is used to remove the sludge resulting from the water-softening process. C. C. RUCHHOFF

Water purification and softening plant at Piqua, Ohio. J. M. MONTGOMERY. *Munic. News and Water Works* 75, 135-9; *Public Works* 59, 341-5(1928).—See C. A. 22, 3247. C. C. RUCHHOFF

Control and the degree of reliability of the chlorination process of drinking water, in connection with the chloramine procedure and the chlorination of ammoniacal water. I. K. HOLWERDA. *Mededeel. Dienst Volksgezondheid Nederland-Indië* 17, Pt. II, 251-97(1928).—From H.'s expts. it is evident that at a rising p_{H} beyond 7 the disinfection by chlorination decreases considerably; the influence at p_{H} 9 and 9.5 is very great. The disinfection period for a definite hypochlorite dose appears to be longer

as the p_H is higher. For a $p_H < 7$ this influence is not so great. At a $p_H = 7$, 69.7% of the hypochlorite added is present in the form of HClO ; at $p_H = 8$, only 18.7%; and so on lower as the p_H becomes higher. Below $p_H = 6$, almost the entire amt. of hypochlorite is present as HClO . The conclusion is drawn that the disinfection by means of a Cl gas soln., as well as by hypochlorites for the same amt. of active Cl , independent of the form in which it is added, is entirely detd. by the p_H which develops after the addn. For a $p_H < 8$ the following min. contact periods are noted at the concns. of active Cl mentioned.

Concn.	Contact period.
0.2 Mg. Cl_2 as hypochlorite	About 3 mins.
0.15 Mg. Cl_2 as hypochlorite	About 5 mins.
0.10 Mg. Cl_2 as hypochlorite	About 10 mins.
0.05 Mg. Cl_2 as hypochlorite	About 30 mins.

It is inaccurate to consider the disinfecting power of chloramine greater than Cl . Less chloramine is fixed by the org. constituents present in the water and a smaller Cl dose of chloramine will sometimes suffice in case of a long contact period. Therefore the disinfecting power of chloramine is only apparently greater. RUSSELL C. ERB

Superchlorination and subsequent dechlorination over carbon of water for municipal supply. ERNST WATZL. *Ind. Eng. Chem.* 21, 156-8(1929).—Increased org. content of water may use up Cl and prevent destruction of harmful bacteria. The use of an excess of Cl regulated by automatic control and the subsequent removal of the excess by special granular charcoal guarantee safety and palatability. EDWARD BARTOW

Chlorination as a factor of safety in shellfish production. WM. F. WELLS. *Am. J. Public Health* 19, 72-9(1929).—The polluting materials do not enter the body of the oyster but are discharged with other matter excreted. Treating of oysters in chlorinated sea water has been shown both experimentally and in a com. plant, to purify oyster and to safeguard them from transmitting disease. EDWARD BARTOW

The chlorination of industrial water, especially tannery water. MARTIN AUERBACH. *Ledertech. Rundschau* 20, 189-91(1928) I. D. C.

Calculus and the construction of filtering basins in water-bearing strata. PAUL LIEBERMANN. Pub. Wks. Dept., Besançon. *Science ind.* 12, No. 175, 75-87(1928).—Calcs. and derivation of engineering formulas are given bearing upon the location and building of filter basins in alluvial strata contg. H_2O , near wells, rivers, in gravels and under other conditions. C. R. F.

The filtration and sterilization of water for potable supplies. HENRI CHABAL. *Science ind.* 12, No. 175, 64-8(1928).—An historical and descriptive résumé of modern filtration methods. The village of Pan showed an av. typhoid rate of 30 cases before 1910. Upon installation of the Peuch-Chabal filtration system, there was but 1 case in 2 years. The fractional filtration method is favored. C. R. F.

The Sandfields filtration installation . . . chemical and bacteriological observations. ARNOLD W. BURTT. *Water & Water Eng.* 30, 557-65(1928).—A rapid gravity system followed by chlorination converts a doubtful quality water into one of high quality. The purification consists in addn. of alumino-ferric, continuous flow sedimentation, filtration followed immediately by chlorination, passage through a clear water tank and finally dechlorination if necessary. The max. load for which the plant was designed is 4 million gal. per 24 hrs. By means of dyes, the water flow through the pptn. tanks was detd. to be 1% after 1 hr., 20% after 2 hrs., 65% after 4 hrs. and 94% after 7 hrs. In order to avoid contamination, the filtered water flows in closed channels only. The filters are of the air-cleaned type. Contrary to prevalent ideas, the filtrate is of as good quality just after starting the filter as after 10 or more min. It is unnecessary to by-pass the filtrate at all. The dose of alumino-ferric is from 0 to 1.0 g. per gal. Al does not play any part in the removal of N in the form of NH_3 from the raw water. Even with regular removal of the sludge from the tanks, bacteria multiply slightly in the pptn. tanks but when sedimentation is encouraged by the use of Al , the reduction in nos. due to sedimentation predominates. Samples of sand taken at depths of 3, 6, and 9 in., resp., from the filter contained 0.77, 0.65 and 0.59% of org. matter, thus indicating that adsorption occurred at all depths but was greatest near the surface. Cl is used regularly at a rate of 0.2 p. p. m. The rate of filtration is 2,750,000 gal. per day. Coarse suspended matter, such as the larger particles of Al floc, are undoubtedly removed by a simple straining action at the surface of the filter bed, but the view is taken that bacteria and colloidal org. matter are removed not by passage through a film on top of the bed only, but by the gelatinous coating surrounding the

individual sand grains throughout the filter. The breaking up of the surface of the filters with a hand rake did not affect the phys. or bacterial purity of the filtrate providing the filter was in good working condition and not clogged. The frothing of water in the pure water tanks was shown to be due to lowering of the surface tension of the water due to colloidal org. matter present in small quantities. C. R. F.

A quickened slow sand filtration in the tropics. K. HOLWERDA. *Mededeel. Dienst Volksgezondheid. Nederland-Indië* 17, Pt. II, 383-92(1928).—After the usual alum treatment the water is run through a preliminary filter of 2.3 sq. m. surface. Sand in this filter has been replaced with coarse gravel to prevent clogging. Behind this filter is a compartment where chemicals, cultures, etc., may be added to the water. Const. level is maintained by an equil. ball valve. The slow filter has a surface of 10 sq. m., the bottom being made of porous stones, on which the filtering sand (grains about 2 mm.) is placed. The initial height of the sand was 90 cm. and the initial speed 4.2 cm. per hr. After operation for about a month, samples incubated 2 days at 37°, gave a variation of the glucose and lactose-titers from 1 to 10 cc.; the germ figure was fairly regular between 200 and 300 and was higher than the original water. *B. coli*, the infecting agent, passed through in significant amts. a month and a half later. Resistance increased a little after 2 months and the speed was changed to 6 cm. per hr. The germ figure < 100 was attained after 70 days only. A month later a resistance of 100 cm. was reached, the germ figure was sufficiently low, but a lactose titer < 50 cc. could not yet be registered. The filter film was removed and the speed set at 10 cm. per hr. The germ figures remained low but the lactose-titers gave poor results. After 4 months still less than 50 cc. of water gave positive fermentation with lactose bouillon. The results did not become worse upon raising the speed to 17 cm. per hr. Detailed tables give the exptl. data. RUSSELL C. FERRIS.

Composition and use of ferric hydroxide as a coagulant. EDWARD S. HOPKINS. Bur. of Water Supply, Baltimore, Md. *Ind. Eng. Chem.* 21, 58-60(1929). It gives practical operating data governing the use of $\text{Fe}(\text{OH})_3$ floc as a coagulant and the max. removal of turbidity by it, as well as a discussion of its theoretical composition. J. A. KENNEDY.

Coagulation processes during the purification of river water. I. C. P. MOM. Expt. Sta. for Water Purif., Manggarai. *Mededeel. Dienst. Volksgezondheid Nederland-Indië* Pt. I, 27-71(1925).—(In English.) The Tjiliwong river in Batavia is fed by rain water and natural springs and because of excessive rainfall, the water carries a great deal of color, org. matter and colloidal clay and has a low mineral content. Coagulation by the addn. of 10 mg. per l. of $\text{Al}_2(\text{SO}_4)_3$, keeping the pH at 5 to 6, gave excellent results. The colloidal clay had the following chem. compn.: Fe_2O_3 3 to 10%, Al_2O_3 29.2 to 44.7%, SiO_2 26.4 to 39.5%, and loss on ignition 10.2 to 23.8%. The addn. of H_2SO_4 or alkali to adjust the pH of the water was found to be necessary. The theoretical considerations underlying coagulation of colloidal silt from water are considered in great detail. C. R. F.

Preparation of a serviceable boiler-feed water for high- and super-pressure steam boilers. W. KÄRSTEN. *Chem. Fabrik* 1929, 27-9.—Sol. reaction products from treated waters have a harmful effect on the evaporators, on the boiler itself, and even on super-heater and turbines. Condensate and distillate can be considered almost pure water. A water with low salt content, free from CO_2 and O, is obtained by a thermochem. system (Balcke). Carbonates are removed on plates or as sludge by settling after heating the water at atm. pressure. The water obtained is gas free. SiO_2 with some CaO is harmful. Soda is added to make sol. Na silicate. The boiler is blown down to prevent high concn. The treated water is kept in a special closed reservoir with an atm. of steam or N to prevent access of O or CO_2 . E. B.

The determination of the number of colon bacilli in water. A. MASSINK. *Nederl. Tydschr. Hyg., Microbiol. en Serol.* 3, No. 2, 103-27(1928).—A review is given first of the older, simpler and theoretically less exact methods of calcg. the no. of *B. coli* in water, as well as of the gradual improvements. Since the modern considerations as to the field of examn. have been and are being applied especially in the U. S., various American papers are discussed and partially cited. Some applications to important problems on water pollution, in relation to rivers as sources of water supply, are briefly discussed. J. C. JÜRRIJENS.

Experiments on the changes in the bacterial flora of stored polluted surface water, especially with a view to Clemesha's method for ascertaining the recency of a pollution. K. HOLWERDA. *Mededeel. Dienst Volksgezondheid Nederland-Indië* 17, Pt. II, 298-356(1928).—In the expts. in open reservoirs hardly any difference of the titers appeared although a higher, Eykman titer was general. A difference between the glucose and

actose titers did not appear in samples obtained in Nov. and Dec., whereas it did appear in May, June and July, when sunlight is more profuse. In advanced purification, spore-forming, fermenting organisms often became prevalent and gave rise to irregular fermentation figures. With sodium taurocholate in the fermentation tubes most of these spore-formers do not develop. This was verified by isolation of the organisms in pure culture. In the expt. in the reservoir, covered with a glass plate, fermentation figures were obtained but no difference of the titers was observed. This expt. was conducted in the rainy season of Jan. Expts. with water kept in the dark showed no general titer difference with but a slight Eykman-titer difference. H. concludes that a difference in glucose and lactose titers on storage waters in open reservoirs is no general phenomenon. Numerous analytical tables are given. R. C. E.

Chemical and biological correlations in a polluted stream. WILLEM RUDOLFS. *Ind. Eng. Chem.* 21, 256-8(1929).—Water of the Raritan River system in New Jersey is in its natural condition suitable for potable and industrial purposes. The lower section of the river is heavily polluted. There is an apparent direct relation between the amt. of NH_3 present, the bacteria, plankton, and the biochem. O demand of the river water. The O depletion was greater in summer than in winter. The no. of *B. coli* was so high that it was recommended that bathing be not allowed. Two low dams increased the dissolved O to a considerable extent. EDWARD BARTOW

Stream-pollution control activities in Wisconsin. L. F. WARRICK. *Ind. Eng. Chem.* 21, 261-3(1929).—A water pollution comm. has been organized with the state sanitary engineer as administrative officer. Elimination of objectionable stream pollution is the ultimate goal. Chem. and biological stream surveys have been made and with the cooperation of canners, paper mill operators, and others, exptl. plants have been run and conditions are being improved. EDWARD BARTOW

Sewage treatment abroad. WILLEM RUDOLFS. *Public Works* 59, 366-9(1928); cf. *C. A.* 22, 4090.—The effect of design, operation, character of sewage, climate and other local conditions in the results obtained from sewage treatment plants in the U. S. and the Ruhr District of Germany are compared. R. concludes that it is not probable that the climatic conditions or digestion capacity of the plants is important in the difference in the behavior in the plants of these countries. He believes that the most important factors are: (1) the low volatile matter content of the sewage in the Ruhr District; (2) the type of trade waste received in a no. of the German plants; and (3) the age (or freshness) of the sewage arriving at the plants. C. C. R.

The economic side of sewage disposal. N. T. VEATCH. *Munic. News and Water Works* 75, 161-2(1928).—A review of the economic reasons for sewage disposal plants, the increase in the no. of plants and a discussion of sources of revenue from some plants. C. C. RUCHHOFF

Successful sewage plant operation. C. H. CURRIE. *Can. Eng.* 54, 551-2(1928).—The main requirements for successful sewage plant operation are: a properly designed and constructed plant, the owner's appreciation of the importance of proper operation, sufficient operating finances and sufficient knowledge and zeal on the part of the operator. C. C. RUCHHOFF

Odorless operation of a two-story sewage treatment plant. CHARLES C. BROWN. *Munic. News and Water Works* 75, 293-5(1928).—The two-story circular treatment plant, which is described at Plant City, Florida had received no attention since it was built and was producing a nuisance during much of the year. The plant did not include a grit chamber or screens. Examin. showed that sludge and sand filled the tank to the slots in the settling chamber and could not be pumped out. The plant was completely cleaned out, a grit chamber and screen were added, and an operator was hired and given detailed instruction for satisfactory operation of the plant. Since then the plant has operated satisfactorily. C. C. RUCHHOFF

Separate sludge digestion experience. ANTHONY J. FISCHER. *Public Works* 59, 382-7(1928); cf. *C. A.* 22, 3250.—The operation of sludge digestion plants at Hartford, Kiel, Sheboygan, and Antigo, Wisconsin, Ridgewood, N. J., Storm Lake, Iowa, and Sioux Falls, S. Dak., after 2 years of observation are discussed. The capacities of these plants are compared on the basis of cu. ft. per lb. dry solids added per day. Difficulties were encountered with all plants started at the beginning of cold weather. Ripe manure was of a doubtful value as a seed. Reaction adjustment with lime was beneficial but also caused foaming. It is recommended that when a tank is started in the fall and acid sludge accumulates until spring the sludge be pumped out and the tank started anew. Removal of all scum, adjustment of reaction and circulation of the ripe sludge from the bottom to the top of a tank are suggested as remedies for foaming. C. C. RUCHHOFF

Effect of pressure upon sludge digestion. MELVILLE C. WHIPPLE, GORDON M. FAIR AND LOUIS KLEIN. *Ind. Eng. Chem.* 21, 254-6(1929).—There seems to be a slight acceleration of digestion of sludge under reduced pressure and a retardation under increased pressure. However, measured in terms of total gas production and total methane production, there seems to be but little difference in the digestion under various conditions. Devices to establish pressures unusual in practice would presumably not shorten digestion time. The use of deep tanks for digestion may have certain advantages in operation, and they would probably have no disadvantage on the ground of increased pressures at which digestion must proceed. EDWARD BARTOW

Sludge digestion and p_H control. H. W. CLARK AND GEORGE O. ADAMS. *Ind. Eng. Chem.* 21, 258-60(1929).—Sludge from different municipalities was digested under identical conditions. The p_H necessary for the best digestion of each sludge may vary because of difference in the org. and mineral content of each. Raising the p_H by the addn. of Ca carbonate is sometimes helpful but in some sludges the available alk. is sufficient so that the addn. is unnecessary. Org. acids resulting from decompn. of sludge may, while causing low p_H , be beneficial to digestion. EDWARD BARTOW

Capacity of sludge digestion tanks. KARL IMHOFF. *Can. Eng.* 55, 239-40(1928); cf. *C. A.* 22, 4688.—Temp., mixing or seeding, and souring of sludge greatly influence the rate of digestion and the digestion capacity allowance. For a mean annual temp. of 15°, 1 cu. ft. per capita should be used in two-story and sep. sludge digestion tanks. This capacity is based on an effective period of digestion of 2 months with a decrease in org. matter of 50%. C. C. RUCHHOFF

Experimenting with sludge lagooning at Waco, Texas. V. M. EHLERS AND CHESTER COHEN. *Public Works* 59, 380-1(1928).—Sewage solids from preliminary settling tanks mixed with activated sludge could not be lagooned without nuisance. Removal of 85% of the settleable solids in preliminary settling tanks did not produce as good results in the activated sludge tanks as a 60% removal in the pre-sedimentation tanks. C. C. RUCHHOFF

Putting Imhoff tanks into service. WELLINGTON DONALDSON AND P. N. DANIELS. *Public Works* 59, 362-3(1928).—Abstracts of paper before the New Jersey Sewage Works Assoc. Experiences with Imhoff tank operation at Newcastle, Pa., and Trenton, N. J., resp., are given. Neither of these plants was seeded with ripe sludge when they were put into operation. At Newcastle after the first 6 months of operation without lime the sludge had a p_H of 5.2 to 6.8 in various tanks. During the next 6 months a large quantity of lime was added, the p_H was maintained at 7.5 and the gas production was increased from 100 to a max. of 25,000 ft. of gas daily. At Trenton the plant was started by adding about 15 lbs. per million gal. but the amt. of lime was steadily increased until a dose of 750 lbs. per million gal. was added to stop foaming. Thereafter the dose was reduced to 110 lbs. per million gal. and the p_H was maintained at 7.3. C. C. RUCHHOFF

Contract aeration at Rochester, N. Y. JOHN F. SKINNER. *Public Works* 59, 369-70(1928).—A contact aerator 24 ft. square with a max. depth of 11 ft. was built into the settling chamber of an Imhoff tank. The bottom of the aerator consists of 2 × 4 in. pine set on edge with 3/4-in. slots between. The aerators include 2 headers with lateral distributors of 1/2 in. Cu pipe placed at 1 ft. intervals. Two 1/8-in. holes are placed at 1 ft. intervals on the lower quarters of the laterals. The aerator is filled with coke of nut size. C. C. RUCHHOFF

Hygiene of public swimming baths. A. L. THOMSON. *Can. Eng.* 55, 721-2(1928).—A discussion of the filtration and disinfection of swimming pools presented before the Royal Assoc. of Scotland is given. The Sanitary Code of the American Public Health Assoc. is suggested as a standard until a better standard can be detd. and adopted. C. C. RUCHHOFF

Chlorination of swimming pool water. R. F. HEATH. *Can. Eng.* 55, 257-62(1928).—The bacteriol. results obtained and the residual Cl present in swimming pools at various intervals after chlorination in pools using Ca hypochlorite without o-tolidine control, Ca hypochlorite with o-tolidine control and liquid Cl with o-tolidine control are presented. The comparison shows that the pools using the third method maintain a more regular residual Cl content together with low bacterial counts and absence of the colon group than the other methods. C. C. RUCHHOFF

Disinfection of swimming baths in the tropics with chlorine and chloramine. K. HOLWERDA. *Mededeel. Dienst Volksgezondheid Nederland-Indië* 17, Pt. II, 357-82(1928).—Disinfection with hypochlorite gave good bactericidal results in spite of certain difficulties. The catalytic action of sunlight decomposes the hypochlorite, making it impossible to keep the quantity of active Cl at a fixed min. Sunlight decompn.

of NH_2Cl is much less, so this is preferred in principle. Because of its weaker disinfecting power, a sufficiently great min. quantity of NH_2Cl is needed. This may be brought to 2 mg. "active Cl" per l. Good results were obtained with a concn. of 0.4 mg. active Cl (as NH_2Cl) per l. The simplest way of applying chloramine is by adding NH_3 or NH_4Cl to the chlorinated water (either with gas or hypochlorites). A great loss of active Cl takes place by the application of both chloramine and hypochlorites at the same time. Every other method where NH_3 is added to water and where the ratio, $\text{Cl}_2:\text{NH}_3::4.2:1$, is surpassed is not to be recommended for use in swimming tanks.

RUSSELL C. ERB

Effluents of factories and cities. J. P. LAURENT. *Science ind.* 12, No. 175, 109-15 (1928).—A general description of the well-known systems of effluent purification. Sugar-house and distillery wastes can be satisfactorily purified by means of double filtrations and the use of moderate sized sludge beds. Preliminary screening and sedimentation for eliminating the coarsest particles in suspension are desirable. Dye plants present special difficulties because the highly dyed effluents must be decolorized as well as purified. Filtration followed by treatment with CaO , then passing over log-wood or activated C beds, is recommended. The C may be recovered and used again by means of a second filtration. Abattoir effluents after screening and pptn. by chem. agents are run into Imhoff tanks for biol. purification. Satisfactory results are not always obtained. In every case the sludge is suitable for fertilizer purposes.

C. R. F.

Sodium aluminate as a coagulant in chemical treatment of cannery waste waters. J. A. HOLMES AND G. J. FINK. *Ind. Eng. Chem.* 21, 150-1 (1929).—The liquid waste after removal of the solid matter by cyclones is passed through screens and settling tanks. Enough chemical is added to insure a clear effluent with a p_H of 10 or above. An av. of 2.5 lb. $\text{Ca}(\text{OH})_2$ and 0.4 lbs. Na aluminate per 1000 gals. of waste is used. Unconsumed tests show a reduction of 81%. There is no turbidity or odors in the rule of open ditch through which it flows.

EDWARD BARTOW

Disposal of packing house waste by irrigation at Laredo, Texas. CHESTER COHEN. *Public Works* 59, 377-8 (1928).—The combined sewage flow from a packing plant was discharged daily into a sufficient no. of furrows about 6 in. deep that were plowed across the land. The discharge was rotated from day to day into adjacent furrows or channels, while the first are allowed to dry. This rotation is continued and as the first channels are dried they are plowed in. If the land is used only for irrigation 6000 gals. of waste per acre per day can be disposed of.

C. C. RUCHHOFF

Treatment of industrial wastes from paper mills and tannery on Neponset River. ALMON L. FALES. *Ind. Eng. Chem.* 21, 216-21 (1929).—The Hollingsworth & Vose Co. make pulp and rope manilla paper. There is some re-use of water. One million gals. of the dirtier washer waste pass through settling tanks and 6 coke or cinder filters of 22 acres area and 3.5 ft. deep. Beater wastes 2.5 to 3.5 m. g. d. are treated by sedimentation and one acre of cinder filters. Bird & Son, Inc., make heavy paper for shipping cases, etc. The waste is of 3 kinds: (1) Boiler wastes from boiling of cotton and lump starch with lye. 4000 to 5000 gals. daily are disposed of on waste land. (2) Washer wastes, 350,000 gals. per day, treated by sedimentation throughout the year. Sand filtration is addnl. in summer. (3) Machine wastes 5.4 m. g. d. treated by chem. pptn. with $\text{Al}_2(\text{SO}_4)_3$, 5.6 gr. per gal. and sometimes H_2SO_4 if waste is extremely alk. Winslow Bros. & Smith Co. tannery and wool-scouring. (1) Rinse wastes from wool department, 250,000 gals. per day are screened only. (2) Wool scouring wastes, 25,000 gals. per day settled, are cooled, acidified with H_2SO_4 , grease and oil removed and refined. Clarified liquor is added to tannery wastes. (3) Combined wastes from tannery and degreasing plant, 400,000 to 600,000 gals. per day are treated by sedimentation, chem. pptn. with $\text{Al}_2(\text{SO}_4)_3$ at p_H of 5.2, sand filtration and dila. The treatment at all plants is varied with the condition of the river. If the treatment becomes insufficient NaNO_2 is added. The companies and the town of Norwood all participate in the treatment with Na nitrate.

EDWARD BARTOW

Domestic smoke problem. CHARLES R. DARLING. *Colliery Guardian* 138, No. 3552, 348 (1929).

Electric device for purifying water. THOMAS J. CURTIS. U. S. 1,702,767, Feb. 19 The device has a thermostatic regulator and is suitable for purifying water for drinking

Water-softening apparatus. WALTER H. GREEN (to General Zeolite Co.). U. S. 1,702,256, Feb. 19. U. S. 1,702,257 specifies intermixing a lime-soda soln. with a body of hard water which has been set into rotary motion, causing the mixt. to ascend (in an app. which is described) and at the same time continually slowing down the rotary movement without disturbing or baffling it.

Apparatus (utilizing compressed air) for gravity separation of oily substances from sewage. KARL IMHOFF. U. S. 1,703,041, Feb. 19.

Treating sewage sludge. M. PRÜSS. Brit. 293,274, Jan. 16, 1928. Decompos. of sludge in digestion chambers is promoted by repeatedly mixing the whole of the digesting sludge with fresh sludge at short intervals, as by the use of high-speed centrifugal pumps. The sludge digestion chamber may be heated to 25° and gases given off during the digestion may be utilized in connection with the heating.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Titration curves and buffer actions of soils. F. TERLIKOWSKI AND T. WŁOCZYSKI. *Rocz. Nauk Rolniczych Lesnych* 13, 602-3(1925) The buffering properties of 15 soils, including various horizons of those soils, were examd. on the ground that such properties vary in significance according to the horizon. The reaction of these soils with HCl and H₂SO₄ was detd. at C₁ values ranging from 2.5×10^{-4} to 2.25×10^{-3} g./l. The reaction with superphosphate contg. free acid in quantities equiv. to the pure acid solns. and also similar to those used in agr. practice was also investigated. Ten g. of soil was mixed with 20 cc. of acid and maintained at 18° for 48-96 hrs.; the p_H value was then detd. potentiometrically. There were examd. 7 humus horizons of partially podsolized, podsol and meadow soils; 3 eluvial horizons; 3 illuvial horizons of the same soil; and also 2 C-horizons of sandy forest soils. The chief findings were as follows: All soils, independent of their initial reaction, showed buffer action, even pure sand formations. As a measure of the buffering properties can be taken the area, bounded on the one side by the theoretical titration curve and on the other by the exptl. titration curve, the initial reaction being taken into account. In the soil profile, the least buffer action is found in the eluvial horizon; this is explained by the soil-building process in this horizon. In this connection are often found significant buffering properties in illuvial horizons, which are produced therein by the products of leaching of the A₁- and A₂-horizons. The A₂-horizon particularly has the highest buffer action, indicating therein the role of humic substances. No distinction in buffering properties could be drawn between forest and arable soils. Greater buffer action is displayed by soils toward free acids than toward superphosphate. The use of the latter in quantities corresponding to those used in agr. practice caused little or no alteration in soil reaction.

Wiessmann's method for determining the nutrient content of soils by pot experiments. K. MAIWALD. *Z. Pflanzenernähr. Düngung* 7B, 370-81(1928). The Wiessmann method (C. A. 22, 2425) is examd. The physiol. effects of the mixing of soil and sand on plant growth are not fully considered in the original method. The growth curves in sand and on soil diluted with sand are not strictly comparable for the purpose of calcg. the correction factor. The nutrient contents of the soil necessitate a different point of origin for the soil-sand growth curve. Further, the effect of the fertil. salts on the phys. and chem. conditions of different soil types may be such as to make comparison of the growth curves of little value.

Determination of the lime requirement of soils. GAY, P. MÜLLER AND O. ROOS. *Z. Pflanzenernähr. Düngung* 7B, 393-434(1928).—The various existing methods for detg

lime requirement of soils are compared from the point of view of their limitations and the differences between exptl. results and those of field trials. Results of numerous comparative tests are recorded and a form of group classification is adopted. The best representation of the "lime condition" of a soil is obtained from a consideration of the analytical figures for chalk, exchangeable Ca, and hydrolytic and exchange acidities. All 4 values are necessary in order completely to specify the soil condition. Detns. of pH values, though not necessary, serve to amplify the above results when used in conjunction with the titrimetric acidity detns. The *Azotobacter* reaction in its present form is not trustworthy. B. C. A.

Comparison of the Neubauer seedling method and the Lemmermann citrate method (for determining the phosphate requirement of soils) with field trials at Aschersleben. G. SCHULZ. *Z. Pflanzenernähr. Düngung*, **7B**, 297-301(1928).—Extensive comparative expts. are recorded. Good general agreement is shown among the 3 methods for cereals, but results diverge considerably with sugar beet. By increasing the limiting figure for phosphate in the Lemmermann process from 20 to 25 mg., slightly better agreement is shown. B. C. A.

Liming (of soils). A. GEHRING. *Z. Pflanzenernähr. Düngung*, **7B**, 249-64(1928); cf. C. A. **22**, 295.—Important points in liming practice are discussed. The form of lime used, the manner and period of application in the crop rotation, and the addnl. use of fertilizers are considered. B. C. A.

Theory of growth factors (of soils). E. A. MITSCHERLICH. *Z. Pflanzenernähr. Düngung*, **7B**, 345-52(1928). O. LEMMERMANN AND P. HASSE. *Ibid* 352-61.—Adverse criticism of the theory (notably that of Gerlach and of Lemmermann) is discussed and the constancy of growth factors reaffirmed. The technic of the Mitscherlich method is criticized. The diln. of the soil with sand introduces secondary factors with the system, and results are vitiated as the addnl. factors are not wholly incorporated in the calculn. Evidence is put forward to discredit the constancy of the growth factors. B. C. A.

Assimilation of biogenic elements by the roots of crops. J. STOKLASA. *Vestn. Českoslov. Akad. Zemedelske* **3**, 242-55(1927).—Difficultly sol. substances in the soil are brought into soln. by acid excretions from plant roots, org. acids and H_2CO_3 , both being excreted. The CO_2 produced by microbiol. action also plays an important part in rendering insol. materials sol. B. C. A.

A reconnaissance of some Australian tobacco soils, with reference to reaction and mechanical analysis. E. P. BAINBRIDGE. *J. Council Sci. Ind. Res. (Australia)* **1**, 341-53(1928).—The pH values and mech. analyses of 42 Australian soils are tabulated. A. L. MEHRING

A preliminary note on the rice crop in the United Provinces. R. L. SETHI. *Agr. Research Inst., Pusa Bull.* **186**, 22 pp.(1928).—Analyses of irrigation waters and soils used for growing rice in the United Provinces of India are tabulated. In expts. with various fertilizers for rice the best results were obtained by green manuring with sannai (*Crotalaria juncea*). K. D. JACOB

Development of the production and use of nitrogenous fertilizers. H. WARMBOLD. *Chem. Ztg.* **53**, 3(1929). E. C. M.

History and technic of the superphosphate industry. IV. The superphosphate industry in Denmark. ANON. *Superphosphate* **2**, 28-30(1929); cf. C. A. **23**, 663.—This is a brief illustrated paper on the Danish superphosphate industry. K. D. J.

Action of nitrogenous fertilizers on the quality of potatoes for "seed" and on the composition of potatoes grown on four different soils. E. KRÜGER. *Z. wiss. Landw.* **66**, 781-843(1927).—The quality of seed potatoes was distinctly influenced by the application of different nitrogenous fertilizers in increasing amts. The soils themselves were an important factor also, moorland soils giving the best and heavy calcareous soils the worst types of seed potatoes. The heavier nitrogenous dressings gave increased yields on the moorland and sandy soils without diminution in quality, but the increase in yield on the heavier soils was accompanied by a lowering of quality. $(NH_4)_2SO_4$ Analyses and in the

... during the winter resting ... is an indication of good seed quality. B. C. A.

The estimation of the fertilizer needs of soils by spontaneous cultures of *Azotobacter*. (Application to the plum tree soils of L'Agenais.) G. GUITTONNEAU. *Compt. rend. acad. agr. France* **15**, 83-8(1929).—In the soil types examd., the *Azotobacter* method shows a need for assimilable phosphoric acid. The *Azotobacter* method has confirmed the cultural indications which have been directly obtained on the spot. It has also confirmed the knowledge already laboriously obtained by chem. studies. Similar tests

were made by replacing sodium phosphate with either potassium phosphate, superphosphate, slag, disintegrated phosphate or pptd. phosphate. The results obtained have always been in agreement. But for each soil, the *Azotobacter* cultures were more or less luxuriant according to the nature of the phosphatic fertilizer employed.

E. F. SNYDER

Influence of potash fertilizing with increasing nitrogen dressings on the yield and quality of barley in 1927. H. WIESSMANN AND E. SCHRAMM. *Z. Pflanzenernähr. Dungung* 7B, 314-22(1928).—Potash fertilizing alone does not increase the protein content of barley, but a small increase results from an addnl. fairly heavy dressing of N. The "wt. per thousand grains" was not affected by potash salts, but the addnl. use of nitrate tended slightly to increase the proportion of small grains at the expense of the large ones

B. C. A.

Fertilization of paddy in lower Burma. DAVID HENDRY. *Agr. J. India* 23, 357-68 (1928).—Preliminary pot expts. indicated that the best N-P₂O₅ ratio for paddy soils in lower Burma is about 1 to 2. Both the 20-20 and 13-48 grades of *ammophos* increased the yield of paddy 67 to 100% over the control plots when applied at the rate of 200 lb. per acre. The residual effects of the 13-48 grade were greater than those of the 20-20 grade due to the higher P₂O₅ content of the former.

K. D. JACOB

Turnip-fertilizing investigations. A. W. HUDSON. *New Zealand J. Agr.* 37 245-51(1928).—In expts. over a period of 4 yrs., superphosphate applied at the rate of 100 lb. per acre increased the yield of turnips 0.8 to 8.2 tons per acre over the yield obtained with the same wt. of *Ephos basic phosphate*. Raw Nauru phosphate gave poor results. Mixts. of equal wts. of superphosphate and *Ephos basic phosphate* gave almost as good results as the same wt. of superphosphate alone. The percentage germination of turnip seed decreased with increasing applications of superphosphate while *Ephos basic phosphate* and Nauru phosphate had no deleterious effect. Germination injury was considerably reduced by applying the superphosphate a day or two before drilling the seed. Mixts. of equal wts. of superphosphate and ground limestone gave better yields than when the superphosphate was used alone and increased the germination of the seed by 50%.

K. D. JACOB

Factors determining the availability to plants of difficultly soluble calcium phosphates. V. V. BUTKEVICH. *Z. wiss. Landw.* 66, 947-92(1927).—The type of culture vessel used in this work consisted essentially of a large glass cylinder in which was placed a narrower glass cylinder. In the outer compartment was a complete nutrient soln. omitting phosphate. The inner cylinder contained sand resting on a porous plate, leaving a small space below. A siphon and air tube reached this space. Seedlings germinated in pure water were placed with their roots partially in the sand and partially in the nutrient soln. In order to study the behavior of various phosphates, these were mixed with the sand. The effect of various solns. percolating the sand on the soly. of the phosphates could be estd. by withdrawing the percolated soln. through the siphon. It was shown that the availability of the insol. Ca phosphates depended in the first place on the properties of the soil soln., particularly on the concns. of Ca bicarbonate and H ions. The utilization of these phosphates by plants did not depend entirely on their soly., and was influenced by the buffer system in the soil soln. The sep. and combined influences of various ions on the soly. of the phosphates and on their utilization by plants were described.

B. C. A.

Increase of iodine content of plants. E. HILTNER. *Forts. Landw.* 3, 1(1928). In an expt. on meadowland using KI as a source of I, the values obtained for the I content of the dry matter were: untreated, 0.146; fertilized with KI, 0.797. Sprayed with KI soln., 2.351 mg./kg.

B. C. A.

Cyanides used for fumigation. A. A. RAMSAY. *Agr. Gas. N. S. Wales* 39, 783-6 (1928).—Analyses of 3 samples of alkali cyanides sold in N. S. Wales are tabulated.

K. D. JACOB

Laboratory experiments with non-arsenical insecticides for biting insects. C. T. GIMMINGHAM AND F. TATTERSFIELD. Rothamsted Expt. Sta., Harpenden, England. *Ann. Appl. Biol.* 15, 649-58(1928).—Fluosilicates of Na, K, Al and Ca applied as liquid sprays were toxic to lepidopterous larvae of the following species: *Selenia tetralunaria*, *Orgyia antiqua*, *Abraxas grossulariata* and *Cheimatobia brumata*. Resistance to the poisons varied with the species and age of the insect, younger larvae being most susceptible. Considerable but irregular injury to plant foliage was produced by these compounds. Plant foliage sprayed with exts. of certain tropical plants (*Tephrosia* sp., *Lonchocarpus* sp.) repelled young lepidopterous larvae.

C. H. RICHARDSON

The action of sulfur as a fungicide and as an ascaricide. I. WM. GOODWIN AND H. MARTIN. S.-E. Agr. College, Wye, Kent, England. *Ann. Appl. Biol.* 15, 623-38

(1928).—The various theories advanced to account for the fungicidal action of S when it is applied to a heated surface have been examd. by the use of chem. methods. Conclusions: The toxic agent is gaseous since it passes through glass wool maintained at the temp. of the heated surface. Removal of the volatile agent by passage through a cooled glass-wool filter furnishes proof that it is neither SO_2 nor H_2S but elementary S.

C. H. RICHARDSON

Some experiments with calcium cyanide as a control for plant parasitic nematodes. W. E. H. HODSON, Seale-Hayne Agr. College, Devon, AND GORDON W. GIBSON, Isles of Scilly Expt. Sta., England. *Ann. Appl. Biol.* 15, 639-48(1928).—Expts. to control *Heterodera radicum* in tomato and *Tylenchus dipsaci* in narcissus with Ca cyanide were only partially successful, requiring very heavy doses.

C. H. RICHARDSON

Peach aphid and leaf curl. Spraying experiments. A. A. HAMMOND. *J. Dept. Agr. Victoria* 26, 728-30(1928).—In expts. with oil-Bordeaux mixts. for control of aphid on peach trees ordinary fuel oil gave slightly better results than lubricating oil and a patent oil emulsion known as "Klecnup." Addn. of nicotine sulfate did not increase the efficiency of the sprays.

K. D. JACOB

Tests for blowfly baits and repellents during 1926. D. C. PARMAN, E. W. LAAKE, F. C. BISHOP AND R. C. ROARK. U. S. Dept. Agr., *Tech. Bull.* 80, 1-14(1928).—A method of detg. the repellent value of a substance consists in smearing 5 cc. of the sample upon a 113-g. cube of fresh beef liver placed on 2.5 cm. of clean, dry sand in an ordinary pint Mason jar, and counting the no. of flies within the jar at stated time intervals. Comparison is made with the no. of flies visiting similar jars contg. untreated meat and placed 1.2 m. from either side of the treated jar. The % ratio of flies visiting the treated jar, compared with the av. no. visiting the adjacent check jars, expresses the repellent value of the material under study. Pine-tar oil, pyrethrum, Cu stearate and Cu resinate gave the most promising results. The work indicates that future progress in the employment of repellents lies in the use of materials which will absorb, adsorb, chemically alter or prevent the formation of volatile compds. attractive to insects rather than the use of masking odors such as those of essential oils or of irritants similar to tear gases.

Fertilizers. FRANS G. LILJENROTH. Fr. 643,968, Oct. 10, 1927. See Brit. 290,518 (C. A. 23, 927).

Fertilizers. RHENANIA-KUNHEIM VEREIN CHEMISCHER FABRIKEN A.-G. Fr. 643,782, Nov. 12, 1927. Mixed fertilizers are made by mixing calcined phosphates, such as Thomas slag, Rhenania phosphate, Wolter's phosphate, etc., with NH_4 salts and removing the alkalinity by acids or acid salts. Cf. C. A. 23, 1208.

Phosphatic fertilizer. J. VAN DER PLAAS. Brit. 293,837, July 13, 1927. A finely divided mixt. of raw phosphate, Mn ore or other manganic material and siliceous material such as the sand waste from glass works and an alk. substance such as Na_2CO_3 or K_2CO_3 , with addn. of lime if necessary, is heated to the sintering temp. or higher so as to form a product contg. a silico-phosphate of the formula $\text{P}_2\text{O}_5 \cdot \text{SiO}_2 \cdot 4\text{CaO} \cdot \text{Na}_2\text{O}$ and in which the Al and Fe present are in the form of spinels, $\text{Al}_2\text{O}_3 \cdot \text{MnO}$ and $\text{Fe}_2\text{O}_3 \cdot \text{MnO}$. The mixt. may be moistened or rendered plastic by addn. of water before being heated.

Dicalcium phosphate and ammonium sulfate. E. R. STACKABLE. Brit. 293,942, May 19, 1927. Materials suitable for use as fertilizers are obtained by treating a mixt. of H_3PO_4 or its Ca acid salts and CaSO_4 with NH_3 , preferably in the presence of a little water. Not more than 2 mol. proportions of NH_3 and 1 mol. proportion of CaSO_4 are used for each mol. proportion of H_3PO_4 , to prevent formation of tri-Ca phosphate. Various details are given.

Copper solution. MARCEL LAVRARD. Fr. 644,188, Nov. 21, 1927. CuSO_4 68.4, Na_2CO_3 26.2, and KMnO_4 6.4% are used in water for *agr. purposes*.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Industrial mold fermentations. ORVILLE E. MAY. *Hexagon of Alpha Chi Sigma* 19, 125-30(1928).—The following fermentations are briefly discussed: gallic acid from tannin by species of *Aspergillus*; the production of phenols from quinic acid; the fermentation of carbohydrate by molds with the production of alc., as high as 24% concn. of alc. having been reported; production of org. acids, such as citric, from sugar by molds, chiefly *Aspergillus* species. Gluconic acid has been produced by the Color and Farm Waste Division, U. S. Dept. of Agr., from glucose by the organism *Penicillium luteum purpurogenum*. Fred and Peterson have studied the fermentation of xylose. Recently, the fermentation of cellulose has received attention in Europe.

C. N. FREY

Industrial distillation of azeotropic mixtures. Absolute alcohol. Compressed vapor and predistilling apparatus. G. DUROIS. *Bull. Feder. Ind. Chim. Belg.* 7, 501-14(1928).—Description of the industrial manuf. of abs. alcohol by distu with C_6H_6 under pressure.

ALBERT L. HENNE

Saccharification of amylaceous substances and manufacture of ethyl alcohol and dextrose in an antiseptic medium by means of oriental bio-enzymes. G. MEZZADPOLL. *Zymologica* 3, 37-9(1928).—If a sample removed from an aseptic saccharification vessel is passed through a filter, and the filtrate, treated with a few drops of toluene, xylene, thymol, CH_3O , fluoride, etc., is kept at the same temp. as the original vessel, the formation of sugar proceeds *pari passu* with that in the vessel. The mucor (amylolytic) process may, therefore, be modified as follows: The grain, broken into three or four, is placed in a bath at 50-60° contg. about 8 parts per 1000 of HCl (d. 1.16), left for about 2 hrs., and heated in a cooker, preferably horizontal, for 40-60 min. at 4 kg. pressure. When the liquor begins to filter well through filter paper, the mass is discharged into a closed, aseptic vessel, cooled and aerated with sterile air, and at 40° seeded with a flask of sporulating mucor 105. After 15-18 hrs. from the time of seeding the mycelia begin to appear and soon assume their normal appearance; when saccharification has produced 30-50 g. of sugar per l., toluene or fluoride is added in sufficient amt. and the mash is discharged into open vats. When the sugar reaches 50-80 g. per l., yeast acclimatized to the antiseptic is introduced. The claims for this procedure are cheaper plant, lower coal consumption, acceleration of the various operations, and diminished chances of failure.

J. H. MOORE

Combination of high-pressure vessel and foremashing vat in distilleries. E. LÜHDER. *Apparatebau* 40, 289-91(1928).—Description of app. covered by Ger. Pat. 462,886.

J. H. MOORE

Cause of the formation of aldehydes in beverage. V. SHOICHI YAMADA. *Bull. Exptl. Lab. Fermentation* 100, 95-105(1928).—Lactic acid or its aq. soln. partly decomposes, giving CH_3CHO on heating. When a mixt. consisting of alanine and an equal or twice the quantity of glucose, fructose, sucrose, galactose, lactose or arabinose is distd. with steam, melanoidin and CH_3CHO are formed. CH_3CHO is also formed by the reaction between the sugars and Na aspartate, asparagine, Na glutamate or casein as well as alanine. Leucine and the sugars form *iso-valeraldehyde*. When phenylalanine is used, phenylacetaldehyde is formed. In the reaction between glycocoll and sugars, no formation of CH_3O is recognizable. The furfurole-like substance formed during the above reactions between sugars and amino acids is understood to have come from the direct decompn. of sugars on heating. These results explain the formation of aldehydes in saké or soy ext.

K. SOMEYA

Preparation of banana vinegar. HARRY VON IORSECKE. United Fruit Co., Boston. *Ind. Eng. Chem.* 21, 175-6(1929).—The banana mash consisting of the pulp and peel of ripe fruit contained an av. of 16% fermentable sugars. By fermentation with *Sacch. ellipsoideus* the cider yield was 56% of the wt. of fruit and the EtOH content varied from 6.55 to 10.12%. An av. of 6 lots which underwent acetic fermentation gave 5.72% AcOH . The Orleans process gave higher yields than the generator process. The high alk. of the sol. ash (120 cc. 0.1 N HCl) differentiated banana vinegar

from ordinary fruit vinegars. The color was amber and the taste and aroma were more agreeable. Persistent cloudiness was an objectionable factor. C. R. F.

Chemical studies on the brewing barley. YUKIHIKO NAKAMURA. *J. Faculty Agr. Hokkaido Imp. Univ.* 23, Pt. 2, 29-86(1928).—Analyses were made of the protein and total N of Chevalier, Hokudai No. 1 and Golden Melon. The protein and N content was greatest in Chevalier, medium in Hokudai and lowest in Golden Melon. The fats and starches in these species of barley were also investigated. Golden Melon has the highest n and the lowest sapon. value, I value and Reichert-Meißl no. The distribution of the 4 kinds of sol. N was detd. The ash content was highest in Hokudai and second in Chevalier. The decompn. of proteins by enzymes follows the equation $k = 1/\mu^k \times x/a(a - x)$. The p_H value of the isoelec. point of the 10% NaCl-soln.-sol.-protein is highest in Golden Melon, lower in Chevalier and lowest in Hokudai No. 1. For hordein it decreases in the following order: Chevalier, Hokudai No. 1, Golden Melon. The 0.2% NaOH-soln.-sol.-protein decreases in the following order: Chevalier, Golden Melon, Hokudai No. 1. The p_H values of the isoelec. points and the values of k of the above equation varied with the fractions studied and the types of barley investigated. The viscosities of the starch solns., the adsorptive power, the acetylation and the chlorination of the acetylated starches were carried out. Conclusion: The mol. wt. of Chevalier starch is greatest and most loosely bound; the smallest and hardest is Hokudai No. 1, Golden Melon having an intermediate position.

C. N. FREY

Palmitic acid as a constituent of fusel oil. K. KINO. Kyoto Imp. Univ. *J. Soc. Chem. Ind. (Japan)* 31, 749; *Supplemental Binding* 31, 180B(1928). When the fusel oil obtained from *kaoliang* was treated with KOH, K palmitate crystd. out in a nearly pure state. Y. TOMODA

Absolute alcohol. ELWOOD L. CLAPP (to U. S. Industrial Alcohol Co.). U. S. 1,702,495, Feb. 19. An app. is described for distg. weak alc. contg. water and impurities including materials of lower b. p.; after preliminary obtainment of aq. liquid alc. of high strength contg. lower b.-p. impurities, purification is effected to eliminate heads; dehydration is then effected by distn. with a third liquid such as C_6H_6 adapted to form an azeotropic mixt. with the alc. and water. Cf. *C. A.* 22, 3259.

Alcohol. SOCIÉTÉ ANONYME DES DISTILLERIES DES DEUX-SÈVRES. Fr. 644,202, April 21, 1927. See Brit. 289,051 (*C. A.* 23, 666).

Alcohol and acetone from straw, grasses and like materials. A. C. THAYSEN, I. D. GALLOWAY and W. E. BAKES. Brit. 293,514, April 30, 1927. The material is subjected to a preliminary hydrolysis with dil. acid, excess acid is removed and the material is steamed at atm. pressure. The mash is neutralized and inoculated with pentose fermenting microorganisms such as *Bacillus acetoethylicus* (Northrup) and the volatile products are collected by distn. An app. is described.

Vinegar. HEINRICH FRINGS. Fr. 643,996, Nov. 2, 1927. An acetification plant is provided with an exhaust air duct which runs the length of a battery of generators and acts through a siphon arrangement above each generator as a charging means for the generators.

Vinegar. FRIEDRICH SCHRANK. Ger. 470,639, Aug. 12, 1927. The cooling of the vats in the quick vinegar process is improved, and the process expedited, by introducing the raw spirit as a spray directed against the sides of the vat. The vats may have external cooling ribs.

Vinegar generator (with pump and connections for liquor circulation). H. FOX. Brit. 293,539, May 30, 1927.

Controlling temperature in malt kilns and the like. COMPAGNIE INDUSTRIELLE DE CONSTRUCTION DE BRASSERIES. Ger. 470,638, Apr. 21, 1925. A mixt. of furnace gases and air passes into a chamber beneath the malt, etc., part of the mixt. ascending and the remainder passing through a conduit leading back to the furnace grate. A

valve operated by the sp. gr. of the gas mixt. is located in the conduit, the arrangement being such that the supply of air to the furnace decreases if the mixt. is too hot.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Essential oils. SCHIMMEL & Co. *Ber. Schimmel* 1927, 4-5, 25-6, 53, 60-1, 66-7 78, 85-6, 86; cf. *C. A.* 22, 4716.—*Araucaria oil*.—The West Australian oil is a granular mass of a pleasant balsamic odor, m. 30° , d_{15} 0.9764, $\alpha_D + 14^{\circ} 25'$, n_D^{20} 1.50928, acid value 3.7, ester value 21.5, ester value after acetylation 173.6 (= 79.1% $C_{15}H_{26}O$) and is sol. in 3.5 vols. of 70% alc. From the fresh wood a yield of 10.5% of araucaria wood oil having d_{15} 0.9756, $\alpha_D + 4^{\circ} 10'$, n_D^{20} 1.51139, acid value 10.2, ester value 243 ester value after acetylation 177.3 (= 81.1% $C_{15}H_{26}O$) is obtained. From the weathered wood 11.7% of oil having d_{15} 0.9742, $\alpha_D + 8^{\circ} 5'$, n_D^{20} 1.51520, acid value 8.4, ester value 46.7, ester value after acetylation 186.7 (= 86.0% $C_{15}H_{26}O$) is obtained. Both wood oils are sol. in 1.1 vols. of 80% alc. *Dill-plant oil*.—Isomyristicin (m. 44°) and myristicin have been identified in dill-plant oil. By oxidation of isomyristicin with ozone, myristicin aldehyde (m. 131°) has been obtained. *Indian geranium oil*.—A South Indian oil had d_{15} 0.9148, $\alpha_D - 8^{\circ} 31'$, n_D^{20} 1.47524, acid value 5.6, ester value 77.5 (32.6% of esters as geranyl tiglate), ester value after acetylation 210 (total geraniol 68.5%), soly. in 70% alc. 1 in 2.5 vols.; after rectification with steam the oil had d_{15} 0.9105 and n_D^{20} 1.47407. Oil from *Laurelia serrata* ("Huahuan").—The leaf oil of *L. serrata* grown in Chile had d_{15} 0.9469, $\alpha_D - 11^{\circ} 25'$, n_D^{20} 1.48731, acid value 0.8, ester value 8.4, soly. in 70% alc. 1 in 2 vols. Oil from the bark had d_{15} 1.0426, $\alpha_D - 2^{\circ} 5'$, n_D^{20} 1.52482, acid value nil, ester value 6.5, soly. in 90% alc. 1 in 0.5 vol. The characteristic constituent of both oils was saffrole, the bark oil contg. the most. *Mexican linaloe oil*.—Steam distn. of linaloe wood from Mexico gave 8.1% of oil having d_{15} 0.8781, $\alpha_D + 8^{\circ} 15'$, n_D^{20} 1.46072, acid value 1.5, ester value 47.5, soly. in 60% alc. 1 in 4.5 vols., and consisted largely of *d*-linalool (75%). *Mexican petitgrain oil*.—Leaf oil from sweet oranges had d_{15} 0.8675, $\alpha_D + 41^{\circ} 40'$, n_D^{20} 1.47407, acid value 2.4, ester value 12.1, and leaf oil from bitter oranges had d_{15} 0.8578, $\alpha_D + 42^{\circ} 55'$, n_D^{20} 1.47299, acid value 1.2, ester value 10.3. Both oils were sol. in 0.4 vol. of 90% alc., but not completely so in 10 vols. of 80% alc. The odor of both oils was stupefying and they did not appear to be suitable for use in perfumery. *Peppermint oil from Palestine*.—Oil from the shade dried plant had d_{15} 0.9096, $\alpha_D - 22^{\circ}$, n_D^{20} 1.46261, acid value 0.8, ester value 13.1 (menthol esters 3.6%), ester value after acetylation 154.9 (total menthol 48.8%), soly. in 70% alc. 1 in 2.6 vols. (solin. opalescent). Oil from sun-dried plant had d_{15} 0.9084, $\alpha_D - 21^{\circ} 17'$, n_D^{20} 1.46340, acid value 0.4, ester value 14.0, menthol esters 3.9%, ester value after acetylation 139.1, total menthol 43.3%, soly. in 70% alc. 1 in 2.9 vols. (solin. opalescent). Shade drying appears to be advantageous. *Pichurim bean oil*. From Brazilian Pichurim beans 2.1% of oil having d_{15} 1.0538, $\alpha_D - 3^{\circ} 30'$, n_D^{20} 1.52076, acid value 9.7, ester value 4.6, ester value after acetylation 44.8, soly. in 90% alc. 1 in 0.5, was obtained. The oil had a sassafras odor. Oil from *Geranium macrorrhizum*.—The oil m. $25-35^{\circ}$, d_{15} 0.9431-0.9638, $\alpha_D - 5^{\circ} 45'$ to $-7^{\circ} 38'$, n_D^{20} 1.50642-1.51538, acid value 1.2-1.5, ester value 5.6-14.9, ester value after acetylation 33.6-35.5, soly. in 80% alc. 1 in 6-7 vols. (slight turbidity), in 90% alc. 1 in 1 vol. The oil has a soft, cryst. consistency and after sepn. of the solid constituent (about 50%, m. $54-55^{\circ}$) has d_{15} 0.9460, $\alpha_D - 8^{\circ} 10'$, n_D^{20} 1.50698, ester value after acetylation 54.1. *Castoreum*.—Steam distn. of Canadian castoreum gave 2.1% of oil, about half of which consisted of phenols. *o*-Cresol and a phenol, $C_{10}H_{10}O$, were detected, and in the phenol-free oil, acetophenone, benzyl alc. and *l*-borneol.

Determination of morphine. L. DÁVID. *Ber. ungar. pharm. Ges.* 2, 103-11 (1926).—Debourdeaux' method, which is preferred, has a constant error of -1.5%. Other methods give too low results.

Manganese content of plants affording officinal drugs. O. WILLMANN. *Ber. ungar. pharm. Ges.* 3, 29-53 (1927).—The Mn content of a large no. of drugs of the Hungarian Pharmacopeia (3rd ed.) has been detd. Aquatic plants contain more than others; young plants contain more than old, and the aerial more than the subterranean portions. The Mn is present chiefly in the cell plasma.

Determination of morphine with barium hydroxide. G. P. SCHOLTZ. *Ber. ungar. pharm. Ges.* 3, 435-7(1927).—In the Debourdeaux' method $\text{Ca}(\text{OH})_2$ is preferably replaced by $\text{Ba}(\text{OH})_2$, the Ba being removed with NH_4 oxalate or sulfate. B. C. A.

Constituents of Indian essential oils. XXIV. Essential oil from rhizomes of *Curcuma zedoaria*, Roscoe. B. SANJIVA RAO, VISHNU P. SHINTRE AND JOHN LIONEL SIMONSEN. *J. Soc. Chem. Ind.* 47, 171-2T(1928).—Distn. in steam of the rhizomes of *C. zedoaria* yielded 0.94% of oil, of which approx. one third was heavier than water; it had d_{20}^{30} 0.9724, n_D^{30} 1.5002, acid value 1.3, sapon. value 3.0, sapon. value after acetylation 66.6. The oil was shown to have the following compn.: *d*- α -pinene 1.5, *d*-camphene 3.5, cineole 9.6, *d*-camphor 4.2, *d*-borneol 1.5, unidentified alcohols trace, sesquiterpenes 10.0, sesquiterpene alcohols 48, residue (probably mainly sesquiterpene alcohols) 21%. B. C. A.

Essential oils of the *Thuja* species from the Crimea. B. RUTOVSKII AND S. BUSSE. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 10, 6-18(1924); cf. C. A. 21, 4020; 22, 4716.—The oils were obtained from the twigs and leaves. *Thuja gigantea* Nutt. gave 1.12% of oil having d_{20}^{30} 0.9125, α_D -1.50° , n_D^{20} 1.4550, acid value 0.38, ester value 12.79, ester value after acetylation 33.02, carbonyl no. (Walter) 261.3, soly. in 80% alc. 1 in 1 vol. The oil contained sabinene, α -thujone thujyl alc. and an aldehyde, which on oxidation gave an alc. (diphenylurethan, m. 52°). α -Pinene and fenchone could not be detected. *Thuja occidentalis*, L. gave 0.082% of oil having d_{20}^{30} 0.89934, α_D $+15.59^\circ$, n_D^{20} 1.4810, acid value 0.54, ester value 23.26, ester value after acetylation 49.55, carbonyl no. 43.7, soly. in 90% alc. 1 in 4.5 vols., and contained *d*- α -pinene and thujone. *Thuja orientalis*, L. gave 0.12% of oil having d_{20}^{30} 0.87955, α_D $+13.78^\circ$, n_D^{20} 1.4792, acid value 0.31, ester value 15.14, ester value after acetylation 37.2, carbonyl no. nil, soly. in 90% alc. 1 in 8.5 vols. The oil contained *d*- α -pinene, a sesquiterpene alc. and probably carophyllene. B. C. A.

Hyssop oil from the Crimea. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 10, 22-3(1924).—*Hyssopus officinalis*, L. gave an oil having d_4^{20} 0.9573, α_D -19.29° , n_D 1.4805, acid value 4.03, ester value 35.86, ester value after acetylation 98.02, soly. in 90% alc. 1 in 0.4 vol. The following compds. were identified in the oil: α - and β -pinene, *l*-pinocamphone (tribromopinocamphone, m. 93-95°), *l*-pinocampeol (m. 56-57°, d_4^{20} 0.9509, α_D -45.63° , n_D^{20} 1.4888), an aldehyde (d_4^{20} 0.9446, α_D -13.0° , semicarbazone, m. 201.5-203°), and acetic acid. Cineole could not be detected. B. C. A.

Essential oils from the berries of *Juniperus excelsa*, MB. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. sci. chem.-pharm. Inst. (Moscow)* 10, 51-61(1924).—11% of oil was obtained from the berries of *J. excelsa* MB. from the Crimea. It contained α -pinene, borneol, isborneol and acetic acid. β -Pinene could not be detected. B. C. A.

Constants of some Crimean and Caucasian essential oils. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. sci. chem.-pharm. Inst. (Moscow)* 10, 88-9(1924); cf. C. A. 19, 2726; 21, 4020.—The consts. of oils distilled in 1923 are tabulated. B. C. A.

Alkaloids of tobacco. A. SHMUK. U. S. S. R. State Inst. Tobacco Invest., *Bull.* 44, 47 pp(1928).—A summary is given of the chemistry and transformations of the alkaloids of tobacco, together with a critical review of the methods suggested for the detn. of nicotine in tobacco. B. C. A.

Review of pharmaceutical and pharmacological chemistry. S. BERLINGOZZI. *Gior. chim. ind. applicata* 10, 555-7(1928).—A review of recent progress in these branches of chemistry, particularly on the relation between chem. constitution of physiol. properties and analyses of pharmaceutical products. A. W. CONTIERI

***p*-Dimethylaminobenzaldehyde as a reagent for organic drugs.** H. W. VAN URK. *Pharm. Weekblad* 66, 101-8(1929).—A large no. (135) of org. substances, mostly medicinal products, were tested for color reactions with *p*- $\text{Me}_2\text{NC}_6\text{H}_4\text{CHO}$. The test may be performed by adding to a small amt. of the substance in a porcelain dish 5-10 drops of a 1% soln. of the reagent in dil. EtOH and sufficient 12% H_2SO_4 to give an acid concn. of about 2% by vol., and evapg. The residue is taken up in a little H_2O and the color of the soln. noted. Or, the test may be performed as a ring reaction by carefully adding concd. H_2SO_4 to an alc. soln. of the substance and reagent. A color is thus obtained with a surprisingly large no. of substances of altogether different chem. constitution. In general, primary amino deriva. give a yellow or orange color, except amino acids where the CO_2H is on the α . C. Phenols react, especially those of high mol. wt.

and those contg. more than 1 OH. Pyrrole and indole derivs. react but not pyridine derivs. Most alkaloids give a color reaction, especially the morphine group, but not thebaine, papaverine, etc. Santonin gives a blue color, terpin hydrate a blood red ring reaction, thymol a fiery red color. α - and β -Naphthol may be distinguished by the green color obtained with the former and the violet color with the latter. The test is negative with purines. The substances tested and the colors obtained therewith are presented in a table.

A. W. DOX

Commercial civet. C. T. BENNETT AND W. M. SEABER. *Perfumery Essential Oil Record* 20, 14-5(1929).—The results obtained in the analysis of 19 different com samples of civet have been tabulated. The usual limits for the values of the MeAc ext. of commercially "genuine" civets are: acid no. 85-115, sapon. no. 130-155, m. p. 40-5°.

W. O. F.

Odor and constitution among the mustard oils. V. Blending of mustard oils. G. MALCOLM DYSON. *Perfumery Essential Oil Record* 20, 3-5(1929); cf. C. A. 22, 4136.—Expts. on the aromatic mustard oils have been continued along 2 lines, namely, the production of mustard oils of a new type, and the blending of known examples with other perfumery substances. In the first direction an example of an entirely novel series of mustard oils has been produced, possessing certain attractive qualities. The new substance termed "thiotrope base" is chemically *p*-thiocarbimide benzaldehyde, it forms white crystals, m. 32°, and is obtained by the interaction of *p*-aminobenzaldehyde and CSCl_2 . It possesses a strong odor intensely resembling that of heliotropine. On comparing the structures of heliotropine (I) and the new substance (II) it is evident that in each case the CHO group is the seat of the osmic activity. According to the theory

of osmic vibrations it appears that in either case the vibrations assocd. with the CHO group are those responsible for odor sensation, and therefore, that it is through the CHO group that adsorption on to the osmic processes takes place. Attempts to utilize the thiotrope base in the production of floral oils of the pansy type were unsuccessful. With oils of the mezereon type, however, an improvement was observed when the heliotropine was substituted with thiotrope base in connection with other minor adjustments. In soap perfuming neither mesityl mustard oil nor thiotrope base proved of any value.

Coffee oil. L. v. NOEL. Hygien. Staatsinst. Hamburg. *Pharm. Zentralhalle* 70, 69-77(1929).—The compn. and constants of this oil as reported by former investigators are presented in tabulated form in connection with a discussion of certain marked differences in the values obtained. A detailed account is given of the methods followed in extg. the oil, in detg. the unsaponifiable constituents and in arriving at the proportions of fatty acids. The limits of constants observed in examg. 6 samples of oil are d. 0.9288-0.9453, n_D^{40} 68.4-69.5, acidity per 100 g. in terms of 0.1 N alkali 3.8-11.4, sapon. no. 176.1-179.15, I no. 87.1-92.45, R.-M. no. 0.52-0.66, Polenske no. 0.20-0.25, $[\alpha]$ 17.6-19.4, unsaponifiable 6.53-13.49 ($[\alpha]$ of same 149.6-159.4), phytosterol 0.58-0.89 (m. p. of the acetate 139.0-141.0°, m. p. of the sterol 133.2-137°, $[\alpha]$ 32.0-32.5). The approx. compn. of the oil with respect to fatty acids is found to be palmitic 29, daturic 3, carnaubic 14, oleic 2, linoleic 50%. It further develops from the present study that coffee oil is unusually rich in unsaponifiable material, that the chief carrier of rotation is not a sterol but some easily decomposable constituent of the unsaponifiable material, that the fatty acids suffer little change during the roasting process. Further study of the unsaponifiable constituents of coffee oil is contemplated.

W. O. F.

Rapid preparation of dermatol and its probable constitution. I. S. TELETOV. *J. Applied Chem.* (Russia) 1, No. 2, 115-7(1928).—Dermatol is prepd. directly from gallic acid and BiONO_2 in a single operation. BiONO_2 (200 g.) is mixed with 200 cc. of distd. H_2O and a few drops of HNO_3 (d. 1.41) is added. The mixt. is warmed on the water bath and 125 to 130 g. of gallic acid added gradually (the theoretical quantity

122 g.), water being added steadily to replace the loss through evapn. Samples of the product are tested with a 5% soln. of NaOH, which if dissolved indicates the end of the reaction. The sediment is then dild., washed and filtered and dried first at room temp. and finally at 60–70°, giving a yield in dermatol of 98.5%, complying with the requirements of the pharmacopoeia. Analysis of the dermatol so prepd. gives it the formula $C_6H_2(OH)_3COOBi(OH)_2 \cdot H_2O$.

C. FABIAN

Determination of novocaine and codeine in the presence of each other. E. SCHULEK and G. VASTAGH. *Magyar Gyógy. Társaság Értesítője* 4, 188–91(1928); cf. C. A. 3, 472. Alkaloids are extd. by $CHCl_3$ from the ammoniacal soln. The $CHCl_3$ is evapd., and the residue dissolved in alc. Acidimetric detn. of this alc. soln. is made in the usual way. Now an alk. soln. is added which is equiv. to twice the quantity of acid necessary to neutralize the bases. Novocaine is further sapond. on the water bath for $\frac{1}{2}$ hr., codeine is shaken out with $CHCl_3$. The soln. is evapd. and an air current is lead through for 1 hr. Then the residue is dissolved in alc. and codeine is titrated in this soln.

S. S. DE FINÁLY

Gravimetric determination of colocynthis in Extractum Colocynthidis. P. RÓZSA. *Magyar Gyógy. Társaság Értesítője* 4, 196–207(1928).—One g. of the ext. is washed out two times with 5 cc. ether and dissolved in 20 cc. abs. alc. The soln. is boiled on the water bath after addn. of 2 g. Carbo animalis. Then the cooled soln. is filtered and coned. to sirup density, and shaken with 50 cc. $CHCl_3$. $CHCl_3$ should be evapd. after filtration. The residue is dissolved in 20 cc. distd. water, 0.5 g. $BaSO_4$ is added and the mixt. filtered into a weighed porcelain cup. The liquor is evapd. and the residue dried at 50–60° to const. wt. The wt. of the colocynthis should not exceed 0.06 g.

S. S. DE FINÁLY

Review for 1928 of therapeutic novelties including specialties and secret remedies. S. RABOW. *Chem.-Ztg.* 53, No. 11, *Fortschrittsber.* No. 1, 33–7(1929). E. H.

Experiences with coramine. M. SCHNAASE. Städtischen Krankenhaus, Charlottenburg, Germany. *Deut. med. Wochschr.* 54, 1887(1928).—Coramine, a com. prepn. of N,N-diethylnicotinamide, was found to be a valuable analeptic, superior in its properties to camphor.

ARTHUR GROLLMAN

Collargol, its production and properties. A. F. GERASIMOV. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1926, No. 16, 69–108.—Egg whites were passed through a linen cloth, $\frac{1}{40}$ by weight of NaOH was added and the mixt. was heated on a water bath. The mixt. was yellowish red with a strong NH_3 odor. Upon standing a ppt. settled out. The hot liquid was filtered through a filter paper and the filtrate was used as the reducing agent. The Ag oxide was thoroughly washed before adding the reducing soln. The collargol thus obtained was treated with AcOH in the presence of various electrolytes, which may be divided into 2 groups with respect to their action on the collargol. The NH_4Cl , NH_4CNS , KI, KBr, $CaCl_2$ and $FeCl_3$ hindered the coagulation when in low concns.; they induced coagulation in high concns. The other group— $KClO_4$, KNO_3 , Na_2SO_4 , $(NH_4)_2SO_4$, $MgSO_4$ —supported coagulation in any concn. The addn. of these electrolytes to the colloidal Ag in the presence of those electrolytes which are a part of the colloidal soln. had no influence on the qual. character of this action. Thus NH_4CNS , irrespective of the presence or absence of NaCl or KNO_3 , at first increased the stability of the collargol but after a while it gradually decreased it. The studies were conducted on both dialyzed and undialyzed colloids. The peptizing and protective influences of NaCl and other halogens may be explained as follows: First a chem. reaction takes place between the colloidal Ag and the reagents forming ustic alkali and colloidal Ag according to the equation: $2Ag + H_2O + O + 2NaCl \rightarrow AgCl + 2NaOH$. The Ag halide is adsorbed by the colloid and serves as a protective colloid. With a high concn. of the halogen salt the usual coagulation effect takes place. The compn. of the coagulated colloid when AcOH has been used changes little upon dilg. the reagent. The influence of electrolytes on the coagulant varies: NaCl influences it greatly; $(NH_4)_2SO_4$ affects it slightly. The keeping qualities of the repn. depend on the moisture content; the less the better.

J. S. JOFFE

The production of salol. O. YU. MAGIDSON and V. M. KROL. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1926, No. 16, 54–64.—The success in obtaining a good yield of salol by etherification with PCl_5 depends on a low temp. at the time of adding the PCl_5 to the mixt. of phenol and salycilic acid. Sixty deg. was the min. at which it was possible to work. The temp. should never go beyond 120°. Only 78% yield of the theoretical was obtained. With $POCl_3$ a 90% yield was obtained. J. S. JOFFE

The oil from ziziphora clinopodioides L. B. N. RUTOVSKII and I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 7–14.—Two samples of oil from Turkistan and Altai were analyzed. Two hundred g. of the Turkistan oil upon

fractionation in a vacuum gave 4 fractions. From fraction I of the Turkestan oil nitrosochloride (m. 99°) was obtained, which upon oxidation gave pinonic acid (semicarbazone, m. 202–203°). This indicates the presence of α -pinene. From fraction II two semicarbazones were obtained of which one (m. 138–140°) corresponds to an aldehyde. The second semicarbazone (m. 169–171°) corresponds to a ketone obtained from fractions III and IV upon treatment with bisulfite. It was identified as a pulegone (semicarbazone, m. 169–170°; oxime, m. 118–119°; oxidized to β -methyladipinonic acid, m. 83–85°; reduced to menthol, m. 38–40°). With phthalic anhydride an alcohol, $C_{10}H_{18}O$, was sepd., the consts. of which are not given in the literature. Upon recrystg. from EtOH shining needle-like crystals were obtained, m. 77–78°, $[\alpha]_D + 26.51^\circ$. In fraction I of the Altai oil α -pinene was demonstrated (nitrosochloride, m. 99°, pinonic acid-semicarbazone, m. 202–203°). The fractions II and III upon shaking for 20 days with bisulfite soln. gave ketones with the following consts.: $d_{20}^{20} 0.9362$, $[\alpha]_D + 26.0$, $n_D^{20} 1.4768$. The oil after the bisulfite treatment was worked over with semicarbazide-HCl. The semicarbazones obtained were not pure, but upon fractional recrystn. from alc. one of them m. 176–178°, the other m. 168–170°. By decomg. the first with oxalic acid there was sepd. a ketone, $d_{20}^{20} 0.9011$, $[\alpha] 22.5^\circ$, $n_D^{20} 1.4525$. By treating the ketone with HCl and NH_2OH a liquid amine was obtained which gradually crystd., m. 50°. No aldehyde was found in this sample of oil. Menthol was obtained.

J. S. JOFFE

The ethereal oil from *Artemisia annua* L. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 15–24. For samples of oil taken at different growth stages were investigated: before blooming in full bloom, after blooming and after ripening of the seeds. After fractional distn. in fraction I α -pinene was demonstrated through the formation of nitrosochloride at oxidation to pinonic acid (semicarbazone, m. 208°), but no β -pinene was found. From fraction II cineole was sepd. with resorcinol compds. This was converted to isoborneol by treating with AcOH and H_2SO_4 . Fraction IV consisted exclusively of artemisia and isoartemisia ketone (semicarbazones, m. 94–96° and 68–71°, resp.). The first had $d_{20}^{20} 0.8755$; $[\alpha]_D - 2.04^\circ$, $n_D^{20} 1.4702$. Upon bromination no cryst. product was obtained. From the residue a camphor was isolated, m. 175–177°, $[\alpha]_D - 44.52^\circ$. Fraction V and VI contained besides the above-mentioned ketones some borneol, m. 200–202°. From fraction VII a nitrosochloride and a nitrosate, m. 158°, were obtained. Upon sapon. of this fraction in H_2O soln., the presence of acetic and butyric acids was demonstrated. The oil from the sample taken after blooming upon treatment with bisulfite soln. gave an aldehyde, which in turn gave cumaldehyde from a 5% NaOH soln. After removing the aldehydes, the residue was treated with semicarbazide and semicarbazone, m. 231°, camphor, m. 175°, artemisia and isoartemisia ketones were obtained. After sepg. the ketones the oil was saponified and the H_2O soln. gave an appreciable quantity of a phenol, which was not investigated more closely. With $FeCl_3$ it showed a green coloration and had an odor of eugenol. Acetic and butyric acids were present. From the saponified oil borneol was obtained by treating with phthalic anhydride. The residues were distd. over metallic Na and two fractions obtained; the first contained cineole, α -pinene and camphene; the second gave nitrosochloride and nitrosate.

J. S. JOFFE

Essential oils of leaves and stems of camphor of Sukhum district. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 25–38.—A sample of oil was fractionated. Fraction Ia gave *d*- and *dl* α -pinene (nitrosochloride, m. 99–100°; cryst. pinonic acid, m. 103–104°; semicarbazone, m. 202–203°; liquid pinonic acid). β -Pinene could not be demonstrated. From fraction Ib isoborneol was obtained (m. 207–210°; phenylurethan, m. 138°) by treatment with glacial acetic acid and H_2SO_4 . Fraction Ic contained cineole, limonene and dipentene. Fraction II treated with phthalic anhydride gave *d*-camphor (m. 174–175° + 43.77°; semicarbazone, m. 236–237°). On saponifying the phthalic acid ester, borneol (m. 202°; phenylurethan, m. 138°) sepd. as a well crystd. product. From fraction III some phenols (not studied in detail) were sepd. It also contained borneol and camphene. The odor of citronellol was apparent, but it could not be demonstrated. No safrol was isolated from either of the fractions. The sesquiterpene fraction gave no nitrosochloride. Raw camphor obtained from the condenser from the distn. of leaves m. 170–172°, $[\alpha]_D + 41.25^\circ$ at $c = 80.25$ in alc. By simple purification consts. were: m. 174–175°, $[\alpha]_D + 45.06^\circ$ at $c = 21.75$ in alcohol. Upon sublimation the m. p. was 176–177°, $[\alpha]_D = 44.6^\circ$ at $c = 19.47$.

J. S. JOFFE

Components of the ethereal oils from Caucasian Citrus species. B. N. RUTOVSKII

ND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 1-85.—A sample of oil from the fresh leaves of *Citrus bigardia* Risso was analyzed. The saponified oil was steam distd. into various fractions. Fraction I contained camphene. Tetrabromide, m. 116–120°, was obtained, which upon closer examn. was found to be a mixt. of limonene and dipentene tetrabromide. By oxidation limonene trite, m. 191–192°, was obtained. From fraction IV a nitrosochloride, m. 110–112°, was obtained, which indicates the presence of α -terpineol. Fraction V and the residue were treated with CaCl_2 and gave geraniol (diphenylurethan, m. 81.5–82°). Further treatment of these fractions gave tetrabromonerol, m. 116–117°. The oil from the leaves of a Japanese orange, "Unshiu," showed an entirely different compn. From fraction I pinene nitrosochloride, m. 99–100°, and by KMnO_4 oxidation pinonic acid semicarbazone, m. 202–203° were obtained. Fraction II gave traces of isoborneol by the acetic acid- H_2SO_4 treatment. This fraction was very resinous. Fraction III gave no solid bromides and by strong oxidation *p*-hydroxyisopropylbenzoic acid was obtained; this indicates the presence of *p*-cymene. Fraction IV is made up of 54% of *p*-cymene.

J. S. JOFFE

Essential oils of Crimean salvias. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 109–18.—The oil from *Salvia grandiflora* Ettl. was fractionally distd. In fraction I α -pinene could be demonstrated. A cryst. acid, m. 124–126°, was found which indicates the presence of β -pinene. By hydration with acetic acid- H_2SO_4 mixt. isoborneol was obtained, which is to be ascribed to the presence of camphene. No cineole, resorcinol, or iodol compds. could be demonstrated. Fraction III had a distinct odor of camphor and gave a semicarbazone, m. 230–232°. This fraction also gave the solid *d*-camphor, m. 174–176°. From fraction IV nitrosochloride, m. 165–170°, and nitrosate, m. 158°, were obtained, which indicates presence of caryophyllene.

J. S. JOFFE

Essential oils of *Heracleum villosum* Fisch. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 119–26.—The oil from the different parts of the plant gave practically the same constns. With the ripening of the fruit the aldehydes disappear and alcs. appear. Fractionation of the sapon. showed that the chief component was octyl alcohol, which upon oxidation gave octaldehyde and caprylic acid. The acids produced by the sapon. were acetic and myric.

J. S. JOFFE

Borneol values of the Siberian pine oil of Altai. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 127–30.—A sample of oil had d_{20}^{20} 0.9581, $[\alpha]_D$ –39.59°, n_D^{20} 1.4748, acid no. 9.67, ester no. 139.21, ester number after acetylation 190.84. Upon sapon. 18% of borneol in solid form could be recovered. By steam distg., 2% more borneol could be obtained. With phthalic anhydride 20% more could be sep'd. out. α -Pinene and camphene also were found.

J. S. JOFFE

Essential oils of *Abies nordmanniana* Spach and *Abies cephalonica* Link. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 131–41.—The oil of *Abies nordmanniana* Spach investigated had d_{20}^{20} 0.8816, n_D^{20} 1.4775, acid no. 1.08, ester number 28.24 (ester content 9.89%), ester number after acetylation 48.53 (corresponds to 13.84% total alcs.), sol. in 3.9 vol. 90% alc., insol. in 80% alc. By fractional distn. various fractions were sep'd. Fraction I contained α -pinene. Fraction II gave a mixt. of borneol and isoborneol upon treatment with acetic and H_2SO_4 , showing the presence of camphene. By oxidizing it with KMnO_4 a cryst. acid was obtained, m. 118–122°, indicating the presence of pinionic acid, which in turn shows the presence of β -pinene in this oil. By saponifying fraction III borneol was obtained. Terpeneol could not be demonstrated. The sesquiterpene fraction gave no nitrosochloride nor hydrochloride. The oil of *Abies cephalonica* Link had d_{20}^{20} 0.8995, $[\alpha]_D$ –20.00, n_D^{20} 1.4773, acid number 3.29, ester number 48.14, ester number after acetylation 73.3, sol. in 8.8 vol. of 90% alc. After fractional distn., in fraction I α -pinene and *dl*- α -pinene were demonstrated. In fraction II a mixt. of borneol and isoborneol was obtained upon treating it with acetic acid and H_2SO_4 , showing the presence of camphene. β -Pinene could not be demonstrated. The saponified fraction IV borneol was obtained. Fraction V gave small amounts of nitrosochloride.

J. S. JOFFE

Essential oils of Crimean junipers. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 142–50.—Twigs and needles of *Juniperus excelsa* MB gave upon steam distn. an oil with the following constns.: d_{20}^{20} 0.812, $[\alpha]_D$ +31.5, n_D^{20} 1.4769, acid number 2.52, ester number 5.52, ester number

after acetylation 28.49, sol. in 2.5 vol. 90% alc. By fractional distn. 5 fractions were obtained, the consts. of which are presented in table 1 (German summary). Fraction I gave nitroschloride, m. 98°, with a good yield of crystalline pinonic acid (m. 104-105°, $[\alpha]_D = 0^\circ$); semicarbazone, m. 202-203°. This shows the presence of α -pinene. Fraction II upon repeated distn. over Na gave the following consts.: d_4^{20} 0.8506, $[\alpha]_D$ 52.5, n_D^{20} 1.4695. No cryst. nitroschloride or bromide could be obtained, neither could camphene be demonstrated. In fractions III and IV an aldehyde could be demonstrated, but it could not be sepd. Fraction IV consisted primarily of a hydrocarbon with the following consts.: d_4^{20} 0.9286, $[\alpha]_D$ - 6.75°, n_D^{20} 1.500. Oxidizing it with KMnO_4 gave diketones, m. 232-233°, and keto acid (semicarbazone, m. 240°), this indicates the presence of cedrene. The cryst. compd. from fraction V proved to be a cedrol, m. 82-84°, $[\alpha]_D$ +9.8.

J. S. JOFFE

Essential oils of *Hyssopus officinalis* from Moscow district. L. P. GUSEVA *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 159-67.—The oil was fractionated. A summary of the consts. of the fractions is presented in a table. Fractions Ia, Ib and II were distd. over Na. In I pinene was demonstrated, but the bulk was α -pinene. Fraction III contained *l*-pinocamphone (dibromide, m. 91-93°; semicarbazone, m. 227°) and an aldehyde. From fraction IV *l*-pinocamphone and 5% alics were isolated. The alics. isolated as phthalic acid ester showed: $[\alpha]_D$ 62°, and by oxidation gave only traces of aldehyde and pinocamphone. From fractions VII and VIII a sesquiterpene was isolated which gave a nitrosate. By treating the oil with bisulfite an aldehyde was isolated (semicarbazone, m. 202-203°). By warming the saponified oil left after the sepn. of the aldehyde with phthalic anhydride the primary and secondary alcohols were split off.

J. S. JOFFE

Essential oils of peppermint from the government of Poltava. V. A. KUZ'MIN *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 168-82.—In tables (German summary) are given the yield of oil from the various parts of the plants of black and white mint and the consts. of the various samples.

J. S. JOFFE

The mutual relation between the size of the grain and the yield of essential oil from coriander. V. I. VARENTZOV. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1927, No. 17, 183-6.—The smaller grains gave more oil than the larger.

Making pollen extracts for the treatment of hay-fever. EDGAR B. CARTER. SWAN MYERS CO., Philadelphia, Pa. *J. Chem. Education* 6, 9-19(1929).

J. A. KENNEDY

Indian varieties of aconite: Their chemical composition and biological assay. R. N. CHOPRA, J. C. GUPTA AND N. N. GHOSH. Calcutta School of Tropical Med. *Indian J. Med. Research* 15, 873-82(1928). The alkaloid content of the so-called ferox form (*A. deinorrhizum* and *A. balfoureyi* combined) is double that of the European variety of *A. napellus* official in the pharmacopeia and is 10 times that of the Indian *napellus* variety (*A. chasmanthum*). The ether-sol. alkaloid (pseudoaconitine) of the ferox form is 1.5 times stronger than aconitine obtained from the European variety. The root of ferox is 3 times stronger than the European root, and the root of Indian *napellus* (*A. chasmanthum*) is 7 times stronger.

FRANCES KRASNOW

Ephedrine from the Indian varieties of Ephedra. R. N. CHOPRA, S. GHOSH AND A. T. DUTT. Calcutta School of Tropical Med. *Indian J. Med. Research* 15, 889-94(1928).—A no. of varieties of ephedra grow in India. Specimens of *E. vulgaris* and *E. pachyclada* or *E. intermedia* were obtained. The yield of total alkaloids from the former was 0.92% and from the latter 1.16%. 71.25% of the total alkaloids in *E. vulgaris* was ephedrine, the residue mostly pseudo-ephedrine. The green twigs showed a higher alkaloid content than the stem. Physiol. and clinical tests were like those given by the alkaloid from Chinese ephedra.

FRANCES KRASNOW

A one-hundred year chemical-pharmaceutical industry in Germany. W. MERCK. *Chem.-Ztg.* 53, 3(1929).

E. C. M.

Straub's method for testing digitalis. T. W. HAMNER. *Svensk Farm Tids* 32, 497-500, 513-6(1928); cf. *C. A.* 4, 1627; 5, 1791.—A cannula is inserted into the frog's heart via an opening in the aorta. The blood is washed out of the heart with saline; the heart is filled with saline, clamped, carefully removed and suspended by the cannula in such manner that the apex can be connected with a cinematograph. Solutions to be tested are introduced through the cannula; they are always of the same vol. The excised heart responds to much smaller doses than does the heart *in situ*. Species do not react the same way and *R. esculenta* is preferred to all others; the frog should not weigh less than 30 g. The time factor of the reaction is not a satisfactory quant. measure although it is very pos. for minute quantities of the drug: e. g., 0.004 mg. gives a time spread of 6 mins. between the av. of 2 series but the stronger prepn. series

ranges from 1.4 to 5.1 mins. The most satisfactory criteria are the cc. to which 1 cc. of the solns. must be dild. in order to show no reactions in 45–60 mins. A. R. ROSE

Bromometric determinations in testing medicines. HUGO WASTENSON. *Svensk Farm. Tid.* 32, 685–7, 701–5, 717–21(1928).—A review. A. R. ROSE

Extractum digitalis—fluidum and spissum. J. W. HAMNER. *Svensk Farm. Tid.* 32, 734–6(1928).—Only digitalis tincture meets the requirements. Neither fluidexts. nor thick exts. can be recommended. A. R. ROSE

Camphor-leaf oil. KINZO KAFUKU AND RYO KATO. Centr. Research Inst. Government, Formosa. *Bull. Ind. Centr. Res. Inst. Government Formosa* 24, 35–40(1928).—The properties of the camphor-leaf oil obtained from the south of Formosa are: $[\alpha]_D^{25}$ 43.20°, sp. viscosity, 3.83, Br no. 79.30, acid value 0.47, sapon. value 7.34, turbidity point (10 cc.) glacial AcOH, 7.34, EtOH, 7.00, acetone 2.50, aldehyde content 0.4%, camphor content 43.97%. From 4500 kg. of the leaf oil was sepd. camphor, which was fractionated and distd. at ordinary or reduced pressure, yield 1440 kg. of oil besides crude camphor. The oil was sepd. into terpenes and sesquiterpenes which were further fractionated into 9 and 15 fractions, resp., the fractions having b.-p. differences of 5°. Pinene is the chief constituent of fractions I and II. Camphene was detected as isoborneol by the Bestrand-Wahlbaum methods; when the same fraction is treated with glacial AcOH and $Hg(OAc)_2$, a substance whose semicarbazone m. at 142° was obtained, but this did not coincide with dihydroxypinene semicarbazone, m. 180°. Phelandrene was detected as β,β -phelandrenebis-nitrite by the Wallach-Gildemeister method in fraction I. Cineole was detd. by shaking IV with 50% resorcinol; yield 28%. By brominating fraction IV after sepn. of cineole, crystals, m. 116°, were obtained, which seemed to be a mixt. of limonene tetrabromide and dipentene dibromide. By treating fractions VII, VIII and IX with Na, and distg., 3 fractions of sesquiterpene were obtained. Fraction II b., 100–5°, d_4^{23} 0.9127, d_{20}^{23} 1.4080, $[\alpha]_D^{23}$ 6.0°, M_D 65.54 (for $C_{15}H_{24}$ $\frac{1}{4}$ = 66.15). Elementary analysis agrees with the formula $C_{15}H_{24}$ and shows it belongs to bicyclic sesquiterpene. An unknown alc. with a characteristic odor is contained in the leaf oil, which vanishes on treating with Na or K. The leaf oil does not differ much from ordinary camphor oil which yields a small quantity of "red" distillate and much "white" distillate. K. SOMEYA

The action of thorium X upon the active-principle content of certain medicinal plants. AVERSENQ, JALOUSTRE AND MAURIN. *Compt. rend.* 188, 345–7(1929).—It is well known that radioactive substances are capable of influencing biological phenomena. A study was made to det. the role played by thorium X in the formation of certain glucosides, alkaloids and other substances used therapeutically. The following plants were selected and their roots sprinkled with H_2O contg. the Th: grenadin, *Datura stramonium*, black mustard, rhubarb and ricin. The plants were harvested at the regular time and the medicinal content was detd. by standard methods. In every case the active-principle content was increased by the thorium X treatment. The alkaloid content of grenadin was almost doubled by the treatment. Conclusion: Radioactivity plays a very important role in the active-principle content of medicinal plants. M. H. SOULE

Bismuth in pharmacy and chemistry. I. History and occurrence of the element. G. MALCOLM DYSON. *Pharm. J.* 120, 242–4(1928).—A detailed crit. account of the history of Bi, the occurrence of its ores and their treatment in the prepn. of the metal and the salts is given. **II. The metal and its inorganic derivatives.** *Ibid.* 348–9.—The mode of obtaining the metal from its oxide and sulfide is given, also the compn. and methods of purification of crude Bi, its properties and technical uses in alloys of low m. p., and the prepn. and uses of its inorg. salts. Barchusen, as early as 1718 (*Elementa Chemicæ*), refers to the medicinal use of "magisterium" of Bi (probably the basic nitrate) in the treatment of venereal disease. **III. The organic bismuth compounds.** *Ibid.* 582–4.—These and their medicinal properties are reviewed under the heads: (1) preps. for the relief of gastro-intestinal disorders (e. g., Bi gallate, Bi NH_4 citrate, bismutose (C. A. 2, 1328) etc.), (2) astringent-antiseptic preps. for external application (e. g., *ibid.* (Bi oxyiodotannate), *airal* (Bi oxyiodogallate) and Bi phenol compds. (e. g., Bi resoremol, etc.)), (3) preps. for the treatment of syphilis. They are of 4 types: (a) suspensions of finely divided or colloidal Bi in an aq., saline or oily medium (e. g., neotropol (C. A. 21, 611)); (b) solns. of a true organo-Bi compd. in an org. medium; only a few examples are known, e. g., *embial* (compn. not disclosed); (c) H_2O -sol. Bi compds., especially the Bi alkali tartrates; (d) suspensions of H_2O -insol. compds. in aq. or oily media (e. g., Bi quinine iodide). Structural formulas are given for 18 of the more typical medicinal org. Bi compds. S. WALDBOTT

Synthetic drugs. A. G. GREEN. Brit. 293,617, Nov. 2, 1927. ω -Sulfonic derivs. of aminoacridines and acridinium salts having an antiseptic and bactericidal action are obtained by the action of aldehydes together with bisulfites, or of aldehyde-bisulfites, upon aminoacridines or amino-acridinium salts or their leuco compds. Examples are given of the condensation of 3,6-diaminoacridine and 3,6-diamino-10-methylacridinium chloride with 2 mol. proportions of $\text{CH}_3\text{O-NaHSO}_3$ and of 3,6-diaminoacridine with 2 mol. proportions of acetaldehyde- NaHSO_3 . Use of crotonaldehyde and glyoxal is also mentioned.

Synthetic drugs. I. G. FARBENIND. A.-G. (Fritz Mayer, inventor). Ger. 466,518, July 25, 1924. Nitriles of *o*-methylolarylcarboxylic acids are prepd. by converting the NH_2 group of *o*-aminoarylcarbinols by way of the diazo compd. into the CN group. The nitriles so prepd. may be sapond. to lactones. Examples are given describing the prepn. of nitriles and lactones from *o*-aminobenzyl alcohol and 2-amino-3-methylol naphthalene. The products have anthelmintic properties.

Therapeutic metallic compounds of thiocarbohydrates. CHEMISCHE FABRIK AUF AKTIEN VORM. E. SCHERING. Brit. 293,363, Feb. 2, 1927. Examples are given of the prepn. of 1-aurothioglucose, 3-aurothioglucose, Bi 1-thioglucose and Cd 1-thioglucose by treating the thioglucose with K auribromide, Bi chloride or Cd chloride.

Bismuth lactate solutions. BYK-GULDENWERKE CHEM. FAB. A.-G. (Georg A. Becker and Agathe Wolff, inventors). Ger. 469,516, Apr. 24, 1923. Stable aq. solns. of Bi lactate suitable for medical use are prepd. by treating an aq. soln. contg. Bi lactate and an alkali lactate with sufficient alkali to render it neutral or alk. Alternatively, Bi_2O_3 may be dissolved in alkali soln. in the presence of glycerol and the soln. treated with $\text{CH}_3\text{CH}(\text{OH})\text{COOH}$ until it is neutral or only feebly alk.

Separation of lysozyme from protein. NAAMLOOZE VENOOTSCAP "ORGANON" Dutch 19,339, Jan. 15, 1929. Lysozyme (Fleming, *Proc. Roy. Soc. (London)* B93, 306) is prepd. by the treating of dil. egg albumin (100 g. + 900 g. 0.9% salt soln.) with colloidal Fe or Al hydroxide (400 cc. 5% $\text{Fe}(\text{OH})_3$), centrifugation, evapn. (below 40°), dialysis (2 days) and finally pptn. with acetone. The process is repeated until the soln. is free from protein and salt. Of the final product 0.01 cc. is as active as 1 cc. egg albumin in dissolving *Micrococcus lysodeikticus*.

Immunizing preparations from pathogenic microorganisms. PARKE, DAVIS & Co. Brit. 293,401, Jan. 31, 1927. Organisms such as typhoid bacilli, gonococci, streptococci and pneumococci are shaken with a solvent such as alc. and centrifuged to sep. the liquid from the organisms. A preservative may be added. By regulating the time of action of the solvent, antigens may be selectively extd.

Mouthwashes; dentifrices. FRIEDRICH BRÄUNLICH. Ger. 470,505, Sept. 14, 1926. Sulfonated fats and fatty acids, or their alkali or NH_4 salts, are used as ingredients of mouthwashes and dentifrices.

Farnesol. M. NAEF & Co. Ger. 469,555, Mar. 14, 1924. See Brit. 213,251 (C. A. 18, 2225).

Tobacco. ZIGARETTEN-FABRIK LESMONA GMBH. and S. ROSENHOCH (known as F. Rosenhoch). Brit. 293,760, July 11, 1927. To "refine" and improve the keeping qualities of tobacco, the rib ends of the leaves are brushed and moistened with sterilized

water, left for several hrs., sepd., and the leaves further moistened, the moisture is allowed to penetrate for 10–16 hrs. and the material then treated with ozone in regulated accord with the nicotine content of the tobacco.

Intensive production of 60°Bé. sulfuric acid. GEORGE A. PERLEY. *Ind. Eng. Chem.* 21, 202–5(1929).—A high reaction rate is secured by utilizing a liquid phase oxidation. Recovery of NO_2 as HNO_3 rather than as nitrous vitriol makes possible high inter recovery. Complete oxidation of SO_2 is rapid. In the lab. less than 0.01 cu. ft. of sulfurous oxidation tower space per lb. of S oxidized per 24 hrs. is required. This is about $1/1500$ part of the lead chamber plant space for like capacity. High reaction velocity and small equipment space mean low installation and maintenance charges. Ability to govern reaction temp. by control of acid circulation rate gives positive control. More acid circulation and cooling, and 15–20% larger NO_2 recovery system than in normal chamber plants are the essential points of difference as compared to the chamber method.

E. M. SYMMES

The reaction mechanism in the contact sulfuric acid process and the method of action of activators. BERNHARD NEUMANN. *Z. Elektrochem.* 35, 42–51(1929); cf. (1) 23, 934, 1210.—After considering the various hypotheses, the view that all noble metals act in the same way as contact agents in H_2SO_4 catalysis, i. e., that only adsorption catalysis comes into play, is favored. Ag, so little effective, is a strong activating agent in V_2O_5 catalysis. In the Fe_2O_3 process FeSO_4 probably plays the most important role. With V_2O_5 , VOSO_4 is formed, and the reactions are probably: $2\text{VO} \cdot \text{SO}_3 = \text{V}_2\text{O}_5 + \text{SO}_3 + \text{SO}_2$; $\text{V}_2\text{O}_5 + \text{SO}_2 = \text{V}_2\text{O}_4 + \text{SO}_3$; $2\text{SO}_2 + \text{O}_2 + \text{V}_2\text{O}_4 = 2\text{VOSO}_4$. SO_3 can also be formed by adsorption. With TiO_2 , TiOSO_4 is formed: $4\text{TiOSO}_4 + 2\text{SO}_2 = 2\text{Ti}(\text{SO}_4)_3$; $2\text{Ti}(\text{SO}_4)_3 + \text{O}_2 = 4\text{TiOSO}_4 + 2\text{SO}_3$. When using WO_3 there is a change of valence, since after use it is green, caused by the presence of blue dioxide in yellow WO_3 . In mixed catalysts pure V_2O_5 is a moderately good agent, Ag is a very poor one, and AgVO_4 or a mixt. of Ag and V_2O_5 , is a very good one, where the action is adsorption. SnO_2 activates a mixt. of $\text{Fe}_2\text{O}_3 + \text{Cr}_2\text{O}_3$ but alone only works poorly at high temp. SnO_2 probably forms SnO , which favors formation of FeSO_4 and CrSO_4 . A catalyst contg. 80% Cr_2O_3 and 20% Ag_2O was not as effective as Cr_2O_3 alone. Differing from Ag_2O , SnO_2 has no influence upon the catalytic effect of V_2O_5 . Activators facilitate a partial reaction.

E. M. SYMMES

Manufacture of zinc chloride and sulfate from whiting. I. E. ADADUROV AND K. V. ZEPONOVICH. Kharkov Inst. Appl. Chem. *J. Chem. Ind. (Moscow)* 5, 1018–19(1928).—Russian whiting, consisting of ZnCO_3 , ZnS , ZnO , Na_2CO_3 , $\text{Na}_2\text{S}_2\text{O}_3$ and Na_2SO_4 contained, when air-dry, Zn 38.8, Na 9.2, SO_4 17.2, CO_2 15.95, SiO_2 0.63, H_2S 20.2, moisture 17.72. Expts. show that on extn. with H_2O in a continuous app., it can be freed of all Na salts in 2 hrs. at ordinary temp., or in 75 mins. at 40° , leaving behind a residue contg. all the Zn compds. The residue, contg. 46.8% Zn, when stirred for 20 mins. at ordinary temp. with 30% HCl or with 30% H_2SO_4 , is entirely converted into high grade ZnCl_2 or ZnSO_4 .

BERNARD NELSON

Providing Germany with sulfur during the war time. F. RAMSER. *Tech. Ind. Schwen. Chem.-Ztg.* No. 7–8, 64–6(1927).—A review.

J. BALOZIAN

Asbestos. ANON. *Mining J.*, Annual Review No. 1929, 14.—The mineralogical varieties of asbestos are discussed. Production figures from 1925 to 1927 show the British Empire meeting 90% or more of the world's needs. Uses are listed. A. H. E.

Rhodesian asbestos. ANON. *Mining J.*, Annual Review No. 1929, 73.—Rhodesia is now the second largest asbestos producer. The properties of the Mapeke Asbestos Mines and the Asbestos and General Trust are briefly described. ALDEN H. EMERY

Asbestos in Western Australia. ANON. *Mining J.*, Annual Review No. 1929, 74.—Western Australia is rapidly becoming an important producer of high-grade asbestos. ALDEN H. EMERY

Problems in drying fuller's earth. MACLEAN HOUSTON. *United Refg. Co. Oil & Gas J.* 27, No. 29, 242, 257(1928).—The use of an eight-hearth 16-ft. Nichols Herreshoff furnace in roasting 80/60 mesh fuller's earth is described. M. B. HART

Lampblack. FRED GROVE-PALMER. *Chemistry & Industry* 48, 60-1(1929).—A summarized description of the prepn. and uses of lampblack. G. CALINGAERT

Evaluation of carbon blacks (CRANOR, BRAENDLE) 30. Crystal growth in aqueous solutions. I. Theory (McCABE) 2. Apparatus for drying clay, chalk, etc. (Brit. pat. 293,765) 1. Photometric determination of the blackness of various types of C black (HOCK) 30.

BUEB, J.: Stickstoffwirtschaft; Rückblick und Ausblick. Berlin, etc.: Stickstoff-Syndikat. 47 pp. Text in German, English and French.

Hydrocyanic acid. MORTIMER J. BROWN (to Pacific R & H Chemical Corp.) U. S. 1,702,761, Feb. 19. In producing HCN continuously from H_2SO_4 and a cyanide soln., the ingredients are mixed in such a manner that the mixed liquids leave the point of mixing quickly and are continuously heated so that no portion of the liquid can mix with other portions that have been subjected to either more or less heating; HCN is recovered from the effluent which is continuously discharged. An app. is described. Cf. C. A. 22, 3743.

Nitric acid. SAMUEL RUBEN. U. S. 1,702,950, Feb. 19. N under pressure is brought into a soln. of an alk. metal hydrate such as LiOH in proximity to the surface of an electrode immersed in the soln., H is liberated electrolytically and the gases are combined by the action of disruptive d. c. and the gaseous product thus formed is led into contact with a heated catalyst such as a Pt catalyst. An app. is described and may be applied to use in other similar reaction between gases.

Nitric acid. NORSK HYDRO-ELECTRISK KVAELSTOFAKTIESELSKAB. Fr. 644,171, Nov. 21, 1927. HNO_3 is concd. by boiling under vacuum in several stages, the vapor from the most concd. acid being led to an app. placed in front contg. less concd. boiling acid, and so on, while the concd. acid flows in the opposite direction. Cf. C. A. 22, 3496.

Concentrating nitric acid. STOCKHOLMS SUPERFOSFAT FAB. AKT. Ger. 470,430 Mar. 11, 1928. In concg. HNO_3 by means of P_2O_5 , the latter is used in briquet form.

Sulfuric acid. ERICH ROTHAMMEL. Ger. 467,587, Jan. 11, 1928. Addn. to 453,508. Part of the gases issuing from the Glover tower is returned to the tower and another part to a conduit connecting a NO-producer with a denitrating app. The burner gases may flow to the Glover tower directly or by way of the NO producer and the denitrating app., means being provided for regulating the flow along either path.

Sulfur trioxide. METALLBANK UND METALLURGISCHE GES. A.-G. Brit. 293,450, July 7, 1927. Gases for use in H_2SO_4 manuf. by the contact process are purified and dried by passing them first through an app. in which they are sprayed with H_2SO_4 of increasing concn. in different sprays, and then through an elec. pptn. app. which is surrounded by a cooling jacket. The app. used is described.

Absorption tower for sulfur dioxide. O. K. GILLER-BOMBIN. Russ. 3557, Sept. 15, 1924. Mechanical features.

Acid containers. ADOLPHE ROCCA. Fr. 643,848, Nov. 15, 1927. Acid containers are made by molding under pressure a mass made from slate, asbestos or rubber, and K_2SiO_3 or Na_2SiO_3 and other secondary ingredients to obtain cohesion. The ingredients are ground and malaxed to obtain a homogeneous mass.

Synthesis of ammonia. I. G. FARBENIND. A.-G. Fr. 643,855, Nov. 15, 1927. Mixts. of N and H suitable for the synthesis of NH_3 are obtained by submitting solid, liquid or gaseous carbonaceous material mixed with air or O and with or without steam, to a treatment in a voltaic arc, freeing the gaseous mixt. obtained from CO formed and CO_2 and other impurities eventually present. In an example, coke-oven gas mixed with $\frac{1}{2}$ its vol. of air is passed through an elec. arc. The resulting gas is freed from CO by treatment with steam and CO_2 is eliminated, giving a mixt. of N and H in the proportion of 1:3.

Drying gases for ammonia synthesis. GASVERARBEITUNGS GES. Brit. 293,361, July 4, 1927. Before contact with the catalyst (which may contain ferric carbides), the gases are preliminarily dried by chem. reagents and freezing and are subjected to a final drying in the presence of NH_3 at a temp. of -25° to -70° so that the residual moisture is absorbed by the liquefied NH_3 .

Nitrates from ammonia. KARL A. HOFFMANN. Ger. 460,432, Jan. 1, 1926.

Nitrates are obtained directly by the catalytic combustion of mixts. of NH_3 with air or O at a temp. not exceeding 450° in the presence of strongly basic substances other than HgO . As catalysts there are used metals or oxides which do not form higher acid oxides under the reaction conditions, *e. g.*, Ni, Co, Ag, Cu, or Fe or their oxides. The basic substance or a mixt. of basic substance with a metal oxide, *e. g.*, NiO , may be arranged between nets of metal, *e. g.*, Ni, and the gas mixt. passed through the structure.

Alkali metal nitrates from nitrites. I. G. FARBENIND. A.-G. Brit. 293,495, April 2, 1927. Nitrites are converted to nitrates with air or O at temps. of $300\text{--}500^\circ$ by use of a catalyst such as an alkali hydroxide, an alk. earth oxide or a eutectic mixt. of KOH and NaOH which m. 180° . Either the catalyst or the nitrite used is liquefied and the O or air bubbled through the material contg. the other component in suspension.

Alkali sulfates; hydrochloric acid. THEODOR LICHTENBERGER and LUDWIG KAISER. Ger. 470,539, Apr. 13, 1926. The manuf. of alkali sulfates and HCl by treating a fused mixt. of alkali chlorides and alk. earth sulfates with steam or a mixt. of steam and air is improved by addn. of SiO_2 to the melt. Instead of steam and air there may be used mixts. of H and air, or sep. streams of the gases may be blown through the melt.

Anhydrous metal chlorides. MAX JAEGER, WILHELM MOSCHEL and ROBERT SUCHY (to I. G. Farbenind. A.-G.) U. S. 1,702,301, Feb. 19. See Can. 277,353 (C. A. 22, 2815).

Purifying aluminates, etc. J. SEAILLES. Brit. 293,392, July 5, 1927. In the manuf. of alumina as described in Brit. 277,697 (C. A. 22, 2142) and Brit. 283,509 (C. A. 22, 4211) from non-halogenated Al ores, the proportion of silica in the alk. earth aluminate obtained by the use of an autoclave, and capable of dissolving on the subsequent treatment with Na_2CO_3 (thus forming an undesirable impurity) may be reduced by regulating the temp., pressure and duration of heating in the autoclave, without reducing the quantity of aluminate extd. from the bauxite by an excessive amount. When lime is used for treating bauxite, the process is further improved by use of catalysts forming sol. compds. with lime, which are decomposed by alumina, *e. g.*, benzenesulfonic acid or sulfo-ricinoleic acid. The bauxite may be treated in a colloid mill before extn. Many details are given.

Chlorides of calcium, magnesium, cerium, lithium and zinc, etc. I. G. FARBENIND. A. G. Brit. 293,410, April 6, 1927. Oxides such as MgO , in suspension in fused metal chlorides such as MgCl_2 , are caused to flow down a heated irrigation tower in countercurrent to an ascending current of a gaseous chlorinating agent such as HCl or phosgene, so that anhydrous chlorides free from oxides are produced. Hydrated chlorides or partially dehydrated chlorides also may be employed and charcoal or coke may be added and Cl then used as the chlorinating agent. In using hydrated salts, the chlorinating agent may be passed in cyclic circulation through a dehydrator. An electrically heated coke mass may be used for facilitating the reaction.

Aluminum and its compounds. CLAY REDUCTION CO. Fr. 643,981, Oct. 24, 1927. Materials contg. Al, Si, K, Ti, etc., are transformed into complex mixts. of $(\text{NH}_4)_2\text{SiF}_6$ and other metallic fluorides by the action of F or $(\text{NH}_4)\text{HF}_2$. The fluorosilicates of NH_4 , V and Ti are isolated by heating, leaving fluorides of Al and K. The $(\text{NH}_4)_2\text{SiF}_6$ is treated with water and NH_3 to obtain SiO_2 gel and NH_4F . The metallic fluorides are converted into chlorides by treatment with gaseous HCl and NH_3 . The NH_4F and AlCl_3 are volatilized and the AlCl_3 is converted into Al_2O_3 by water. If the primary material contains oxides of Al they may be reduced.

Iron oxides. CLARENCE L. DELACHAUX. U. S. 1,702,250, Feb. 19. A product comprising Fe oxides richer in O than ferrosiferrous oxide wherein the ratio between ferrous Fe and ferric Fe is smaller than $1/2$ (the proportion of FeO being less than 31.03% when no allowance is made for impurities) is obtained by regulated oxidation of forge and mill scale. This product is suitable for use in aluminothermic processes.

Chromium oxide. I. G. FARBENIND. A.-G. Brit. 293,494, April 12, 1927. See Fr. 633,956 (C. A. 22, 3745).

Ammonium sulfate. H. HELIN. Belg. 347,042, Jan. 31, 1928. Synthetic NH_3 is absorbed in dil. H_2SO_4 , and the steam generated by the heat of the reaction is passed through an injector and into a distg. column to which is fed aq. NH_3 . The NH_3 evolved is mixed with the synthetic NH_3 going to the neutralizer.

Potassium and ammonium fluorides. I. G. FARBENIND. A.-G. (Curt Röhre and Walter Rüdelsberger, inventors). Ger. 469,515, Mar. 13, 1927. NH_4F and KF are sepd. from aq. solns. contg. both salts by evapg. the soln. to satn. point, pptg. NH_4F , *e. g.*, by passing NH_3 into the soln., dilg. the soln., and finally cooling it strongly to sep. KF . An example is given.

Cleaning and disinfecting composition for use in sweeping floors, etc. S. A. JAGO, W. A. CROFTS and P. W. HANCOCK. Brit. 293,892, April 11, 1927. A "body substance" such as sawdust, sand, wood pulp or paper is mixed with CH_2O soln., paraffin and paraffin oil and various other substances may be added such as essential oils, hygroscopic salts, creosote and coloring substances.

Vermin-destroying compositions. I. G. FARHENIND. A.-G. Ger. 470,513, Jan. 11, 1922. Addn. to 443,391. *N*-Aldehydopiperidines or their tannates, resinsates or other salts are used alone or in suitable admixture for the destruction of animal pests, such as grubs and worms. 2-Methyl-5-ethylpiperidoacetaldehyde, prep'd. by oxidation of the reaction product of $\text{CH}_2\text{ClCH}_2\text{OH}$ and 2-methyl-5-ethylpiperidine, is particularly effective.

Vermin-destroying compositions. I. G. FARHENIND. A.-G. (Adolf Steindorff, Robert Voss, Paul Igler and Otto Weickert, inventors). Ger. 470,514, Feb. 1, 1922. Addn. to 443,391. *N*-Nitrosopiperidines, alone or in suitable admixture, are used for the destruction of animal pests, such as worms. The nitroso comp'd. of 2-methyl-5-ethylpiperidine is particularly effective.

Decorative coating. FOBER & PALM. Belg. 347,193, Jan. 31, 1928. The coating consists of a mixt. of BaSO_4 , BaCO_3 , K or Na silicate, Pb oxide and H_2O .

Composition for targets. L. I. FAVORSKII and G. P. ELAGIN. Russ. 5034, Sept. 15, 1924. Targets are prep'd. from a mixt. of coal-tar pitch, m. not below 60° , and finely ground kaolin or alabaster by heating to about 300° until water is completely expelled, and continuing the heating for 1-2 hrs. until the more or less volatile hydrocarbons are evap'd.

Printing-plates. I. G. FARHENIND. A.-G. Brit. 293,834, July 13, 1927. Grained plates for lithographic offset printing are prep'd. by etching plates of Mg (or alloys of Mg such as those with Al and Si). The etching may be effected with very dil. HNO_3 , which is allowed to act on the plates for 10-100 sec. while they are rapidly moving.

Forming plates from mica flakes. LOUIS T. FREDERICK (to Chicago Mica Co.) U. S. 1,702,896, Feb. 19.

Ornamental articles formed by dipping a form in fluent "marble cement." JOSEPH TORR (to Petrolignum Co., Ltd.). U. S. 1,702,623, Feb. 19.

Polishing creams. I. G. FARHENIND. A.-G. Fr. 644,149, Nov. 18, 1927. Montan wax, refined by treating with oxidizing agents other than HNO_3 , particularly chromic acid in the presence of glacial AcOH , is used instead of Carnauba wax in the making of creams for boots, floors, etc.

Cigaret tips of Japanese tissue paper treated with gelatin, bismuth oxide and collodion, successively applied. W. A. BEARE. Brit. 294,038, Nov. 14, 1927.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Collapsing temperature of various kinds of laboratory glass tubing. A. W. LAUDEN-GAYER. *Ind. Eng. Chem.* 21, 174(1929). Tubes with a bore of 13 mm. and a wall thickness of 1.8 mm. were used. Tests were of 2 types: (1) A tube open at both ends was heated in an elec. furnace; the temp. was quickly raised to 300° and then at the rate of 3° per min. until the tube collapsed. (2) A tube was sealed at one end, evacuated to 3-mm. pressure, and heated until the tube collapsed. Results were as follows:

Glass	Collapsing temp	
	Open tube	Evacuated tube
Soft soda-lime (Greiner-Friedrichs)	700	585
"R" (resistance glass, G. and F.)	750	635
Pyrex	820	670
Jena combustion tubing	860	720
Bohemian combustion tubing	860	740
Moncrieff combustion tubing	820	770

A. J. MONACK

Perkin medal award--The many sidedness of glass. EUGENE C. SULLIVAN. *Ind. Eng. Chem.* 21, 177-80(1929).--The first part of the article gives a brief biography of Eugene C. Sullivan, the recipient of the Perkin Medal for 1929. A list of previous medalists is included. The latter part is the lecture given by S. First research on

low-expansion glasses, glass for baking dishes, lab. glassware, other applications of low-expansion glasses, phys. properties of glasses, and unsolved problems is discussed.

A. J. MONACK

Study of the coloring of glass. KITSUZO FUHA. Research Lab. Tokyo Elec. Co. *J. Mazda Research Lab.* 3, 21-49(1928).—(1) *Coloring with Mo.*— $(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$ is used in F.'s expt. Mo gives no special color to glass, but the glass contg. Mo according to compn. sometimes presents opalescence on reheating. Above certain limits Mo cannot enter into glass, the remainder either floating on the surface of the melt or sinking to the bottom. (2) *Coloration with W.*— Na_2WO_4 , WO_3 , metallic W powder, Na_2WO_4 + oxidizing agents, and Na_2WO_4 + As_2O_3 are used; WO_3 and its salts give no special color to glass. Metallic W partly suspends in the glass to color the latter gray. When WO_3 and Na_2WO_4 are added, opalescent glass is formed. Above a certain quantity, W cannot enter into glass, the remainder floating on the surface or sinking to the bottom in the form of a H_2O -sol. salt. Na_2WO_4 with an oxidizing agent or with As_2O_3 produces no special coloration. (3) *Coloration with U.*—U. is used for making yellow glass, and the recent observation that the glass absorbs ultra-violet rays opened a wide field for its application. Na uranate, $\text{UO}_2(\text{OAc})_2$, Na uranate + an oxidizing agent, Na uranate + As_2O_3 were tested. The use of WO_2 or Na uranate causes no great difference with phosphorescence, but the luster is best with Na uranate. 1-2% UO_2 salt gives a greenish yellow color; with 5%, deep yellow or orange to brown color is produced in some glass, the coloration being different with the kinds of glasses. Glass contg. Na uranate fluoresces in diff. degrees, K glass more strongly than Na glass. If the glass contains boric acid, it has a strong fluorescence. K-Mg glass and K-Zn-B SiO₂ glasses have always a beautiful fluorescence. The addn. of As_2O_3 to Na uranate has no influence.

K. SOMEYA

Shrinkage of glass threads during heating. I. SAWAI AND O. MORISAWA. *Z. anorg. allgem. Chem.* 173, 361-72(1928).—The behavior of threads of lead borate glass when heated under varying loads has been detd. With small loads of the order of 50-500 g./mm.² the initial expansion is followed by a contraction beginning at 180-190° and ending at 395-360° according to the load. Then follows a small range during which no change in length takes place, and finally rapid expansion ensues, due to the great decrease in the viscosity as the softening point is approached. The shrinkage is shown to be due to release of the longitudinal strains in the thread produced in its formation by rapidly drawing it out from a molten mass of the glass. When the viscosity of the glass decreases sufficiently to make these strains greater than the sum of the load and the viscosity, shrinkage takes place. With loads of about 1 kg./mm.² shrinkage occurs, but the length of the thread remains constant between 200° and 400°. With higher loads the load is greater than the sum of the viscosity and the internal stresses, therefore no shrinkage takes place on heating.

Notes on the brick industry. ALBERTO PELLACINI. *Corriere ceram.* 9, 503, 505 (1928)

G. SCHWOCH

Refractory materials in the non-ferrous metal industry (SEARLE) 9. Electric furnace for the firing of ceramic ware (KORACH) 4. Destruction of brick by CO (DIEPSCHLAG, FEIST) 9. Destruction of blast-furnace building materials, particularly fire bricks (DIEPSCHLAG, FEIST) 9. Apparatus for drying clay, chalk, etc. (Brit. pat. 203,765) 1.

Glass. SOC. ANON. DES MANUFACTURES DES GLACES ET PRODUITS CHIMIQUES DE ST. GOBAIN, CHAUNY, ET CIREY. Brit. 293,310, July 2, 1927. Violet colored glass is made by adding Ti oxide to a batch having a base of P_2O_5 (with or without B oxide) without use of silica. A deeper coloration is obtained by also adding a reducing agent such as C. A light filter, which is a true gray with a transparency nearly constant for all the rays within the visible spectrum, can be formed of such as violet tinted glass and a chate glass colored green by Fe oxide.

Apparatus for drawing glass sheets having bulb edges. RENE J. DOGNAUX (to Blackford Window Glass Co.). U. S. 1,702,501, Feb. 19.

Apparatus for producing a continuous strip of glass. PILKINGTON BROS., LTD. Ger. 470,664, Oct. 2, 1924. See Brit. 228,627.

Uniting glass sheets. E. GEISEL. Brit. 293,671, March 27, 1928. Composite transparent sheets are formed by uniting sheets of glass to a polymerization product of the ethyl or methyl ester of acrylic acid or a mixt. of these.

Uniting glass sheets with intervening material. H. LEV. LAWRENCE and KENILWORTH MFG. Co., LTD. Brit. 293,666, March 1, 1928. Preliminary to uniting glass

sheets with an intervening sheet such as celluloid or mica, the glass is cleaned and polished and then coated with a soln. of nitrocellulose together with the gums elemi and mastic and the celluloid or other intervening sheet material is coated with a soln. contg. the gums elemi and benzoin. Dyes may be added to the solns. Proportions and other details are given.

Glass-rolling apparatus. JOHN H. FOX (to Pittsburgh Plate Glass Co.). U. S. 1,702,504, Feb. 19.

Apparatus for trimming glass sheets. WILLIAM OWEN (to Pittsburgh Plate Glass Co.). U. S. 1,702,522, Feb. 19.

Forming glassware. RICHARD LA FRANCE (to Owens Bottle Co.). U. S. 1,702,262, Feb. 19. Mech. features.

Apparatus for annealing glassware. JOTHAM F. BLACK (to Hartford-Empire Co.). U. S. 1,703,073, Feb. 19.

Rotary glass-blowing apparatus. C. A. BROWN, C. W. CRAIG and F. B. VANSICKLE (to British Thomson-Houston Co., Ltd.). Brit. 293,456, July 8, 1927.

Tilttable mold bottom construction for use in forming glass articles. ALBERT N. CRAMER (to Owens Bottle Co.). U. S. 1,702,498, Feb. 19.

Glass-making furnaces. ROBERT L. FRINK. Fr. 644,561, Oct. 4, 1927.

Ceramic glazes. DEUTSCHE GOLD- UND SILBER-SCHNEIDANSTALT VORM. ROESSLER. Brit. 293,317, July 1, 1927. Glazes are used contg. water-insol. borates such as borate of Ca or Mg, together with other usual constituents such as Pb oxides, silicic acid marble and kaolin, etc.

Decolorizing ceramic materials, white pigments, etc. I. G. FARBENIND A.-G. Fr. 644,547, Sept. 13, 1927. Metals such as Fe, Co, Mn and others which color glazed earthenware, ceramic products and the crude materials such as kaolin, feldspar, quartz and white inorg. pigments are removed by heating the materials to redness or higher in a current of gas contg. Cl.

Refractory material. STAHLWERKE RÖCHLING BRUDERUS A.-G. and ALFRED KROPP. Ger. 469,433, Dec. 19, 1926. Ta powder, which may contain up to 10% of impurity, is mixed with graphite in the proportions 3:2 with the use of a binder, e. g., pitch or molasses. The mixt. is molded under pressure, dried at 300-500°, and then heated at 2000-3000°. The molded piece may be given a coating of graphite before heating. The products may be used as elec.-resistance heaters or for making crucibles, furnace linings, etc.

Refractory materials. ROBERT L. FRINK. Fr. 644,540, Sept. 8, 1927. A refractory material for vats or basins used in industry is composed of sillimanite or like substance not readily fusible, bound with a substance of vitreous nature which may be a siliceous material combined with B, alkalis, $MgCl_2$, MgO or oxides of rare earth metals.

Treating refractory material such as in reclaiming bonded abrasives. EARL L. HAUMAN (to Exolon Co.). U. S. 1,702,942, Feb. 19. In effecting the reclaiming of granular material, the surfaces of the material are progressively exposed and heated to form a "uniformly reacted" mass which may be formed into a homogeneous pig.

Refractory porous bricks. IVAR SETTERBERG. Fr. 643,764, Nov. 10, 1927. See Brit. 281,254 (C. A. 22, 3505).

Grading bonded refractory particles. EARL L. HAUMAN (to Exolon Co.). U. S. 1,703,065, Feb. 19. Bonded particles such as material of used refractory linings or retorts are graded by particle size, the included C is driven off and the material is subjected to gravity sepn.

Enameling metals. ELECTRICAL RESEARCH PRODUCTS, INC. Fr. 644,496, Nov. 25, 1927. Means are described for regulating the temp. of the enameling furnace to control the hardness of the enamel.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

The setting of cement. II. HERMANN GESSNER. *Kolloid Z.* 47, 65-76(1929); cf. C. A. 23, 1237.—An exptl. method is described for measuring the viscosity of cement and water mixts. The results showed a gradual increase in viscosity with time. Stirring or shaking reduced the viscosity. The elec. cond. increased to the end of the first hr., decreased gradually to a low figure in about 40-60 hrs., and approached zero at the end of 150-200 days. The vol. of a cement decreased as much as 5-7.5% over a period of 3-5 days.
L. F. MAREK

Heat transfer in the rotary kiln burning portland cement clinker. ROBERT D. PIKE. Pike and West, Emeryville, Calif. *Ind. Eng. Chem.* 21, 230-4(1929); cf. *C. A.* 23, 255.—The derivation of equations for calcg. temp. in different parts of the kiln is given with an example showing the close agreement of calcd. value with exptl. value. Approx. values of heat-transfer numbers are calcd. from existing data and compared with values obtained if heat is assumed to be transferred only by conduction and convection. Large differences between the values are observed; radiation from the hot gases can account for the discrepancies. Some further discussion of the heat-transfer numbers in the calcining and clinking zones is given. Many indeterminate variables are to be taken account of in designing rotary kilns. M. C. ROGERS

Light porous concrete. J. MEYER. *Chem. Fabrik* 1928, 433-5, 449-50.—To produce a porous concrete, 0.1-0.5% of an alloy of Ca is added to the cement mixt. before addn. of water. Molds are only filled to the extent of 70-80% and the evolution of gas can be regulated to require 30-45 mins. or 3-4 hrs. The concrete can, if desired, be made lighter than water, the apparent sp. gr. varying, of course, with the proportions of the usual ingredients. The relation of compression strength to apparent sp. gr. is given by curves. The two diminish together, so that the lightest forms are only suitable for filling material, etc. A further addn. of the Ca alloy results in a part of the gas evolved being lost. With a proper mixt. the gas pores are very uniform, and heat cond. measurements show that the porous concrete is a very good insulating material. It can be structurally combined with iron in the same way as ordinary concrete. B. C. A.

Bituminous fillers for cracks in concrete pavements. C. E. SLAUGHTER. Michigan Eng. Expt. Station, *Bull.* No. 11, 3-24(1927).—Field tests were made on crack fillers for concrete pavements on a three-mile section of Trunk Line No. 16 near East Lansing, Michigan. Crack fillers failed in five characteristic ways: raveling, spreading, cracking, picking up by traffic, wearing. The tar fillers as a class failed by wearing away. The highly blown asphalts as a class had good wearing qualities but lacked adhesion to the concrete and failed by picking up when under traffic. The straight-distilled oil asphalts tended to spread out during hot weather and become brittle and chip during cold weather. Two out of three cut back materials tested gave excellent results. The advantages incident to their use appeared to be long life, no heating required during application, thorough penetration of material into the crack. The disadvantages were large quantities of sand required, tracking likely to occur during the first day or two after application and higher cost of materials. The life of tar-crack fillers tested seemed to depend on consistency, those m. 30-35° were most satisfactory for summer use. Many of the asphalt fillers gave better service than did the tars. The expts. suggest that a slightly blown asphalt of 35-50 penetration for summer use followed by very soft or liquid unblown asphalt during winter would give good results. Other things being equal, a filler of greater adhesion will have longer life. A sand covering seems to be necessary for tars and soft asphalts to prevent tracking; if tracking does not occur, a sand covering does not add materially to the life of the filler. L. B. MILLER

Development of the rotary kiln. N. C. KYRIACOU. *Zement* 17, 973-5(1928); cf. *C. A.* 22, 3276. H. F. K.

Processes used for road silication. G. LOPPENS AND L. NYS. *Athénée de Liege. Bull. soc. chim. Belg.* 37, 263-6(1928).—The material used for road silication is a mixt. of limestone and Na silicates. In order to be able to make up the mixt. several days in advance, without danger of its setting, silicates should be used with a $\text{SiO}_2/\text{Na}_2\text{O}$ ratio approaching 2.42 instead of 3.20 as is customary. ALBERT L. HENNE

Asphalt emulsions (LEEMANS) 22. Solubility of CaSO_4 from 0° to 200° (PART-
RIDGE, WHITE) 2. Apparatus for testing the transverse strength of concrete blocks,
etc. (U. S. pat. 1,702,803) 1. Various products from coal, lignite, shale, peat, etc.
(Brit. pat. 203,578) 21. Resinous compositions (Ger. pat. 468,587) 26.

BATES, EDWARD E. **Plain Concrete.** New York: McGraw-Hill Book Co., Inc.
346 pp. \$1. Reviewed in *J. Western Soc. Eng.* 34, 72(1929).

Cement. ARTHUR C. DAVIS. *Fr.* 644,452, Nov. 24, 1927. Mixts. for making
cement are forced in one or more jets upwardly through the combustion zone of a verti-

cal furnace and allowed to descend. A current of air may be introduced to agitate the particles.

Rotary cement kiln. O. BOUZIN. Belg. 346,967, Jan. 31, 1928. Improvement to Belg. 331,427. The refractory lining of the kiln is provided with an inwardly projecting ring back of the high-temp. zone to retard the progress of the charge through this zone; the cooler is provided with a similar ring to retard the progress of the clinkers.

Cellular products from cement mixtures. G. B. HINTON. Brit. 294,041, Nov. 21, 1927. See U. S. 1,687,067 (*C. A.* 22, 4757).

Material for expansion joints of concrete, etc. THOMAS E. MCSHAFFREY. U. S. 1,702,788, Feb. 19. Pieces of compressible material such as cork of different sizes are each coated with stone dust and embedded in a bituminous binder.

Treating low-grade gypsum. ROBERT E. HAIRE. U. S. 1,702,940, Feb. 19. In treating low-grade gypsum rock for producing as a by-product a sanded base for sanded hard wall plaster, the mass of harder and coarser particles constituting the residue is subjected to further grinding to produce a product which contains a quantity of released gypsum with the impurities from the rock in finely divided state.

Bituminous paving material. O. H. BERGER. Brit. 293,830, July 13, 1927. See U. S. 1,672,361 (*C. A.* 22, 2650).

Bituminous emulsions. FERNAND-G. E. CHAMPILOU. Fr. 644,199, April 21, 1927. Aq. emulsions of bitumen or tar for roads, etc., are used hot, and only slightly dild. with water. Fr. 644,200 describes an *app* for making bituminous emulsions.

Plastic composition for structural uses. JOSEPH F. HAGGERTY (to National Gypsum Co.). U. S. 1,702,965, Feb. 19. A flocculent mass comprising fibers such as wood fiber satd. with a liquid such as water is admixed with plaster of Paris to form a paste and the latter is shaped into desired form. About 12 times as much (or more) of the plaster of Paris is used than of the fibrous material. U. S. 1,702,966 specifies wall board formed of gypsum and contg. not over 2% of wood fibers.

Artificial marble. KAREL STICHA, JOHANN KNEIFL and JOSEF HUBACEK. Fr. 644,286, Sept. 16, 1927. A compn. contg. Na_2SO_4 2, CaCl_2 5, deep black dye 10, red dye 2, sol. glass 16, water contg. a little NH_4Cl 28 parts is applied to a smooth surface and dried during 6 hrs. to give a surface resembling marble. The color may be varied.

Composition floor "tiles." J. B. METZLER. Brit. 293,700, July 7, 1927. A wood veneer is secured to a thicker base which may be formed of an agglomerate of sawdust, wood shavings, cork waste, asbestos, or like materials and a binder.

Floor-covering materials manufactured in long lengths. A. LANNOVE. Brit. 293,778, April 11, 1927. Mech. features of coating and impregnating felt or the like with bituminous and natural or artificial resinous compns. An *app.* is described.

Printing wood graining, etc. R. KOCH and O. KIENZLE (trading as Koch & Kienzle). Brit. 293,873, July 14, 1927. The surface of the wood or other material is provided with a protective coating such as electrodeposited metal, to prevent penetration and adhesion of the ink; the coated material is used as an intaglio printing surface and the ink is transferred from it to the article to be printed by a transfer roller, or the metal coating may be made sufficiently thick that it can be removed from the material and used independently as a printing block or as a mold for the production of relief electrotypes.

Fireproofing and preserving wood. FERNANDO S. VIVAS (to International Fireproof Products Corp.). U. S. 1,702,285, Feb. 19. See Brit. 286,725 (*C. A.* 23, 498).

Preserving wood and protecting plants from insects and fungi. L. P. CURTIN. Brit. 293,908, April 19, 1927. See Can. 277,103 (*C. A.* 22, 2651).

Preserving wood. PAUL WACK. Fr. 644,004, Nov. 9, 1927. Wood is impregnated with anhydrous phenols, cresols, etc., which absorb the water contained in the wood.

Impregnating wood. HERBERT RENNER. Ger. 470,458, May 5, 1926. The impregnating agent is a fused mixt. of an odoriferous insecticide, *e. g.*, camphor, a terpene, or C_{10}H_8 , with a diluent, *e. g.*, a hydrocarbon, wax, resin, resin acid, or the like.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Recent work on motor fuels. I. SINGER. *Petroleum Z.* 25, 152-3(1929).—Comprehensive review with 31 references to original papers.

Foreign trend in new motor fuels. I. H. NELSON. *Oil & Gas J.* 27, No. 27, 148, 164(1928).—Various expts. which are being conducted in France and England are discussed on the use of heavy oils, alc. and gases as motor fuels.

M. B. HART

Fusibility and chemical composition of ash from a number of Russian fuels. N. G. PATZUKOV AND V. I. UVAROV. *Izvestiya Teplotekh. Inst. (Trans. of the Thermo-Tech. Inst. (Russia))* 1926, No. 8, 26-37.—Samples of fuel were pulverized, sieved and burned to ash. The ignited ash was formed into a cone, which after drying was heated to the fusion temperature in a modified Meker's gas furnace. The combustion of gases was carried out in a semi-reducing flame; the products of combustion were composed of 50% $H_2O + CO_2$ and 50% of $CO + H_2 + CH_4 + C_2H_4$. The test cones were heated to 800° and kept at this temperature for one hour to facilitate the reaction $Fe_2O_3 + CO \rightleftharpoons 2FeO + CO_2$ in order to reduce the Fe_2O_3 present to FeO which lowers the melting temperature of the cone. The equilibrium of CO , CO_2 , Fe, FeO and Fe_2O_3 depending on the proportions of CO and CO_2 in the surrounding medium is explained in the U. S. Bureau of Mines, *Bull.*, No. 129. The following table shows the chemical compns. of some ashes from anthracite culm and their behavior at various temperatures:

	SiO ₂	Al ₂ O ₃	Fe ₂ O ₃	CaO	MgO	Na ₂ O + K ₂ O	SO ₂
Bokovo-Khrustalskoye, mine No. 4	53.70%	26.70%	15.54%	3.03%	1.02%	0.44%	0.48%
Same, sample II	50.51%	27.89%	16.62%	3.35%	0.62%	0.70%	0.53%
Same, mine No. 7/8	47.34%	22.62%	17.31%	8.28%	1.94%	0.91%	2.21%

Tests and standards adopted by the Fourth All-Russian Thermo-Technical Meeting. A. P. SHAKHNO AND A. N. SHCHUKAREV. *Izvestiya Teplotekh. Inst. (Trans. Thermo Tech. Inst. (Russia))* 1927, No. 6, 65-82. —Standards are given for the use of the adiabatic calorimeter, detn. of the calorific value of fuels in a simplified calorimeter and correction for radiation in calorimetric expts.

A. A. BOEHTLINGK

Automatic combustion control for boiler furnaces. ANON. *Ind. Chemist* 5, 27-8 (1929). A description (illustrated) of the Hagan system of regulation for boilers, which controls the fuel and air supply in accordance with demands for steam and its pressure. The master regulator comprises (a) the demand detector and (b) the mechanism carrying out the control movement. The former is said to be sensitive to changes of pressure of a couple of ounces per sq. in., and the latter to be very simple in operation.

W. C. EBAUGH

Some results with the Hagan automatic combustion control system. T. R. ALEXANDER. *Ind. Chemist* 5, 29-31(1929); cf. preceding abstr.—Tests conducted on an installation of 4 Babcock land-type boilers, each of 13,000 lbs. per hr. capacity, equipped with chain grate stokers driven by a steam engine through line shafting, at a plant of the British Xylonite Co., Ltd., are reported. The control app. proved itself mechanically perfect during the 7 months it was in operation, setting the controls even when the variation in pressure was insufficient to show on the pressure gage, and maintaining pressure within 2 lbs./sq. in. when the steam demand fluctuated 25%. Steadiness of CO_2 showed an overall improvement of 1%, and the av. increase of boiler efficiency,

2.7%. Total savings amount to £285 per annum on a coal consumption of 6000 tons at £1 per ton, thus showing a good return on the cost of the app. W. C. EBAUGH.

The control of calorific value. J. G. STEWART. *Gas J.* 184, 259-63(1928).—The mechanism, operation and performance, in actual use, of recently developed app for the automatic maintenance of a uniform calorific value of gas during manuf. is described, illustrated and discussed. Such app. is operated by a recording calorimeter and comprises a relay valve in which the fluctuating calorific value produces a corresponding fluctuation of gas pressure which, in turn, actuates either a water valve, controlled by a diaphragm, which loads, with water, the governor controlling, through the exhaustor, the vacuum in the retort system, or a valve supplying diluting gas, *e. g.*, air or water gas, to the main gas. The relay valve is operated by a lever moved by the hot expansion tube of the calorimeter. This valve releases gas from a chamber which is fed through an orifice from a supply of constant pressure. Such an app. is in use at the works of the Weston-Super-Mare Gas Co. The performance is satisfactory.

F. S. GRANGER

The control of firing with the Ados apparatus. O. KALLABIS. *Apparaturen* 40, 303-5(1928).—A calcn. of heat losses at 6% CO₂ in flue gas, and of fuel saved by Ados control at 14% CO₂.

Tkvisbulskii Caucasian coal. A. P. SHAKHNO AND I. B. RAPOPORT. *Trudy Teplekhn. Inst. (Trans. Thermo-Tech. Inst. (Russia))* 1927, No. 6, 52-7.—All 3 samples investigated belong to the class I according to Gruner's classification. The combustible parts, being composed of the 2nd, 3rd and 4th layers, resp., contained C 79.12, 79.33, 79.07; H 4.45, 4.56, 4.67; N 2.21, 2.24, 2.06; O 13.92, 13.87, 14.20% 71.3, 5.0 and 69% semi-coke were obtained at 550°, also 8.05, 8.47 and 11.0% primary tar and 0.3, 0.3 and 0.85% gasoline. The semi-coke contained 85% C, 3.7% H, 0.8% S. A metric ton yielded 42.6 cu. m. gas recalc. to 0° and 760 mm. which had a calorific value of 7200-11000 Cal. per cu. m.

A. A. BOEHLINGK

Relation between caking and moisture-absorbing power of some Japanese coals. SADA O IRI. *Ind. Eng. Chem.* 21, 239-41(1928).—Moisture-absorbing power decreases with increase of caking power probably because the chief caking constituent of coal, gamma, has the least moisture-absorbing power and the strongest absorbing constituent is ulmin.

A. WHITE

Coal dust firing for boilers and industrial furnaces. H. BERG AND ERICH VOGT. *Colliery Guardian* 138, 344-5(1929).—A discussion of storage, drying and pulverization of hard coal, and the design of combustion chambers for firing coal dust. The removal of incombustible constituents in the coal by turning the flame through an angle of 90° or larger is suggested.

A. WHITE

Conveying coal dust by means of coal-dust pumps. A. WIPPRECHT. *Chem. Fabrik* 1929, 25-7.—Methods for conveying coal dust (powdered coal) are outlined, with special attention to the Fuller-Kinyon system.

W. C. EBAUGH

Theory of coal washing. A. FRANCE. *Colliery Guardian* 138, 431-3(1929).

E. H.

Liquefaction of coal. SHIGERU KOMATSU. *J. Fuel Soc. (Japan)* 7, 1240-50 (1928).—Two methods of liquefaction of coal are considered: (1) gasification of the coal, and then liquefaction of the gases, and (2) direct liquefaction. K. discusses the latter method. Since boiling and melting points of matter are functions of pressure, the chemical, and not the physical properties of coal are the dominant factors in the liquefaction of coal. Two methods of direct liquefaction of coal may be expected from a study of the compn. of coal and petroleum, that is (1) removing the oxygen from the coal, or (2) adding hydrogen to the coal, for coal is a compd. consisting of C, H and O, while petroleum consists of C and H. The first reaction takes place in the course of formation of coal, while the second takes place in the Bergius process.

Separation of sulfur and ammonia from coal gas and generator gas. Zs. GALÓCSY. *üzéstechn.* 1, No. 2, 8-11(1928).—A review of German methods. S. S. DE FINÁLY

The composition of gas as related to its production method. D. J. ADRIAANSE. *Hel Gas* 49, 13-20(1929).—If normal values are assumed for coal gas, coke gas (blue gas) and flue gas as to calorific value, d., etc., sets of curves can be constructed to give the heating value for known d., and various percentage compns. of the gas. Examples of such curve families are given. Other lines of interest in these diagrams are those of const. calorific value/ $\sqrt{d.}$, the "normal lines." B. J. C. VAN DER HOEVEN

The central gas supply of Limburg and Noord-Brabant with coke-oven gas. CL. DRIESSEN AND R. C. A. FRANKEN. *Hel Gas* 49, 5-12(1929).—A description of the plans for long-distance transmission of coke-oven gas in the Netherlands. The coke ovens at Treebeek and Geleen (Emma and Maurits) of the Dutch State Mines will supply 4 towns with an initial yearly consumption of 20 million cu. m. gas (700 million cu. m. yearly available). A map shows the course of the pipe line; it is mostly of 300-mm. size, with a max. pressure of 6.5 atm. Part of the gas distributed in the future will be residual gases of the synthetic N plant; they have a 5800 Cal. per cu. m. heating value (mostly CH_4). The chem. specifications for the gas are: less than 15% inerts; 0.7% O_2 , 100 mg. S per cu. m.; 0.5 density, no NH_3 , naphthalene, H_2S or HCN; 4200 ± 200 Cal. per cu. m. The sliding scale of prices runs from 2.8 cents (Dutch) per cu. m. for the first million down to 1.9 cents per cu. m. for more than 7 million per year. These prices are related to a "normal" coal price of 10 guilders per ton at the mine and will vary with this coal price. For the pipe line seamless steel tubes with acetylene-welded joints will be used; in the mine region expansion joints are provided every 75 to 100 m. and the welds are protected by "Escout & Meuse" special couplings. Coke-oven or gas-plant gas. F. K. TH. VAN IJERSON. *Hel Gas* 49, 34-6(1929).—The quantities of coke-oven gas are discussed. B. J. C. VAN DER HOEVEN

Control of dust in water-gas sets. W. I. BATTIN. *Am. Gas J.* 130, 49-50(1929).—As a dust catcher between generator and carburettor in water-gas sets adds greatly to the efficiency of the plant, the U. G. I. Contracting Co. Division of United Engineers and Constructors, Inc., experimented with some 17 types of dust catchers. Weighed quantities of dust of the character carried over from a generator were fed through them, the amt. being supplied in measured quantities from a large fan with regulated velocity. The amt. of dust trapped by each type of dust catcher was weighed and the efficiency of the app. detd. A modified cyclone-type dust catcher was evolved having an efficiency of 95% and a pressure-drop no greater than that through a "standard" dust catcher. Dust catchers of the new design installed on two 10.5 ft. generator sets have shown that from a practical standpoint an efficiency of approx. 100% is attained. It is anticipated that economies from using this dust catcher will pay for the installation in less than 1 year. W. C. EBAUGH

Spherical gas holders. W. J. A. DUYNSTER. *Hel Gas* 49, 36-9(1929).—It is shown that spherical (const. vol.) gas holders are unsuitable for use in ordinary gas plants on account of the cost of compression of the gas. B. J. C. VAN DER HOEVEN

Spherical gas holders. A. C. KOPPEJAN. *Hel Gas* 49, 39-40(1929).—High-compression cost makes the use of spherical gas holders impractical. B. J. C. v. d. H.

Natural gas as source of benzene attracts commercial notice. G. A. BURRELL. *Natl. Petroleum News* 21, No. 2, 79-80(1929).—A review of the methods for producing benzene from CH_4 . M. B. HART

Chemical analysis of alcohol-benzene-gasoline mixtures. JOSEF ŠTÄSTNÝ, IVO KEME AND ROBERT BRODINA. *Chem. Obsor* 4, 1-3(1929).—Of the various methods (colorimetric, refractometric) for analysis of dynalkol (C. A. 22, 3513) the sulfonation method proved to be the most satisfactory on account of various raw materials used for prepn. of dynalkol. Alc. is sepd. from the mixt. 12 hrs. after addn. of NaCl and the amt. of unsatd. hydrocarbons and unsatd. hydrocarbons + benzene is detd. by adding sulfuric acid (96%) and (100%), resp. To 25 cc. of gasoline + benzene mixt. 60-70 cc. of 100% H_2SO_4 is added. The increase of the amt. of the lower layer before and after sulfonation of benzene corresponds to the amt. of benzene; the difference between this and 25 cc. is gasoline. JAROSLAV KUČERA

The thermodynamic diagram of the system of Rochefort. J. AUCLAIR AND J.

VILLEY. *Compt. rend.* 187, 699-701(1928).—The ideal indicator diagram of the cycle of a Rochefort internal-combustion engine is described. F. R. BICHOWSKY

Composition of tar from low-temperature carbonization of Utah coal. RALPH L. BROWN AND ROBERT N. POLLOCK. *Ind. Eng. Chem.* 21, 234-8(1929).—The third of a series of studies of the compn. of tars obtained from Utah coal when carbonized with steam superheated to about 700°. The tar was collected in 2 parts, one lighter than the aq. condensate and the other heavier than water. The composite total tar contained 3.5% insol. material—dust, coal, coke, etc.—2.15% carboxylic acids, 26.9% phenolic material, 2.1% tar bases, and 63.3% neutral portion (working loss 2.2%) made up as follows: resin 9.4, wax 10.8 and oil 42.8. The oil was approx. 35% unsatd., 30% naphthenic, 20% aromatic and 15% paraffin hydrocarbons. An outstanding fact is the large paraffin-wax content of the tar. The importance of the wax content arises from the potential increase it offers in economic return from the by-products of low temp. carbonization. A. WHITE

Recent work on the constituents of brown-coal tar and the tar builders in brown-coal. S. RUHEMANN. Tech. Hochschule, Berlin. *Erdöl u. Teer* 4, 629-32(1928); 5, 10-2(1929).—Most of the paper is a review of previous published work, mainly by R. and his associates. New work, now in progress, to be published in full later, is also mentioned. This is concerned with the cracking of phenol. Decompn., to a practical extent, begins at 630°, in contact with pumice, into CO + a residue which in turn breaks up into C₂H₄, C₂H₂, CH₄ and finally C and H, C₂H₂ only in traces. Butadiene is always found. At 750° liquid and solid products begin to appear, formed presumably from C₂H₂. Up to 900° benzene, naphthalene, anthracene, phenanthrene and chrysene can be detected. At about 850° the type of decompn. changes to H₂O + residue. Catalysts are divided into 3 classes, dehydrogenating, e. g., Ni; dehydrating, e. g., Al and Th oxides; and, third, activated C. Activity of Ni begins at 300° but is soon disturbed by deposited C. Up to 450° clean decompn. to CO, C, H and CH₄ occurs. Active C, at 650°, yields at first principally H₂O, C, H and CH₄, but later, because of weakening of the activity by deposited C, CO appears. Reduction to C₆H₆ + H₂ by the H₂ also occurs. Equil. const. are calcd. from the Nernst heat theorem.

F. S. GRANGER

The cleavage of phenolsulfonic acids and the purification of phenols by the sulfonic acid separation method. HORST BRÜCKNER. Tech. Hochschule Dresden *Z. anal. Chem.* 75, 289-92(1928).—In the working up of coal tar, it is possible to obtain pure phenol and *o*-cresol from the middle fraction by using a sufficiently tall fractionating column. Some phenols, such as *m*- and *p*-cresols, cannot be sep'd. by fractionation. The best method of sepg. them is to form sulfonic acids and decompose these with steam. This method of sepg. has been carried out successfully on the large scale but for working with small quantities of substance the literature does not provide correct details. Appropriate temps. for the decompn. with steam were det'd. for *p*-phenolsulfonic acid (123-5°); 4-hydroxy-*m*-toluenesulfonic acid (133-5°); 4-hydroxy-*o*-toluenesulfonic acid (116-9°); 6-hydroxy-*m*-toluenesulfonic acid (133-6°); 4-hydroxy-2,3-xylenesulfonic acid (115-8°); 6-hydroxy-3,4-xylenesulfonic acid (107-11°); 4-hydroxy-3,5-xylenesulfonic acid (124-8°); 2-hydroxy-3,5-xylenesulfonic acid (121-5°) and 1-hydroxy-2,5-xylenesulfonic acid (115-8°). One phenol only, 3,5-xenol, was found which did not sulfonate with concd. H₂SO₄ and can be blown over with steam at a temp. below 100°. A convenient way of carrying out the sulfonation is as follows: Mix 100 g. of the phenol with an equal wt. of concd. H₂SO₄ and stir with a glass rod until no more streaking is noticeable. Heat 3 hrs. in a closet at 103-5°. Dil. carefully with 200-300 cc. of water, heat to the boiling point (103°) and introduce steam until the unsulfonated phenol is all removed. Cool and dissolve out the resin with ether. In this way a soln. of the pure, sulfonated product is obtained. To recover the phenol, evaporate off the water until the b. p. of the liquid reaches the decompn. point of the sulfonic acid in question and introduce steam at this temp. Working in this way, about 80 g. of pure *m*-cresol can be obtained from 100 g. of the 97-8% commercial product.

W. T. H.

By-product coke plant of The Steel Company of Canada at Hamilton, Ontario. J. F. SLER. *Iron & Steel Can.* 12, 40-44(1929). E. H.

Dry coke extinguisher, Sulzer system. R. W. MÜLLER. *Chem. Fabrik* 1928, 727-8.—The coke is cooled in a chamber and the heat utilized for generating low-pressure steam. J. H. MOORE

Microscopic observations on graphites and cokes. PAUL RAMDOHR. *Arch. Eisenhüttenw.* 1, 669-72(1928).—The behavior of graphite in the ore microscope is discussed, its most important optical characteristic being the extraordinary reflex pleochroism.

ism shown when an immersion system is used. As compared to other minerals, the anisotropic effect with graphite is unusually strong. By microscopic expts., properties of coke may be explained which have not been explained by Röntgenographic methods. Cokes prepd. by R. from bituminous and anthracite coals, retort graphite and tech. cokes are studied under the microscope. The cokes from bituminous coal consist principally of graphite, showing large variation in grain size; those from anthracite coal consist of 0-13% graphite and show fine grains, due to both the short time and temp. of formation. The coarse-grained crust of retort graphite is made up of the finest portions. The tech. cokes are porous throughout, the size of the graphite plates varying considerably. The membranes surrounding the pores are shown to be of graphite. Reflex pleochroism can be detected in these. Small amts. of carbohydrates are found, mostly in the larger grains. The tech. cokes show low reflecting power in air, this disappearing entirely in oil. Twenty structural photographs of the various substances are given. J. BALOZIAN

Synthetic rubber from coal (HOFMANN) 30. Determination of the S content of gases from coke ovens (HEINRICH, PETZOLD) 7. Applicability of coke-oven gas to the iron industry (BULLE) 9. CONDAMINE, CH. DE LA: *Recueil de constantes de l'office central de chauffe.* Paris: Chaleur et industrie. Reviewed in *Rev. métal.* 25, 708(1928).

Agglomeration of fuels. AURÉLE L. J. VOINCHET and ACHILLE A. LERCIU. Fr. 644,225, Apr. 25, 1927. Fuels are agglomerated with cellulose derivs. prepd. by treating cellulose with a caustic alkali and then with CS_2 or compds. forming the latter. Fr. 644,226 describes the agglomeration of fuels by means of alkali or alk. earth silicates or compds. forming these and kaolin or alk. earth hydrate.

Agglomerating powdered fuel. W. E. TRENT (to Trent Process Corp.). Brit. 293,451, July 7, 1927. In agitating wet powdered fuel with oil to agglomerate C particles and exclude ash and water, as described in Brit. 151,236 (*C. A.* 15, 592) and Brit. 183,430, agglomerates of predetd. size are formed by controlling the temp. and degree of diln. of the liquid, and continuing the agitation. The quantity of oil used exceeds 14% that of the solid fuel and the bath may be heated to about 50° . An app. is described. Cf. *C. A.* 23, 1250.

Briquetting fuels. FRANCIS M. CROSSMAN. Ger. 470,477, Sept. 29, 1925. A binder for fuel briquets is prepd. by adding a small amt. of NaNO_3 or other oxidizing agent to a soln. of starch, boiling, and then adding, in turn, sulfite cellulose lye and a heavy oil residue in considerable amts. The sulfite cellulose lye may be replaced, wholly or in part, by furfural or like products obtained by distg. corn husks.

Controlling flow of fuel oil to burners by use of an intermixture of gas such as flue gas, steam or air. CLIVE M. ALEXANDER. U. S. 1,702,373, Feb. 19. An app. is described.

Motor fuel. I. G. FARBENIND. A.-G. Fr. 643,785, Nov. 12, 1927. See Brit. 281,247 (*C. A.* 22, 3517).

Producing high temperatures by combustion of fuels such as coal, oil or gas. HERBERT A. HYMER. U. S. 1,702,731, Feb. 19. Fuel and a combustion-supporting medium such as air are introduced in explosive proportions into a mixing chamber and the mixed charge is passed longitudinally into one end of an elongated combustion chamber open at the other end and burned in the chamber while laterally confined.

Drying and grinding coal, etc. EMIL BARTHELMUSS. U. S. 1,702,333, Feb. 19. Mech. features.

Hydrogenation of coal, etc. I. G. FARBENIND. A.-G. Fr. 644,148, Nov. 18, 1927. Gaseous hydrocarbons obtained as by-products in the hydrogenation of coal, etc., are transformed in any manner into H which is used for the synthesis of NH_3 . Cf. *C. A.* 23, 265.

Hydrocarbons by destructive hydrogenation and dehydrogenation. I. G. FARBENIND. A. G. Brit. 293,887, March 10, 1927. A product contg. mainly aromatic hydrocarbons is obtained by heating, with a dehydrogenating catalyst, the liquid hydrocarbons obtained by destructive hydrogenation of carbonaceous materials or extn.

products of these hydrocarbons. As catalysts, there may be used oxides of metals of the 6th group, with or without oxides of elements of the 3rd and 4th groups, or Ag, Cu, Cr or Ni alloys, Al, Fe sponge, porous C, ZnS, Al_2O_3 , pumice, CdS, Zn chromate or Pd. Oxide catalysts are preferably preliminarily treated with H at an elevated temp. Cf. C. A. 22, 2817.

Destructive hydrogenation of coal, etc. A. POTT and H. BROCHE. Brit. 293,808, July 12, 1927. Before treatment of coal or the like with H under pressure to produce "benzines, etc.," the solid material is disintegrated with solvents such as "tetraline" or oils under pressure and preferably in stages in which the temp. of each stage is near the decompn. point of the residual material.

Destructive hydrogenation of coal, oils, etc. I. G. FARBERIND. A.-G. Brit. 293,719, Aug. 7, 1926. In processes such as are described in Brit. 275,663 (C. A. 22, 2463), catalysts are used comprising (a) elements of the 4th-8th groups of the periodic system (especially those of the 6th group), together with (b) small proportions (less than 10%) of elements of the 4th-7th groups. An example is given of the use of molybdic acid with 10% of Cr oxide for producing a high yield of "benzines" by the action of H on a mixt. of crude petroleum and alderwood charcoal at 420° under a pressure of over 200 atm. Brit. 293,720, specifies catalysts contg. elements of the 4th-8th groups or their compds. together with Cu or Au or their compds., e. g., molybdic acid and Cu Cf. C. A. 23, 503.

Hydrogenating oil together with de-ashed carbonaceous material such as coal. FRANK A. HOWARD (to Standard Oil Development Co.). U. S. 1,702,899, Feb. 19. Finely ground material such as coal is treated with a hydrocarbon oil and an aq. liquid to effect sepn. of most of the ash with the aq. liquid, and the purified carbonaceous material and assocd. oil are hydrogenated under the action of high pressure and heat with H, to produce motor fuel.

Various products from coal, lignite, shale, peat or like materials. T. D. KELLY. Brit. 293,578, July 29, 1927. See Fr. 642,310 (C. A. 23, 1249).

Transformation of coal into liquid fuel. JOSEPH BETHENOD. Fr. 643,927, April 20, 1927. Powdered coal or the gaseous products therefrom is passed in a current of H through an elec. arc, which may be established between C electrodes taking part in the reaction.

Carbonizing plant for wood or coal. G. MERTURI-MERTURI (to Carbonisation soc. generale d'exploitation des carbones). Brit. 293,321, June 30, 1927.

Treating lignite. MASCHINENFABRIK HARTMANN A.-G. Ger. 470,626, May 3, 1925. Air preheated by the vapors evolved from the drier is drawn through the lignite as it passes from the drier to the place of use.

Separating gases by liquefaction. GES. FÜR LINDE'S EISMASCHINEN A.-G. (Paul Schufftan, inventor). Ger. 470,429, July 28, 1927. The fraction first liquefied is further cooled and used to wash further constituents from the unliquefied residue. The treatment of coke-oven gas is described by way of example, together with suitable app., and it is stated also that water gas may be washed with liquid CO, a mixt. of CO and H being obtained. Cf. C. A. 22, 4678.

Purifying gases. M. AURIG and G. BRÜCKLMAYR. Brit. 293,592, Aug. 24, 1927. In sepg. H_2S and CO_2 from gases by washing with an alk. soln. the latter is regenerated by treating with an Fe compd. such as $\text{Fe}(\text{OH})_3$ to ppt. sulfide and with lime to ppt. CaCO_3 . The Fe sulfide may be treated with air to reform $\text{Fe}(\text{OH})_3$ and the process thus carried on in a continuous manner.

Purifying coal gas. FIRM OF C. STILL. Brit. 293,702, July 8, 1927. Benzoid hydrocarbons are extd. from coal gas by washing with oil contg. C_{10}H_8 in such proportion that practically no C_{10}H_8 is absorbed by the gas.

Purifying coke-oven gases or like gases. GEORGES CLAUDE (to Lazote, Inc.) U. S. 1,702,683, Feb. 19. Gases contg. H, such as coal gas or coke-oven gas, intended to be subjected to partial liquefaction, after drying and freeing from CO_2 , S compds and benzene, and before final sepn., is passed in heat exchange relation with a cooling medium in such a manner that the liquids which are successively formed are allowed to intermingle and flow towards progressively colder regions; the liquids are separately collected and withdrawn under substantially the same pressure as that of the compressed mixt. of gases and independently of the residual unliquefied portion of the gases, and are reheated by heat derived from the entering gases in order to effect further fractionation. An app. is described.

Coke-oven gas. GESKILLSCHAFT FÜR LINDE'S EISMASCHINEN A.-G. Fr. 643,839, Nov. 14, 1927. NH_3 is recovered from coke-oven gas by submitting the gas under pressure to cooling with the condensation products which it contains until these products

are nearly saturated with $(\text{NH}_4)_2\text{CO}_3$, and is, after sepn. of the condensation products, submitted to a further cooling with the introduction of a small quantity of fresh water, which flows counter to the gas. C_6H_6 and C_{10}H_8 are recovered in the second cooling. Cf. C. A. 23, 693.

Means for using the sensible heat of coke-oven or like gases for raising steam. HEINRICH GRONO. Ger. 470,551, Oct. 13, 1927.

Gas production. DESSAUER VERTIKAL-OFEN GESELLSCHAFT M. B. H. Fr. 643,965, Oct. 7, 1927. A gas mixt. contg. coal distn. gas and water gas is obtained by introducing coal into a retort exteriorly heated and into another retort also exteriorly heated or the top portion of the same retort, fuel of a lower quality (small coke), the distn. gases from the coal being caused to pass through the coke, and steam being passed into the coke when it reaches redness.

Gas producer. I. G. FARBEIND. A.-G. Brit. 293,413, April 2, 1927. The process described in Brit. 214,544 (C. A. 18, 2802) is carried out in a producer having a horizontal fuel support formed with very small vertical openings through which the gasifying agent passes upwardly into the fuel. Details of construction are described.

Gas producer. FERDINAND DEBOUCK. Fr. 644,491, Nov. 25, 1927. Construction of hearth.

Gas producers. KLAS A. WIDEGREN and EMIL H. WIDEGREN. Fr. 643,816, Nov. 14, 1927.

Gas producer using solid fuel. PAUL LAFONT. Fr. 643,867, Nov. 15, 1927.

Gas producer using peat and crude lignite. JEAN M. LARGE. Fr. 643,792, Nov. 12, 1927.

Water-gas producer for continuous gasification of granular or powdered fuels. JULIUS PINTSCH A.-G. Ger. 470,653, Aug. 20, 1927. The fuel descends a central tube in a downward current of hot gas and steam. Regenerators surround the tube and are worked alternately.

Water-gas plant. SEMET-SOLVAY ENGINEERING CORP. Brit. 293,284, March 1, 1928. The air for the blowing period is supplied by the use of a comparatively small volume of air under high pressure, and this air draws in atm. air by an injector action. Various details of construction of the plant are given.

Treating exhaust gases. CHARLES E. THOMPSON. Ger. 470,389, Sept. 6, 1925. Exhaust gases such as those from internal-combustion engines are freed from noxious gases by mixing them with an oxidizing agent and subjecting the mixt. to combustion. The combustion is initiated by an external source of heat and is maintained catalytically. Suitable app. is described.

Exhaust gases from motors. I. G. FARBEIND. A.-G. Fr. 644,146, Nov. 18, 1927. Exhaust gases from motors driven with heavy oils, such as Diesel motors, are rendered inoffensive by passing them over catalyst such as Fe, Cu, Ag or difficultly reducible metallic oxides.

Montan wax. I. G. FARBEIND. A.-G. Fr. 644,461, Nov. 25, 1927. Crude or desulfurized montan wax is purified by submitting it in soln. or suspension in the presence of electrolytes and oxidizing agents to the anodic action of an elec. current.

Tar-distillation apparatus. KOKSOFENBAU & GASVERWERTUNG A.-G. and TOBIAS F. WEICKEL. Ger. 470,419, Jan. 30, 1924. The app. is of the kind comprising two superposed vessels, of which the lower one has internal heating means and is connected with the upper by ascension and descension pipes.

Extraction of phenols from tar. GEORGES HÜBSCH and EUGÈNE KÁRPÁTI. Fr. 643,765, Nov. 10, 1927. Phenols are recovered from tar or tar oils, by mixing the tar under pressure of 1.5 to 6 atm. and at a temp. above 100° with aq. solns. of solvents for phenols, such as dil. solns. of MeOH, EtOH, Me₂O, etc., and allowing the mixt. to sep. into 2 layers while cooling and lowering the pressure.

Vertical coking oven for continuous operation. JOHANN LÜTZ. U. S. 1,702,699, Feb. 19.

Regenerative coking oven. HINSELMANN, KOKSOFENBAU G. M. B. H. Ger. 470,214, April 2, 1927. Addn. to 469,480 (C. A. 23, 1254).

Portable arrangement for opening and shutting coke-oven doors. RUDOLF WILHELM. Ger. 470,574, Jan. 24, 1926.

Drawer for coke ovens with horizontal chambers. C. OTTO & CO. G. M. B. H. Fr. 643,797, Nov. 12, 1927.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

F. M. ROGERS

Technical questions and manufacturing methods in the petroleum industry. MICHAEL FREUND. *Petroleum Z.* **24**, 1269-76(1928).—A brief résumé of modern refinery methods. M. B. HART

Natural and synthetic petroleum. A. V. WEINBERG. *Petroleum Z.* **25**, 147-51 (1929).—A historical review of the theories on the origin of mineral oil is given. W favors the theory of oil formation from coal, supporting it by the results obtained in berginizing and hydrogenating coal and similar products. A. A. BOEHTLINGER

Progress and research in the petroleum industry during 1927. R. KISSLING. *Petroleum Z.* **24**, 1314-8(1928); cf. *C. A.* **23**, 694. A survey of progress in refining, utilization, testing and research during 1927. M. B. HART

Hydrocarbons of Peruvian petroleum having boiling points below 150°. W. F. SEYER AND A. F. REES. Univ. of British Columbia, Can. *Trans. Roy. Soc. Can.* [3], **22**, III, 359-60(1928); cf. *C. A.* **20**, 23, 2407. —B. p., mol. wt., and d. are given for the following hydrocarbons, isolated and identified from a sample of petroleum taken from the Lobitos oil fields of Peru: C_6H_{14} 62.5-63.5, 90, 0.6683; C_7H_{16} 98.5-101.0, 106, 0.7419; C_8H_{18} 114.5-117.0, 109, 0.7526; C_9H_{20} 136.5-131.5, 124, 0.7731. J. W. S.

Desulfurizing petroleum products. A. E. DUNSTAN. Anglo-Persian Oil Co. *Oil & Gas J.* **27**, No. 30, 138-9(1928).—Gasoline having no elemental S, H_2S or mercaptans may have a high S content with no bad effects. H_2S should be removed first by soda or alkali washing in the condenser or immediately thereafter. Hypochlorite will sweeten mercaptans and lower odoriferous sulfides from 0.1 to 0.035% S. Kerosene is decolorized with 8 lbs. to the gal. of freshly roasted bauxite. The bauxite is not efficient when roasted in pure air. The Edlecanu process followed by 4-5% of bauxite is the present practice in Persia. Phys. rather than chem. means for treating petroleum products is to be preferred. An adaptation of the Claus process has been used for the desulfurization of gases contg. up to 14% H_2S . M. B. HART

Studies in the fractional distillation of crude petroleum. M. B. COOKE AND H. P. RUE. Bur. Mines, *Tech. Paper* **431**, 54 pp.(1928).—Expts with the pipe still bubble tower combination as applied to the continuous distn. of crude petroleum by the Bur. of Mines have led the authors to recommend the adoption of this type of app. because of its economy, simplicity, flexibility and effectiveness. Preliminary sepn. of the crude oil is recommended before final sepn. in the bubble tower app. D. F. BROWN

Refining cracked distillates by means of hypochlorite. STANLEY F. BIRCH AND WOODFORD S. G. P. NORRIS. Anglo-Persian Oil Co. *Refiner Natural Gasolin. Mtr* **7**, No. 7, 94, 96, 98(1928).—Expts on the action of hypochlorite solns. on petroleum solns. of pure S compds. have led to the following conclusions: H_2S is oxidized to elementary S with the simultaneous formation of a small quantity of H_2SO_4 , an org. sulfide is oxidized to a sulfone which is neutral; a mercaptan is oxidized in 2 stages, first merely to the disulfide and then to the sulfonic acid; increased alky. decreases the oxidation, desulfurization being obtained when only enough alkali is used to prevent spontaneous decompn., but sweetening should be possible when enough free alkali is present to prevent the oxidation of disulfides. The application of the hypochlorite process is analogous to refining by means of Na plumbite and elementary S. Exptl. data are given for various distillates. M. B. HART

Pipe stills in vacuum distillation. A. E. HARNSBERGER. Pure Oil Co. *Oil & Gas J.* **27**, No. 29, 116, 286(1928).—Pipe-still vacuum units have a wide application operating on a continuous basis resulting in max. efficiency and low maintenance. Principle of operation are described. M. B. HART

Edlecanu process for refining mineral oils. G. CATTANEO. *Petroleum Z.* **24**, 1634-41(1928).—A general article on the Edlecanu SO_2 process for treating mineral oils. The continuous process has several advantages over the batch process, particularly with respect to steam consumption. The process is equally applicable to the refining of lubricating oils and kerosene distillates. M. B. HART

The oil industry of the U. S. S. R. in 1927-28. V. LEONTIEV. *Mining J., Annual Review* No. 1929, 15-8.—A statistical survey of the oil industry in the different Russian oil fields is given under the following headings: total production, gusher output, output per well, gas production, amt. of oil raised by different methods, amt. and methods of drilling, exploration, fuel consumption by the industry, oil refining, sales, export and new equipment. ALDEN H. EMERY

Oil in 1928. ANON. *Mining J.*, Annual Review No. 1929, 14.—The estd. world production of oil for 1928 is 1,285,200,000 bbls. A brief statistical analysis of the sources of this oil is given. ALDEN H. EMERY

Refining of Pecos County crude oil. SIDNEY BORN. *Transcontinental Oil Co. Oil & Gas J.* 27, No. 29, 224(1928).—Crude oil from Yates pool, Pecos County, Texas, has a gravity of 29.6° Bé. and S content 1.55%. The crude oil is refined by skimming to remove 25% of 437° end-point blending naphtha, the topped crude being cracked directly to produce 45.4% cracked gasoline, 9.5% pressure distillate bottoms and 18.1% coke and gas. When recycling pressure distillate bottoms a total of 49.4% gasoline is obtained. On cracking a heavy fuel oil the following yields were obtained: blending naphtha 25, cracked gasoline 41.5, pressure distillate bottoms 3.7, Bunker "C" fuel oil 20.2 and loss 9.6%. In running to lubricants, approx. 28% gas oil is produced which can be cracked to give about 45% gasoline. The lubricant fractions are treated with acid and clay and resemble paraffin-base oils in viscosity. M. B. HART

Latent heat of vaporization of fractions from Russian crude oils. OBRVADCHIKOV. *Azerbejdjanskoye Neftyanoe Khozyaistvo* 1928, No. 8/9, 78-80. Latent heat of vaporization was detd. for various fractions of Grozny paraffinic and non-paraffinic crude oils also from Balakhanui, Binagadui and Kirmaki crude-oil fractions, by Trouton's equation and Sakhanov and Vasiliev's method. A. A. BOEHLINGK

Analyzing crude-oil emulsions. S. VUISHETRAVSKII. *Azerbejdjanskoye Neftyanoe Khozyaistvo* 1928, No. 11, 75-6. A rapid graphical method is described for the detn. of the proportion of crude oil in oil-water emulsions, where the character of the crude oil and the compn. of the oil-well water are known. On a chart a curve is constructed which indicates the sp. gr. of the crude oil and the bore hole water in various and known proportions. To det. the oil in an emulsion obtained from the same bore hole only a sp. gr. detn. is needed, the proportion being interpolated from the curve. A. A. B.

Six main causes of refinery halitosis. DAVID E. DAY. *Oil & Gas J.* 27, No. 29, 114(1928). The 6 main sources of refinery odors are fumes from acid hydrolyzers, fumes from acid precipitators, caustic wash water, vapors from lubricating oil vacuum stills, fixed vapors from oxidizing asphalt stills and fixed vapors from cracking stills. Fumes from the sludge acid hydrolyzers are collected in lead pipes and mixed with the fixed gases from the fixed vapors from the vacuum stills and asphalt stills and burned in a Dutch oven type furnace. A complete vapor recovery system at the cracking plant eliminates such gases as the dry gases are burned. Fumes from acid precipitators may be burned. Caustic wash waters are treated with hot flue gas. M. B. HART

Method of utilizing plant sludge. EUGENE P. KIEHL. *Atlantic Refg. Co. Oil & Gas J.* 27, No. 30, 139(1928). A burner and a boiler for the combustion of sludge are described. M. B. HART

Making acid sludge fit for plant fuel. L. W. BARBOUR. *Pierce Petroleum Co. Oil & Gas J.* 27, No. 29, 242, 257-8(1928). At the Pierce Petroleum Company's Sand Spring refinery acid sludge from 180-230 viscosity steam refined stock is treated by fluxing with an equal quantity of 13-15 gravity fuel oil with air or steam agitation at 180-200° F. and the product fed by gravity to injector-type burners. M. B. HART

Metal viscometers for simultaneous testing of three oils. D. HOLDE. *Tech. Hochschule, Berlin. Petroleum Z.* 24, 1412-6(1928). The development of the viscometer and comparative results obtained with a simple and triple Holde metal app. and the Engler and Vogel-Ossag app. are described. M. B. HART

Shortening of viscosity determination by the Engler and Holde viscometer. W. BLEYBERG. *Tech. Hochschule, Berlin. Petroleum Z.* 24, 1416-7(1928).—The conversion factors are given for changing Engler and Holde values for viscous oils when small samples are used. The formula for the Engler viscometer is $f = 200/v = 0.2486/[2.6617 - \log(458.9 - V)]$ and for the Holde app. $f = 100/v = 0.4470/[2.1920 - \log(155.6 - V)]$. M. B. HART

Developments in refinery technology. E. W. ISOM. *Oil & Gas J.* 27, No. 29, 137, 258-260(1928). A brief review of recent developments in atm. distn., vacuum distn., pressure cracking distn., vapor phase cracking, fractionation, treating, etc. M. B. HART

Remove sulfur from refinery gas. D. L. JACOBSON. *Koppers Co. Oil & Gas J.* 27, No. 36, 151, 169-70, 172(1929).—The Seaboard process of liquid gas purification is briefly outlined and various installations are described. M. B. HART

Sulfur content not stressed by users in many countries. G. EGLOFF. *Oil & Gas J.* 27, No. 32, 150(1928).—Evidence obtained from various sources indicates that there is no reason for setting a limit on the S content of motor fuels. Diesel fuels contg. up to 2.5% S are marketed in Europe. Engines have been run on fuels contg. 0.35%.

0.4% and 0.6% S without corrosion. There is no S specification for motor fuels in England, fuels contg. up to 0.7% S being sold. Germany also has no S specification, fuels running from 0.2 to 2.0% being used.

Accelerated protective coating tests. C. T. LANGFORD. *Oil & Gas J.* 27, No. 29, 121, 265-6(1928); Am. Petroleum Inst. *Bull.* 10, No. 2, 93-9(1929).—Report of the Am. Petroleum Inst. Comm. on Corrosion regarding accelerated tests on pipe line and interior tank coatings.

Permian corrosion problems persist. L. G. E. BIGNELL. *Oil & Gas J.* 27, No. 31, 30, 159-60, 162, 164, 166(1928).—Added costs for replacing equipment for handling high-S crude oils when it has been destroyed by corrosion are distributed as follows: lease equipment 5 cents per bbl. crude; casinghead plant 12 cents per bbl. gasoline produced; refineries 17 cents per bbl. oil treated. Various methods of combating the corrosion problem include removing the H_2S as soon as the oil is produced, the use of small diam. pipe lines, and pumping under pressure. Scale from the damaged section of a gas-gathering line has been shown to consist largely of $FeSO_4$ contg. a small quantity of $Fe_2(SO_4)_3$. Since effective protective coatings must be applied to clean surfaces it is suggested that such coatings be applied at the factory when the pipe is built. Corrosion at the bottom of the well which is probably due to FeS scale may be reduced by running a string of "Macaroni" tubing in after the tools and forcing air in.

The determination of aromatic hydrocarbons in benzines. K. R. DIETRICH. *Auto-Technik* 16, No. 12, 13-4; *Chem. Zentr.* 1927, II, 889.—The anti-knock ability of the benzines, which is especially essential for high-compression motors, depends much on the relation between the unsatd. aromatic and naphthalene hydrocarbons, and the paraffins which cause knocks. The exact detn. of the different groups was carried out according to Riesenfeld and Bandte. D. detd. the crit. soln. temp. of a ternary mixt. of 7 parts benzine and 3 parts alc.- H_2O , 96% alc. being used for the latter binary system. The soln. temp. declines with increasing content of the benzine on aromatic and unsatd. hydrocarbons; this is demonstrated in tables for a series of various benzines. The relation of this "spirit value" to the anti-knock ability of the benzines is to be further elucidated.

The determination of the aromatic hydrocarbons in benzines by means of the "spirit value." K. R. DIETRICH. *Auto-Technik* 16, No. 18, 7-9; *Chem. Zentr.* 1927, II, 2528 (cf. preceding abstr.).—The spirit value (i. e., the crit. soln. temp. of a mixt. of 7 parts by wt. of benzine and 3 parts by wt. of 96% alc.) enables one to inform himself quickly on the content in a benzine of aromatic compds., with an accuracy sufficient for the practice. The content of unsatd. hydrocarbons seldom interferes, if it remains within narrow limits as in straight-run benzines. The "spirit curve" enables one to conclude whether a benzine is rich or poor in naphthalenes. The spirit curve and the spirit value included in it give an approx. image of the compn. of the benzine. The method cannot be employed for benzines with an extraordinary high content of unsatd. compds. There is a relationship between anti-knock ability and spirit value of benzines not exceedingly rich in unsatd. substances, though it is not strictly conformable to a law.

Quality of fuel supremely important. G. G. BROWN. Univ. of Michigan. *Oil & Gas J.* 27, No. 36, 75(1929); cf. *C. A.* 23, 965.—Aviation fuel properties are discussed. The most successful aviation fuel possesses high total volatility combined with a relatively low vapor pressure and high-knock rating. The 10% point should never be below 100° F. to insure freedom from vapor lock.

Report of the vapor pressure committee of the California Natural Gasoline Association. ANON. *Petroleum World* (Los Angeles) 13, No. 12, 105-9, 130(1928).—A consistent vapor-pressure test must show the total vapor pressure of everything in the liquid including dissolved air or gas. Five testing methods, the Bur. of Explosives, Beistle-Prather, Reid, Gard and Wade-Campbell, are compared with each other and the absolute standards. The reference methods include the analysis of the liquid and calcn. of the true vapor pressure from the analysis; and the use of an extremely large bomb with a negligible vapor space.

Gas analyses in plant operation. GAS ANALYSIS COMMITTEE OF THE CALIFORNIA NATURAL GASOLINE ASSOC. *Oil & Gas J.* 27, No. 36, 151, 160, 162, 164, 166, 169(1929).—Fundamental analysis of natural gas and gasoline may be used for the accurate and absolute detn. of potential production of products from a wet gas, to det. plant and equipment efficiency. The development of analytical methods is reviewed and applications of fundamental analysis are presented. The further application of both fundamental analysis and calcn. of compn. changes is advised.

Method of natural gasoline analyses. WALTER J. PODBIELNIAK. *Oil & Gas J.* 27, No. 35, 38, 144, 146(1929).—The improved fractional distn. app. is described and the method of operation discussed in detail. M. B. HART

Dew point data on gasoline. OSCAR C. BRIDGEMAN. Bur. of Standards. *J. Soc. Automotive Eng.* 23, 478-90(1928); cf. *C. A.* 22, 3520.—The detn. of the volatility of gasoline has been extended from the 10-90% range to 100% evapd. The Sligh equil. air distn. app. has been used with 21 gasolines. For each temp. the dew-point temps. were found to be related to the 90% Am. Soc. Testing Materials distn. points by a simple ratio of abs. temps. Similar results were obtained with the Stevenson and Babor app. Corroborative evidence was obtained from measurements of the equil. soln. temps. of 5 gasolines. An equation was obtained for the ratios between the absolute temps. of the dew-points and the dew-points of the various air-fuel mixts. in terms of the mixt. ratio as the independent variable, and values computed from this equation were in good agreement with the work of other investigators. Mol. wt. detns. were made on 24 gasolines and an approx. relation to density was deduced. With mol. wt. values, the temp. ratios were expressed analytically in terms of partial pressures of the fuel in the mixts. The dew-point of any mixt. of com. gasolines can be calcd. from the 90% Am. Soc. Testing Materials distn. point. M. B. HART

Casinghead gasoline from recycled gas in Ramanui. G. SARKISYANTZ. *Azerbejdzhanskoye Neftyanoe Khozyaistvo* 1928, No. 8/9, 61-77.—Gas from gas lift wells is led through individual gas traps into cylindrical gas purifiers with baffles, and into gas driers filled with steel shavings, is then compressed to 4-5 atm., sent to another separator, to an oil-spray condenser, through gas traps to sep. the condensate, through a set of absorbers, to another trap and finally to the storage container, to be recompressed and used again in wells in a new gas lift operation. The same oil is used for all gasoline absorption operations and is finally freed from gasoline by distn. A. A. BORHTLINGK

Factors entering into the design and operation of natural gasoline absorption plants. A. J. L. HURCHINSON. Research and Equipment Co. *Petroleum World* (Los Angeles) 13, No. 8, 110-1(1928); cf. *C. A.* 22, 3769.—A brief review is given of the progress. M. B. HART

Accuracy in measuring detonation. NEIL MACCOULL. Texas Co. *Oil & Gas J.* 27, No. 29, 146, 205, 206(1928); cf. *C. A.* 22, 2658.—Mech. variables in engines which must be considered in measuring detonation are discussed with 5 diagrams. M. B. H.

Relation of anti-knock value and distillation range shown. A. L. DAVIS. Empire Oil and Refining Co. *Oil & Gas J.* 27, No. 34, 120(1929).—A graph drawn for each type of crude run shows the relation between anti-knock value, yield, gravity and distn. range of different com. end point gasolines. Directions for prepg. the graph are given in detail. M. B. HART

Study on the double bonds present in vaseline, with special reference to vaselines sed in smokeless powder. R. POGGI. *Giorn. chim. ind. applicata* 10, 601-5(1928).—no. of unsatd. substances were examd. for unsatn.; the Hanus method was used, and the results were compared with the Rosenmund method. In the latter, the reagent prep'd by dissolving separately 8 g. C_6H_5N , 10 g. H_2SO_4 (concd.) and 8 g. Br_2 , each in 20 cc. of glacial $AcOH$, mixing the first 2 carefully and then adding the third, and dilg. to 1000 cc. with $AcOH$. The product, $C_6H_5N.H_2SO_4.Br_2$, yields its Br_2 to double bonds by addn. without giving any substitution reaction. The soln. is titrated with 0.1 N As_2O_3 , methyl orange being used. A comparison of results follows:

	Br addn. calcd. %	Br % found Rosenmund	Br % found Hanus
Amylene	228	230.8	252.8
Allyl alc.	275.3	265.8	229.7
Undecylenic acid	86.9	82.9	80.1
Oleic acid	56.6	36.7	45.6
Methyheptenone	126.7	152.3	113.1
Cinnamic acid	107.9	20.7	18.5
Anethole	107.9	97.9	67.9
Safrole	98.7	96.7	34.4
Dihydrocarvone	105.0	100.8	—
Terpineol	103.7	100.2	70.9

Apparently, the Rosenmund value is much closer to the theoretical. Using this, various vaselines were examd., giving Br% addn. as follows: vaseline = 0.7, white vaseline = 8.1, oil of vaseline = 4.9, medicinal white vaseline 18.8, natural vaseline 58.1, yellow = 95.0, gray = 120.3, rubber 1225.8. A. W. CONTIERI

The physical principles of lubrication, in particular for the explosion engine. S. KYROPOULOS. *Z. tech. Physik* 10, 2-18(1929).—The basic principle of lubrication, keeping up of liquid friction instead of dry friction, is derived from the resistance of oil against its removal due to (1) viscosity, (2) molecular forces, (3) adhesion to the walls (monomol. film formation), (4) dielec. const. and mol. size of oil by their influence on the mol. forces. Viscosity and capillary const. of a lubricating oil should be low to prevent overheating. Besides the thermal condition of the engine, oil combustion, etc., the elec. condition is of importance due to elec. effects on the oil. Elec. charges in an engine may be set up by friction of the piston, exhaust gas electricity and less frequently by ignition charges. They cause self-purification of the oil, i. e., deposition of solids on the electrodes, also improved lubrication by attraction of dipoles (in dipole oils) on the rubbing faces. In road tests there were used 3 oil types, Valvoline H and XRM and a mixed oil, Castrol XL. The viscosity curves of 30 different oils between 20° and 150° were detd. (Coulombs method by damping of torsion pendulum); the friction coeff. (b from differential equation) is tabulated. The temp. dependence of the castor oil viscosity is not different from that of some other oils, contrary to current opinion; only a few mineral oils of high dielec. constant show considerable viscosity decrease between 100° and 150°. The curves of the viscosity of mixts. of mineral oils and castor oil are not in any way abnormal. For four paraffin oils the viscosity curves could be made to coincide by a shift along the t axis; their viscosity increases with the length of the chain and increases with drop in temp. faster than that of liquids like castor oil, glycerol or water. The stretched shape of the molecules is held responsible for the ability to form mol. felt-like complexes which cause high viscosity at low temps. At higher temp. this resistance disappears gradually to make place for mol. friction along the sides of the individual mols., which is approx. equal for all and independent of the chain length, thus explaining the identity in the shape of the curves. The orientational effect of these long chains accounts for their comparatively slow drop in viscosity with rising temp. It is evident that for oils with branched chains, unsatd. or asymmetric character the viscosity will drop relatively faster at high temp. (cf. Vorlander and Walter, *C. A.* 20, 539). For the study of the mol. forces the capillary const. α of numerous oils was measured in the Lenard manner (*C. A.* 18, 2827) with their d ; the data are tabulated. For castor oil α is max. (3.60 mg. per mm. at 15°), from 3.0 to 3.3 for av. oils, highest for heavy oils, lowest for short-chain paraffin oils. Less symmetric hydrocarbons have a little higher const.; the total range of the α values is only 15%. For oil mixts. (paraffin oil + castor oil) the α curve is a little above the straight line; the α - t line is largely identical and linear for all oils. The dielec. const. of oils is an expression of their dipole content; it is high for castor oil (4.65 at 18°) and low for satd. paraffins (2.2). Its detn. allows a classification of oils and is an easy means of identification for admixts. either of castor oil or of asphaltic oils. The same identification is possible by means of the $\text{KMnO}_4\text{-Na}_2\text{CO}_3$ reaction: class (a) of high dielec. const. ($D > 2.36$) and high d . (> 0.93) discolors this soln. in 4 weeks completely; class (c) of low dielec. const. ($D = 2.24$) and d around 0.88 has very little effect on the soln. As expected D drops with increasing t for castor oil by dissoen. of complexes. D of castor oil-mineral oil mixts. is slightly below linear. Slight addns. of castor oil to mineral oil will give considerable oil saving in combustion engines; this is attributed mostly to a decrease in vapor pressure of the mineral oil with consequently less oil combustion. The elec. fields occurring in an engine were studied. The elec. cond. of oils is low and increases by self-purification, thus permitting an actual elec. orientation effect of the dipole mols. and improving lubrication. The subjective test for "oiliness" test does not necessarily indicate a high castor oil content; pure mineral oil can feel just as "oily." "Oiliness," $O = \log(d\alpha\eta_{16.7}/d\eta \cdot dt)$, in which η = viscosity and t = temp.; the lubrication value of an oil is, however, not in any way directly related to O . Highly viscous oils give higher running temp. and increased oil combustion. The best temp. is obtained with medium viscosity and additional certainty of lubrication can better be obtained by admixture of dipole oil (stearic acid, castor oil) than by using heavier oil. For practical purposes when the running temp. is known an oil should be chosen which has at that temp. a friction factor b of about 0.14.

B. J. C. VAN DER HORVEN

Rapid determination of specific gravity of semi-solid bituminous substances. S. E. BERKENBLIT. *Ind. Eng. Chem., Analytical Ed.* 1, 39-40(1929).—A detailed description of the app. and procedure used for a rapid and accurate detn. of the sp. gr. of bitumens (asphalts and tar pitches). The water displacement method is used.

A. WHITE

Asphalt emulsions. E. T. LEEMANS. *Chem. Weekblad* 26, 2-6(1929).—A review

of the literature, especially patents, from 1907 to 1928. Asphalt emulsions are used for road building principally, but also for waterproofing paper, concrete, etc. The problems involved are the formation, stabilization and breaking of the emulsion. The literature covered discusses all these points and studies the effects of the properties of the asphalt and of addition agents on the qualities of the emulsions obtained. G. C.

Catalytic decomposition of turpentine. A. MAILHE. *J. usines gaz* 53, 30-2 (1929).—Catalysis with com. activated C, instead of Cu, the activity of which is soon impaired by deposited C, is affected at the same temp., namely around 600°, and gives the same products, but in different proportions. Instead of benzene and toluene, fractions from 130° to 170° predominated, from which, by nitration, etc., derivs., identified as those of *m*-xylene, *m*-methylethylbenzene and *m*-cymene, were obtained.

Notice critique sur l'essai de résistance à l'altération des huiles pour transformateurs. Gand: Maison d'édition et d'impression, Anciennement A. D. Hoste, S. A. 12 pp. Reviewed in *Chimie et industrie* 20, 1010(1928).

Technische Entwicklung auf dem Gebeite der Kohlenwasserstofföle und Fette. Band I. **Leichte Kohlenwasserstofföle.** An Hand der Internationalen Patentliteratur. Edited by Fritz W. Croner and Max Naphtali. Berlin: M. Krayn.

LIDGETT, ALBERT: **Petroleum.** London, New York: Sir I. Pitman & Sons, Ltd. 3d ed., revised and enlarged. 160 pp.

Petroleum and bitumen from rocks, etc. PAUL VEROLA. Fr. 33,334, Dec. 22, 1926. Addn. to 637,619. Before the bitumen is extd. with water as in 637,619 (C. A. 22, 508) the rocks are broken in contact with an oil which can dissolve bitumen.

Fractionating tower suitable for distilling petroleum oils. WILLIAM H. BAHLEKE (to Standard Oil Co. of Ind.). U. S. 1,702,805, Feb. 19.

Combustion of hydrocarbons. JAMES L. BRESE, JR. (to Oil Devices Corp.). U. S. 1,702,929, Feb. 19. A gaseous hydrocarbon is hydroxylated while maintaining it substantially throughout at a temp. below that of active combustion, a secondary O supply is admitted to envelop the hydroxylated mixt. and the latter is then burned.

Dehydrogenating hydrocarbons. I. G. FARBENIND. A.-G. Brit. 293,906, March 10, 1927. Hydrocarbons obtained by cracking processes or those of any origin contg. cyclo-paraffins or naphthenes are dehydrogenated by use of catalysts comprising oxides of metals of the 6th group, preferably with addn. of oxides of metals of the 3rd or 4th groups or active charcoal. Temps. of 450-600° are suitable and the process may be effected with or without the presence of H, water vapor or inert gases. An example is given of the treatment of cyclohexane to produce C₆H₆.

Catalytic decomposition of hydrocarbon oils. ERIC T. HESSLE. U. S. 1,702,540, Feb. 19. The oil is directed against a counter-current stream of a hydrocarbon vapor under sufficient pressure to form a "true fog" of highly dispersed liquid oil suspended in the vapor, and this fog is passed through a decompn. catalyst such as Sn contg. some Sb to produce hydrocarbons of lower b. p. An app. is described.

Purifying hydrocarbon distillates. H. PRASS (to Gray Processes Corp.). Brit. 293,440, July 7, 1927. The material, preferably in vapor form, is passed through solid adsorptive material such as fuller's earth and the latter is revived at intervals by materially reducing the pressure applied to the effluent fluid below that applied to the entering fluid. An app. including a cracking plant is described. Cf. C. A. 23, 273.

"Cracking" hydrocarbons. JEAN F. P. DE LA RIBOISIÈRE. Fr. 644,615, Nov. 8, 1927. The vapors liberated are caused to pass through an extended zone in which the temp. is kept constant by the introduction of water or C_2H_6 . The space may be filled with Rashig or like rings.

Cracking oils. C. J. PRATT. Brit. 293,829, July 13, 1927. Heavy oils are first heated at relatively low temp. and then at higher temps. under atm. pressure and the vapors are blended and fractionated. A system of app. is described.

Cracking oils. ANGLO-PERSIAN OIL CO., LTD., E. S. L. BEALE, G. H. COXON and A. E. DUNSTAN. Brit. 293,889, March 15, 1927. Turbulence is imparted to a stream of oil flowing through a cracking coil by causing the stream to move in surges generated by a reciprocating pump. An app. is described in which the oil is pumped through a coil by a pump under a pressure of 1000 lbs. per sq. in., the temp. being gradually increased from 380° to 450° and then lowered to 400° and the products finally passed through a cooler at 250° .

Vertical retort and associated apparatus for distillation and depolymerization of liquid or liquefiable hydrocarbons. ADOLPHE A. F. M. SEIGLE. U. S. 1,702,275, Feb. 19.

Apparatus for distilling and cracking oils, tars, etc. R. FEIGE (to Kohlenveredlung A.-G.). Brit. 293,430, July 6, 1927. Material to be distd. or cracked is fed onto rotating disks mounted on a vertical shaft and spaced between fixed baffle plates. Hydrogenating gases and catalysts also may be used in connection with the process and various structural details are described.

Rotating still for continuous distillation of bitumen and hydrocarbons contained in sand and sandstone. AUGUSTE DRIEZ. Fr. 641,543, July 20, 1926.

Purification of benzine and cracking oils. COMPAGNIE GÉNÉRALE INDUSTRIELLE. Fr. 644,281, May 3, 1927. Benzine from the pyrogenation of coal or middle oils from tar, or "cracking" oils from petroleum, etc., are purified from substances forming gums when they are used as motor fuel, by the action of H in the presence of a metal catalyst such as Ni kept in suspension in the liquid by agitation. The temp. is kept at about 80° at first and afterwards increased to 180° .

Refining mineral oils with acid. ALEXANDER S. RAMAGE (to Gyro Process Co.) U. S. 1,702,313, Feb. 19. A mixt. of measured quantities of oil and acid is delivered into the lower portion of a slowly moving body of material from which the sludge is allowed to settle out; the clear acid oil overflows into contact with a NaOH soln and is agitated with the latter and the mixt. thus produced is delivered into the lower portion of a slowly moving body of material, and this is allowed similarly to overflow and wash. An arrangement of app. is described.

Treatment of acid sludges from the refining of mineral oils. J. CORNER. Belg. 347,671, Jan. 31, 1928. Small portions of the sludge are distd., in a closed chamber, at progressively increasing temps. The treatment is carried out in a continuous cycle. The distd. gases are passed through a scrubber, and the SO_2 is liquefied. The pitch can be used for the production of illuminating gas and of a pure coke.

Oil filter (suitable for use with internal-combustion engines). STEVE KRALJEVICH. U. S. 1,702,348, Feb. 19.

Oxidation products of paraffin wax, etc. I. G. FARBENIND. A.-G. (Wilhelm Pungs, inventor). Ger. 467,930, Aug. 30, 1922. The oxygenated products obtained by oxidizing solid hydrocarbons, e. g., paraffin wax, with gaseous oxidants are sep'd from unaltered hydrocarbon by careful warming so that the oxidation products sep. in liquid form from the solid hydrocarbon. An example is given.

Filter for lubricating oil (suitable for use with internal-combustion engines). J. W. JONES and C. W. MCKINLEY (to General Motors Corp.). Brit. 293,745, July 11, 1927.

"Self-lubricating" material for bearings. FRED K. BEZZENBERGER (to Cleveland Graphite Bronze Co.). U. S. 1,702,927, Feb. 19. A soln. of a salt of a bearing metal such as $CuSO_4$, also contg. a small quantity of a finely divided lubricant such as graphite is treated with an elec. current to effect deposition of the bearing metal and lubricant together in a uniform deposit.

Artificial asphalt. GEORGES HÜBSCH and EUGÈNE KÁRPÁTI. Fr. 643,766, Nov. 10, 1927. Substances resembling asphalt, bitumen and pitch are prepd. by the action of phenols on cellulosic or ligneous substances, particularly sawdust. An acid such as HCl or H_2SO_4 may be added to hasten the reaction. The app. usually employed for making artificial resins may be used.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Fire hazard in plants producing celluloid and celluloid articles and fire extinguishing systems. A. BAHL. *Kunststoffe* 18, 174(1928).—There are set forth factors which tend to accentuate the fire hazard inevitably existent in the mfg. plants producing celluloid and celluloid articles. Fire-combating systems, both valve operated and automatically operated, for combating fires are described. These systems are in the nature of sprinkler systems, and are situated at strategic points. The automatic systems are set in operation through the action of the heat of the fire. These automatic systems have the advantage of localizing the water spray, thereby reducing the extent of water damage, a disadvantage which is attendant upon valve-operated systems unless these be specially constructed. The author also points out the fact that hand extinguishers are widely employed and that the use of froth-producing extinguishers is increasing. B. HAMILTON

Equipment for burning wood waste. H. A. HATFIELD. *Pulp Paper Mag. Can.* 27, 3 8(1928); cf. *C. A.* 23, 951.—A description of some of the modern equipment available for the cleaning of wood and for the prepn. and burning of wastes in pulp and paper mills. A. PAPINEAU-COUTURE

Recovery of the precipitant in the manufacture of viscose. A. HILLRINGHAUS. *Silk J.* 5, No. 51, 57(1928).—A plant for the recovery of Na_2SO_4 is described. C. E. M.

Making rayon from cellulose acetate. JOSEPH ROSSMAN. *Rayon* 7, No. 10, 20 1, 37, No. 11, 16–18(1928).—A review of the U. S. patent literature upon the spinning of cellulose acetate into rayon. CHAS. E. MULLIN

Treatment of industrial wastes from paper mills (FALES) 14. Velocity of the acid hydrolysis of cotton cellulose by HCl, alone and in the presence of alkali chlorides (HUNTER) 2. Relation between atmospheric humidity and breaking strengths and extensibilities of [brown paper] before and after weathering (TURNER) 25. Relation between humic acids and lignin (FUCHS) 10. Apparatus for preparing carbon paper, color pastes, etc. (U. S. pat. 1,702,380) 1. Lixivating apparatus (Fr. pat. 643,883) 1. Food material from grasses, reeds, etc. (Brit. pat. 293,779) 12.

Cellulose esters of higher fatty acids. I. G. FARBENIND. A.-G. Fr. 644,480, Nov. 25, 1927. Chlorides of higher fatty acids in the presence of pyridine, quinoline or the like are caused to react on cellulose not previously treated at a temp. above 100° till the desired soly. of the cellulose ester is reached. In examples, pyridine and cellulose are added to stearyl chloride and xylene and heated to $135\text{--}140^\circ$. A sol. distearate of cellulose is obtained by pptn. in alc. A dilaurate sol. in aromatic hydrocarbons and in chlorinated aliphatic hydrocarbons is obtained in a similar manner. Cf. *C. A.* 23, 1504

Coloring cellulose esters such as nitrocellulose. I. G. FARBENIND. A.-G. Brit. 293,485, April 8, 1927. The process described in Brit. 247,288 (*C. A.* 21, 649) is modified by the incorporation of large quantities of coloring substances (suitably 25% or more) with compns. of cellulose esters or ethers. Examples are given of nitrocellulose compns.

Plasticizers for cellulose esters. PATHÉ CINÉMA (ANCIENS ÉTABLISSEMENTS PATHÉ FRÈRES). Fr. 643,884, Apr. 18, 1927. A plasticizer for cellulose esters or ethers is composed of a mixt. of triphenylphosphate 12–18, and tricresylphosphate 15–19 parts, preferably 15 of the first to 12 of the second.

Plasticizing cellulose esters and ethers. HANDS and SPICERS, LTD. Brit. 294,008, Aug. 27, 1927. Diphenylmonocresyl- and monophenyldicresyl-phosphate are used as plasticizers with compns. contg. cellulose acetate or other cellulose esters or ethers, in making films, artificial silk, or other products.

Carbohydrate esters. I. G. FARBENIND. A.-G. Brit. 293,757, July 11, 1927. Air is removed from cellulose, starch or other carbohydrates before esterification by treatment as described in Brit. 293,316 (cf. following abstract) with a gas or vapor which is absorbed by the acylating liquid. A vacuum is also preferably employed and among the gases and vapors which may be used are: pyridine, NH_3 , CH_3O , HOAc and H_2O vapor. Examples are given of the treatment of linters with H_2O vapor before nitration and of cellulose pulp with NH_3 before acetylation.

Carbohydrate esters and ethers. I. G. FARBENIND. A.-G. Brit. 293,316, June 30, 1927. In forming esters and ethers, such as those of cellulose or starch, the carbohydrate is first converted into alkali carbohydrate with exclusion of air as by use of a gas or vapor which reacts with the alkali used, such as CO_2 , formic acid, HOAc or CH_3O . Removal of the air may also be assisted by a vacuum. An example is given of the treatment of cellulose in a vacuum chamber with CO_2 and acetaldehyde vapor, and then with NaOH soln. before etherification.

Cellulose acetates. H. J. MALLABAR and NON-INFLAMMABLE FILM Co., Ltd. Brit. 293,724, April 6, 1927. ZnCl_2 and HCl are used for acetylation and, by the addn of small quantities of HCl when using ZnCl_2 as condensing agent, the acetylation may be carried out without heating. The acetate produced may be rendered sol. in acetone by treatment, after pptn., with dil. inorg. acids and heating.

Cellulose acetate compositions. GUSTAV LEYSIEFFER. Ger. 470,579, Nov. 4, 1924. Hard elastic masses are prepd. from cellulose acetate without the addn of fillers by using acetate previously softened with water and incorporating it with a plastifier. In the example, a mixt. of cellulose acetate, water and triacetin is kneaded and then rolled hot.

Decorative sheet material comprising nitrocellulose or cellulose acetate. Soc. DES BREVETS J. PAISSEAU. Brit. 293,391, July 5, 1927. A sheet such as celluloid or cellulose acetate compn. is treated with a cold compn. comprising a volatile solvent such as Et lactate, MeOH and EtOAc , which will cause the compn. to adhere to the sheet and which may also contain pigments and material such as nitrocellulose or cellulose acetate corresponding to the material of which the sheet to be decorated is composed.

Nitrocellulose. J. B. WISEL (to Hercules Powder Co.). Brit. 293,291, July 1, 1927. Nitrocellulose is dehydrated by percolation with secondary butyl alc., and excess alc. is removed by centrifuging or pressing, leaving 20-40% of the alc. in the mass.

Residual oils in cellulose manufacture. OEL UND FETT-CHEMIE G. M B H. Fr. 643,853, Nov. 15, 1927. The oils are sepd. into their 2 principal constituents of fatty acids and resin acids by distn. under a high vacuum (4 mm.) until the resin acids begin to distil.

Decorating celluloid with opaque colored lacquers, etc. JAMES S. MOTTER (to O'Neil Duro Co.). U. S. 1,702,663, Feb. 19.

Viscose. CHEMISCHE FABRIK POTT & CO. Fr. 644,514, Nov. 26, 1927. Aromatic sulfonic acids are added at one or more phases of the manuf. of viscose, preferably during the manuf. of the alk. cellulose. Salts of di- or tri-sulfonic acids of C_{10}H_8 alkylated in the ring or of hydroaromatic compds. of the anthracene or phenanthrene series may be used.

Desulfurizing artificial silk or other products made from viscose. I. G. FARBENIND. A.-G. Brit. 293,833, July 13, 1927. Desulfurization is effected by the use of a soln. contg. impurities extd. from crude viscose, e. g., there may be used a soln. formed by treating the crude viscose with aq. MeOH .

Artificial silk, etc. JACQUES M. BERNARD. Fr. 33,357, April 13, 1927. Addn. to 631,721. The process of 631,721 in which cellulose is treated in a closed rotating cylinder with CS_2 and NaOH soln. is afterward added and the CS_2 recovered under vacuum is applied to celluloses previously treated with soda and washed. Cf. C. A. 22, 1854.

Artificial silk. SOCIÉTÉ POUR LA FABRIKATION DE LA SOIE RHODIASETA. Fr. 33,364, Apr. 14, 1927. Addn. to 598,081. In the manuf. of artificial filaments by dry spinning solns. of cellulose derivs. in an atm. rich in the solvent vapors, a gaseous exchange is effected between the atm. of a heated cell in which spinning takes place and a cooled condenser where the solvent condenses by a single large opening, the condenser being connected to the cell by this opening. Cf. C. A. 22, 1474.

Artificial silk, films, etc. I. G. FARBENIND. A.-G. Brit. 293,350, July 4, 1927. The strength and elasticity of artificial silk, films or other articles made from viscose or from solns. of cellulose esters or ethers are increased by incorporating in the soln. used or in the finished product a cementing substance, such as linseed oil, or a synthetic resin, or reactive substances such as $(\text{CH}_3)_2\text{N}_2$ and urea. A bright yellow film suitable for use as a filter in photography may be formed from cellulose ethyl ether to which is added

the aldehyde resin produced from acetaldehyde and NaOH soln. (after washing with water and dil. HOAc soln.).

Artificial threads, films, etc. COURTAULDS LIMITED. Fr. 644,485, Nov. 25, 1927. Threads, films, etc., of cellulose or compds. thereof contg. one or more finely divided solids or liquids equally distributed therein are obtained by filtering and eliminating air from the spinning soln., adding more of the solid or liquid, mixing without introduction of air and spinning the soln. obtained.

Spinning bowls for artificial silk. NAAMLooZE VENNOOTSCHAP NEDERLANDSCHE KUNSTZIJDEFABRIEK (to J. C. Hensing). Brit. 293,871, July 15, 1927. The bowl shell is made of drawn Al so that an ebonite covering is not necessary and the foot may be made of an acid-resisting alloy such as an alloy of Al and Si. Various structural features are described.

Spinning nozzles; filtering. CHARLES L. WALKER. Fr. 644,453, Nov. 24, 1927. Spinning nozzles for artificial silk are made of pierced disks of precious metal, such as Pt, fixed in a support across an opening made in the support. The necessary parallel little holes in the disks may be made by putting a relatively sol. metal in holes made in a metal such as Pt and drawing, putting the drawn metal in holes made in another piece of Pt and again drawing, which operation may be repeated. When the desired fineness is reached, the drawn metal is cut into disks and the relatively sol. metal is dissolved out chemically. The method may also be used for making a filter with microscopic holes for sepg. a solid in suspension from a liquid.

Apparatus for supplying regulated quantities of artificial-silk-spinning-solution to spinning jets, etc. BRITISH CELANESE, LTD., and E. KINSELLA. Brit. 293,325, Dec. 23, 1926.

Use of "sintered glass" for filtering solutions used for making artificial silk. H. KINDERMANN. Brit. 293,816, April 12, 1927. A filtering disk may be used of varying permeability in different portions. A filtering device is described.

Die for making artificial filaments by extrusion of cellulose ester or other solutions, etc. R. A. J. THENOZ and H. L. BARTHELEMY (to Ruth-Aldo Co.). Brit. 293,416, July 6, 1927. The die is provided with a conduit for circulation of a temp.-controlling fluid. Structural details are described.

Apparatus for spinning artificial-silk. HARBENS (VISCOSE SILK MANUFACTURERS) LTD., and W. E. SHARPLES. Brit. 293,596, Sept. 3, 1927. Structural features.

Apparatus for making artificial-silk filaments by the stretch-spinning process. BRYSLKA, LTD., and F. W. SCHUBERT. Brit. 293,977, July 15, 1927. The spinning vessel contg. the coagulating liquor or the superposed coagulating liquors is provided with a volute taper funnel through which the thread passes, and the suction thus created draws in liquor as required.

Apparatus (with an adjustable orifice) for making artificial-silk filaments by the dry spinning process. M. KLEIN (to Ruth-Aldo Co.). Brit. 293,424, July 6, 1927.

Rayon-filament manufacture. ISAAC B. MERRIMAN (to Manville Jenckes Co.). U. S. 1,702,837, Feb. 19. Mech. features.

Treating residual liquor from sulfite-pulp manufacture. LINN BRADLEY and EDWARD P. MCKEEFE (to Bradley-McKeeffe Corp.). U. S. 1,702,586, Feb. 19. Liquor from cooking pulp with Na sulfite with or without the use of NaOH is evapd. to dryness and calcined to drive off S compds. The residue left is high in Na_2CO_3 and also contains Na_2SO_3 ; it may be leached and sulfited. U. S. 1,702,587 specifies calcining under conditions which avoid oxidation or reduction of the Na_2SO_3 . U. S. 1,702,588 specifies producing carbonate from the sulfite in the evapn. and calcination. U. S. 1,702,589 specifies producing caustic alkali by calcining the evapd. liquor, heating the residue in an elec. furnace to produce a product contg. alkali metal carbide and treating this product with water.

Pulp-wood digester. REX W. HOVEY. U. S. 1,702,347, Feb. 19. Structural

Roll construction for "ref. engines" for treating paper pulp. FRANK G. FEELEY (to E. D. Jones & Sons, Co.). U. S. 1,702,633, Feb. 19.

Suction box for pulp and paper machines. GEORGE J. MANSON. U. S. 1,703,010, Feb. 19.

Paper drying apparatus. WILLIAM A. LORENZ (to Otaka Fabric Co.). U. S. 1,702,907, Feb. 19.

Carbon paper for manifolding. LAURENCE E. LENTZ (to Elliott-Fisher Co.). U. S. 1,702,834, Feb. 19. In a manifolding assembly, sheets are used, the C coatings of which are of graduated relative hardness so that the transferring capacity increases relatively through the assembly.

Wrapping paper. ÉTABLISSEMENTS A. POLL & CIE. Belg. 347,099, Jan. 31, 1928. Certain portions of the surface of the paper are waterproofed by means of paraffin, or otherwise, while other portions are not waterproofed so as to allow certain ventilation of the wrapped goods.

Fixing metallic sheets on paper, etc. ALUMINIUM-WALZWERKE SINGEN, LAUBER NEHER Co. G. M. B. H. Fr. 644,333, Nov. 22, 1927. Metallic sheets are fixed on paper or other support by a glue or adhesive insol. in water and not softening with heat, and which requires no evapn. of a solvent, or admission of air, or lowering of temp. in order to harden. Solns. of cellulose esters, of resin or rubber, of metallic soaps or bakelite varnishes may be used. Cf. C. A. 22, 2057.

24—EXPLOSIVES AND EXPLOSIONS

C. E. MUNROE

The explosives industry in the years 1924-1927. ALFRED STETTbacher. *Chem. Ztg.* 53, No. 11, *Fortschrittsber.* No. 1, 1-32(1929). E. H.

Developments in the explosives industry in England and Italy in 1926. JOHN WEIR. *Z. ges. Schiess-Sprengstoffw.* 23, 78-9(1928).—In England, PbN_3 is becoming a serious competitor with $Hg(ONC)_2$ in detonators. This explosive must be loaded in Al shells instead of the usual Cu ones. Such detonators have, therefore, been forbidden in fiery mines, as the Al increases the probability of gas ignition. Ethylene glycol dinitrate is being rapidly introduced in low-freezing dynamites as a partial substitute for nitroglycerin, instead of nitro substitution compds., etc. Considerable work is being done in the development of *flashless, non-hygroscopic smokeless powders*. TNT with setting point of 80.5-80.6° is now being produced without the use of a volatile solvent. FRANCO GROTANELLI. *Ibid* 79-80.—In Italy, blasting explosives in which surplus war explosives are utilized are largely employed for agricultural purposes. C. G. STORM

Explosibility of suspensions of soap dust in air. DAVID F. SMITH AND F. A. HARTGEN. *Bur. Mines, Repts. of Investigations* No. 2905, 3 pp.(1928).—Mixts. of quite pure soap dust with air when tested in Clement-Frazier app. devised for detg. the explosibility of mixts. of coal dust with air, and by it the soap suspensions, were shown not only to be explosive but notwithstanding that the particles of the soap were much larger than the coal, the soap suspension gave the higher pressures, indicating a greater violence than the coal. Suspensions of this soap dust become dangerous when the concn. of soap dust is greater than about 0.1 g. of dust per l. C. E. M.

Double bonds present in vaselines used in smokeless powder (POGGI) 22. Device for C and H analysis of explosive organic liquids (SEVAG) 1.

Explosive mixtures. OSKAR MATTER. Fr. 644,505, Nov. 26, 1927. An explosive mixt. contains pentaerythritol tetranitrate and trinitrotoluene and (or) tetrametromethyl-aniline, *e. g.*, 80 parts of the 1st with 20 of the 2nd or 3rd.

Blasting fuses. J. FRITZSCHE. Brit. 293,478, April 6, 1927. Fuses which are tarred or otherwise impregnated with an adhesive material are externally coated with a protective layer of opaque finely divided pigment such as Al or bronze powder, red lead, hydrated Fe oxide, ultramarine, zinc white, graphite and talcum. Brit. 293,479 relates to drying fuses with hot air, etc.

Smokeless powder. EUGÈNE BAZYLEWICZ-KNIAZYKOWSKI and CASIMIR PARTYKA. Fr. 643,857, Nov. 15, 1927. Smokeless sporting and gun powder is made in the ordinary machines used for making carbine powder by degelatinizing the threads of powder immediately after leaving the press by means of water or steam.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Dyes and their application: Recent technical progress—technical developments in 1928. L. J. HOOLEY. *Chem. Age* (London) 20; *Dyestuffs Monthly Supplement* 3-5, 14-15(1929). E. H.

The German dye industry. FRITZ MAYER. *Chem.-Ztg.* 53, 4(1929). E. C. M.

Textbooks on dyeing. C. B. HOUGH. *Dyer, Calico Printer* 59, 74-5, 106-7, 120 1, 148-9, 161(1928).—Discussing the need of authoritative books on dyeing and the subjects they should cover. CHAS. E. MULLIN

Present and possible future applications of electricity to jig dyeing. RAFFAELE SANSONE. *Textile World* 75, 487-91, 1413-7(1929). RUBY K. WORNER

The fastness to sulfur dioxide of fabric dyed with azo dyestuffs. A. T. KING. *Wool Record* 34, 1053-5; *Dyer, Calico Printer* 60, 192-3; *Textile Recorder* 46, No. 548, 83 5(1928).—See C. A. 23, 986. RUBY K. WORNER

Fastness properties of wool dyestuffs. J. STEPHEN HEUTHWAITE. *Can. Colorist Textile Processor* 8, 154-6(1928); cf. C. A. 23, 518.—General. CHAS. E. MULLIN

Defects in dyeing woolen tweeds. GEO. RICE. *Can. Colorist Textile Processor* 8, 158(1928).—General. CHAS. E. MULLIN

Recent developments in dyeing, printing and finishing the rayons. CHAS. E. MULLIN. *Textile School of Clemson College. Rayon* 8, No. 1, 20, 58-61(1929).—A review and discussion of the recent developments in rayon oils and their removal, *ph* in scouring and dyeing, special rayon dyes, and the dyeing of two-shade or two-color effects on all viscose piece goods, special effects on acetate silk, tin-weighted acetate silk, embossed effects, rubberized celanese, metallized effects, mercerization in the presence of viscose or acetate silks, and the Richard "denierometer." C. E. M

Effects of tension on the dyeing of viscose and cellulose acetate silks. VISKEX. *Silk J* 5, No. 52, 59-60(1928).—While viscose yarn stretched prior to dyeing, or under tension during the dyeing, tends to give lighter shades than the unstretched yarn with most dyestuffs, acetate silk does not show nearly as much difference in shade, with and without tension, as the viscose silk. This may to some extent explain the preference of knitters for acetate silk. Certain dyestuffs, particularly those recommended by Whittaker, give more level colors on combinations of stretched and unstretched viscose than the ordinary dyestuffs. CHAS. E. MULLIN

Dyeing mixtures of natural silk and viscose. WM. BENNETT. *Silk J.* 4, No. 46, 45(1928), cf. C. A. 23, 281.—Two-color and solid effects are discussed. C. E. M.

Care of the iron bath in silk dyeing. FRED. GROVE-PALMER. *Can. Colorist Textile Processor* 8, 124-6(1928); cf. C. A. 22, 2469.—The use of Fe baths in silk dyeing is discussed. CHAS. E. MULLIN

Dyeing silk piece-goods with acid colors. G. RUDOLPH. *Silk J.* 5, No. 55, 52-3(1928).—General, with suggestions as to dyestuffs. CHAS. E. MULLIN

Printing of cellulose acetates (acetate silks). WM. BENNETT. *Silk J.* 5, No. 50, 59 60(1928).—Formulas are given for printing with the direct, S. R. A., Setacyl, Iona-mme, Duranol and vat dyestuffs on acetate silk. CHAS. E. MULLIN

The effect of printing, discharging and stripping agents on muslin. IV. The destruction of wool by the hyposulfite group. H. UDAKA. *J. Soc. Chem. Ind. (Japan)* 31, Suppl. Binding 107-8B(1928); cf. C. A. 23, 519.—The effects of various decompn. products of the S_2O_4 group and Zn salts were examined. $ZnSO_4$, $Na_2S_2O_3$, and $NaHSO_4$ had little influence on wool fiber; $NaHSO_4$ had a more serious influence. Allworden's reaction was observed by treating S Wool fibers with H_2SO_4 ; U. considers that this reaction is caused by the hydrolysis of wool protein. Y. TOMODA

The ionic theory and its applications. F. H. CAMPBELL. *Textile J. of Australia* 3, 24, 87 8, 153-4, 219-20, 278-9, 342(1928).—An elementary discussion of the theory of ionization and its applications in the softening of water, theory of dyeing, prepn. of salt-free water and waterproofing of woollens. CHAS. E. MULLIN

Review of outstanding American textile machinery developments of 1928. EDWIN D. FOWLE. *Textile World* 75, 1287-9, 1315(1929). RUBY K. WORNER

Relation between atmospheric humidity and breaking strengths and extensibilities of textile fabrics before and after weathering. A. J. TURNER. *J. Text. Inst.* 19, 101-68T(1928).—Doped and undoped flax and cotton fabrics, ramie and jute fabrics, brown paper, cotton sheet, cellulose acetate film and pigmented nitrocellulose varnish film were tested in an Avery machine at various relative humidities from 30% to satn., before and after weathering for different periods. The warp of cotton fabrics is more affected by humidity changes than the woof, and so are coarser than fine fabrics, while mercerized cotton fabrics are less sensitive to such changes than unmercerized. Phys. difference...

...in terms of the strength at 70% R. H.), but chem. treatments, such as the mercerization of cotton or the cuprammonium or bitumen proofing of flax fabrics, cause considerable changes in this factor. The effect of doping depends largely on the ex-

tensibility of the material treated, while the effect of humidity on doped fabric corresponds roughly to the sum of its sep. effects on the fabric and on the dope. The humidity-strength coeffs. of all classes of fabrics are greatly changed as a result of weathering, the strength and extensibility of the weathered fabric decreasing with increasing humidity.

What constitutes good fulling practice. A. W. DAVIDSON. *Can. Colorist Textil. Processor* 8, 92-4(1928).—Perfect results cannot be obtained on faulty fabrics.

CHAS. E. MULLIN

Studies in flax retting. I. Aerobic spore-bearing bacteria isolated from retted flax fiber. ANTOINETTE TREVETHICK, B. B. ROBINSON AND R. M. SNYDER. Mich. Agr. Expt. Sta., *Tech. Bull.* 95, 1-26(1928).—The predominating organisms found on flax fiber were Gram-positive, sporulating rods. Some coccus forms were also present. The subtilis, mycoides and mesentericus-like organisms predominated. All attack the common carbohydrates and may attack starch as well. Clostridium-shaped bacteria similar to *Cl. butyricum* were considered the principal flax retters. II. Pure-culture flax retting. *Ibid* 24-37.—Retting is defined as a biol. process by which the pectic substance or binding material in the flax straw is dissolved or removed from the fiber bundles, thus permitting the sepn. of the fiber bundles from the rest of the flax stem. Flax straw was sterilized by heating for 3 hrs. on 3 successive days in hot air at 145-160°. By means of pure-culture tests, 3 organisms of the mesentericus-megatherium group were found to ret flax. It is not commercially feasible to heat or sterilize flax straw for retting because the fibers become harsh and discolored, and the natural retting bacteria are destroyed. Molds discolor the fiber and cling tenaciously to them. Molds may be controlled by complete submersion of the flax. The optimum retting temp. is 30°. Org. substances, coloring matter and the by-products from a previous ret should be removed to prevent retarding the next ret and discoloring the fiber. The retted straw should be thoroughly washed before drying. III. Acidity in retting flax. *Ibid* 38-49.—The work shows that the acidity which develops in a ret plays an important role. Numerous H-ion tests prove that the retting of flax in H₂O proceeds faster at neutrality than in an acid or an alk. medium. The speed of the retting depends upon the temp. and with high temp., 25° or more, the difference in time between retting at p_H 7 and p_H 5 or a p_H 10 might be only a few hrs. but at 22° retting at p_H 7 will be several days faster. This acceleration in speed of retting would make it practical in medium warm H₂O rets to control the p_H of the retting soln. especially if the retting H₂O was free of mineral salts. If the retting H₂O contains mineral salts in soln., they will tend to prevent the p_H from going low. The quality of the fiber of a p_H 7 ret was better, or, in no case poorer, than the fiber from more acid or alk. rets. Retting with buffers requires a smaller addn. of alkali and gives a faster ret than without the buffer. The fiber from the rets where the buffer was added was considerably stronger for the same degree of retting. The passing of air through a retting soln. keeps the acidity from becoming very low. Rets conducted in this manner showed a slightly higher % of fiber than the stagnant-water retting but this may have been due to lack of the same degree of retting. Retting done where the H₂O circulates tends to become acid unless the addn. of fresh water is sufficient to replace the old H₂O at least once in 6 hrs. This makes the entire control of acidity impracticable. However, the replacing of the old H₂O once in 24 hrs. is better than every 6 hrs. as it produces a fiber that indicates better quality, but one which hackles a smaller % of line fiber. A bibliography of 34 references is appended.

C. R. F.

Finding width in reed and length of warp for woolen and worsted fabric. A. S. MARK. *Textile World* 75, 1407-11(1929).—These can be determined quickly with a nomographic chart.

RUBY K. WORNER

Customs classification of woolen and worsted yarns and fabrics. EBER MIDGLEY. Technical College, Bradford. *Wool Record* 35, 227-31(1929).

RUBY K. WORNER

Oils for wool. CHAS. E. MULLIN. Clemson College Textile School. *Textile Colorist* 50, 670-3(1929); cf. C. A. 23, 1275.—The following subjects are discussed: the oils used on wool, their properties, blending and emulsification for application to the wool; the surface area of the wool fiber and its effects upon changes in the oil on the fiber; heating and ignition on the fiber; oxidation of olive oils on heating and the temp. rise of wool oils; catalysts and stabilizers; hygroscopic properties of oils and soaps; scouring properties of the oils and their removal from the goods; emulsifying bases and the p_H of emulsions; p_H in scouring, and a review of the patents and literature.

CHAS. E. MULLIN

Process for distinguishing between viscose and Schreiber and W. A. Hamm. *Melliand Textilber.* 9,

rayon. W. T.

ation of

impurities in viscose rayon such as Na thiocarbonate, alkali sulfides and similar S compounds, which liberate H_2S , distinguishes viscose rayon from cuprammonium. For detecting a small quantity of H_2S , an app. has been devised which consists of a round-bottom flask, the mouth of which is covered with a piece of filter paper moistened with 10% $Pb(C_2H_3O_2)_2$ soln. This "diaphragm" is held firmly in place by a glass with a flange similar to the mouth of the flask, to which it is fastened with rubber bands. An illustration of the device is given. Five g. of unknown rayon with 100 cc. distd. water and 3 cc. concd. H_2SO_4 are placed in the app. and heated on the water bath for 4 hrs. Darkening of the paper shows the presence of viscose rayon. Attempts to detect it by the liberation of CS_2 from the impurities were successful in only a few cases.

Loss of strength [tendering] of cotton exposed to light. P. W. CUNLIFFE AND D. FARROW. **Effect of structure and of bleaching on the strength of cotton yarns.** W. CUNLIFFE AND E. MIDGLEY. *J. Textile Inst.* 19, 169-88T(1928).—Comparison made between the strength of cotton in the form of hairs, yarn, or cloth after exposure o Hg-vapor lamps, the C arc, and to sunlight, in England and abroad and that of imilar unexposed materials. Cotton hairs exposed to the quartz Hg-vapor lamp lose trength at a const. rate until the tendering amounts to about 40%; the rate then dimin-shes. Over a small range the rate of tendering is proportional to the intensity of the light. There are sp. differences between the susceptibilities to light tendering of cotton hairs f different origin, and destruction proceeds more rapidly in the presence of O, water, r CO_2 than in H, N, or *in vacuo*. The proportional loss of strength of yarns is about alf that of hairs fully exposed under the same conditions, the hairs in the yarns being tendered to the same extent as the yarns themselves. Fine yarns are more rapidly tendered than coarse, and soft twisted than hard, both for bleached and raw cotton. Bleached cotton is more rapidly tendered than raw, and material dyed chrome-green is much more resistant to destruction than the undyed, scoured material. $Fe(OH)_3$ has a slight protective action, while cloth dyed mineral-khaki is as resistant as the chrome dyed material, the effect being such as to extend the life of fabric subject to strong illumination to as much as 5 or 6 times that of untreated material. Org. dyes modify the rate of tendering of cotton by light, some unfavorably, others favorably, the effects

never being so large as those found with Cr hydroxide. In an appendix it is observed that when the results of breaking tests on yarns of different counts are made comparable by expressing them in terms of the strength of equal wts. of cotton in a standard length, for the same twist constant, coarse yarns are inherently stronger than fine, and doubled yarns are stronger than the 2 singles from which they are spun, but weaker than a single yarn equal in actual counts to the doubled. Bleached yarns are weaker than raw, the work done in breaking a standard strip of cloth being taken as a measure of its strength, bleached cloth is weaker than unbleached.

Bleaching drills for the white shoe and painted awning trade. GEO. RICE. *Can Colorist Textile Processor* 8, 12(1928).—General.

Raw Materials of Commerce. [Fibers.] Complete in 24 fortnightly parts. London: Sir Isaac Pitman & Sons, Ltd. 32 pp. 1s. 3d., net each part. Reviewed in *Pharm. J.* 122, 76(1929).

Dyes. FÉLICE BÉNSA. Fr. 644,024, Nov. 15, 1927. Chloroperylene quinones are prepd. by treating highly chlorinated perylenes with fuming H_2SO_4 . In an example dodecachloroperylene is heated to 150–160° with H_2SO_4 contg. 25% SO_3 . The product is sepd. by pouring into water. It gives a vat dye which dyes cotton a dark olive green. An after-treatment with alum or Cr changes the color to a red approaching violet.

Dyes. FÉLICE BÉNSA. Ger. 470,160, Oct. 29, 1926. Halogen substituted methyl- or ethyl-perylenediketone is heated with metal cyanide in the presence of an org. solvent such as pyridine or quinoline, with or without pressure. Thus, diacetylchloroperylene is heated with $CuCN$ in quinoline. The dye seps. out as a blue powder. Other examples are given with a method of prepg. the perylene diketone employed.

Dyes. I. G. FARBENIND. A.-G. Brit. 293,352, July 4, 1927. Monazo dyes contg. an acetoacetyl chloride residue are caused to react with an arylamine sulfonic acid or a deriv., preferably in a solvent such as pyridine or quinoline capable of neutralizing the HCl produced. The products dye wool clear even shades fast to fulling and to light and when pptd. as lakes and used as size colors yield clear yellow orange to shades fast to light and water. Examples are given.

Dyes. I. G. FARBENIND. A.-G. Brit. 293,768, July 11, 1927. Cyche ketones and quinones (some of which are vat dyes) are prepd. by heating an aromatic mono or poly-ketone, contg. at least one free peri-position to the ketone carbonyl, with AlCl₃ and an alkali chloride such as NaCl in the presence of O or a gas contg. O and suitably also with accompanying use of an addnl. oxidizing agent such as MnO_2 , $NaNO_2$, PhO_2 , or $CuCl_2$. Examples are given of the prepn. of 2-chlorobenzanthrone, 2-cyanobenzanthrone, benzanthrone-2-carboxylic acid, 3,4,9,10-dibenzopyrene-3,10-quinone, 3,4,8,9-dibenzopyrene-5,10-quinone, 3(2),4(1)-naphtho-8,9-benzopyrene-5,10-quinone and 2-Bz 1-benzanthrone-dicarboxylic anhydride.

Dyes. I. G. FARBENIND. A.-G. Fr. 644,150, Nov. 18, 1927. Yellow shades are produced on animal, vegetable or artificial fibers by vat dyes obtained by treating 1-hydroxyanthraquinone or its derivs. with caustic alkalis in the presence of org. solvents or diluents such as alc. or $PhNH_2$, preferably in the absence of O. Examples are given of the treatment of 1-hydroxyanthraquinone with KOH and alc. or $PhNH_2$ to produce 1,1'-dihydroxy-2'-dianthraquinonyl, and of 1-hydroxy-4-amino- and 1-hydroxy-4-methoxy-anthraquinone to produce the corresponding derivs.

Dyes. SOC. ANON. POUR L'IND. CHIM. À BALM. Brit. 293,795, July 12, 1927. Mixts. of isoviolanthrone and dichlorisoviolanthrone are prepd. by mech. admixt. or by oxidation of mixed solns. of their leuco compds. The mixt. may be converted into its leuco compd. or leuco ester and used for dyeing or printing.

Azo dyes. I. G. FARBENIND. A.-G. (Eugen Glistenberg and August Sigwart, inventors). Ger. 470,661, Dec. 4, 1926. Insol. azo dyes are prepd. by diazotizing a

compd. of the formula $\text{NH}_2\text{C}:\text{CHCH}:\text{C}(\text{OR})\text{CH}:\text{CH}$, in which R is an aliphatic or an aromatic radical, and coupling with PhNHAc . The diazo component may contain other nuclear substituents, e. g., Cl, NH_2 , or OCH_3 , and instead of PhNHAc its N-substituted derivs. may be used. Examples describe the prepn. of dyes from (1) 4-aminoacetophenone and PhNHAc ; (2) 4-amino-3-nitroacetophenone and PhNClAc ; (3) 4-aminobenzophenone and PhNHAc . The products are yellow.

Azo dyes. I. G. FARBENIND. A.-G. (Richard Stüsser, inventor). Ger. 470,652, Jan. 27, 1927. Substantive dyes are prepd. by coupling a diazotized aminothiazolemonosulfonic acid with a sulfonated acetoacetic arylide, or alternatively by sulfonating the dyes prepd. from a diazotized aminothiazolemonosulfonic acid and an acetoacetic arylide. The examples describe the prepn. of dyes (1) from dehydrothiotoluidine-*o*-monosulfonic acid (prepd. from dehydrothiotoluidine sulfate by baking) and acetoacet-*o*-anisidinesulfonic acid and (2) by sulfonating the dye prepd. from dehydrothiotoluidinemonosulfonic acid and acetoacet-*o*-chloranilide. The products dye cotton yellow. Cf. C. A. 23, 1281.

Azo dyes. SOC. ANON. POUR L'IND. CHIM. À BAËLE. Fr. 644,153, Nov. 19, 1927. New azo dyes of the general formula $\text{acidyl}-\text{NH}-\text{R}-\text{N}=\text{N}-\text{P}$, in which R represents a ring of the C_6H_5 series contg. a sulfo group *o*- to the azo chromophore and the group NH acidyl *m*- to the same chromophore and P the residue of a 1-aryl-5-pyrazolone, are prepd. by coupling diazo compds. of the general formula $\text{acidyl}-\text{NH}-\text{R}-\text{N}=\text{N}-\text{OH}$ with aryl-5-pyrazolones. In examples, 1-*p*-sulfo-phenyl-5-pyrazolone-3-carboxylic acid is diazotized and coupled with 4-acetylamino-2-amino-1-benzenesulfonic acid. The product dyes wool in a H_2SO_4 bath fast shades resembling those from tartrazine. If 1-(4'-sulfo-2'-methyl)-phenyl-5-pyrazolone-3-carboxylic acid is used a greenish yellow dyeing is obtained, and a greener dyeing if 1-(4'-sulfo-2'-methyl-6-halogen)phenyl-5-pyrazolone-3-carboxylic acid is used. A greenish yellow dye is also obtained if 4-acetylamino-2-amino-1-benzenesulfonic acid is coupled with 1-(5'-sulfo-2'-chloro)phenyl-3-methyl-5-pyrazolone.

Monoazo dyes from naphthylaminocarboxylic acids. LEOPOLD LASKA and FRITZ WEBER (to Grasselli Dyestuff Corp.). U. S. 1,702,832, Feb. 19. Dyes suitable for dyeing "acetate silk" contain as one constituent a naphthylaminocarboxylic acid (suitably 2,3-naphthylaminocarboxylic acid) together with another component such as resorcinol, β -naphthol, β -naphthylamine, ethyl- β -naphthylamine, 2,3-aminonaphthoic acid, dimethyl-*m*-toluidine, phenylmethylpyrazolone, *m*-phenylenediamine, *m*-toluylenediamine, 1,5-naphthylenediamine, α -naphthylamine, dimethylaniline, *o*-anisidine, *p*-aminacetanilide, *p*-phenylenediamine, *p*-nitroaniline, *p*-nitro-*o*-anisidine, *p*-cresidine, 2,4-dinitroaniline, aminohydroquinone-dimethyl ether, aniline, *o*-toluidine, *o*-chloroaniline, 2,5-dichloroaniline, *m*-chloroaniline or *p*-nitroaniline. The various dyes described give strong yellow and red to blue-violet shades on "acetate silk."

Isodibenzanthrone dyes. I. G. FARBENIND. A.-G. (Arthur Lüttringhaus, Hugo Wöhl, and Heinrich Neresheimer, inventors). Ger. 470,500, Mar. 24, 1925. Addn. to 409,689. 2-*Bz*-1'-Dibenzanthronyl or its derivs. is treated with alk. or acid condensing agents. The initial material may be a mixt. of a *Bz*-1'-halogenbenzanthrone and a benzanthrone not substituted in the 2-position, which mixt. may be treated with an alk. condensing agent at a low temp. to produce a 2-*Bz*-1'-dibenzanthronyl, and then warmed to complete the reaction. In the examples, (1) 2-*Bz*-1'-dibenzanthronyl is treated with Na anilide at 150° ; (2) 2-*Bz*-1'-dibenzanthronyl is treated with alc. KOH at 135° ; (3) 6-methyl-2-*Bz*-1'-dibenzanthronyl is treated as in (2), a product which dyes cotton blue being obtained; (4) 6-chloro-2-*Bz*-1'-dibenzanthronyl is treated as in (2); (5) 2-*Bz*-1'-dibenzanthronyl is fused at 250° with a mixt. of FeCl_3 and NaCl; a product which contains Cl and gives blue-violet shades from blue vats is obtained. If AlCl_3 replaces FeCl_3 in (5), isodibenzanthrone is obtained, and the same dye is obtained by treating 2-*Bz*-1'-dibenzanthronyl with 80% H_2SO_4 in the presence of Hg salts. The prepn. of the initial materials of the examples is described in Ger. 468,475. See Brit. 255,277.

Vat dyes. I. G. FARBENIND. A.-G. (Heinrich Neresheimer, inventor). Ger. 470,502, Dec. 24, 1926. *Bz*,*Bz*'-Diarylpyranthrones are treated with oxidizing or condensing agents. When oxidizing agents are not used, the hydro deriv. of the dye is first obtained. In the examples, (1) *Bz*,*Bz*'-diphenylpyranthrone in H_2SO_4 soln. is treated with MnO_2 , and (2) the same initial material is treated with a fused mixt. of AlCl_3 and NaCl, the oxidation of the resulting hydro compd. being completed by aeration. Cf. Brit. 282,620 (C. A. 22, 3785).

Vat dyes. I. G. FARBENIND. A.-G. (Heinz Scheyer, inventor). Ger. 470,501,

Oct. 1, 1926. The condensation products prep'd. from anthrone or its derivs. and glyoxal are treated with alk. condensing agents. In the examples, dyes are prep'd. by treating with alc. KOH the condensation products from glyoxal and anthrone, 2-phenylanthrone, 2-chloranthrone and 1-chloranthrone. The dyes give red to violet shades and are only sparingly sol. in org. solvents.

Dye intermediates. I. G. FARBENIND. A.-G. (Hugo Jaesschin, inventor). Ger. 469,654, Dec. 3, 1925. Urea derivs. of 2-hydroxynaphthalene-3-carboxylic acid, useful in developing azo dyes on the fiber, are prep'd. by treating 2-hydroxynaphthalene-3-carboxylic acid aminoarylamides with COCl_2 , or by treating 2-hydroxynaphthalene-3-carboxylic acid with diaminodiarylureas in an indifferent medium in the presence of a water-binding substance. Examples are given describing the prepn. of urea derivs. from (1) 2-hydroxynaphthalene-3-carboxylic acid, 3'-aminophenylamide and COCl_2 and (2) 2-hydroxynaphthalene-3-carboxylic acid and 4,4'-diaminodiphenylurea.

Derivatives of anthanthrone. I. G. FARBENIND. A.-G. Fr. 644,577, Oct. 12, 1927. Hydroxy and alkoxy derivs. of anthanthrone are prep'd. by transforming the sulfonic acids or alkoxy derivs. of the anhydride of 1-aminonaphthalene-8-carboxylic acid (naphthostyryl) by alk. sapon. agents into the corresponding derivs. of 1-amino-naphthalene-8-carboxylic acid, treating their diazo compds. with reducing agents and transforming the derivs. of 1,1'-dinaphthyl-8,8'-dicarboxylic acid, while still contg. the sulfo groups into the corresponding hydroxy derivs. by alk. fusion, and finally submitting the hydroxy or alkoxy derivs. thus obtained to the action of condensing agents such as H_2SO_4 or ZnCl_2 . The hydroxy derivs. obtained may be subsequently alkylated. In examples, 5-methoxynaphthostyryl is sapond. with NaOH lye, diazotized and reduced with ammoniacal- Cu_2O to 5,5'-dimethoxy-1,1'-dinaphthyl-8,8'-dicarboxylic acid. This acid is introduced while cooling into concd. H_2SO_4 and afterwards poured into water. The dimethoxyanthanthrone obtained dyes cotton violet shades from the vat which turn to an orange-red on exposure to air or sapon. Dihydroxyanthanthrone is obtained by sulfonating naphthostyryl, and heating with NaOH lye to obtain 1-amino-4-sulfo-naphthalene-8-carboxylic acid, which by diazotizing and reducing is converted to 1,1'-dinaphthyl-4,4'-disulfo-8,8'-dicarboxylic acid. This acid is converted by fusion with KOH into 4,4'-dihydroxy-1,1'-dinaphthyl-8,8'-dicarboxylic acid and this is heated under reflux with Ac_2O and ZnCl_2 . The dihydroxyanthanthrone may be methylated with the Me ester of toluenesulfonic acid.

Naphthoquinone derivatives. I. G. FARBENIND. A.-G. (Josef Stock, inventor). Ger. 468,507, Mar. 28, 1925. See U. S. 1,681,599 (C. A. 22, 3996).

Naphthalene derivatives. I. G. FARBENIND. A.-G. Fr. 643,795, Nov. 12, 1927. Derivs. of 2-hydroxynaphthalene-3-carboxylic acid amide which are of importance in dyeing are obtained by heating 2-hydroxynaphthalene-3-carboxylic acid with mustard oils. An example is given of the prepn. of the phenylamide of 2-hydroxynaphthalene-3-carboxylic acid by heating the acid with phenyl mustard oil till evolution of CO_2 ceases. Other esters of isothiocyanic acid may also be used. Cf. C. A. 23, 1139.

Sulfur derivatives of phenol and homologs. NAAMLOOZE VENNOOTSCHAP FABRIEK VAN CHEMISCHE PRODUCTEN. Dutch 19,063, Dec. 15, 1928. Sulfur derivs. of phenol, useful for fixation of basic dyes on cotton, are prep'd. by heating dry alkali phenolates either suspended in solvent naphtha or dissolved in excess phenol (at least $\frac{1}{2}$ phenolate) with S at high temp. Twenty kg. NaOH and 188 kg. phenol are heated to 180° to remove reaction H_2O . The mixt. is cooled to 125°C , S is added and the mixt. heated to 180° for 24 hrs., H_2S escaping. The mass is cooled and ground.

Dyeing. I. G. FARBENIND. A. G. Brit. 293,813, April 6, 1927. Cotton is dyed by treating it with a urea deriv. of an azo or disazo dye contg. one or more carboxyl groups (other than a salicylic acid grouping) and contg. a free amino group in the coupling component, and then treating the material with a Cr salt. The urea derivs. used may be obtained by the action of phosgene on the *p*-aminoazo or *p*-aminodisazo compds. The process is especially applicable to batik dyeing. Several examples are given.

Dyeing. I. G. FARBENIND. A.-G. Fr. 644,436, Nov. 24, 1927. Animal fibers are treated with sulfonated derivs. of 1,4-diaminobenzene or of 1,4-di-(4-aminophenyl-amine) benzene, which carry in the 2 amino groups a naphthyl group substituted or not, or one amino group may have a naphthyl group and the other amino group may or may not be substituted, or with diaminonaphthalenes in which one or both amino groups have an aryl group. Subsequent oxidation of the fibers gives valuable colors. In examples, wool is dyed a full black by 4-aminosulfo-phenyl-2-naphthylamine and subsequent oxidation with $\text{K}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 . A deep black is also obtained with 1,4-di-(6-sulfo-2-naphthylamine) benzene. Other examples are given.

Dyeing. SOC. ANON. POUR L'IND. CHIM. A BALG. Fr. 644,385, Nov. 23, 1927.

Dyes of the formula $\text{NH}_2\text{R}^1\text{N}=\text{N}\cdot\text{R}^2\text{NH}_2$, in which R^1 and R^2 represent 2 aromatic rings of the C_6H_5 series are diazotized on the fiber and coupled with β -hydroxynaphthoic acid or β -naphthol in acid or neutral medium. In an example, acetate silk is dyed in a bath contg. a dispersing agent and the dye obtained by sapon. the product from diazotized *p*-aminoacetaniline and cresidine. The dye is then diazotized on the fiber and coupled with β -hydroxynaphthoic acid or β -naphthol in AcOH or $\text{H}\cdot\text{COOH}$ soln. The dispersing agent may be delimed sulfite cellulose lye or condensation products of CH_2O and sulfonic acids.

Dyeing and printing with ester derivatives of leuco vat dyes. STANDFAST DYERS & PRINTERS, LTD., J. I. M. JONES and W. KILBY. Brit. 293,890, March 15, 1927. In dyeing and printing with ester derivs. of various leuco vat dyes, the color is developed in dil. aq. acid solns. in the presence of a cupric salt such as CuSO_4 or CuCl_2 , preferably at the b. p. Several examples are given.

Dyeing "acetate silk" or other cellulose esters or ethers. I. G. FARBENIND. A.-G. Brit. 293,766, July 11, 1927. The process described in Brit. 215,783 (C. A. 18, 3481) is modified by replacing the hydrogenated pyridine or the aliphatic base or deriv. by a hydrogenated isocyclic base or salt of such a base preferably in a slightly alk. bath. Hexahydroaniline, its substitution products such as hexahydromethyl-aniline and hexahydroethylaniline and homologues, such as hexahydroethyl-*o*-toluidine and similar compds., may be used. Examples are given.

Dyeing vegetable fibers. I. G. FARBENIND. A.-G. (Leopold Iaska and Arthur Zitscher, inventors). Ger. 470,537, Jan. 1, 1927. The goods are impregnated with an ether of 2,3-hydroxynaphthoyl-2-amino-3-naphthol and the color is developed with suitable diazo, tetrazo or diazoazo compds. In the examples, cotton is impregnated with 2,3-hydroxynaphthoyl-2-amino-3-naphthol methyl ether and the color developed with the diazo solns. from 4-nitro-1,2-anisidine and 5-chloro-1,2-toluidine, resp.

Dyeing furs, etc. I. G. FARBENIND. A.-G. Fr. 644,349, Nov. 22, 1927. Fur, hair, feathers, etc., are dyed by treating them with an aq. soln. of salts of those derivs. of C_{10}H_8 which contain at least one 3-aminoarylamino group of the C_6H_5 series and with an acid soln. of nitrite. In an example fur is dyed in a bath contg. 2-(3'-amino-phenylamine)naphthalenehydrochloride, a little alc. and HCl and afterwards treated in a bath contg. NaNO_2 and AcOH . The color varies from yellow to rose. Other examples are given.

Dyeing fur, hair, etc. I. G. FARBENIND. A.-G. Fr. 644,190, Nov. 21, 1927. Fur, hair, feathers, etc., are dyed in fast shades from violet-red to blue-black or greenish gray by treating them with aq. solns. of those derivs. of C_{10}H_8 which contain at least one aminoarylamino group of the C_6H_5 series and oxidizing. In an example mordanted fur is dyed in a bath contg. 2-(4'-aminophenylamino)-naphthalene hydrochloride, a little alc. and HCl , and afterwards rinsed in a $\text{K}_2\text{Cr}_2\text{O}_7$ bath, to give a gray-blue shade. Other examples are given.

Dyeing apparatus. SOCIÉTÉ KARPELÈS FRÈRES. Fr. 644,138, Nov. 17, 1927. Centrifugal force is used to drive the dye through one or more thicknesses of cloth.

Vat and associated apparatus for treating textile materials with dye solutions or other liquids. CHARLES P. COLE, SR. U. S. 1,702,535, Feb. 19.

Mordanting. HENRY DREYFUS. Fr. 644,565, Oct. 5, 1927. Mordanting of threads, fabrics, etc., of or contg. cellulose esters, particularly the acetate, is expedited by the use of solns. of the thiocyanates of metallic mordants, in which the concn. of the thiocyanate radical is in excess of that chem. equiv. to the mordant metal. The excess may be obtained by the addn. of a thiocyanate of a non-mordanting metal, e. g., NH_4 , K or Na . The thiocyanate is afterwards hydrolyzed with Na_2CO_3 .

Printing fabrics. I. G. FARBENIND. A.-G. (Alwin Schneevoigt, inventor). Ger. 470,538, Feb. 11, 1927. In printing with azo dyes to be developed on the fiber, a soln. of the base and the coupling component in a solvent such as thiodiglycol, cyclohexyldiethanolamine, or triethanolamine is mixed with a thickener and printed on, the color being developed in an acid bath with the addn. of nitrite either to the printing paste or to the bath. The process is particularly applicable to the printing of acetate silk. Examples are given. Cf. C. A. 22, 3051.

Fibrous materials. BRITISH DYESTUFFS CORP., LTD. Fr. 643,742, Nov. 10, 1927. Wool, silk, fur or other fibrous material of animal origin is protected against the action of alk. or acid agents, by adding to the agents a sol. condensation product of urea and an aldehyde, suitable products being mono- and di-methylolurea.

Vegetable wool. JEAN M. A. FAUSSEMAGNE. Fr. 644,241, April 27, 1927. A fiber resembling wool is prepd. by boiling wood fiber in an autoclave for 2 hrs., allowing it to remain in a bath contg. 2 1/2% NaOH for 2 hrs., then for 6 mins. in a bath contg.

KOH, then in a 3rd bath contg. 1% HNO_3 , and finally in a bath contg. soap 3 kg., Na_2CO_3 250 g, Na_2BO_3 1 kg. and glycerol $1\frac{1}{2}$ kg. in 100 l. of water.

Machine for damping and chilling cloth. PETER W. CÜSTERS. Fr. 643,768, Nov. 10, 1927.

Device for treating fabrics with liquids. FLORENT HINNEKENS. U. S. 1,702,770, Feb. 19.

Liquid treatment for finishing fabrics. H. T. BÖHME A.-G. Brit. 293,746, July 11, 1927. Finishing agents such as a soln. of MgSO_4 and dextrin are used with an added luster-producing agent such as paraffin or stearic acid which may be emulsified with an aromatic sulfo-acid or highly sulfonated oil.

Washing, bleaching, etc., cakes of artificial silk while covered with fabric. E. K. GLADDING (to duPont Rayon Co.). Brit. 293,767, July 11, 1927. Mech. features.

Bleaching material for making hats. H. GOLDBEITER. Brit. 293,828, July 11, 1927. Materials such as rabbit hair treated with Hg salts, Zn nitrate or Sn nitrate are bleached as described in Brit. 291,743 (C. A. 23, 1290) by use of H_2O_2 (preferably in alk. soln.) in the presence of catalysts such as $\text{K}_2\text{FeC}_6\text{N}_8$ which accelerate decomposition of the peroxide.

Felt hats. JESSE MEYER. U. S. 1,702,658, Feb. 19. The felt hat body is treated with coconut oil, shaped into hat form, superficially treated with "coconut butter" and subjected to pressure, in order to give a rain-proof smooth and glossy finish.

Dry cleaning, laundry washing or scouring wool. A. E. HATFIELD, E. A. ALBERT and ACHILLE SERRE, LTD. Brit. 293,886, Feb. 15, 1927. In processes of this character, in which a filter aid such as that described in Brit. 266,850 (C. A. 22, 876) is added to soiled liquid from a washing machine and the suspension thus obtained is filtered and the filtrate returned to the washing machine (preferably in a continuous cyclic manner), soaps of high soly. and emulsifying power and with little tendency to disintegrate are used in the washing machine to prevent clogging of the filter press. Soaps such as described in Brit. 289,582 (C. A. 23, 727) are suitable for this purpose. Various details are given.

Pleating fabrics containing thermoplastic cellulose derivatives. C. DREYER (to British Celanese, Ltd.). Brit. 293,857, July 15, 1927. Permanent pleating is effected by heat and pressure, preferably after treatment of the fabric (such as one comprising cellulose acetate) with a solvent, softening agent or swelling agent (of which several examples are given).

Metallization. ANTOINE BORENSZTEDT. Fr. 644,429, Nov. 24, 1927. Substances such as threads and ribbons to be metallized are passed through a cupro ammoniacal bath contg. about 5% AgNO_3 , then into a coagulating bath contg., e. g., MeOH 60, Me_2O 25, AgNO_3 5, HNO_3 10 parts and is then reduced with H_2S before passing to the electrolytic bath.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Practical methods of paint-making control. GEORGE SUTHERLAND. *Paint, Oil, Chem. Rev.* 87, No. 8, 10-1, 16(1929).—The various methods of testing color, sp. gr., yield value and fineness of grind for paints are discussed and methods which have proven most practical for production are suggested.

Recent advances in the protection of engineering products with paints. HANS WOLFF. *Farbe u. Lack* 1929, 38-9, 51.—W. reviews briefly the drying of oils, cause and prevention of corrosion, use of accelerated tests, structure of paint films, etc.

Zinc oxide paints. C. P. VAN HOEK. *Farben-Ztg.* 33, 2789-90(1928). Straight ZnO -linseed oil paints are considered by many users to be deficient in flowing out proper ties, opacity, adhesion and elasticity. This is attributable in part to the flocculating tendency of the weakly positively charged pigment, badly flowing masses that retain considerable amts. of oil being formed. The extra oil necessarily added leads to poor opacity, to poor adhesion on wood (owing to absorption of "free" oil), and to poor flow of such paints used as primings. Further, the formation of Zn soaps causes loss and lack of elasticity of the film. The addn. of 5-10% of stand oil in the grinding process corrects the above faults to some extent.

Modern methods of testing paints, etc., for weathering and rust-preventive properties. R. KEMPF. *Farben-Ztg.* 33, 2359-61(1928).—Accelerated weathering tests are discussed generally and a bibliography of published work on the subject is given. An alternative to the intensive-cycle procedure is furnished by refined method of detecting

failures in normal exposure tests. Factors influencing outdoor exposure tests are noted and suggestions are offered for controlling these variables so as to increase the value of an outdoor exposure by giving it the reproducibility of a lab.-accelerated test without the errors inherently induced by the artificial nature of the latter. B. C. A.

Loss of material of paints by weathering. H. A. MÖLLER. *Farben-Ztg.* 33, 2484-6(1928).—Quantitative expts. on the weathering of white lead paints spread on sheet iron were made and the "half-life periods" of the coatings calcd. for comparison. Gray-white lead paints proved notably more resistant than white, the weathering varying according to the nature of the black pigment incorporated. Sulfate white lead paints preserved the surface gloss longer, collected less dirt, and had a longer life than those contg. carbonate white lead. In all cases loss of material was less for those paints having a red lead undercoat. B. C. A.

Yellowing of white enamels. H. MUNZERT. *Farben-Ztg.* 33, 2849-51(1928).—Previous German work on the yellowing of enamel vehicles with age is summarized. A series of comparable enamels was prepd., using equal bulks of ZnS ("sachtolith"), titania, ZnO and white lead, all in a high state of purity, with each of the following vehicles (white spirit being the solvent): 60% soln. of lime-hardened rosin, 60% soln. of ester gum, 70% soln. of pale linseed oil stand oil, and 60% soln. of a tung oil-linseed oil stand oil. The 16 enamels were brushed on tin plate, and dried for 4 days in diffused daylight. The films were then half-covered by black paper and exposed to direct sunlight for 14 days, after which the degree of yellowing was noted in comparison with freshly prepd. films of the stored enamels and with films of similar freshly prepd. enamels. The covered films were found to yellow more than the exposed ones, while of the pigments white lead caused most yellowing, followed by ZnO, titania and ZnS in descending order. Yellowing is attributed in the main to dark-colored oxidized acids which rapidly undergo further degradation in the light to form gaseous or colorless compds. This degradation is, however, delayed in the dark and to a greater degree still by salt formation with pigments, the "fixing" of the yellowing being proportional to the basic nature of the pigment. B. C. A.

Temperature-humidity control cabinet for testing paint, varnish and lacquer films. G. G. SWARD. *Am. Paint Varnish Mfrs. Assoc. Circ.* No. 345, 91-8(1929).—A const.-temp.-humidity room is described in detail, together with its operation and erection costs. R. J. MOORE

Titanium offers new possibilities as a pigment. A. W. HIXSON AND W. W. PLECHNER. *Chem. Met. Eng.* 36, 76-8(1929).—Ti pigments are reviewed and their characteristics compared with other paint pigments. Tables are given to show that while Ti pigments are higher priced per lb. they are relatively cheap per sq. ft. of painted surface because of their high tinting strength and obscuring power. R. J. MOORE

Cellulose ester solvents. II. H. WOLFF, G. ZRIDLER AND W. TOELDT. *Farben-Ztg.* 33, 2668-72(1928).—Solvents of the glycol type (cf. C. A. 23, 1292) were further investigated from the practical point of view. The conditions under which a tendency to irregularity appears in the films of lacquers contg. these solvents and varying amts. of diluents, and the correction of the irregularity by the addn. of BuOH and plasticizers are described. The use of the glycol solvents, particularly "ethyl glycol," in lacquers induces good "insulation" from oil undercoats, while improving the rubbing qualities and elasticity of the lacquer film. The whitening effect produced by "methyl glycol" may be counteracted by suitable solvent mixts. or alternatively may be made use of to obtain opacity with a smaller concn. of pigment than would otherwise be necessary. The mech. properties of such films are in no way inferior to those of corresponding films contg. Bu acetate as solvent. B. C. A.

Tung oil. D. HOLDE, W. BLEYBERG AND M. A. AZIZ. *Farben-Ztg.* 33, 2480-4(1928).—The I value (Hanus) of tung oil has been found to rise markedly with increasing time of reaction from $\frac{1}{4}$ hr. to 2 hrs., and afterwards to remain steady at 230-240, corresponding to satn. of the 3 double linkings of the eleostearic acid present. A 0.2 N soln. of I bromide in CCl₄ gave a similar result in 3 hrs. Since with other vegetable oils a constant I value is obtained after $\frac{1}{4}$ hr., it is suggested that the presence of tung oil in linseed oil might be recognized quantitatively by observation of an I value increasing with the time of reaction and *vice versa*. In the case of β -eleostearic acid, the I value rose from 176 to 279 during $\frac{1}{2}$ -2 hrs.' treatment (45% excess of I bromide); 60% excess of the reagent gave I values up to 300, and, in a few cases, values up to 350 (equiv. to 4 double linkings) were attained, resulting possibly from the occurrence of substitution or of traces of water in the glacial acetic acid, etc. Solns. of I or Br alone were less reactive than was I bromide. B. C. A.

Recent developments in manipulating wood oil. FERDINAND RIEMANN. *Farbe u.*

Lack 1929, 6.—This is a short review of recent German patents for incorporating wood oil into varnishes. Instead of cooking the resin with the oil from the beginning, the oil, heated to a temp. of 220–250°, is added to the resin which has been heated to a temp. of 320–340°. Cooling and thinning are carried out in the usual manner. G. G. S

The importance of white oil (refined mineral oil) in the varnish industry. EWALD PYHÄLÄ. *Farben-Ztg.* 34, 783–4(1928).—As much as 55% of white oil may be incorporated into tung oil which has been heated with Mn borate to the consistency of honey. A brief description of the refining of white oil is given. G. G. SWARD

Floor varnishes. H. KÖLLN. *Farbe u. Lack* 1929, 52–3.—Many complaints of inferior floor varnishes are due to improper prepn. of the floor or to an insufficient period of drying. When time permits, an excellent finish is obtained with a zinc oxide-stand oil enamel. Tung oil in small quantities may be added to accelerate the drying. G. G. SWARD

Lifting of varnishes by lacquer solvents. Harry F. HOFMANN AND E. W. REID. *Ind. Eng. Chem.* 21, 247–9(1929).—The "lifting" of oil base coatings by the application of brushing lacquers is discussed and the various contributing factors are analyzed. The expts. cover lifting tests by different solvents or combinations of solvents on many types of varnishes and enamel aged for various periods. The single solvents arranged in order of increasing tendency to "lift" are as follows: (1) petroleum hydrocarbons; (2) coal-tar hydrocarbons; (3) alcs.; (4) esters and glycol ethers. Typical 2 and 3 component mixts. are then listed in regard to lifting tendencies. Various factors in the varnish which influence lifting are outlined. The most suitable solvent combination of the 40 mixts. tested with respect to lifting was: kemsolene T 40, C. D. alc. No. 1 20, Et acetate 20, butyl cellosolve 20%. R. J. MOORE

Combination lacquers. MATTH. LUSCHIN. *Farbe u. Lack* 1929, 27–8.—Combination lacquers possess properties intermediate between varnishes and lacquers and should therefore be useful in the industry. Four general methods of prepg. them are (1) mixing the finished lacquer and varnish, (2) adding a portion of the lacquer solvents and thinners to the varnish before mixing them, (3) adding to the varnish in the mixing vessel the cotton, the solvents and the thinners in the order named, (4) mixing the lacquer with drying oils. Number 2 is the best. G. G. SWARD

Relation of composition to properties of lacquer solvents. ROBERT CALVERT. *Ind. Eng. Chem.* 21, 213–5(1929).—The required properties of lacquer solvents are discussed and certain generalities stated which will be helpful in predicting whether a given substance will dissolve nitrocellulose and resins, and resist hydrolysis. In several series of solvents studied there is a decrease in solvency for nitrocellulose as the percentage of O becomes farther from that in pyroxylin. But within certain limits, an increase in the percentage of O within a homologous series increases the solvent power for pyroxylin and decreases the compatibility with certain resins. A method is given for measuring the rate of hydrolysis of ester solvents. This rate varies as the strength of the acid whose radical is contained in the ester. R. J. MOORE

Nature and constitution of shellac. I. Preliminary investigation of the action of organic solvents. WM. HOWLETT GARDNER AND WILLET F. WHITMORE. *Ind. Eng. Chem.* 21, 226–9(1929).—The solvent action of 84 org. solvents for stick-lac, T. N. shellac and dry-bleached shellac is tabulated. Alcs., org. acids and ketones are the best solvents. The connection between soly. and chem. relationship between solvent and solute, and the colloidal aspects are discussed. R. J. MOORE

Light-colored condensation resin. H. A. GARDNER, C. A. KNAUSS AND A. W. VAN HENCHEROTH. *Ind. Eng. Chem.* 21, 57(1929).—A soft liquid resin of the glyptal type was prepd. from triethylene glycol, phthalic anhydride and tartaric acid. This gave a durable nitrocellulose lacquer without using a plasticizer. If heating at about 200° is prolonged a darker variety is formed, incompatible with nitrocellulose but compatible with the acetate of cellulose. R. J. MOORE

Resin from *Pinus silvestris*. II. Solid constituents. B. ARBUZOV. *J. Russ. Phys. Chem. Soc.* 60, 707–19(1928); cf. C. A. 22, 2069.—The cryst. solid, m 118–130° (33–35% of the total), which separates from the raw resin on keeping has $[\alpha]_D^{20} -102.23^\circ$ to -60.47° in alc. (in benzene about 20° less). The dispersion was almost const., $[\alpha]_F/[\alpha]_C = 2.37-2.39$, closely similar to that of the solid from the resin of *Pinus maritima*. Fractional crystn. from acetone yielded a solid, m. 132–134°, $[\alpha]_D -112.20^\circ$ to -111.08° , which on keeping became yellow, and the rotation changed slowly, in benzene from -41.69° to $+12.9^\circ$ in 365 days, and in alc. from -60.47° to $+4.5^\circ$ in 430 days, while the m. p. fell to 90°. This was due to atm. oxidation. The solid (colorphony) obtained by distg. the liquid resin had $[\alpha]_D +31.65^\circ$ to -21.82° in benzene and 0° to -74.79° in alc., depending on the conditions of distn. and dispersion. B. C. A.

Glyptal and coumarone resins. J. H. FRYDLENDER. *Kunststoffe* 18, 182.—See C. A. 22, 2474.

B. HAMILTON

A new process for the production of inlaid linoleum. FELIX FRITZ. *Kunststoffe* 18, 173(1928).—The process described is for the manuf. of two-color inlaid linoleum and it depends upon the property of pigments used in the coloring of linoleum of changing color when heated. The colored linoleum stock is passed between a heated pair of rolls, the temperature of which is maintained at about 140°, the surfaces of the rolls being in the form of the pattern to be imparted to the linoleum so that the pattern is formed in relief as the linoleum stock passes between the rolls. The portions of the linoleum which make contact with the heated parts is penetrated by the heat and the color of the areas of contact of the linoleum is changed. The process is very simple and cheap. A historical résumé of the development and manuf. of inlaid linoleum is also given.

B. HAMILTON

Weight buret (ITABASHI) 1. Determination of color number of oils, lacquers, and similar products (STOCK) 27. Asphaltite from the Philippine Islands (HODGE) 8. Chemistry of natural resins and resin acids (BALAŠ) 10. Introducing or eliminating substances from artificial products (Fr. pat. 644,077) 13. Decolorizing ceramic materials, white pigments, etc. (Fr. pat. 644,547) 19. Printing wood graining, etc. (Brit. pat. 293,873) 20. Various products from coal, lignite, shale, peat, etc. (Brit. 293,578) 21. Decorating celluloid with opaque colored lacquers, etc. (U. S. pat. 1,702,663) 23. Sulfonated oils (Brit. pat. 293,806) 27.

Paint. FRANCISCO LANDRINI. Fr. 644,211, April 22, 1927. A paint giving a surface resembling stone contains casein 2.76, water 18.50, NH₃ 0.35, paint from gum lac and linseed oil 3.50, vaseline oil 0.08, stand oil 0.19, Spanish white 25, linseed oil 3, Zn white 6.50, mineral oil 1.40, salt 0.08, fish glue 0.10, prussic acid 0.03, drier 0.10, sand or ground stone 38.5 parts.

Paint. KARL NITTINGER. Fr. 643,772, Nov. 10, 1927. A paint for Fe, wood, etc., is made by mixing 80% of finely ground soot with 20% finely ground electropositive Zn, and adding a binder or varnish.

Cellulose paints. H. WOLFF and R. SINGER. Brit. 293,732, April 11, 1927. Non-thickening paints such as those of nitro- and acetyl-cellulose contain lead pigments and org. compds. having 2 or more C atoms in their mol. and which react as weak acids such as carboxylic acids, hydrocarboxylic acids, aldehydes and nitrohydroxy compds. such as picric acid. Dispersions of red lead oxides are preferred, such as may be obtained from Pb vapor. Numerous examples are given.

White pigment. L. WILLIAMS. Brit. 293,661, Feb. 13, 1928. See U. S. 1,662,625 (C. A. 22, 1486).

Preventing "livering" of coatings. J. D. MCBURNEY and E. H. NOLLAU (to E. I. Du Pont de Nemours & Co.). Brit. 294,029, July 22, 1926. See Can. 284,964 (C. A. 23, 999).

Coating compositions containing nitrated carbohydrates. G. H. PETERS (to Hercules Powder Co.). Brit. 293,434, July 8, 1927. See Can. 283,058 (C. A. 22, 4262).

Ink or other coloring substance. BRUNO KALISCHER. Fr. 644,086, Nov. 18, 1927. Esters of alcs., such as esters of glycol or acetic esters of glycerol, are added to ink or other coloring substance to increase the speed of drying on paper.

Colored varnishes. SOC. ANON. POUR L'IND. CHIM. A BALE. Brit. 293,358, July 4, 1927. Cr or Cu compds. of *o*-oxyazo dyes are used for coloring varnishes or lacquers such as those contg. nitrocellulose. Examples are given of compns. of intense fast orange color, suitable for use on surfaces of different character. Cf. C. A. 22, 4844.

Inlaid linoleum manufacture. ARTHUR E. CLARKE (to Congoleum-Nairn). U. S. 1,702,630, Feb. 19.

Resinous compositions. ÖSTERREICHISCHE-ALPINE MONTANGES. Ger. 468,587, Aug. 24, 1927. Resinous compns. are prepd. by treating sulfite cellulose lye with a soln. of water glass and drying the gelatinous ppt. so obtained. Fillers may be mixed with the ppt., the addn. of blast furnace slag, for example, giving a product suitable for use as a *building or road-making material*.

Synthetic resins. V. H. TURKINGTON (to Bakelite Corp.). Brit. 293,453, July 7, 1927. A phenol is caused to react with a fatty oil such as tung oil and the product is combined with a CH₃-contg. hardening agent such as CH₃O or (CH₃)₃N, and with a sufficient proportion of a non-phenolic resin (either natural or synthetic) to act as a

blending agent and prevent sepn. of insol. products. Small proportions of H_3PO_4 and NH_3 , etc., may be used. The products may be liquid when hot and non-tacky solids when cold and may be used with solvents in prepg. *varnishes*, etc.

Synthetic resin. LA FIBRE DIAMOND. Fr. 644,075, Nov. 18, 1927. A synthetic resin is made by reaction of an amine and an aldehyde such as $PhNH_2$ and CH_2O , and distg. under vacuum in the presence or not of a phenolic substance to recover the constituents not acted upon. The resin obtained is heated in the presence of a hardening agent such as $(CH_3)_6N_4$.

Synthetic resins. I. G. FARBERIND. A.-G. Fr. 644,015, Nov. 15, 1927. Synthetic resins are made by treating crude solvent naphtha while adding phenols or their homologs with $FeCl_3$. Examples are given.

Synthetic resins. G. S. PETROV and K. I. TARASOV. Russ. 5145, April 30, 1928. The usual method of condensing phenols with AcH or CH_2O and acids is applied in the presence of sulfonic acids from petroleum products and the product so obtained is washed with water and neutralized with caustic.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Committee No. 1 on fats and oils. (Intern. Soc. Leather Trades' Chem.) Bibliography of oils, fats and waxes. I. D. BURTON AND G. F. ROBERTSHAW. *J. Intern. Soc. Leather Trades' Chem.* 12, 490-505(1928).—A bibliography is given of about 300 titles arranged under the following heads: (A) books, (B) constitution, (C) oil and fats with reference to leather manuf., (D) analysis, (E) sulfonated oils—prepn., properties and uses, (F) sulfonated oils—analysis, (G) emulsions. H. B. MERRILL

Trial to remove hydrogen from higher fatty acids. T. SUZUKI AND T. KURITA. *Sci. Papers Inst. Phys. Chem. Research, (Tokyo) Supplement* 9, 5-6(1928). Dehydrogenation without decompn. of higher fatty acids and their esters has been tried by using several catalysts, very reduced pressure, and temps. ranging from 0° to 200° . Not much success has been achieved. ALBERT L. HENNE

New contributions to the theory of the drying of fatty oils. JOHANNES SCHEIBER. *Farbe u. Lack* 1928, 518-20.—To test the theory that the drying of oils is due to the formation of a solid continuous phase and that the nature of the disperse phase is of secondary importance, S. prepd. the triglyceride of octadecadienic (9, 11) acid (1). This synthetic glyceride, although homogeneous, dried with a wrinkled film similarly to raw wood oil, triglyceride of octadecatrienic (9, 11, 13) acid (1). S. rejects the isomerization and wrinkle theories as incomplete. The drying of wood oil proceeds as follows: polymerization, due to an autocatalytic agent, takes place on the surface of the film. This is followed by coagulation, the formation of a solvated phase several molecules thick. This phase tends to form itself into a single layer which causes wrinkles. G. C. SWARD

Vegetable-oil storage methods. ALAN P. LEE. *Oil & Fat Ind.* 6, 15-9(1929)

Daily growth and oil content of flaxseeds. A. C. DILLMAN. Bureau of Plant Industry, Wash., D. C. *J. Agr. Research* 37, 357-77(1928).—The total oil content of the seeds increases with the dry wt. Rapid formation of oil begins on the 7th day after flowering and continues from 15 to 18 days. The max. oil content is attained from 6 to 9 days before the seeds are ripe. The coloring substance, thought to be a form of tannin, appears on drying seeds harvested before maturity. A. L. MEHRING

Neat's-foot oil and its adulteration. MARTIN AUERBACH. *Ledertech. Rundschau* 20, 195-7, 270-1(1928).—Adulteration of neat's-foot oil is often so cleverly done that only an experienced chemist can detect it; the I and sapon. nos. alone are not sufficient. A product contg. wool grease is described. I. D. C.

Determination of color number of oils, lacquers and similar products. E. STROCK. *Farben-Ztg.* 33, 2967-9(1928).—An improved tintometer ("Komparator nach Hellige-Strock") is proposed which is simple, rapid in use, and gives accurate reproducible results; it is suitable for quant. colorimetric analysis and for the detn. of pH by the Walpole method. B. C. A.

Comparative observations on the Wijs and Hanus methods of determining the iodine values of oils. A. D. STEWART AND N. L. BANERJEA. Calcutta School of Tropical Medicine. *Indian J. Med. Research* 15, 687-94(1928).—The Hanus method is better because there is no chance for higher values and the soln. is more easily prepd. FRANCES KRASNOW

The determination of the iodine number. I. V. KUBELKA, J. WAGNER AND S. ZURAVLEV. *Collegium* 1929, 17-30.—A comparison was made of the methods of Hanus, of Rosenmund and Kuhnhehn (*C. A.* 18, 477), and of Margosches (*C. A.* 18, 2436). Results by the 3 methods agreed if the I no. was less than 100, but differed greatly if the I no. was greater than 100. A rapid method must be volumetric. It must not be too sensitive to slight errors in technic, principally to slight deviations from the prescribed time or quantity of sample. Results with 9 oils showed that the prescribed quantity of sample could not be exceeded in the Margosches method if the I no. was over 20, nor in Rosenmund's method if the I no. was over 100. Results by Hanus method with any oil and by Rosenmund's method with oils having an I no. below 100 were the same even with a 100% excess of sample.

I. D. CLARKE

Polymerization of linolenic acid and herring oil by heating. T. MAZUME AND G. SHIBAYASHI. Kyoto Imp. Univ. *J. Soc. Chem. Ind. (Japan)* 31, 746-8; *Supplemental Binding* 31, 179-80B(1928).—Me linolenate was heated at 300° in an atm. of H₂, and the changes in I no., n and mol. wt. were traced. On heating during 6-10 hrs. the mol. wt. was doubled and the I no. was lowered almost to half of the original no. These facts indicated that polymerization of 2 mols. had occurred. Similar expts. on herring oil showed that the decrease of I no. did not exactly correspond to the increase of mol. wt., and it had been thought that an extra-molecular polymerization occurred in this case.

Y. TOMODA

The waxes of industry. JAMES R. SANDERSON. *Chem. Markets* 24, 141-4(1929).

E. H.

The American method of soap boiling. K. LÖFFL. *Seifensieder Ztg.* 55, 159-61 (1928). On the basis of Schuck's account of the American method of soap boiling (*C. A.* 21, 2074) L. calculates a loss in glycerol and in time. *Ibid* 166-8.—L. gives the detailed calcn. for the consumption of Cals. by steam (36.100 kg. steam) and coal (4.104 tons) and the total cost (\$4718.12) for boiling 30 tons of soap contg. 60% fatty acids. P. E.

"Physiol" and soap. H. DORNER. *Seifensieder Ztg.* 55, 222-3, 241-2(1928).—Analyses and expts. with "Physiol A," "Physiol C" and "Physiol B I" from the Polydynwerke at Prague give the following results, resp.: H₂O 92.43, 49.75, 67.70; ash 1.92, —, —; org. substance 5.65, —, —; fat, vaseline-like —, 46.62, 27.50; polysaccharides —, 3.63, 4.80; CaCl₂ 1.48, —, —. Albuminoids and starch are absent, sugar (after HCl inversion) is present. These results indicate the probable presence of bassorin (gum tragacanth). The presence of Ca yields insol. Ca soaps and is the cause of an increased amt. of "dirt" in the wash water. A mixt. of 90% soap and 10% "Physiol" (both on a dry basis) produces optimum conditions for cleansing, viz., lather no. 23.3 cc. (increased from 11.4) and foam vol. 550 (decreased from 700). Soap treated with "Physiol" dries the same as soap without it, provided the conditions are identical.

P. ESCHER

Determination of water and crude fat in substances rich in fat (PRYANISHNIKOV, TELNOV) 7. **Oils for wool** (MULLIN) 25. **Dielectrics at high voltage.** II. **Impregnating oils.** **Insulating properties of some high-tension cables** (SETOH, MIYATA) 2. **Oil filter** (U. S. pat. 1,702,489) 1. **Apparatus for separating oil from water, etc.** (U. S. pat. 1,702,612) 1. **Electrical treatment of hydrocarbons and fatty oils** (Ger. pat. 466,813) 4. **Residual oils in cellulose manufacture** (Fr. pat. 643,853) 23. **Utilization of the stones from plums** (SALOMONE) 13.

Fats of high vitamin content. J. LYONS & Co., LTD, L. H. LAMPITT and J. H. BUSNELL. Brit. 293,777, April 5, 1927. Fats of high vitamin-A content are extd. from viscera or the like by freezing and pulverizing the material, thawing and treating with NaOH or other suitable alk. soln., heating to about 40° and, after mixing, allowing it to stand and then sepg. the fat after the protein has dissolved. The crude fat is purified with NaCl and neutralized with HCl and may be centrifuged and further purified with hot water and Na₂CO₃.

Sulfonating fatty compounds. NAAMLIOOZE VENNOOTSCHAP-CHEMISCHE FABRIEK SERVO and M. D. ROZENBROEK. Brit. 293,690, July 9, 1927. Sulfonation of castor oil or other fatty materials or derivs. is effected by the use of H₂SO₄ together with a dehydrating agent such as oxides, chlorides, oxychloride or acids of P. Chlorosulfonic acid also may be used and the reaction products may be rendered less viscous by the use of HOAc or Ac₂O.

Sulfonated oils. CHEMISCHE FABRIK MILCH A.-G. (to Oranienburger Chemische

Fabrik A.-G.). Brit. 293,806, July 12, 1927. Linseed oil is mixed with oleic acid or with a fatty material contg. glycerol oleate and the mixt. is sulfonated (suitably with H_2SO_4 monohydrate at a temp. not exceeding 35°). The product is suitable for oiling, smoothing, or varnishing in the *textile and leather industries* and may be used with linseed oil or as a substitute for the latter. Cf. C. A. 23, 536.

Sulfonating oils, etc. CHEMISCHE FABRIK STOCKHAUSEN ET CIE. Brit. 293,717, April 6, 1927. Sulfonation of castor oil or other animal or vegetable oils, fats or fatty acids is effected with concd. H_2SO_4 in excess of 35% added as quickly as possible and with intensive cooling to keep the temp. below 15° ; the product is washed and neutralized immediately. Cf. C. A. 22, 3548.

Sulfonating oils, etc. CHEMISCHE FABRIK STOCKHAUSEN ET CIE. Brit. 293,480, April 6, 1927. After sulfonating oils, fats or fatty acids and removing the resulting dil. acid, the resulting product is mixed with water or dil. acids and allowed to stand until no further sepn. occurs. By adding a neutral or "indifferent" solvent such as C_6HCl_3 (either before, during or after the sulfonation), 2 layers are obtained, one contg. the unattacked or slightly attacked component and the other the sulfuric acid esters. An example is given of the treatment of castor oil. Cf. C. A. 22, 3548.

Solidifying materials containing oils for transportation, etc. A. NYROP. Brit. 293,342, April 4, 1927. Raw vegetable oil-bearing materials such as copra or the pericarp of oil palm are converted into a non-meltable paste or powder by treatment in water with a film-forming material such as a carbohydrate or albuminate (which may be added in an emulsifier or homogenizer) and then spray drying the material.

Edulcorating oils and fats. MME. BRUGAROLAS (née Élisabeth Canals). Fr. 643,958, Sept. 20, 1927. Mineral or animal oils or fats are edulcorated by mixing therewith a neutral vegetable oil such as castor oil to which saccharine has been added. The saccharine is dissolved in the castor oil by slow heating to $110-150^\circ$.

28—SUGAR, STARCH AND GUMS

F. W. ZERBAN

Progress in beet-sugar manufacture in 1928. EDMUND O. VON LIPPMANN. *Chem.-Ztg.* 53, No. 11, *Fortschrittsber.* No. 1, 37-40 (1929). E. H.

Temperature, time of treatment and acid concentration to be utilized in cleaning the effects. J. ZAMARON. *Bull. assoc. chim. suc. dist.* 45, 583-7 (1928). Corrosion of bolts by acids of different concns. was studied so as to obtain an idea of the action of acids on the evaporator cells. The following conclusions are given. To keep the app. in good condition, the acid concn. should not exceed 3 to 4% at a temp. not over $140-158^\circ F.$ for 40-45 mins. This applies to the 1st cell. For the other cells, which are partly covered with scale, the danger of corrosion is reduced because of the insulating effect of the scale. The acid concn. used may be approx. 5 to 6% using the same temp. and time. The regular routine of boiling out for 1 or 2 hrs. with 20° to $30^\circ Be$ NaOH followed by acid may be used. E. A. FIEGER

Sodium light for polarimetry (THUNBERG) 1. Tyrosinase of *Beta vulgaris* (WEIDENHAGEN, HEINRICH) 11D. Food material from grasses, reeds, etc. (Brit. pat. 293,779) 12. Dehydrating vegetable substances (Fr. pat. 643,987) 12. Purification of lime (Fr. pat. 644,493) 18.

EYNON, LEWIS, AND LANE, J. HENRY: Starch: Its Chemistry, - uses. Cambridge: W. Heffer & Sons, Ltd. 12s. 6d. Reviewed in *Intern. Sugar J.* 31, 39 (1929).

Extracting sugar from molasses. A. I. VOSTOKOV. *Russ.* 4,801, Mar. 31, 1928. Molasses is filtered rapidly (on centrifuges) through fresh sugar pressings to free the molasses from the mineral admixts. and a second time slowly to ext. the sugar, after which the second portion of pressings is treated, the usual sugar-extn. method being applied.

Sugar. GASTON A. DURET. Fr. 643,894, April 14, 1927. An app. is described for converting solns. such as sugar solns. into a fine dust by spraying the soln. centrifugally against a surface along with heated gases or superheated steam.

Sugar from beets. SUGAR BEET & CROP DRIERS, LTD., W. K. MELROSE and J. C.

STEAD. Brit. 293,946, May 24, 1927. Sliced or disintegrated dried beets are diffused in water at a temp. of 50–70°, the raw sirup is limed at the same temp. and then clarified (suitably by centrifuging). Prior to a final filtration, the clarified sirup is preferably mixed with melted low-grade sugar and decolorized with activated C. A second strike of white sugar is obtained and a low-grade product for mixing is made by boiling the remaining green sirup.

Sugar from peat. PAUL DUTOIT and LOUIS FRIDERICH. Fr. 644,440, Nov. 24, 1927. Crude peat contg. about 15% of dry material is treated in a mixer with sprayed concd. H_2SO_4 and heated under pressure. The sugar juice is centrifuged or pressed out, and the residue is washed and made into briquets.

Removal of protein from sucrose-containing liquids, including molasses. JACOB POHLMANN and JACOBUS R. F. RASSERS. Dutch 19,211, Dec. 15, 1928. Enzyme proteins present in the sugar juice are not pptd. by the usual processes but remain in molasses. They are removed by tannic acid in neutral or weak acid medium at room temp. 100 kg. molasses is dild. with 3 times its vol. of water, 1 l. of 25% H_3PO_4 is added and 1.75 kg. tannic acid (excess) dissolved in water. After filtration, the excess of the latter is removed with CaO and CO_2 .

Screening, settling, filtering and partially recirculating effluent liquids of beet-sugar factories, etc. R. H. L. PENNELL and F. W. BRACKETT. Brit. 293,927, April 29, 1927. An app. is described.

Fluid starch. SOCIÉTÉ DES PRODUITS DU MAÏS (S. A.). Fr. 643,740, Nov. 10, 1927. Starch, particularly maize starch, is made fluid for use as paste or glue by treating it with mineral acid to 50–80° and neutralizing with a carbonate.

29—LEATHER AND GLUE

ALLEN ROGERS

Chandler Lecture, 1928. Chemistry and leather. JOHN A. WILSON. A. F. Gallun & Sons Corp., Milwaukee. *Ind. Eng. Chem.* 21, 180 90(1929).—An address.

H. B. MERRILL

Properties of leather—committee report (A. L. C. A.) 1927–8. JOHN ARTHUR WILSON, *et al.* *J. Am. Leather Chem. Assoc.* 24, 2 21(1929).—Each committee member analyzed and measured the properties of his own leather. All measurements were repeated by the Bur. of Standards. Analyses of all leathers are given. Data are presented on the following subjects: tensile strength, recovery, tear, and cracking of oak belting leather; sp. gr., strength, stretch, stitch tear, and resilience of vegetable-tanned side leather; sp. gr., "pile-up," and H_2O absorption (as a function of location on the piece) of vegetable sole leather; sp. gr., stitch tear, strength, stretch, resilience, and H_2O absorption of miscellaneous Cr leathers; tensile strength and stretch of vegetable-, Cr-, and combination-tanned belting leathers; stretch and strength of Cr- and vegetable-tanned sheet leathers; stretch and strength of vegetable and Cr calf leathers.

H. B. MERRILL

Specific gravity, per cent voids, and "pile-up" of leather. R. E. PORTER. Ashland Leather Co., Ashland, Ky. *J. Am. Leather Chem. Assoc.* 24, 37–42(1929).—Pile-up is defined as "the no. of pieces 1 ft. sq. and 8 irons thickness to make 100 lbs. of leather." Pile-up = $115.5 / \text{apparent sp. gr. } (H_2O = 12\%)$. Apparent sp. gr. ($H_2O = 12\%$) = $\text{apparent sp. gr. } (H_2O = x\%) + 0.008 (12-x)$. The const. 0.008 has been detd. empirically. Actual sp. gr. is detd. by kerosene displacement. Apparent sp. gr. is detd. by kerosene displacement of leather previously satd. with kerosene. Per cent voids is detd. by difference. Data are given for sole leather at 4 stages of manuf., and for 10 finished leathers. The app. used for detg. sp. gr. by kerosene displacement is illustrated.

H. B. MERRILL

Determination of fat in leather. D. WOODROFFE. *J. Intern. Soc. Leather Trades' Chem.* 12, 569–72(1928).— H_2O cannot be removed quantitatively from fat residues by drying at 100°. Consequently the detn. of fat by extn. of moist leather with gasoline will give high results. At 105° H_2O is removed, but such oils as cod are appreciably decomposed. A vacuum oven for drying fat residues, or, better, for drying of the leather before extn., is recommended. Data are presented showing that exactly the same results are obtained when the leather is dried at 105° extracted, and the residue dried at 105° than when the undried leather is extd. and the residue dried at 105°. This refutes the claim that the lower results obtained when leather is previously dried are due to fixation of the oil during drying.

H. B. MERRILL

Effect of heat on wetted vegetable-tanned leather. W. J. CHATER. Northampton Tech. Col., Northampton, Eng. *J. Intern. Soc. Leather Trades' Chem.* 12, 544-58 (1928).—Strips of sole leather immersed in water at different temps. for 5-30 mins. and subsequently dried were little altered up to 70°. At temps. greater than 70°, there was a rapid destruction of characteristic leather properties. The temp. at which rapid shrinkage begins was detd. for numerous leathers. The best results were obtained with an app. in which a strip of leather is supported vertically under water, one end being clamped and the other attached by a hook and cord passing over a pulley to an indicator free to move vertically along a scale. As the water is heated, there is a slight expansion until the temp. reaches about 75°, when rapid shrinking occurs. Pelt, under-tanned leathers, leathers stripped with borax, and other abnormal leathers shrink at much lower temps. Examn. of splits showed that grain and flesh shrink much more than center split, although the temp. at which shrinking occurs is the same for all

H. B. MERRILL

Water penetration tests for sole leather. F. O. SPRAGUE. Deford Co., Luray, Va. *J. Am. Leather Chem. Assoc.* 24, 87-8(1929).—The time required for penetration under a column of H₂O is measured by means of a Kilp machine so modified that the first drop of water that penetrates stops a clock, thus permitting measurements to be made without any attention and at night.

H. B. MERRILL

Resistance to wear of sole leather. U. J. THUAAU. *J. Intern. Soc. Leather Trades' Chem.* 12, 505-20(1928).—Previous work is reviewed and several wear test machines are described. The author's machine is the same in principle as that of Hart and Bowker.

H. B. MERRILL

Production, marketing and use of vegetable tanning materials in world commerce. CARL STEYER. *Ledertech. Rundschau* 20, 261-6, 274-80(1928); 21, 1-6(1929) — Statistical.

I. D. C.

Darmstadt apparatus for tannin analysis. J. GORDON PARKER. London Leather Ind. Lab., London, Eng. *J. Intern. Soc. Leather Trades' Chem.* 12, 520-4(1928).—Comparative analyses of 24 samples of 12 tanning materials (a) by the official method and (b) using the Darmstadt app. gave results for non-tans that agreed within 0.3%. A dry chromed hide powder prep'd. by the Freiburg leather research station was used for analysis of 11 samples of 6 materials by the official method and also with the Darmstadt app.; concordant results were obtained. The use of the Darmstadt app. is advocated.

H. B. MERRILL

Tanning properties of methylene dinaphthol. G. GRASSER AND K. HIROSE. *J. Faculty Agr. Hokkaido Imp. Univ.* 24, No. 1, 17-24(1928). (In German).—Naphthol treated with HCHO yield insol. methylene dinaphthols which have tanning properties. α - or β -Naphthol was treated with HCHO in H₂O, MeOH, EtOH or (Me)₂CO. The product was isolated by filtration from H₂O and by evapn. of the other solvents. The several preps. were dissolved in EtOH, MeOH or Me₂CO, and used for tanning strips of skin previously dehydrated with EtOH. With α -naphthol derivs., the tanned skin was white turning to yellow; with β -naphthol derivs. it was permanently cream-colored. Tannage was gaged by resistance of specimens to boiling water. After 8-24 hrs. the leathers were completely hydrolyzed except grain, which was hydrolyzed only by Na₂S.

H. B. MERRILL

Smoke tannage. L. S. TS'AI AND E. O. WILSON. Yenching Univ., Peking, China. *J. Am. Leather Chem. Assoc.* 24, 21-36(1929).—Smoke tannage is widely used in China. After unhairing and bating in the usual way, the skins are exposed to smoke from green straw for 3-4 days. Vegetable tanning sometimes follows. Smoke-tanned leather is yellow-brown, soft and pliable, rather harsh-grained, withstands hot H₂O up to about 70°, is imputrescible, unaltered by dil. acid, but rapidly destroyed by dil. alkali. The effect of smoke tannage of hide powder on subsequent fixation of vegetable tannin, of Cr and of OH⁻ was studied as a means of detg. what groups are active in smoke tannage. Moist hide powder was treated with pine-sawdust smoke at 20-30° for 4 days. The product was dark brown. Series were run in duplicate with smoked and ordinary hide powder, employing (a) a liquor contg. 28% basic Cr sulfate, (b) myrobalans ext. and (c) NaOH. Concn. of Cr₂O₃ varied from 0.14 to 60 g. Cr₂O₃ per l.; pH value, 3.6-2.88; time, 48 hrs. The usual convex concn.-fixation curve was obtained with both smoked and unsmoked hide powder, but the fixation by smoked powder was only about 50% of the fixation by unsmoked hide powder. Fixation was detd. by analysis of tanned powder. The concn. of myrobalans liquor was 1.67-15.74% total solids; pH value, 3.47-3.33. Smoked hide powder fixed considerably less tannin than unsmoked, particularly at higher tannin concns. Smoked hide powder fixed more alkali than ordinary hide powder. The results are similar to those obtained with aldehyde-

tanned hide powder, which indicates that aldehydic substances in the smoke may be the tanning agents, and that combination occurs through the amino groups of collagen, the carboxyl groups thus being rendered more active.

H. B. MERRILL

Russian tannin barks. C. H. PETERS. *Ledertech. Rundschau* 20, 225-6(1928).—Willow bark has an av. compn. of 10% tannin and 5-8% non-tannin. It gives a soft, elastic leather and so is good for producing upper leather. A purer ext. can be obtained by a double cold-hot extn.; the most favorable temp. for extg. the tannin is 64-70° and for the non-tannin 70-80°. Oak bark contains 10% tannin and 6.5-9% non-tannin. Pine (*Pinna excelsa*) is very abundant. The bark contains 10-11% tannin and 8-10% non-tannin and considerable sugar.

I. D. CLARKE

Tanning value of so-called "Takaout" galls of *Tamarix articulata*. F. AND M. HEIM DE BALSAC AND A. DEFORGE. *J. Intern. Soc. Leather Trades' Chem.* 12, 559-64(1928); cf. C. A. 22, 4866-7.—This plant, a typical desert species, bears a profusion of galls, which are used locally, and to some extent in France, for tanning. Analyses of 4 specimens from different localities showed: H₂O 11.7-13.1, insol. matter 21.5-28, tannin 41.6-56.3, sol. non-tannin 11.4-17.1%. Extn. is easily effected at comparatively low temp., and the resulting ext. is almost clear. The tannin is almost entirely of the pyrogallol type. Sheep skins tanned with "takaout" possess a light cream color. The material seems especially suited to light fancy leathers. The bark of *Tamarix articulata* contains enough tannin to be utilizable (about 10%), but the wood and leaves contain very little.

H. B. MERRILL

Gambier. TH. KORNER. *Ledertech. Rundschau* 20, 191-5, 228-32, 244-7(1928); cf. C. A. 22, 4867.

I. D. C.

The determination of non-tannin. L. KEIGUELOUKIS. *Collegium* 1929, 30-3; cf. C. A. 22, 4865-6.—The hide powder is washed, chromed and shaken with the tannin soln. in a 200-cc. glass cylinder closed with a stopper. A filter candle with a porcelain head attached to a suction line is used to remove wash water or non-tannin soln. By pressing the candle against the powder the moisture content of the latter can be reduced sufficiently; with the Paessler app. this is not always possible. The non-tannin soln. does not need to be refiltered.

I. D. CLARKE

Russian hide powder. V. S. SADIKOV. *Collegium* 1929, 33; cf. C. A. 22, 4865.—The method for prep. hide powder given by Tatarskii is the same as that in German patent 459,428.

I. D. CLARKE

Methods for analysis of beamhouse liquors. JOHN H. HIGHBERGER AND E. KENNETH MOORE. Dept. Leather Research, Cincinnati Univ. *J. Am. Leather Chem. Assoc.* 24, 68-76(1929).—The methods given are those employed in the Tanners' Council Foundation Lab. (1) *Total N* is detd. by the Kjeldahl-Gunning method. (2) *Protein N* is detd. as follows: Filter the liquor through cotton. Measure 50 cc. and render the lime liquors just alkaline to phenolphthalein with 2 N HCl. Add rapidly with stirring 150 cc. of a soln. contg. 50 g. CCl₃COOH and 66 g. NaCl per l. The final salt concn. must not exceed 5%; if the liquor contains NaCl, the NaCl concn. of the reagent must be reduced proportionately. Let stand overnight. Filter and wash 6 or 7 times by decantation with 15 cc. of a wash soln. contg. 1 part H₂O to 3 of reagent, bring the ppt. on a filter and wash with 100 cc. of the wash soln. Determine N in the ppt. as usual. (3) *Non-protein N* is detd. by difference. (4) *Heat-coagulable protein N* is detd. as follows: Measure 100 cc. into a flask and weigh to 0.1 g. Make the lime liquors just acid to phenolphthalein with 99% HAcO. Add 2 cc. of 99% HAcO to the soak or to the acidified lime liquors. Boil 5 mins., reweigh and make to original with H₂O, mix, and filter. Determine N as usual in 25 cc. of the filtrate. Calculate the coagulable protein N by difference. (5) *Volatile bases*.—(a) *total volatile N*: Add excess CaO and distil in a vacuum at 60-70° into excess standard acid, and back-titrate. Van Slyke's app. is recommended. (b) *Seprn. of amines and NH₃*.—Transfer the titrated distillate from (a) to a 500-cc. flask, make up to about 480 cc., add 10 cc. of soln. contg. 100 g. NaOH and 150 g. Na₂CO₃ per l., and make up to 500 cc. Place in a 700-800 cc. brown bottle 0.1 g. yellow HgO per cc. of 0.1 N acid consumed by volatile bases in (a). Add the whole soln., cover with a black cloth, and shake 1 hr. Let stand overnight. Filter through cotton by air pressure (app. described). Distil 400 cc. of the filtrate into standard acid and back-titrate. Calculate amines from titration and NH₃ by difference from (a). (6) *Chlorides*.—Determine by modified Volhard method.

H. B. MERRILL

Lecithin. BRUNO REWALD. *Ledertech. Rundschau* 20, 268-70(1928).—Lecithin, now extd. from soy beans, is an excellent, cheap material for fat liquors; it always produces uniform liquors.

The use of emulsions in the leather and fur industries. RUDOLF AUERBACH. *Ledertech. Rundschau* 20, 215-7(1928).—A brief description of a machine for producing emulsions. I. D. CLARKE

Some applications of rubber to leather. FINI G. A. ENNA. *J. Intern. Soc. Leather Trades' Chem.* 12, 464-84(1928).—Rubber is employed in the jointing of footwear or belting. Thin coats of rubber are applied to leather and subsequently vulcanized as a water-proofing material and as a bottom coat for patent leather. The chemistry of rubber is discussed. H. B. MERRILL

A contribution to the preparation of standard gelatin. J. HAROLD HUDSON AND S. E. SHEPPARD. *Ind. Eng. Chem.* 21, 263-4(1929).—Seven tentative specifications are given for a standard gelatin possessing as nearly as possible definite chem. compn. and phys. properties similar to those of the highest grade of gelatin now obtainable. W. H. BOYNTON

Specifications for standard gelatin. CLARKE E. DAVIS, S. E. SHEPPARD AND M. BRIEFER. *Ind. Eng. Chem., Analytical Ed.* 1, 56(1929).—Ten tentative specifications for standard gelatin for physico-chem. purposes are listed in a rept. of the comm. of standard gelatin of the Division of Leather and Gelatin Chemistry. This standard is established from the scientific rather than from the commercial standpoint. W. H. BOYNTON

Chlorination of tannery water (AUERBACH) 14. Treatment of industrial wastes from tannery (FALES) 14. Reduction of dichromate to basic chromic salts (GRASSER, NAGAHAMA) 6. Extraction apparatus for wood, bark, etc. (Fr. pat. 643,763) 1. Sulfonic acids (Brit. pat. 293,781) 10. Coating compositions containing nitrated carbohydrates (Brit. pat. 293,434) 26. Sulfonated oils (Brit. pat. 293,806) 27.

Tanning. ALEXANDER T. HOUGH. Fr. 644,238, April 26, 1927. Hexamethylenetetramine is used for pptg. tannin in leather, preferably with the addn. of an acid and a metallic salt, e. g., oxalic acid and a sol. salt of Sb.

Impregnating leather. OTTO RÖHM. Ger. 470,552, Dec. 20, 1924. Depilated hides tanned in the known manner are treated with a soln. of a water-insol. substance, e. g., natural or artificial resin, in a solvent miscible with water, and are then treated with water.

30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Modern rubber research laboratory. ANON. *India Rubber World* 79, No 3, 65-6 (1928).—An illustrated description of the labs. of the N. J. Zinc Co. at Palmerton, Pa. C. C. DAVIS

Manufacturing rubber goods from latex by electrodeposition. PAUL KLEIN. Hungarian Rubber Works, Budapest. *Rubber Age* (N. Y.) 24, 319-21(1928).—See C. A. 22, 4877; 23, 1305. C. C. DAVIS

Determination of the rubber content in latex preserved with trisodium phosphate and formalin. W. SPOON AND N. BEUMÉ-NEUWLAND. *Arch. Rubbercultuur* 12, 659-71(1928), (Summarized in English 672-4).—In developing a method for detg. the rubber latex preserved with 0.2% Na_3PO_4 and 0.2% HCHO , the influence of various factors had to be ascertained. *Weighing the latex.*—The most satisfactory way was to weigh 200 g., since adding latex drop by drop at the end requires no more time than weighing an arbitrary portion. *Coagulation with acid of various concns.*—As with fresh latex and latex preserved with NH_3 , the yields of rubber from latex preserved with $\text{Na}_3\text{PO}_4 + \text{HCHO}$ increased with increase in the concn. of acid. Much smaller increases occurred when the quantity of acid was increased. As a standard for coagulation, 15 cc. of 10% AcOH per 100 cc. of latex was adopted. *Age of latex.*—With the foregoing quantity and concn. of AcOH , coagulation was complete regardless of the time of standing previously. *Comparison of latex contg. NH_3 and that contg. $\text{Na}_3\text{PO}_4 + \text{HCHO}$.*—With the foregoing quantity and concn. of AcOH , the results were exactly the same as with latex contg. NH_3 dild. with an equal vol. of water and treated with 25 cc. of 20% AcOH (per 100 cc. of original latex). *Addn. of a fixed or variable quantity of acid.*—

Addn. of 10% acid until thickening begins while stirring leads to variable results. *Influence of the quantity of HCHO.*—Excess inhibits coagulation, AcOH thickening the latex but failing to produce a coherent clot. When the HCHO eventually evapns., a clot usually forms. *Influence of time between coagulation and milling.*—With increase in the time from coagulation to milling, the wt. increases. *Influence of drying.*—Prolonged drying *in vacuo* has no effect on the final wt. *Procedure for the detn.*—Shake the sample, thoroughly weigh exactly 200 g. in an Al bowl, add 300 cc. of 10% AcOH or 5% HCO_2H with continuous stirring, cover and let stand 2–3 hrs., knead and crepe the coagulum under standardized conditions, dry in the air overnight, roll in paper, dry *in vacuo* for 2 hrs., place in a desiccator over CaO and weigh the next day (to centigrams).

C. C. DAVIS

Coagulation phenomena in Hevea latex. VIII. Rubber obtained by freezing the latex. G. DE VRIES AND N. BEUMÉE-NIEUWLAND. Proefstation voor Rubber, Buit-zorg (Java). *Arch. Rubbercultuur* 12, 675–82(1928), (Summarized in English 683–5); (cf. *C. A.* 23, 304).—Coagulation takes place only considerably below 0° . Even at -15° coagulation is complete only after about 5 days. The coagulum obtained by freezing has a peculiar structure. The surface layer is a coherent film as in ordinary coagulation, but beneath it is a network of thick and thin white threads with ice crystals between. When sufficiently cold, the mass is hard and brittle, but when the ice melts the threads of rubber bind together to form a coherent coagulum from which clear serum is exuded. The properties of this coagulum do not differ from those of ordinary coagulum except that it is yellower. The serum is a clear yellow color, with a p_H value of 6.2. Boiling does not form a ppt., but on addn. of a trace of AcOH and further boiling a ppt. appears. Addn. of 2.5% AcOH to the serum forms a flocculent ppt., which gives the biuret and Millon reactions for proteins. The serum also forms ppts. with NaCl, MgSO_4 and $(\text{NH}_4)_2\text{SO}_4$ solns., and with dil. alkali a ppt. which redissolves in excess. The serum coalesces B-mixt., whereas the ppt. obtained by acidifying the serum has no coalescing power. Furthermore, in ordinary coagulation this coalescing agent is adsorbed by the coagulum (cf. *C. A.* 19, 419; 22, 698). The following data give the analytical results on coagula obtained by coagulation by AcOH and by freezing, resp.: % ash, 0.22, 0.23; % acetone ext., 3.3, 3.3; % N, 0.39, 0.31; viscosity, 31, 33; viscosity (after acidification), 16, 17; plasticity (d_{30}), 1.47, 1.54; tensile strength, 1.46, 1.51, time of cure, 108, 100; slope, 36, 35.5. The % N shows that with frozen rubber a considerable part of the proteins remain in the serum. Nevertheless, rubber from frozen latex vulcanizes more rapidly than that from acid coagulation. Prolonged freezing of latex does not materially affect the plasticity. Even after being frozen 7 months, the plasticity changes but little, while the viscosity remains the same. C. C. D.

The determination of inorganic matter in soft rubber goods. S. MINATOYA, H. OKUHARA AND S. OHKI. *Res. Electrochem. Lab.* (Japan) No. 234, 42 pp.(1928). (In Japanese, with synopsis in English.)—The method uses solid paraffin as a disintegrating agent. Heat 1 g. of finely divided sample with 10 g. of paraffin at 180° until completely dispersed and the mineral substances are settled out, while still warm add 70 cc. of petroleum benzine, keep warm for 15 mins., centrifuge (2500 r. p. m.), decant, add fresh benzine, centrifuge again, decant, add to the residue a mixt. of acetone and CHCl_3 (equal wts.), boil, decant or siphon, repeat 3 times, dry and weigh. The acetone- CHCl_3 is particularly effective in removing decompn. products of rubber, and there is no fear of high results.

C. C. DAVIS

The solubility of sulfur in rubber. HEINRICH LOEWEN. *Kautschuk* 4, 243–9 (1928).—A review and discussion of the literature, with photomicrographs of droplets of supercooled S in rubber, rhombic crystals of S in rubber, monoclinic crystals of S in rubber accompanied and unaccompanied by droplets of S, the boundary between rhombic and monoclinic crystals both newly formed and after 7 hrs., sepn. of S induced by light both newly formed and after 7 yrs., and the diffusion of S into the interior of rubber during vulcanization in a S bath. A gradual disappearance of cryst. S in the micro-sections during the years is ascribed to "after-vulcanization," which consumes part of the S in soln. and therefore allows some of the crystd. S to pass into soln. All evidence points to the fact that S dissolves in the mol. state in rubber, the mol. probably being S_8 . There is no evidence of the existence of "thiozone" or "thiozonides." When a rubber-S mixt. is alternately heated and cooled above and below the m. p. range of S, there is no sharply defined "soln. point," but rather an interval. Soln. of the rubber-S mixt. in C_6H_6 , with subsequent evapn. of the solvent, allows the prepn. of mixts. particularly suitable for such a study. When a rubber-S mixt. is heated to 120° to fuse the S and dissolve it, and is then cooled, droplets of S appear at a certain temp. range (depending upon the proportion of S) and the mixt. becomes microscopically turbid. Because of super-

cooling, this temp. does not coincide exactly with the soly. of S, but is lower. If the mixt. is then warmed slowly, it again becomes clear, but not uniformly, some portions remaining turbid longer than others. There is accordingly no sharp "soln. point," but only an interval. The same phenomenon is evident when the rubber-S mixt is dissolved in C_6H_6 and the latter is then evapd. at 60–80°, the resulting clear mixt. being particularly suitable for quant. measurements of the soly. of S in unvulcanized rubber. Through observations of the temp. at which turbidity appears on cooling, and the temp. at which the mixt. becomes clear on heating, the soly. of liquid S in unvulcanized rubber was found to be 5% at 53°; 7.5% at 86–7° and 10% around 108°. C. C. DAVIS

The photometric determination of the blackness of various types of carbon black. LOTHAR HOCK. Univ. Giessen. *Kautschuk* 4, 266–8(1928).—With the photometric method for detg. blackness which is described, it was found that there is a close relationship between the sp. surface, i. e., the surface of a definite wt. of C black, and the blackness of the latter, the greater the sp. surface the more intense the blackness. Accordingly, the quality of a C black may in an approx. way be judged by its blackness. The sp. surfaces were measured indirectly by detg. the heats of wetting (cf. H. and Bostrom, *C. A.* 21, 1335; Bostrom *C. A.* 22, 4271). A series of blacks was chosen with heats of wetting ranging from 0.45 to 5.23 Cals., i. e., from a gray colored one to an intense black one. The blacks were then mixed (1) with 100 parts of lithopone and (2) into rubber-ZnO mixts., and each mixt. was compared with pure lithopone or with rubber-ZnO by measuring the relative intensities of reflection of light by means of a Marten polarization photometer for measuring blackness (cf. Weigert, *Optische Methoden der Chemie*, *C. A.* 22, 536), or better by means of a recently developed leucometer (manufactured by Schmidt and Haensch as a modification of the unimeter of Bloch, *C. A.* 22, 3089). The following data give the heats of wetting (g.-Cals.), photometric angles for the lithopone mixts., leucometric reflections (as % of the reflection of pure lithopone) and the leucometric reflections (as % of the reflection of rubber-ZnO), resp. for 6 blacks: (1) 0.45, 35.6, 50.5, 9.3; (2) 1.32, 31.9, 39.0, 4.2; (3) 2.71, 26.2, 24.1, 2.1, (4) 2.86, 26.5, 24.8, 2.0; (5) 4.08, 28.1, 28.5, 2.0; (6) 5.23, 25.5, 22.7, 2.5. The method is also applicable to the quant. measurement of the color imparted by other pigments to rubber mixts. C. C. DAVIS

The evaluation of carbon blacks. D. F. CRANOR AND H. A. BRAENDLE. Binney & Smith Co., New York City. *India Rubber World* 79, No. 4, 67–8(1929).—The conclusions are based on exptl. data, rubber-S-PbO-C black mixts. being used, because with such mixts. the rate of vulcanization is not greatly influenced by the C blacks. The blacks tested included a reinforcing black of standard quality, a moderately reinforcing high yield black, a soft high yield black, and 2 exptl. blacks. The ΔA values (energy capacities) were 100, 64, 35, 64 and 21, resp. In general the results show that the ΔA function as defined by Wiegand (cf. *C. A.* 19, 3386) can be utilized to judge the relative merits of C blacks in practical rubber compounding. It will indicate not only the quality at the optimum concn. of C black but also the range of concn. over which the C black is effective. When C blacks of similar type are concerned, it is important to supplement the information gained from the ΔA function by other stress-strain data and by performance tests in the lab. and in service. C. C. DAVIS

An improved oxygen bomb. ANON. *India Rubber World* 79, No. 5, 75–6(1929).—A new type of O-bomb and accessories (cf. Bierer and Davis, *C. A.* 18, 2617; 19, 3172), which has been designed at Du Pont de Nemours & Co., is described and illustrated. A battery of bombs is heated in a water bath. Each bomb has a Ni safety disk for a max. of 475 lb. per sq. in. pressure, and a thermometer well to detect differences between the internal temp. and that of the water. The water is heated in a const.-temp. tank by steam coils, with control of temp. at 70° \pm 0.5°, and is circulated through the bath. Various other features are described, including the method of charging and discharging O. A max. of 8% of the internal capacity of a bomb should be occupied by rubber samples. C. C. DAVIS

Note on the evaluation of antioxidants. T. L. GARNER. *India Rubber J.* 77, 31 (1929); cf. *C. A.* 22, 3804.—When an antioxidant is tested in an unaccelerated mixt. the time of vulcanization must often be adjusted to counteract the accelerating or retarding effect of the antioxidant, and it is much better to use an accelerated mixt. where the effect of the antioxidant is masked by sufficient acceleration by an accelerator. Expts. with various mixts. led to the adoption of the mixt.: rubber 100, S 3.5, diphenylguanidine 1, ZnO 3, antioxidant 0.5–1, as a standard for testing antioxidants. The antioxidant properties of the various substances were judged by the aging of the mixts. in the Geer oven at 70°. In the mixt. above, the order of merit of various antioxidants depended upon the state of cure of the mixts., an antioxidant which gave the best pro-

tection in badly overcured mixts. not giving the best results in normally cured mixts. In general the beneficial effect of antioxidants was relatively great in overcured mixts. Only 1 among 9 antioxidants failed to discolor a white mixt., and most of them showed a tendency to stain, bad stains being made on wood pulp. The colors imparted by antioxidants to white mixts. vary greatly in ultra-violet light, and these colors change gradually on continued exposure, so that the color combinations on immediate and prolonged exposure offer a means for the identification of individual antioxidants. C. C. D.

The stickiness of unvulcanized rubber. R. W. GRIFFITHS AND MALDWIN JONES. *Trans. Inst. Rubber Industry* 4, 235-46(1928).—The great importance in present mfg. processes of the property of stickiness in vulcanized rubber mixts. suggested the need of a *quant. method* of testing this property. In the test which has been developed by G and J., the force required to sep. 2 surfaces which have been in contact under a definite load for a definite time is measured. With the *app.* which is described and illustrated, the adhesion between rubber sheets and their linings can be measured at different temps. By this means it was shown that stickiness increases with the time of mastication, and that under the same condition of mastication, washed rubber is less sticky than unwashed rubber. The tackiness of calendered sheets depends upon the temp. of the calender, speed of calender, and subsequent cooling before entering the lining. Mixts. apparently unsatisfactory can be rendered usable by regulating the calendering conditions. Sudden chilling, *e. g.*, by a cold bottom roll, destroys the desired tackiness by inducing a S bloom. The new *app.* will reveal differences in tackiness between the 2 sides of a calendered sheet. When a calendered mixt. is wrapped in lining, its stickiness several days later is distinctly higher than the stickiness of the same sheet left exposed to the air. The results show the need of cooling processed mixts. under controlled conditions before they enter linings, *e. g.*, by air jets or atomized water sprays. To prevent blooming, it is necessary at times to graduate the temp. of the cooling drums in such a way that the hot fabric does not first come in contact with too cool a drum. A general discussion follows. C. C. DAVIS

A new physical test for vulcanized rubber. D. D. WRIGHT. Hood Rubber Co., Watertown, Mass. *Ind. Eng. Chem., Analytical Ed.* 1, 17-20(1929).—Vulcanized rubber must often withstand torsion, tearing and bending as well as compression, stress and shear, and, furthermore, on aging the resistance to tearing and shearing often diminishes faster than does the resistance to simple stress. These facts were sufficient to warrant the development of a new test, in which a new design of test sample permits subjecting the sample to a combination of tensile and shearing stresses, which shear the predominant stress. This new "*longue shear*" test, so named from the shape of the test piece, is described in detail and illustrated. It is of special value (1) in revealing "shortness," inner tubes being found to deteriorate relatively sooner as judged by this test than by tensile strength or stress-strain curve measurements; (2) as an unusually sensitive means of detecting the deterioration which takes place during artificial aging and (3) in detecting the beginning of overcuring, the test indicating poor resistance to sudden stress, low resistance to shear and exceedingly poor tearing quality in tubes which judged by tensile strength tests may appear to be of satisfactory quality. C. C. DAVIS

Effect of temperature on the stress-strain properties of vulcanized rubber. A. A. SOMERVILLE AND W. H. COPE. R. T. Vanderbilt Co., New York City. *Trans. Inst. Rubber Industry* 4, 263-80(1928).—To ascertain to what extent in general the quality of rubber products depends upon their temp., the following relations were studied: (1) differences in the stress-strain curves of a typical tire at different temps. from 0° to 100°; (2) differences in the stress at different elongations at different temps. from 0° to 100°; (3) differences in the stress-strain curves of different cured rubbers; (4) the effect of the time of cure and the effect of overcure on the stress-strain curves at different temps.; (5) the effect of the % S and the % accelerator on the stress-strain curves at different temps.; (6) the effect of antioxidants on the stress-strain curves at different temps.; (7) the effect of fatigue on the stress-strain curves at 0° and 100°; (8) the effect of the permanent set at 0° and 100°; and (9) differences in stripping tests at 0° and 100°. For *app.*, an ordinary testing machine, was equipped with a glass-windowed chamber contg. water at the required temp., through which the sample was stretched. With increase in temp. the stress-strain curves of the tire tread (rubber-S-accelerator-antioxidant-softener-ZnO-C black) approached the elongation axis, *i. e.*, for a given elongation the stress became progressively smaller with increase of temp. The difference between 0° and 100° was very great, at 400% elongation the stresses being approx. 27(0) and 600 lbs. per sq. in., resp. The relative changes at different elongations were not const., the higher the elongation the greater being the proportional de-

crease in stress for a given increase in temp. The effect of an increase in temp. on the stress-strain curve differed for different rubbers, e. g., guayule mixts. showing greater changes than fine para, smoked sheet or crêpe mixts. The state of cure of a mixt. had a great influence on the changes in its stress-strain curves with changes of temp., the stresses at 400% elongation both at 0° and at 100° increasing with increase in the time of cure. In tests where the % S was varied over a wide range, the min. difference between the stress-strain curves at 0° and 100° occurred with 2-3% S (based on the rubber). Hence for the ordinary type of rubber mixt. which must withstand elevated temps., 2-3% S is the best proportion to use for curing. At the optimum cure, the proportion of accelerator had less influence on the sensitivity of the stress-strain curves to temp. than did the S. However, with high acceleration, a reduction of S from 4 to 2% diminished the sensitivity of the stress-strain curves to temp. When samples were repeatedly elongated 400% and immediately released, the stress-strain curves both at 0° and 100° approached a const. position which differed greatly from the initial curve. When the samples were stretched in a similar way but were held 5 min. each time before release, there was a still greater difference between the initial and final curves, both at 0° and at 100°. In stripping tests of rubberized fabric belting at 0°, 25° and 100°, the friction stress at 100° was about 0.5 that at 0°. In an overcured mixt., the stress-strain curve at 0° may not reveal an overcure, and yet the curve at 100° may show an exceedingly "short" condition. Some mixts. have a much wider range than others over which they may be cured without suffering an overcure, but an overcured state can always be detected at 100° with a readiness which has not been possible with any previous test. It is, therefore, very important not to overcure products which must withstand elevated temps. Tests at 0° and at 100° of mixts., with and without antioxidants, in different states of cure, and which had been aged in air at 70°, showed that deterioration is not in this case a result of overcuring, for the stress-strain curves both at 0° and 100° changed in the same general manner. In this test, the longer the cure the faster the rate of deterioration. Addn. of an antioxidant retarded the rate of deterioration, particularly with overcured mixts., but it did not alter the relations between the stress-strain curves at 0° and 100°. In conjunction with earlier expts by van Rossem and van der Meijden (*C. A.* 22, 1059) and others, the results show how much poorer in quality rubber mixts. are when hot than when cold, particularly when they are overcured. Also in *India Rubber World* 79, 64-71 (1928) and *Rubber Chemistry and Technology* 2, 1-20 (1929).

C. C. DAVIS

Some new laboratory work on rubber. A. A. SOMERVILLE AND J. M. BALL. R T Vanderbilt Co., New York City. *Rubber Age* (N. Y.) 24, 490-4 (1929).—With most rubber mixts. there is a wide difference between the stress-strain curves at 0° and at 100°, the mixts. becoming relatively weak, particularly when overcured (cf. preceding abstr.). There are, however, 3 types of mixts., the stress-strain curves of which at 0° and at 100° cross in such a way that at low elongations the stresses at 100° are higher than those at 0°, while at higher elongations (up to the breaking point) the stresses at 100° are lower than those at 0°, viz., rubber cured with (1) 1-1.5% S and a high % of accelerator; (2) tetramethylthiuramdisulfide and neither S nor other accelerator, and (3) a low % of S, an org. accelerator and Se. With this 3rd type of mixt., the elongation at which the stress-strain curves cross depends not only upon the ingredients and their proportions but also upon the state of cure, the higher the latter the higher the crit elongation. Stripping tests of rubberized fabric belts show strikingly the effects of overcure, for at 0° the "friction" values of belts correctly cured and overcured may be virtually the same, and yet at 100° the friction of the overcured belts may be perhaps only 0.5 that of the correctly cured belts. Furthermore such belts show just as strikingly the effect of Se, for, where without Se the friction values diminish progressively with increase of temp., addn. of Se results in progressive increases of friction strengths with increase of temp., so that the values are not only higher at room temp. but become proportionately still higher at 100°. The results are obtained with Se when the belts are judged by means of flexing tests. The use of Se in mixts. used in the construction of automobile fan belts has proved to be of great value in lengthening the span of life of the belts. Discussion. J. M. BIERER. *Ibid* 493.—Replacement of part of the S by Se in a belt friction mixt. resulted in twice the resistance to flexing. EVERETT MORSE. *Ibid* 493-4.—A brief history of the development of the use of Se by Boggs is given (cf. B. and Follansbee, *C. A.* 21, 1566). GLIDDEN. *Ibid* 494.—Replacement of part of the S by Se in a tire-tread mixt. shortened the time of optimum cure, increased the tensile strength and hardness and slightly improved the aging. SCHILDHAUER. *Ibid* 494.—Replacement of part of the S by Se in belt friction mixts. resulted in increases of flexing tests from 30,000-85,000 to 150,000-200,000 cycles. JOHN T. BLAKE. *Ibid*

494.—The expts. of Somerville (*loc cit.*) suggest that Se increases the range of cure over which a mixt. does not overcure. At ordinary vulcanizing temps. about 0.5% Se dissolves in rubber, but no reaction takes place (even up to and above the m. p. of Se) unless an accelerator is added. The soly. explains, however, why Se is active as a vulcanizing agent far below its m. p. All attempts to make hard rubber with Se alone have failed. Soft rubber and hard rubber are different substances. Hard rubber is a plastic which is sensitive to temp. changes, whereas true soft rubber is elastic and is relatively insensitive to temp. changes, so that when rubber is cured with Se and insufficient S to endanger overcuring, the resulting vulcanizate is relatively insensitive to temp. changes. A. A. SOMERVILLE. *Ibid* 494.—Results indicate that when a mixt. contains not over 2% S (based on the rubber) and not over 1% Se, there is little or no tendency to bloom. C. C. DAVIS

Synthetic rubber from coal. FRITZ HOFMANN. *Rubber Age* (N. Y.) 24, 322-3 (1928).—An address, dealing with past work. C. C. DAVIS

Rubber solvent gasoline. BRUCE C. DODD. Anderson-Prichard Oil Corp., Oklahoma City. *India Rubber World* 79, No. 3, 68(1928).—A brief review of the development of gasoline solvents for use in the rubber industry, with a description of the com. solvents termed "Rub-Sol" and "Dip-Sol." These have distn. ranges of 40-145° and 98-145° resp., but give cements which dry in about the same length of time. The latter is particularly useful for dipped goods. C. C. DAVIS

Complete recovery of scrap rubber. F. ROUXVILLE. *Rev. gén. caoutchouc* 6, No. 48, 15 6(1929).—On the assumption that vulcanized rubber is not plastic because the viscous phase of raw rubber has been modified by S, it should be possible to reclaim vulcanized rubber by restoring to it a viscous phase and as a result its plasticity. Terebenthene may be polymerized by catalysts with the formation of a viscous *terpene* of the compn. $(C_{10}H_{16})_n$, the phys. and chem. properties of which are similar to those of the viscous phase of raw rubber. It dissolves raw and vulcanized rubber, it vulcanizes in a mixt. with raw rubber and it does not influence the quality. Scrap rubber is finely ground, mixed with 5-10% of the polymerized terpene, the ordinary proportion of S is added and the mixt. is vulcanized in the ordinary way. The polymerized terpene has an antioxidant effect. Because of its consistency it is better than rubber for impregnating cotton, jute, cork, etc. Various other applications are suggested. C. C. DAVIS

Band tires. T. S. GARDNER. Dunlop Rubber Co. *Trans. Inst. Rubber Industry* 4, 247 62(1928).—An illustrated review and discussion of present methods of manuf., of band (solid) tires, including the best compn. for the steel band, designs of bands, the character of the hard rubber base, methods of forming and attaching the tread, molding, vulcanizing and electrolytic cleaning of molds. Tests to det. the detrimental effect on the adhesion between bands and hard rubber of oil showed that no trouble is likely to arise from the use of a sol. oil in machining. A general discussion follows the paper. C. C. DAVIS

A simple tread-cracking test. A. H. NELLEN. Lee Tire & Rubber Co., Conshohocken, Pa. *Rubber Age* (N. Y.) 24, 373-4(1928).—The machine described and illustrated is the first app. to measure the relative tendencies of different designs of treads to crack in service. A tire tread and carcass (with sidewalls and beads removed) runs as a belt at the speed desired over pulleys so arranged that multiple and exaggerated flexing takes place. Besides results of a mech. nature which were obtained, it was found that resistance to cracking may be enhanced by the use of special compounding ingredients, many of the most effective agents being powerful antioxidants. On the other hand, not all antioxidants inhibit cracking; in fact, there is probably no relation between antioxidant power and ability to improve resistance to cracking. C. C. D.

American practice in the manufacture of rubber-insulated conductors. RICHARD APR. *Kautschuk* 4, 268-70(1928). C. C. DAVIS

Organic accelerators. WEBSTER NORRIS. *India Rubber World* 79, 53-7(1929).—A review dealing with the development of org. accelerators of vulcanization, their classification according to the systems of Dinsmore and Vogt (C. A. 22, 4273) and of Bloc (C. A. 22, 4870), the phys. properties and the accelerating characteristics and peculiarities of 58 com. aldehyde-amines, thio acids, thiuramsulfides, thiazoles, thioureas, guanidines and miscellaneous org. salts, and finally recommendations for the use of particular accelerators for various types of rubber goods. C. C. DAVIS

The influence of zinc oxide on the coefficient of vulcanization. S. A. BRAZIER AND L. R. RIDGWAY. *J. Soc. Chem. Ind.* 47, 351-6T(1928).—The present paper shows that erroneous values are often obtained when the coeff. of vulcanization is calcd. as the ratio of the difference between the total and free S and the rubber content. When

ZnO and org. accelerators are present, there is more ZnS formed than has hitherto been supposed, in fact enough to render useless the ordinary method of calcn. of the coeff of vulcanization. The expts. described deal with the effects on the extent of formation of ZnS and ZnSO₄ of: (1) increasing proportions of ZnO, for a const. rubber-S ratio; (2) various org. accelerators; (3) the time and temp. of vulcanization; (4) the addn. of fatty acids and of basic compds., *e. g.*, stearic acid, MgO and CdO; (5) the type of rubber; and (6) the rubber-S ratio. The exptl. mixts. contained rubber 100, S 5, org. accelerator 0-1, ZnO 0-45. In unaccelerated mixts., the quantity of ZnS was very small, its quantity increasing both with the time and with the temp. of vulcanization. With diphenylguanidine but no ZnO, the max. coeff. obtained was 4.9, but with ZnO the max. coeff. was only 3.8. With diphenylguanidine the proportion of ZnS was in all cases 3-4 times as great as in the corresponding unaccelerated mixts. In general the ZnS increased both with the time and the temp. of vulcanization, and decreased with reduction in the S/ZnO ratio. Addn. of 1 part of MgO to rubber-S-diphenylguanidine-ZnO mixts. increased the rate of combination of rubber and S, and suppressed almost wholly the formation of ZnS. Aldehyde-ammonia behaved somewhat like diphenylguanidine, though without ZnO, combination of rubber and S was more rapid, and in some cases the free S was higher with ZnO than without it. In conjunction with the formation of appreciable quantities of ZnS, this showed that ZnO retards the chem. part of vulcanization. With tetraethylthiuramdisulfide, ZnO increased greatly the combination of rubber and S, with formation of only traces of ZnS. Zn isopropylxanthate acted like tetraethylthiuramdisulfide. It was decompd. during vulcanization the Zn combining with the S, which conforms to the theory of Bruni and Romani that dioxanthogen is formed and functions as the accelerator. The behavior of mercapto benzothiazole was intermediate between that of the ultra-accelerators and the mild ones. Though it is supposed to be superior in an acid medium, the addn. of 0.5 part of stearic acid caused no appreciable change in the proportion of ZnS formed. Oleic acid did not influence the formation of ZnS except at high vulcanizing temps., where it reduced it. Preliminary expts. with CdO indicated that its behavior is similar to that of ZnO, though in unaccelerated mixts. higher coeffs. were obtained, owing to a greater rate of combination of rubber and S. Analytical data on several technical mixts. are tabulated to show the errors encountered in detg. the coeffs. of vulcanization by calcn. from the free S only, instead of taking into account the sulfide-S. The older methods of detg. inorg. S compds. are not so reliable as that of Stevens (*J. Soc. Chem. Ind.* 34, 244(1915); *cf. C. A.* 9, 2466), particularly the PhNO₂ and paraffin disintegration methods. In some cases not all the rubber is removed by PhNO₂ and the insol. part contg. combined S remains with the inorg. S compds. Some transference of S from rubber to ZnO is possible during the heating with PhNO₂ or paraffin, a similar effect occurring in prolonged overcuring of mixts. vulcanized at high temps. In unaccelerated mixts. the ZnS is small enough to be ignored in calcg. the coeff. of vulcanization from the free and total S, but with some org. accelerators it upsets the results. The quantity of ZnS depends upon the % ZnO, the % S, the accelerator and other ingredients, and no general correction is possible. A small quantity, not over 0.1% of ZnSO₄ was also formed. The results are of importance in relation to specifications which restrict the coeff. of vulcanization but allow the use of org. accelerators and ZnO.

Accelerator of vulcanization. JAN TEPPEMA (to The Goodyear Tire and Rubber Co.). Can. 286,103, Jan. 1, 1929. Reaction products of certain aromatic aldehydes, particularly the aldehydes having a hydroxyl group substituted in the aromatic nucleus, and amines, such as aniline or toluidine, when incorporated in a rubber compd. materially accelerate the rate of vulcanization and impart desirable characteristics to the product. An example of such reaction product is obtained by the interaction of β -hydroxynaphthaldehyde and aniline. One method of prepg. this product is to intermix mol. quantities of β -hydroxynaphthaldehyde and aniline, and heat under a reflux condenser for several hrs. A yellow cryst. compd. is obtained which upon being heated

gives off an oil and leaves a resinous mass. The latter material is a desirable accelerator, whereas the yellow cryst. product has little, if any, accelerating properties.

Rubber. THE ANODE RUBBER COMPANY, LTD. Fr. 643,762, Nov. 10, 1927. Added ingredients and stabilizing agents are added to latex before or during concn. by evapn., and accelerators and vulcanizing agents are added afterward. The stabilizing agents may include colloids such as glue, gelatin, casein, vegetable gums, dextrin or soap, Na_2SiO_3 or viscose. In an example ZnO 8, S 25, lampblack 1, talc 20, whiting 15, emulsified paraffin wax 2 and finely ground mineral rubber 1, are mixed with 100 parts of water contg. KOH 0.1, oleic acid 0.3 and casein 0.3 part. Preserved latex contg. 60 parts rubber is added and the whole mixed and concd. After concn. NH_3 and an accelerator such as 0.3 part diethylammonium diethyldithiocarbamate are added during cooling, the mixing being continued until both are uniformly distributed. Other examples are given, in one of which S and piperidine piperidylcarbothionolate are added during the latter part of the concn.

Rubber latex. RUBBER LATEX RESEARCH CORP. Fr. 644,605, Nov. 3, 1927. Latex is stabilized by adding blood or hemoglobin in quantity representing 5-25% of its content of rubber.

Concentrating latex. METALLBANK UND METALLURGISCHE GES. A.-G. (to K. D. P., Ltd.) Brit. 293,771, July 11, 1927. According to an example, there is added to fresh tapped latex 0.5% K salicylate or 0.25% KF and 0.25% KOH and the mixt. is inspissated. Other similar substances may be also used.

Treating latex. GENERAL RUBBER CO. Brit. 294,002, Aug. 25, 1927. Rubber latex is treated with a creaming agent such as NH_4 alginate and allowed to stand until it seps. into an uncoagulated rubber-contg. upper layer and a lower layer contg. sol. non-rubber constituents; the upper layer is then removed and the rubber is either used directly in manuf. or is spray dried or otherwise suitably treated. The latex may be subjected to 2 or more successive creaming treatments. Cf. C. A. 22, 3551.

Rubber compositions. DUNLOP RUBBER CO., LTD., AND D. F. TWISS. Brit. 293,702, April 19, 1927. Viscous liquid or semi-solid accelerators, "anti-ageing" substances or softeners, *e. g.*, oleic acid, aldol- α -naphthalene or crotonaldehydeaniline are mixed with colophony before they are added to the rubber. Solvents may be used or the substances may be melted together.

Rolls for masticating or mixing rubber, etc. DUNLOP RUBBER CO., LTD., and D. F. TWISS. Brit. 293,519, May 11, 1927. Direct water-cooling of the rolls is made more efficient by rust prevention, by placing wear-resisting material such as balls or cylinders of iron, stone or rubber inside the rolls.

Forming rubber tubing on a fusible core. DUNLOP RUBBER CO., LTD., and A. W. T. HYDE. Brit. 293,535, May 26, 1927. An aq. rubber dispersion is deposited on a core or mandrel such as Wood's alloy (either electrophoretically or by dipping) and the core is removed by fusion. Various details and modifications are described.

Product for making tires puncture-proof. COLONIAL RUBBER. Belg. 347,420, Jan. 31, 1928. Rubber, glycerol or glucose in which is suspended powdered cork or vegetable fibers is mixed hot with a mineral pulverulent constituent such as talc, mica or MgCO_3 .

Product for making tires puncture-proof. G. L. HUYSMANS. Belg. 347,557, Jan. 31, 1928. The product consists of an aq. soln. of animal gelatin, glucose, glycerol and nitrobenzene, or similar products, contg. non-decomposable pulverulent or fibrous mineral matter.

Deposition of rubber. W. A. WILLIAMS. Brit. 293,815, April 8, 1927. See Fr. 638,630 (C. A. 23, 547).

Rubber deposition by electrophoresis. DUNLOP RUBBER CO., LTD., and F. H. LANE. Brit. 293,343, April 6, 1927. In order to det. the c. d. necessary for the electrophoretic deposition of rubber of desired character, a test anode is used which is mounted so as to bear a varying c. d. along its length and therefore a deposit of varying character. A scale may indicate the c. d. at each point of the anode. Various structural and manipulative details are given.

Rubber sheets by electrodeposition. JOHN PORTER. U. S. 1,702,705, Feb. 19. Deposition from latex is effected on the surface of a bi-polar electrode of readily oxidizable metal such as Pb while at the same time oxidizing the metal and reducing the metallic oxide, as by electrolytic action. An app. is described.

Rubber floor covering composition. CYRUS F. WILLARD. U. S. 1,702,678, Feb. 19. Vulcanized sheets are formed of a compn. comprising mixed rubber and fiber 65, S 3, thiocarbanilide 0.5, $\text{Ca}(\text{OH})_2$ 2.5, petrolatum 4, Fe_2O_3 8, paraffin 2 and wood flour 17 parts.

Machine for reducing waste rubber to a fine powder. VICTOR D. LLOP. FR. 644,296, Oct. 29, 1927.

Recovering cotton or other fiber from rubber fabrics. D. F. WILHELM (to Naamlooze Vennootschap Vereenigde Nederlandsche Rubberfabrieken). Brit. 293,419, July 6, 1927. Material such as that of old tires, while it may be held by feed rolls and immersed in water or subjected to water jets or sprays, is combed or torn asunder and the liberated fibers are afterward sep'd. from the water. Various details of operation and of the app. used are described.

Vulcanizing rubber. OSKAR FISCHER. Ger. 467,863, Dec. 9, 1925. The known method in which a mixt. of rubber with S and a mixt. of rubber with a vulcanization accelerator are mixed together prior to vulcanization is modified by mixing the mixts continuously and in small amts. at a time.

Apparatus for repairing rubber articles by vulcanization. MAXIMIN MOMPIOT. Fr. 643,866, Nov. 15, 1927. The platform on which the article rests is indirectly heated by hot gases.

CHEMICAL ABSTRACTS

Vol. 23.

APRIL 20, 1929

No. 8

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Small laboratory table. LUDWIG KAUFMANN. *Chem. Fabrik* 1929, No. 4, 40.—Description of a small rectangular table mounted on rollers with handles for convenient transportation of larger pieces of app. and fitted with set screws for attachment to the main table. S. L. B. ETHERTON

Colorimeter in the laboratory and the factory. HUGO FREUND. *Quim. ind.* 5, 8(1928).—The colorimeter is now used in the Fe and steel industries for the detn. of Cr, Ni, Co, Ti, V and Mo; in the Cu and Pb industries for Co, Bi, etc.; in the mic lab. for small quantities of Ti, Fe and Mn; in the textile industry for waters Cu, in the fertilizer industry for phosphates, nitrates and K; in the food industry milk, gelatin, preservatives, etc., F. discusses, simply, inversion colorimeters, particularly of the compensated type and the universal type. S. L. B. ETHERTON

A new drying apparatus. FRITZ FRIEDRICHS. *Chem.-Ztg.* 52, 601(1928).—A modification of Abderhalden's drying app. is described and illustrated. It permits drying in any given gas or in a vacuum. W. C. EBAUGH

Stirrer from windshield wiper. A. V. MOTSINGER. *Ind. Eng. Chem.* 21, 192 (1929). The mech. suction part of a windshield wiper, with stirring rod attached, makes an ideal stirrer as the speed and stroke can be adjusted readily. It can be used wherever there is a suction line. W. C. EBAUGH

A new sampling instrument for viscous and lard-like substances. LOUIS EISEN. *Chem. Umschau, Fette, Oele, Wachse u. Harze* 35, 228(1928)—Illus. P. ESCHER

Manometer for the determination of gases in vapors. D. F. OTHMER. Univ. Michigan. *Ind. Eng. Chem., Anal. Ed.* 1, 46-7(1929).—To measure the amt. of air steam a manometer was constructed combining the characteristics of a gas thermometer with those of a vapor-pressure thermometer. Readings to 0.5 mm. on an ordinary scale give an accuracy of 1 part in 2000 when the steam is slightly above atm. pressure. W. C. EBAUGH

Specifications for Engler's viscometer. PASCHEN. Phys.-Tech. Reichsanstalt, Berlin-Charlottenburg. *Chem. Fabrik* 1928, No. 52, 726.—Supplementary specifications are given concerning thermometers and measuring flasks for use with Engler's viscometers. W. C. EBAUGH

Improved apparatus for vapor-pressure determinations. O. A. PICKETT. Hercules Powder Co., Kenil, N. J. *Ind. Eng. Chem., Anal. Ed.* 1, 36-8(1929).—Ramsay and Young's app. (cf. *J. Chem. Soc.* 47, 45(1885)) was modified so as to cause any distillate from the condenser to return to the boiling tube (by making the condenser slope upward from the tube) at a slow uniform rate such as would not exert any disturbing influence on the vapor-liquid equilibrium in the said tube. Check detns. on vapor pressure of H₂O and on satd. NaCl solns. show close agreement with results accepted standards. W. C. EBAUGH

Simple apparatus for measuring vapor pressure of volatile liquids. ALFRED W. RANCIS. Arthur D. Little, Inc., Cambridge, Mass. *Ind. Eng. Chem., Anal. Ed.* 1, 8-9(1929). A small long-stem dropping funnel, supported preferably by a split ring, connected by a rubber pressure tube with a gas-analysis leveling bottle contg. Hg. The funnel is lowered until Hg flows into it, the stopcock closed, and the funnel raised until Hg falls away from the stopcock. The height of Hg is read with a meter rod. A few cc. of the volatile liquid, e. g., gasoline, is poured into the funnel, the latter lowered, the liquid admitted so that it is on both sides of the stopcock; the funnel is then raised again and the Hg column measured. The difference in the 2 readings gives the vapor pressure at the surrounding temp. W. C. EBAUGH

Simple device for pipetting obnoxious liquids. LEOPOLD SCHEFLAN. Syracuse Univ. *J. Chem. Education* 6, 114(1929).—A flask is provided with a 2-hole rubber

stopper carrying an inlet tube through one of them and a pipet through the other; an atomizer bulb on the inlet tube forces the liquid up into the pipet, and a piece of rubber tubing with a screw clamp on it attached to the pipet enables the operator to fill and empty the pipet.

A practical aspirator. ORRO RÖDG. *Chem.-Ztg.* 52, 601(1929).—Two large bottles have fitted to them rubber stoppers with 2 holes; through one hole of each passes a tube to a point just within the stopper, and a 3-way stopcock closes the other end. Through the other hole a glass tube extends to the bottom of the bottle; these similar tubes are connected by rubber tubing. The bottles can be used alternately as the upper and lower parts of an aspirator.

Laboratory apparatus for vacuum distillation. V. M. SEMENOV. *J. Chem. Ind. (Moscow)* 5, 722(1928).—An app. for fractionation *in vacuo* which has the advantages of enabling (1) to conduct uninterrupted distns. and (2) quickly to attain the needed

air rarefaction when dealing with small volumes has been designed by S. The distn. flask A (see fig.) is provided with a capillary tube, which regulates the access of air so as to avoid bumping, with a separatory funnel for the introduction of the liquid to be fractionated, and with a thermometer. The receivers B and C have 2 upper outlets, one of which is connected with a vacuum and the other one serving as a connecting link; the lower outlets are provided with well-ground stopcocks M and N. 1, 2, 3 and 4 are clamps. The running-water pump I gives the system the needed vacuum on condition that 1, 3 and 4 are tightened, 2 is unscrewed, M is closed and N open. When a vacuum is obtained and the distn. begins, the first fraction is collected in C; by tightening 1 the entry of the liquid into C is facilitated. When the second fraction begins to distil, N is closed, 1 is unscrewed and 2 is tightened, while air is admitted into C through 3, and the first fraction is evacuated through M. Then M is closed, 3 is tightened and 4 is unscrewed to open communication with the pump II which

gives vacuum to C. Then 4 and 1 are tightened, 2 is unscrewed and N is opened (turned on) to permit the passage of the contents of B into C, and so on. New quantities of the substance to be distd. can constantly be introduced through K without interrupting the distn.

Distillation columns and flasks with Hücke's dropping neck. ANON. *Chem.-Ztg.* 52, 601(1928).—To prevent the contamination of the distillate by pieces of cork or stopper the return tube is directed to the side and the lower end is cut off diagonally.

Modified distillation apparatus for the chemical engineering laboratory. W. L. BEUSCHLEIN. Univ. of Wash., Seattle, Wash. *Ind. Eng. Chem., Anal. Ed.* 1, 43-4 (1929).—A simple layout for still, condenser and accessory app. is described. W. C. EBAUGH

Simple pressure regulator for vacuum distillations. HENRY L. COX. Mellon Inst. of Industrial Research. *Ind. Eng. Chem., Anal. Ed.* 1, 7-8(1929).—A closed arm Hg manometer contg. a sealed-in contact and an adjustable contact is connected in series with a relay and a battery; the armature of the relay is connected to a motor which drives the vacuum pump. The app. is automatic, requires little attention, and maintains any desired pressure constantly within ± 0.1 mm. of Hg. W. C. E.

A separator for continuous fractional distillation under reduced pressure. R. DELABY AND R. CHARONNAT. *Bull. soc. chim.* 43, 1287-8(1928).—A device made of Pyrex glass, which allows a sepn. of fractions without interrupting distn., is described. The bulbs, in which the fractions are collected, are connected by means of stopcocks.

A modified Pirani gage for use in corrosive systems. GERHARD K. ROLLATSON. *J. Am. Chem. Soc.* 51, 804(1929).

Orsat apparatus for complete gas analysis. ANON. *Gasinstitut. Gas u. Wasserfack* 72, 59-60(1929).—The Thermal Lab. of the Gasinstitut has developed a new

portable type of Orsat app. for complete gas analyses and N detns., which is especially adapted to the analysis of water gas and producer gas and other gases free from heavy hydrocarbons. Methods of analysis are given, a novelty being the use of 50% glycerol solns. as the retaining liquid for gas to be subjected to slow combustion. R. W. R.

Intermittent injection of gas in gas-lift installations. MORGAN WALKER. *Am. Inst. of Mining and Met. Eng., Tech. Publ. No. 146*, 11 pp.(1928).—General discussion.

HANS C. DUUS

Apparatus for the determination of the breakdown point of adsorbing systems. ANTON MACKERT. *Chem. Fabrik* 1929, No. 4, 39-40.—The breakdown point is the point at which the adsorbent is satd. with the adsorbed substance, so that the adsorbable medium is no longer removed by the adsorbent. Pieces of adsorbent carbon are tied upon metal wires suspended from a light metal ring. This ring hangs from a bent steel spring, one end of which can complete an electric circuit through mercury contact. Exit gases from the main adsorbing chamber pass over the carbon which increases in wt. when the gases contain adsorbable material. The metal spring is thus depressed, and on reaching the mercury the elec. circuit is completed and a bell rings. By adjusting the length of the spring, the app. is made to be sensitive and can be arranged to give the alarm at a detd. increase in the wt. of the carbon. The app. is thus automatic and does not require continual watching.

S. L. B. ETHERTON

Zambelli's vacuum evaporator. R. GIORDANO. *Rev. centro estudiantes farm. buquim.* 16, 596-601(1927).

H. L. D.

Aging phenomena in thermoelements. HEINRICH LENT AND FRANZ KOFLER. *Arch. Eisenhüttenw.* 2, 173-6(1928).—Expts. are made to det. which one of the thermocouples, chrom (83.7% Ni, 14.7% Cr), I-constantin, I-V2A (8.0% Ni, 15.7% Cr)-steel, I-NCT3 (17.5% Ni, 37.6% Cr, 0.48% Mn), I-cekas (59.7% Ni, 11.2% Cr, 2% Mn) and I-Ni, has the longest life and shows the smallest change in thermoelec. force when heated in coke or blast-furnace gas atms. at 850-900°. The I-Ni element is chosen as the most satisfactory since it does not age and has a straight-line temp.-voltage curve, although its durability is less than that of other elements and the Ni wire has a coarse cryst. structure after 13 days' heating. The thermoelec. force of this the I-Ni couple is const. up to breaking. The coke gases have a greater effect on the thermoelectric force than do the throat gases. The I-constantin element cannot be used because of aging, although its thermoforce is satisfactory. In a coke-gas atm. the I-V2A and I-NCT3 elements cannot be used, while in blast-furnace gas a change of the thermoelec. force is shown after 16 hrs. Above 700° the thermoforce of the I-cekas element increases; therefore, this is not a suitable couple. Aging is defined as a decrease in thermoelec. force due to increased use of the element, and is not caused by a change in its resistivity.

J. BALOZIAN

Furnace system for carrying out chemical reactions at high temperatures. FRANZ MEYER. *Chem.-Ztg.* 52, 599-600(1928).—A furnace system suitable for the production of Na₂S, etc., is shown. It consists of 2 reverberatory furnaces built end to end, with a flue connection from one to the other, with fire boxes at the opposite ends, and with flue openings from the lateral walls, near the fire bridges of each, controlled by dampers, leading to the common chimney. While one furnace is operating, the other one is being charged and brought up to heat by waste gases from the first; later, the operation is reversed.

W. C. EBAUGH

Apparatus of porous glass prepared from sintered glass powder. G. F. HÜTTIG. *École technique allemande de Prague. Chimie et industrie* 20, 1034-8(1928).—A review of their phys. and chem. properties and of their possible uses, particularly in analytical work, with bibliography of 82 references.

A. PAPINEAU-COUTURE

Comparison from a practical standpoint of washing towers packed with Raschig rings and of rotary washers. A. DZIURZYNOWSKI. *Gas Woda* 8, 130-3(1928); *Chimie et industrie* 21, 38-9(1929).—From a discussion of the relative merits of the 2 types of gas washers, particularly in view of present conditions in Poland, towers packed with Raschig rings are considered both cheaper and more efficient.

A. P.-C.

The suitability of Monel metal for tower packing. G. WEISSENBERGER AND L. PIATTI. *Chem. Fabrik* 1928, 703-4.—Spiral rings of light, resistant metals may replace, in some cases, heavy, voluminous, ceramic packing. Tests show Monel metal to be especially suitable for tower packing which is to be exposed to gases contg. H₂SO₄ or HCl. Comparative data are given for Monel and Al.

DAVID GORDON

Discharge coefficients of square-edged orifices for measuring the flow of air. H. S. BEAN, E. BUCKINGHAM AND P. S. MURPHY. *Bur. Standards J. Research* 2, 561-658(1929).

E. J. C.

Further research on pipe bends. W. HØVGAARD. *J. Math. Phys., Mass. Inst.*

Tech. 7, 239-97(1928).—Exptl. material and analysis are presented to assist in developing a simple criterion for the strength of pipe bends. A theory is developed that the longitudinal stresses, particularly those in the middle surface, determine the point of breakdown of pipe bends.

T. P. KELLER

Handbook of Cast Iron Pipe for Water, Gas, Steam, Air, Chemicals and Abrasives. Chicago: Cast Iron Pipe Research Assoc. 336 pp.; \$3.

Filter. HERMANN FRISCHER. Fr. 645,136, Dec. 3, 1927. An app. for dissolving, filtering and washing substances comprises a rotating cylinder forming the filter and carrying on its outer circumference agitating blades.

Dust filters. EDUARD W. STRAUS. Fr. 644,940, Nov. 30, 1927. Dust filters in the form of flexible tubes are maintained in position by a frame of metallic wires so that they may be cleaned by pressure on the top and sudden release.

Centrifugal device for separating dust from air. A. C. SPARK PLUG CO. Brit. 294,135, Jan. 18, 1927.

Apparatus (suitable for use with cigaret-making machines) for removing dust from air. F. F. RUAAU and MOLINS MACHINE CO., LTD. Brit. 294,501, April 23, 1927. Structural details of a bag-filter device are described.

Drum construction for rotary cell filters. HEINRICH NOTZ (to Maschinenfabrik Buckau R. Wolf A.-G.). U. S. 1,705,226, March 12.

Flat-bottomed filtering cup and funnel. ALFRED KÖNIG and GERHARD MÜLLER (to Staatliche Porzellan Manufaktur). U. S. 1,704,330, March 5. Structural features

Apparatus for sorting and separating various different mixed materials by their different actions on a photoelectric cell or like device. H. KOLITSCH. Brit. 294,575, July 26, 1927.

Evaporator for sea water, etc. FREDERICK W. SIEVERT. U. S. 1,704,064, March 5. Liquid to be evapd. is passed through the perforations of a perforated rotating drum onto heating tubes within the drum. Various structural features are described.

Röntgen-ray apparatus. F. S. SMITH. Brit. 294,408-9, Oct. 27, 1927.

Röntgen-ray apparatus. NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPEN-FABRIEKEN. Brit. 295,028, Aug. 5, 1927. Structural features.

Röntgen tube. FRITZ ECKERT (to the Firm Sendlinger Glaswerke G. m. b. H.). U. S. 1,703,391, Feb. 26. Röntgen tubes are made of glass contg. a rare earth, such as Ce oxide, as one constituent of the glass and having a relatively low m. p. so that it is easily worked.

X-ray apparatus. FRANKLIN S. SMITH. Fr. 644,807, 644,808, 644,809, Oct. 21, 1927.

X-ray apparatus for taking pictures of objects in motion. SAM KATZMAN. U. S. 1,704,974, March 12.

Apparatus for x-ray control. MOSES JACOBSON (one-half to Louis S. Aronson). U. S. 1,704,477, March 5.

X-ray tube construction. CLAYTON T. ULREY (to Westinghouse Lamp Co.). U. S. 1,704,267, March 5.

Liquid-circulating system for cooling electrodes of x-ray tubes or similar apparatus. FRANKLIN S. SMITH (to Products Protection Corp.). U. S. 1,705,033, March 12.

Luminous tube containing a conductive gaseous atmosphere and partly coated with fluorescent material. RENÉ GRANDJEAN (to Rainbow Light, Inc.). U. S. 1,703,524, Feb. 26. A device is provided for periodically interrupting the elec. current supplied to the tube so that the fluorescent material will serve as a secondary intermittent source of illumination. Cf. C. A. 23, 1533.

Luminescent tubes. PAUL F. J. LEBRUN. U. S. 1,704,981, March 12. See Can. 248,156 (C. A. 23, 570).

Apparatus for irradiation of substances with ultra-violet or other rays. QUARZ-LAMPEN-GES. Brit. 295,023, Aug. 4, 1927.

Thermionic valves. COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 645,670, Dec. 14, 1927.

Gas-filled thermionic rectifier tube. ALLGEMEINE ELEKTRICITÄTS-GES. (to International General Electric Co.). Brit. 294,665, July 28, 1927. Anodes are made from or coated with materials having a low-electron emission at operating temps. The metals of the anodes may be purified by heating to their m. p. in a high vacuum or they may be coated with low-emission materials such as Cr or Cr oxide. Various structural features are described.

Thermionic devices with cathodes coated with oxides of high emissivity. A.

SCHEIDT (to British Thomson-Houston Co., Ltd.). Brit. 294,168, July 19, 1927. Various structural features are specified.

"Frame" cathode for electron emission lamps. LA RADIOTECHNIQUE. Fr. 644,759, Mar. 16, 1927.

Heat-exchange apparatus suitable for heating air. LEWIS GRAFFLIN (to The Two Season Process, Inc.). U. S. 1,704,535, March 5. Structural features.

Heat-exchange device with layers of nested tubes. POWERGAS CORP., LTD., and N. E. RAMBUSH. Brit. 294,836, Dec. 19, 1927. Structural features.

Heat-exchanger construction suitable for use with laundry liquids. WALDRON C BEEKLEY and ALFRED D. MARTENS (to Whitlock Coil Pipe Co.). U. S. 1,703,655, Feb. 26.

Gas-burner construction. MAX KRAVITZ. U. S. 1,705,368, March 12.

Gas-burner construction. CHARLES FISLER. U. S. 1,704,359, March 5.

Gas-burner construction. HERBERT M. REEVES (to Ironton Stove & Mfg. Co.). U. S. 1,703,597, Feb. 26.

Bunsen burners. HERMANN GUHL. Fr. 644,723, Nov. 29, 1927. "Lighting-back" is prevented by imparting vibrations to the gas entering the mixing chamber.

Burners for powdered fuel. RILEY STOKER CORP. Fr. 644,891, Nov. 29, 1927.

Furnace. CARL LUBER & SOHN (Johann Vokac, inventor). Austrian 112,100, Dec. 15, 1927. Improvements are described in a furnace of the kind in which the fuel is stacked in a shaft over a grate and so is degasified before it is burnt, the gases from the degasification and the combustion gases being drawn off together and burnt.

Furnaces. SOC. FRANÇAISE DES CONSTRUCTIONS BABCOCK & WILCOX. Fr. 645,818, Dec. 16, 1927. Construction of walls contg. cooling pipes for furnaces burning powd. fuel.

Annealing furnaces. AKT.-GES. BROWN, BOVERI & CIE. Swiss 128,083, Sept. 2, 1927. An electrically heated sealed annealing furnace is provided with means for accelerating the cooling of the charge within the furnace. The furnace cover carries a bell which is raised during the cooling period, without breaking the seal, to an extent dependent on the cooling time required. Inert gases may be passed through the charge at the same time. Cf. C. A. 23, 1066.

Continuous-working annealing furnace. "ILVA" ALTI FORNI & ACCIAIERIE D'ITALIA. Fr. 645,310, Dec. 1, 1927.

Muffle furnace. CHARLES MUSIOL. Fr. 33,467, May 16, 1927. Addn. to 625,122. Methods of uniting the parts.

Cupola furnace with superposed series of nozzles operable in groups from one place. OTTO WEICHEL. Ger. 470,766, June 3, 1926.

Bakery furnace. ÉMILE ROUGIER. Fr. 645,836, Dec. 17, 1927.

Bridge wall and open-hearth furnace construction. THOMAS T. SCOTT (to Scott Furnace Co.). U. S. 1,703,460, Feb. 26. Structural features.

Furnace grate. SCHIFF & STERN. Austrian 112,103, July 15, 1927. The bars of a trough shaped grate are made of different widths, the center bar being the narrowest and the edge bars the widest.

Inclined furnace grate for brown coal. FIRMA K. H. PAUL LUDWIG. Ger. 470,793, Nov. 19, 1926.

Driving means for traveling grates. VEREINIGTE KESSELWERKE A.-G. DÜSSELDORF and HANS RENKER. Ger. 470,761, Aug. 2, 1927.

Boiler grate adapted for burning difficultly combustible and coking coals. MASCHINENFABRIK UND EISENGIESSEREI A.-G. "SOPIANA." Austrian 112,223, Sept. 15, 1928.

Furnace charger. CAMMELL, LAIRD & CO., LTD., JAMES MCN. ALLAN and HENRY C. LOVING. Ger. 468,898, Oct. 28, 1926. See Brit. 268,207 (C. A. 22, 1129).

Furnace charger for damp, pasty or plastic fuels. VESUVIO FEUERUNGSBAU, G. M. B. H. Ger. 470,764, Apr. 23, 1927.

Apparatus for feeding fuel to tunnel furnaces. JEAN B. MONNIER. Fr. 645,703, Nov. 30, 1927.

Furnace-draft regulator. CHARLES H. SMOOT. Fr. 644,796, Oct. 13, 1927.

Maintaining furnace tops, etc. ANSON G. BETTS. U. S. 1,703,656, Feb. 26. A furnace roof or other structural part is moved toward the heating chamber and its reverse surface is rebuilt with an unconsolidated refractory mixt. such as ground fire-brick or chrome ore, etc.

"Blast stoves" and regenerators, etc. BOLCKOW, VAUGHAN & CO., LTD., and M. A. McLEAN. Brit. 295,075, May 16, 1927. Structural features.

Apparatus for effecting physical or chemical processes. JUVÉNAL MAXIMOFF

and MARIA S. DE COSTA NEÉ VINCENT. Ger. 470,748, Sept. 29, 1926. Phys. processes, such as the fusion of quartz, and chem. processes, such as combustion processes are effected in an app. comprising a rotatable electrically heated crucible made of magnesite, zircon, or the like and contg. a fusible substance, *e. g.*, Cu, Pb, Mn, or other metal. The crucible is heated and rotated so that the metal fuses and assumes a paraboloidal surface. The materials to be treated are then fed in, and when the process is complete the speed of rotation is increased so that the fused metal is forced entirely to the sides of the crucible, the desired product being then run off through a removable plug in the bottom. Constructional details are given.

Apparatus for effecting chemical reactions between fluids. MARIA CASALE-SACCHI. Swiss 128,001, June 7, 1927. The app. comprises a reaction space surrounded by a heat exchanger composed of two series of annular passages for the reagents and the reaction products, resp. The parts of the app. are independent and easily separable and are arranged so that each is free to expand.

Distilling or extracting apparatus. GEORG FRITZ. Ger. 470,584, Feb. 13, 1926. Improvements are described in app. of the kind comprising a heated vessel with a cooled dome fitting over its neck.

Calorimeter for flowing liquids. MAX BAREISS. Ger. 470,963, Nov. 21, 1926.

Delivering measured quantities of liquid. NAAMLOOZE VENNOOTSCHAP MAATSCHAPPIJ VOOR UITVINDINGEN VAN DIKKERS & BARGEBOER. Ger. 470,774, Apr. 15, 1927. Constructional improvements are described in an app. of the kind in which 2 measuring vessels are provided and the distributing cock is operated by a float when 1 of the vessels is completely empty.

Volumetric flask (with a side tube to facilitate reading of the liquid meniscus). H. M. HAYNES. Brit. 295,083, May 24, 1927.

Mixing apparatus for liquids. FIRMA SNIA-Viscosa. Ger. 470,930, Oct. 26, 1927. Improvements are described in connection with the structure of an agitating shaft driven from below.

Mixing or emulsifying apparatus. FRANKFURTER DAMPFKESSEL-FABRIK GARTHE & Co., VORM. JUSTUS GARTHE. Ger. 470,802, Nov. 25, 1927. A rotating vane is arranged in a compartment at the bottom of a mixing vat so that the liquid is propelled by the vane back into the vat through a narrow annular slit.

Means for removing liquids from containers. KARL KIESER. Swiss 128,053, May 28, 1927. Improvements are described in an app. of the kind in which a member covering the whole surface of the liquid and carrying an outlet tube is pressed down onto the liquid.

Removing foam from centrifuged liquids. RAMESOHL & SCHMIDT A.-G. Ger. 470,724, Dec. 5, 1924. The centrifuge outlet pipe is bent to form a liquid seal, and a suction pipe is attached to the upper side of the outlet pipe between the seal and the centrifuge.

Spiral stirring device for use in hydrogenation of liquids. SCHERING-KAHLBAUM A.-G. Brit. 294,155, July 18, 1927.

Expressing water from sheets of material. RICHARD PRÜCKNER. Austrian 112,276, Oct. 15, 1928. In removing water from sheets of material, *e. g.*, paper pulp, by pressing, a pressing device with a projecting surface is used so that pressure is applied from the center outward.

Apparatus for drying under pressure. FRITZ BINSWANGER. Ger. 470,932, Sept. 15, 1926. Structural improvements are described in an app. of the kind in which granular material, *e. g.*, NH_4 salts, descends a series of tables in a vessel contg. warm air under pressure.

Apparatus for dehydrating materials on superposed trays. MARTHA E. BUSSLER. U. S. 1,704,912, March 12. Structural features.

Apparatus for drying powdered substances with a gas. INDUSTRIAL SPRAY-DRYING CORP. Fr. 645,757, Dec. 15, 1927.

Apparatus for drying air by refrigeration (for use in blast furnaces or for other purposes). M. FRÄNKEL. Brit. 294,354, June 22, 1927.

Apparatus for evaporating diluents from lubricating oils or other materials while spread in a thin film. CHARLES VAN BRUNT (to General Electric Co.). U. S. 1,703,643, Feb. 26.

Apparatus for gravity separation of foreign matter from lubricating oils or other liquids. ISAAC A. HILLS and GORDON B. HOOTON (Hills to Hooton). U. S. 1,705,329, March 12. Structural features.

Absorption tower suitable for treating oils. JULIAN A. CAMPBELL. U. S. 1,703,571, Feb. 26. Structural features.

Grinder for ores, cereals, etc. ADOLF STEINBRUCKNER. Fr. 645,385, Dec. 8, 1927.

Apparatus for washing coal and other minerals. ERNEST HODELIGE. Fr. 645,630, Dec. 13, 1927.

Slime classifier. KALI-IND. A.-G. and EBERHARD KAYSER. Ger. 470,734, Aug. 21, 1923. Structural improvements are described in an app. of the kind comprising a vertical column of zig-zag contour up which a stream of water flows and about the middle of which the slime is introduced.

Apparatus (with riffles and a pervious air cushion deck) for separating mineral materials. HENRY M. SUTTON, WALTER L. STEELE and EDWIN G. STEELE. U. S. 1,705,342, March 12.

Apparatus for simultaneously coating the inner and outer surfaces of long tubes. AUGUST PAHL. Ger. 471,055, Jan. 7, 1926.

Apparatus for covering metal or other threads with a liquid substance. BAYKOGARN, G. M. B. H. Fr. 645,469, Dec. 9, 1927. The threads are led through a horizontal cylinder contg. the liquid, transversely to its longitudinal axis, passing over rotating agitators which serve as guides for the threads.

Apparatus for the production of solid blocks of carbon dioxide. DRYICE CORP. OF AMERICA. Fr. 645,020, Nov. 29, 1927.

Apparatus for compacting carbon dioxide "snow." W. HESSLING. Brit. 294,584 and Brit. 294,614, July 26 and July 27, 1927. Mech. features.

Device for electric control of carbon dioxide or other gas supply. CHARLES S. JOHANN (to CO₂ Fire Equipment Co.). U. S. 1,704,944, March 12. Mech. features.

Vertical column scrubber suitable for extracting ammonia from gas. WALTER F. SLATER (to Kirkham Hulett & Chandler, Ltd.). U. S. 1,704,518, March 5. U. S. 1,704,519 relates to a rotative spraying device suitable for use in similar app.

Container for gases under pressure. P. BENKWITZ. Brit. 294,943, Aug. 1, 1927. A plurality of chambers are arranged one within another, and successively lower pressures are maintained in the outer than in the inner chambers. Various structural features are described.

Gas safety valve for cut-off of supply at low pressures. EDWARD E. BORCK. U. S. 1,703,570, Feb. 26.

Apparatus for the catalytic transformation of gases. SOCIÉTÉ ANON. D'OUGRÉE-MARIHAYE. Belg. 350,349, May 31, 1928. The app. comprises a gas preheater, a catalysis chamber and a recuperator for recovering particles of catalyst entrained by the gases, the preheater being heated by the catalyzed gases.

Apparatus for separation and liquefaction of gases. WILLIAM S. BOWEN. U. S. 1,704,649, March 5.

Apparatus for aerating and revivifying gas-purification liquids or other liquids. FREDERICK W. SPERR, JR. (to Koppers Co.). U. S. 1,703,967, March 5.

Molding press and method of operating the same. JOSEF POLÁK and HEINRICH TALLA. Swiss 128,049, Sept. 2, 1927.

Vibrating molding machine. WILFRED LEWIS. Ger. 468,711, June 3, 1927.

Apparatus for disinfecting and deodorizing by emanations. SOC. ANON. ITALIANA EVANS. Fr. 645,754, Dec. 15, 1927.

Funnel and vent-tube construction. PETER ROVANO. U. S. 1,705,312, March 12. Various structural details are specified.

Crucibles of tungsten. CHARLES F. LORENZ (to Westinghouse Lamp Co.). U. S. 1,704,256, March 5. Crucibles are formed of W powder sintered to W wool. Mo also may be used.

Tunnel kiln with vaulted cooling zone and channelled side walls. HEIMSOHN & VOLLMER, G. M. B. H. Ger. 470,834, Dec. 24, 1926.

Self-cleaning vibrating sieve. INGENIEUR MÜLLER & Co., G. M. B. H. Ger. 470,735, Aug. 14, 1927.

Apparatus for heating molten type metal or other materials and treating them with gaseous or liquid hydrocarbons, etc. C. F. HAMMOND and W. SHACKLETON. Brit. 294,697, Feb. 2, 1927. An app. is described in which circulation is effected by an "air lift" action.

Oxyhydrogen and oxyacetylene blow-pipes. JEAN B. BARGE. Fr. 644,713, Nov. 29, 1927.

Temperature alarms. FRANZ BUKESCH. Austrian 111,997, Aug. 15, 1928. The sensitiveness of temp. alarms actuated when an elec. circuit is closed by the Hg in a thermometer is increased by surrounding the thermometer with an adsorbent conductive mass. A suitable mass comprises a mixt. of a non-volatile org. acid, e. g., tartaric

or citric acid, with FeCl_3 and a porous material, *e. g.*, pumice or asbestos wool, impregnated with a soln. of a Pt salt.

Electrically operated mixer (suitable for clamping to a tank wall). FREDERICK L. CRADDOCK. U. S. 1,703,099, Feb. 26.

Mercury-vapor lamp for producing ultra-violet rays. G. J. BLAKE and G. D. G. LEADBETTER. Brit. 294,288, April 23, 1927. Structural features.

Metallic-vapor lamps using cadmium amalgam. H. STAMMBEICH. Brit. 294,172, July 19, 1927. A condenser is connected to the arc tube for collecting metal distd. from the latter.

Mercury-vapor tubes containing argon. RAINBOW LIGHT, INC. Fr. 644,800, Oct. 15, 1927.

Mercury-vapor rectifier with tilt start. ALLGEMEINE ELEKTRICITÄTS-GES. (Gustav Müller, inventor). Ger. 470,842, Nov. 22, 1921. Addn. to 462,140.

Mercury boiler construction. B. L. NEWKIRK (to British Thomson-Houston Co., Ltd.). Brit. 295,021, Aug. 4, 1927.

Recording apparatus for indicating boiler efficiency (by temperatures and carbon dioxide percentages). REPUBLIC FLOW METERS CO. (Electroflo Meters Co., Ltd.). Brit. 294,812, Nov. 4, 1927.

Device for automatically cutting off the gas supply when a gas-burner flame becomes extinguished. R. LANGER. Brit. 295,181, Jan. 5, 1928.

Thermostatic electric switch. PIERRE BLOCH and ATANASIO NUNEZ U. S. 1,705,391, March 12.

Thermostatic electric switch. GLENN MUFFLY. U. S. 1,704,141, March 5.

Thermostatic electric switch. LOUIS A. M. PHILAN (to Absolute Con-Tac Tor Corp.). U. S. 1,704,370, March 5 U. S. 1,704,371 (Phelan to Time-O Stat Corp.) also relates to an elec. switch construction.

Thermostatic electric switch. CARL T. PENTON. U. S. 1,704,406. March 7.

Thermostatic control for electric circuits. GEORGE D. KINGSLAND and PHILIP S. RUSSEL. U. S. 1,703,134, Feb. 26.

Thermostatic control for electric circuits. AUSTIN H. OSGOOD. U. S. 1,703,357, Feb. 26.

Thermostatic fuel-control device for gas burners. HENRY W. O'DOWD (to Standard Gas Equipment Corp.). U. S. 1,704,512, March 5.

Thermostatic control system for maintaining different temperatures in different containers. CHARLES L. BASTIAN and RALPH L. FARNHAM (to Bastian-Blessing Co.) U. S. 1,705,106, March 12.

Thermostatic control devices for vents of kilns such as those used for drying lumber. HOWARD M. CONE (to Long-Bell Lumber Co.). U. S. 1,705,176, March 12. Structural features.

Thermostatic device for control of air conditioning apparatus, etc. JOHN M. LARSON (to National Regulator Co.). U. S. 1,704,008, March 5. Structural features.

Thermostat for controlling flow of water in cooling systems, etc. EDWARD J. LEVY (to Bishop & Babcock Mfg. Co.). U. S. reissue 17,228, March 5. Reissue of original pat. No. 1,644,533 issued Oct. 4, 1927 (C. A. 21, 3772).

Valency. XI. Molecular conductivities and extinction coefficients of derivatives of cyclotelluropentane. FRANK L. GILBERT AND THOMAS M. LOWRY. *J. Chem. Soc.* 1928, 2658-67; cf. *C. A.* 22, 4396.—The extinction coeffs. in dry alc. and the conductivities in H_2O of the dihalides of the following series have been measured: (a) $C_5H_{10}TeX_2$, (b) $C_5H_{10}TeXCH_2(CH_2)_3CH_2X$, and (c) $C_5H_{10}TeXCH_2(CH_2)_3CH_2TeX:C_5H_{10}$. The following compds. have also been prep'd. and exam'd.: monocyclic base $C_5H_{10}Te(OH)_2$, hydroxy halides $C_5H_{10}Te(OH)X$, tetraiodide $C_5H_{10}TeI_4$, dicyclic base $(C_5H_{10})_2Te_2(OH)_2$ and its derivs., bistribromide and bistriiodide $(C_5H_{10})_2Te_2I_6$. The dihalides of b and c behave as binary and ternary electrolytes, resp., but those of a give anomalous values due to hydrolysis, forming hydroxy halides. The monocyclic diiodide resemble α dimethyltelluronium diiodide rather than the isomeric β -diiodide in its absorptions spectrum and its behavior toward iodides and alkalis. This resemblance is further borne out in the cond. of the monocyclic base and the form of the curve obtained by potentiometric titration. The curve obtained by the latter method for the dicyclic compds is anomalous.

ALBERT L. HENNE

The constants of elasticity and their relation to the periodic system of the elements. M. KAHANOVICZ. *Atti accad. Lincei* 8, 584-90(1928). Contrary to most other physical properties, which are periodic, elasticity is related to the atomic number of the element. In fact the elasticity of form (c), volume (μ), and stretch (E) are related by simple proportions, so that for each group of elements the product of the modulus by the at. no. is a no. characteristic of the group. For example, for the group Zn, Cd, Sn, Bi, $c/Z = 10^2 \times 10^{-8}$ (C. G. S. units); $\mu Z = 10^5 \times 10^{-6}$; and $E Z = 2.6 \times 10^5 \times 10^{-8}$ in which $Z =$ at. no. From the above, Poisson's coefficient (σ) may be deduced $\mu = E/2.6 = E/2(1 + 0.3) = E/2(1 + \sigma)$ or $\sigma = 0.3$, which agrees well with the exptl. value.

A. W. CONTIERI

Density of boric oxide glass and the atomic weight of boron. ARNOLD COUSEN AND WILLIAM ERNEST STEPHEN TURNER. *J. Chem. Soc.* 1928, 2654-7.—The d. of B_2O_3 glass prep'd. by fusing H_3BO_3 at 1400° and annealing the product thoroughly was det'd. both by the sp. gr. bottle and the flotation methods; between 18 and 25° , $d. = 1.844$. Inadequate annealing or fusion of the H_3BO_3 at too low temp. gives a glass with lower d.; this explains the low values of Briscoe, Robinson and Stephenson, *C. A.* 20, 1733 and 3606. Since the variation in the d. of B_2O_3 glass from 6 terrestrial sources observed by these authors may be ascribed to varying degrees of strain, it is not evidence of variation in the at. wt. of B.

ALBERT L. HENNE

Atomic distance in metals. V. M. GOLDSCHMIDT. Oslo Univ. *Z. physik. Chem.* 133, 397-419(1928).—Lothar Meyer propounded the law that the at. vols. of solid elements are periodic functions of their at. wts. (or better, of the ordinal no.). H. Schröder, H. Kopp and W. Biltz propounded views as to mol. vols. of compds. But the at. vols. of different elements are not directly comparable. Hence the differences between the crystal forms of the elements cannot be placed upon an exact relationship, particularly where the element has more than one crystal form, e. g., C or Zn. W. L. Bragg discarded at. vols. for at. radii. The distances between at. centers of gravity in the elements are hardly ever directly comparable. In cases like gray and white Zn, γ and δ Fe, etc., the variation in at. distance is related to the crystal structure. Every atom is bounded by a definite number of neighboring atoms, this number being the coordination no. At. distance and coordination number are related; thus a diminution of the coordination no. from 12 to 8 involves a simultaneous reduction in the at. distance of about 3%. Hence to compare two different substances care must be taken that the substances are in comparable state and particularly that the coordination numbers are the same. The crystal structures of elements in a comparative condition must be

the same or commensurable. In regular plane-centered crystals the coordination no. is 12 and $d = (a/2)\sqrt{2}$ where a is the lattice const. In hexagonally packed crystals every atom has 12 neighbors and if a be the length of the horizontal edge and c that of the vertical edge then $e = \sqrt{(a^2/3) + (c^2/4)}$. If $(c:a = 1.633$ then a and c are also large. In the following only such crystals are considered where $c:a$ varies from 1.55–1.633. G. used a Debye-Scherrer camera with a diameter of 58 mm. The substances investigated were mixed with salt whose lattice distance, 5.628 A. U., served as a comparison. The calcn. of at. distance of elements is simple, but for mixed crystals the formula $L^*M = xL^*A + (x-1)L^*B$ was used, where L^*M, L^*A, L^*B are the at. distances of the mixed crystals and of the components A and B, x or $(1-x)$ are the consns. of the species A and B and are fractions of unity, and n is an exponent whose value is yet to be detd. Mixed crystals were used whose pure components have the smallest possible difference of at. distance. The at. distances of Ru, Rh, Pd and Ag have already been detd. G. used AgCd_4 and AgCd_2 , obtaining values for $c:a$ and for e . The at. radius of Cd [12] is 1.534 A. U. From Ag_3In the at. radius In [12] = 1.569 A. U. and Sn [12] = 1.582 A. U. From Ag_3Sb the radius Sb [12] = 1.614 A. U. Thus in the series Ru to Sb there is a regular increase in at. radius when the elements have a coordination no. of 12. From Ag to Hg, Hg [12] = 1.545 A. U., Tl [12] = 1.707 A. U. and there are two more modifications, Pb [12] = 1.747 A. U., Bi [12] = 1.82 A. U. Thus there is a steady increase in atomic radius. For the series Mn, Fe, Co, Ni, Cu, Zn, Ge, the resp. dimensions are 1.36, 1.27, 1.257, 1.244, 1.276, 1.374, 1.39. When the coordination no. falls from 12 to 8 the at. distance falls about 3.4%; this figure was obtained from various alloys. For the transition 12 to 6, the contraction is 4.1%; for 12 to 4 the contraction is about 11.5%.
S. L. B. ETHERTON

Physicochemical researches on peroxides. II. G. PONZIO AND M. MILONE. *Atti accad. sci. Torino* 63, 335–48(1928); cf. C. A. 22, 4120.—Cryoscopic measurements with an Eysckmann depressimeter have been made in various solns. of the 2 oxides resulting from the dehydrogenation of the β -glyoximes, $\text{CH}_3\text{C}(\text{NOH})\text{C}(\text{NOH})\text{Ar}$ of

the 2 forms possible for the higher- and lower-boiling, resp., I, $\text{CH}_3\text{C}:\text{N}(\text{O})\text{O}:\text{N}:\text{CAr}$,

and II, $\text{CH}_3\text{C}:\text{N}:\text{O}:\text{O}:\text{N}:\text{CAr}$, only I would be expected to form a solid soln. with

furazan derivs. (III, $\text{CH}_3\text{C}:\text{N}:\text{O}:\text{N}:\text{CAr}$) as it has a similar constitution, and this has been found to be true. Conversely, II cannot have the other possible structure IV,

$\text{CH}_3\text{C}:\text{N}:\text{O}:\text{N}(\text{O}):\text{CAr}$, as it does not form a solid soln. with III. Various substitution products were also studied, by detg. their mol. wts. in various solvents. Thus the following V (I, Ar = Ph), VI (I, Ar = $\text{C}_6\text{H}_4\text{OMe}$), VII (II, Ar = Ph) and VIII (II, Ar = $\text{C}_6\text{H}_4\text{OMe}$) were found to have normal mol. wt. in HOAc , C_6H_6 and $\text{C}_6\text{H}_5\text{OH}$. The following derivs. were also studied: IX (I, Ar = $\text{C}_6\text{H}_4\text{Br}$), X (III, Ar = $\text{C}_6\text{H}_4\text{OMe}$), XI (II, Ar = $\text{C}_6\text{H}_4\text{Br}$), XII (III, Ar = Ph), XIII (I, Ar = $\text{C}_6\text{H}_4\text{Br}(\text{OMe})$), XIV (I, Ar = $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OMe})$), XV (II, Ar = $\text{C}_6\text{H}_4\text{Br}(\text{OMe})$), XVI (II, Ar = $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OMe})$), XVII (III, Ar = $\text{C}_6\text{H}_4(\text{OMe})\text{Br}$), XVIII (III, Ar = $\text{C}_6\text{H}_4(\text{NO}_2)(\text{OMe})$). In benzol as solvent, mol. wt. of V = 76.79, VI = 98.2, VII = 78.2, VIII = 99.9, X = 86.6, XVII = 115.8, XVIII = 128.3. In naphthalene, mol. wt. of V = 76.51, VI = 97.72, VII = 78.5, VIII = 99.7, X = 86, XVII = 116.62, of XVIII = 128.5. In X as solvent, mol. wt. of V = 287, VI = 800, VIII = 346, IX = 305, XI = 274, XIII = 304, XIV = 279, XV = 292, XVI = 265. Lastly the mol. wt. of X in the following solvents, in V = 265, in VI = 715, in VII = 210, in VIII = 230. The mol. wt. of XIII in XVII = 295; and of XIV in XVIII = 274.
A. W. CONTERI

The dynamical allotropic states of selenium. GÜNTHER BRIGLER. *Chem. Inst., Kiel. Naturwissenschaften* 17, 51(1929).—X-ray examn., absorption spectrography and an extn. process have shown the binary state of all phases of Se. In the fused state two types are in temp. equil. as shown by CS_2 extn. of the properly chilled melt; their rate of soln. is quite different; not so much their soly. In CS_2 solns. of Se the two modifications are in equil. which varies with concn. (spectrographic evidence) in other solns. the Se is dissolved colloiddally. Marcs' Se modifications in hexagonal Se were also found in partly blackened monoclinic Se. X-ray photographs showed the identity of black, non-conductive Se A and black, metallic, Se B, both being hexagonal of the same lattice type and dimensions. The difference in cond. is attributed to grain size, incomplete crystn. or impurity. All modifications of Se could be well represented in a T - x diagrams (Smits type) for the pseudo-binary solids and pseudo-ternary soln

The modifications are (1) amorphous Se (glassy or red), (2) monoclinic metalloid Se, (3) hexagonal metallic Se.

Changes in the specific gravity of copper and silver [after heat treatment]. R. RUTER AND J. KUSCHMANN. *Z. anorg. allgem. Chem.* 173, 262-7(1928).—Repeated heating of Ag and Cu alternately in a vacuum and in H causes a rapid and progressive decrease in the value of d ; with Cu a decrease of 6% was obtained after several repetitions of this treatment. This phenomenon is attributed to adsorption of H, followed by expulsion of the adsorbed gas on subsequent heating in a vacuum with consequent swelling of the metal and the formation of internal voids.

Iron-containing rings of smaller effective permeability. U. RETZOW. *Physik. Z.* 29, 534-8(1928).—The order of magnitude of the effective max. permeability for alloys, wires and "mass cores" has been detd. as follows: Fe-Ni alloys (Cu and Mn as minor constituents), $\chi \times 10^4$; Elmen bronzes (Ni, Co, Fe, Mn), $\chi \times 10^3$; Heusler bronzes (Cu, Al, Mn), $\chi \times 10^1 - \chi \times 10^2$; ring wire cores of Fe and steel wires, $\chi \times 10^2$; "mass cores" of pressed powdered Fe enclosed by an insulating material, $\chi \times 10^{-1} - \chi \times 10^2$; Fe and steel wires, $\chi \times 10^1$.

Coördination combination and the electronic theory of valence. N. V. SIDGWICK. *Z. Elektrochem.* 34, 445-50(1928).—On the ground of "effective atomic numbers," S. gives a general account of the covalence rule, the valence groups and the distinction between electrovalent and covalent combinations. From the results obtained by Debye (see following abstract) it seems that the capacity of an acceptor to enter into a coordinative combination depends on the existence of a dipole in which it is positive. Association in the liquid state is to be regarded as a coördination phenomenon.

Electric moment of molecules and the intermolecular forces. PAUL DEBYE. *Z. Elektrochem.* 34, 450-3(1928).—The mol.-refraction method of measuring dipole moments eliminates that part of the moment which is due to orientation and measures only the deformation polarization. Intermol. forces are likewise made up of two parts. D. discusses the relation existing between the constitution and the dissymmetry of compds. as characterized by the dipole moments, and gives examples. It is possible to base the formulation of compds. on conclusions reached from the dielec. method.

Stoichiometric considerations. RUDOLF SCHARIZER. *Min.-petr. Institut Graz. Neues Jahrb. Min. Geol., Abt. A. Beil.-Bd.* 57, 57-62(1928).—A series of theoretical structural formulas of silicates is presented.

Rate of vibration and molecular packing of organic compounds. W. HERZ. *Z. anorg. allgem. Chem.* 173, 358-60(1928).—If ν is the rate of vibration and z the no. of mols. in unit vol. just above the m. p., it is shown for about 30 org. liquids that the ratio ν^2/z is a const. which is approx. 3. For the hydrocarbons ethane to decane the results recorded vary from 3.02 to 3.75, for the corresponding primary alcs. from 2.90 to 3.08, and for various fatty acids and aromatic hydrocarbons from 2.77 to 3.28. HCN, however, gives a value of 1.82 and iodobenzene 4.14.

Theory of forced double refraction (photoelasticity). K. F. HERZFELD. *J. Optical Soc. Am.* 17, 26-36(1928).—Mathematical. The double refraction of crystals is discussed, and it is pointed out that it may be due to (a) the anisotropy of the ions taken separately, (b) the anisotropic arrangement of the ions in the lattice which results in an anisotropic force even if the ions are undisturbed, or (c) an anisotropic "Lorentz-Lorenz force" due to the anisotropic arrangement of the ions. Calcns. are made to det. the magnitude of (c) in cubic crystals of rock salt and sylvine under stress (forced double refraction, photo-elasticity), and it is concluded that the double refraction cannot be explained entirely by this means. It is also shown how the Lorentz-Lorenz force is built up in the unstrained crystal.

Rotation polarization of electromagnetic waves due to tetrahedral molecule models. K. F. LINDMAN. *Acta Acad. Åboensis Math. phys.* 4, No. 1, 1-22(1927).—Expts. were carried out with isotopic three-dimensional systems of numerous small tetrahedral mol. models and waves of length greater than those of the resonators and the dimensions of the angle models. In accord with Biot's corresponding law for optical activity, the rotation of the plane of polarization of the electromagnetic waves is proportional to the no. of mol. models in their path, i. e., to the cross-section of the active substance.

Absorption of light by iron pentacarbonyl. J. DRECHSLER. *Z. Elektrochem.* 34, 320-3(1928).—The absorption of visible light by $\text{Fe}(\text{CO})_5$ in various solvents follows Beers' law at all concns. between 99 and 0.5%, and is independent of the solvents employed (Me_2CO , CHCl_3 , CCl_4 , C_6H_6 , $\text{C}_6\text{H}_5\text{Me}$, *o*- and *m*-xylene). Qual. expts. show,

however, that the rate of decompn. of the carbonyl is influenced by the solvent. No connection could be observed between the dielec. const. of the solvent and the rate of decompn.

The question of space lattices. H. TERTSCH. *Neues Jahrb. Min. Geol., Abt. A, Beil.-Bd. 57*, 63-88(1928).—A lengthy discussion of the probable division of space between the elements and ions in the crystal structures of NaCl, CsCl and similar salts.

Space-filling forms in crystal lattices. H. TERTSCH. *Fortsch. Min. Kryst. Petr.* 12, 89-90(1927).—The alkali halides exhibit two types, cubic and octahedral; NaCl belongs to the former, and CsCl to the latter type, while RbCl is partly intermediate. Metal ions do not vary from their type, as do neg. ions. The change from cubic to octahedral type is considered to be assocd. with the no. and distribution of the electronic orbits.

What forces direct the structural development of crystals? F. STÖBER. *Neues Jahrb. Min. Geol., Abt. A, Beil.-Bd. 57*, 139-62(1928).—A theoretical discussion of the mechanics of crystal structure.

The crystal structure of glaserite and potassium sulfate. B. GOSSNER. *Univ. München. Neues Jahrb. Min. Geol., Abt. A, Beil.-Bd. 57*, 89-116(1928).—Crystals of apthitalite (glaserite) gave by the rotating-crystal method $a = 5.65$ A. U., $c = 7.29$ A. U., the cell having a rhombic base containing one mol. of $\text{NaK}_3(\text{SO}_4)_2$. The Laue diagram indicates trigonal symmetry and the space group is D_{3d}^3 . K_2SO_4 (usual a and b axes interchanged) gave: $a = 10.06$, $b = 5.85$, $c = 8.33$ A. U., with 4 mols. of K_2SO_4 in the cell; it belongs to space group V_{h3}^1 .

Deformation of fibers. R. O. HERZOG AND W. JANCKE. *Z. Physik* 52, 755-8 (1928).—Röntgen photographs of deformed fibers of mercerized cellulose and natural silk show that these fibers can be put into class four of anisotropy by rolling or pressing.

The influence of pressure on the friction along the gliding planes of crystals. G. TAMMANN AND W. SALGE. *Inst. Phys.-Chem. Göttingen. Neues Jahrb. Min. Geol. Abt. A, Beil.-Bd. 57*, 117-40(1928).—Crystals of ice and NaCl were studied under pressure and data obtained on the ease of deformation by slipping along certain of the gliding planes.

Crystal structures of the compounds ruthenium sulfide, osmium sulfide, manganese telluride and gold antimonide. I. OFTEDAL. *Z. physik. Chem.* 135, 201-9 (1928).—Powder photographs show that the compds. RuS_2 , OsS_2 , MnTe_2 , and AuSb_2 exhibit the pyrites structure. Parameters of about $1/2$ are found. The following lattice consts. are given: pyrites (Kongsberg) $a = 5.414$ (± 0.003) A. U. MnTe_2 , $a = 6.943$ (± 0.002) A. U.; AuSb_2 , $a = 6.636$ (± 0.010) A. U.

Crystal structure of tetramethylammonium iodide. WM. H. ZACHARIASEN. *Norsk geol. Tidsskr.* 10, No. 1, 9 pp.(1927).—The edge of the unit cell of tetragonal Me_4NI is 5.76, and $a = 8.03$ A. U. The unit cell contains two mols. Alternative positions of the N atoms in the space-group D_{4h}^2 are possible, but cannot be differentiated by consideration of the intensity of reflection, although chem. relationships indicate one. Vegard's results (*C. A.* 11, 2986) are criticized. The NH_4 ion is considered to possess spherical symmetry, whereas the symmetry of the PH_4 , Me_3NH and Me_3PH ions is considered to deviate from spherical.

The crystal structure of sesquioxides and compounds of the type ABO_3 . WM. H. ZACHARIASEN. *Skrifter Norske Videnskaps-Akad. Oslo. I, Matemat. Natur. Klasse* 1928, 7-165.—The crystal structure of sesquioxides and compds. of the type ABO_3 is detd. by several methods: the Laue method using a Coolidge tube and W anticathode with plate-to-crystal interval of 5 cm., 69 or 80 kv. and a current of 2 milliamp.; the rotating method with Cu or Fe anticathode, 30 to 35 kv., 10 milliamp.; the powder method using the modified Hadding-Siegbahn tube. Of the sesquioxides the structural types examd. are the corundum structure, C-type structure, A-type structure and *irsen-like* modifications, while of ABO_3 compds. the types examd. are calcite, aragonite, AgNO_3 , RbNO_3 , KClO_3 , KBrO_3 , HIO_3 , NaIO_3 , *perovskite*, KNO_3 , AgClO_3 , AgBrO_3 , MgTiO_3 and LiCBO_3 . With compds. of the corundum type structure r , the edge length of the elementary rhomboid, and α , the rhomboidal angle, are given as follows: for Al_2O_3 $r = 5.13 \pm 0.02$ A. U., $\alpha = 55^\circ 16' \pm 5'$; for Ti_2O_3 $r = 5.42 \pm 0.01$, $\alpha = 56^\circ 50' \pm 5'$; for V_2O_3 $r = 5.45 \pm 0.03$, $\alpha = 53^\circ 49' \pm 8'$; for Cr_2O_3 $r = 5.33 \pm 0.03$, $\alpha = 55^\circ 0' \pm 8'$; for Fe_2O_3 $r = 5.42 \pm 0.02$, $\alpha = 55^\circ 14' \pm 5'$; for Ga_2O_3 $r = 5.31 \pm 0.02$, $\alpha = 55^\circ 50' \pm 5'$; for Rh_2O_3 $r = 5.45 \pm 0.03$, $\alpha = 55^\circ 43' \pm 8'$. The av. interval between atoms is as follows: Al-O = 1.92 A. U., Ti-O = 2.04 A. U., V-O = 2.00 A. U., Cr-

O = 1.99 A. U., Fe-O = 2.02 A. U., Ga-O = 1.99 A. U., Rh-O = 2.03 A. U. The parameters u and v are 0.10 ± 0.01 and 0.30 . Z , the no. of mols. in the elementary cell = 2, Rgr , the space grouping = D_{3d}^6 , and the coordination nos. are 6 and 4. In compds. of the C -type structure $Z = 16$, $Rgr = T^6$, the parameters t , u and v are 0.25 , 0.021 ± 0.007 and 0.542 ± 0.014 , and the coordination nos. are 6 and 4. In this group the compds. examd. are Sc_2O_3 , Mn_2O_3 , Y_2O_3 , In_2O_3 , Sm_2O_3 , Eu_2O_3 , Gd_2O_3 , Th_2O_3 , Dy_2O_3 , Ho_2O_3 , Er_2O_3 , Tm_2O_3 , Yb_2O_3 , Cp_2O_3 and Tl_2O_3 and a varies from 9.79 ± 0.03 A. U. for Sc_2O_3 to 10.85 ± 0.02 A. U. for Sm_2O_3 . The av. interval between atoms is as follows: Sc-O = 2.18 A. U., Mn-O = 2.10 A. U., Y-O = 2.36 A. U., In-O = 2.25 A. U., Sm-O = 2.42 A. U., Eu-O = 2.42 A. U., Gd-O = 2.41 A. U., Tb-O = 2.39 A. U., Dy-O = 2.37 A. U., Ho-O = 2.36 A. U., Er-O = 2.35 A. U., Tm-O = 2.34 A. U., Yb-O = 2.31 A. U., Cp-O = 2.31 A. U., and Tl-O = 2.36 A. U. *Bixbyite*, $(Fe, Mn)_2O_3$, crystallizes in the C -type. In this type of structure the particle intervals are about 2% greater than in the corundum type. Calcite structures show $Z = 2$, $Rgr = D_{3d}^6$. $LiNO_3$ gives $r = 5.74 \pm 0.02$ A. U., $\alpha = 48^\circ 3' \pm 10'$, $d = 2.38$, $u = 0.264 \pm 0.006$, Li-O = 2.15 A. U., and N-O = 1.25 ± 0.03 A. U. $CdCO_3$ gives $r = 6.112 \pm 0.006$ A. U., $\alpha = 37^\circ 24' \pm 5'$, $d = 5.02$, $u = 0.25$, the interval Cd-O = 2.31 A. U. and C-O = 1.23 A. U. The aragonite structure is possessed by $SrCO_3$, $BaCO_3$ and $PbCO_3$. In this type $Z = 4$, $Rgr = V_h^{16}$. In all 3 compds. the parameter $u_1 = 0$. For V , $SrCO_3$ gives 0.403 ± 0.006 , $BaCO_3$ 0.417 ± 0.010 , and $PbCO_3$ 0.422 ± 0.010 . The coordination nos. about the ions A and B are 9 or 3. In the case of $AgNO_3$, $Z = 8$, Rgr is either V_h^{16} , V_h^{12} , V_h^{10} or V_h^8 , $a = 6.97 \pm 0.05$ A. U., $b = 7.34 \pm 0.05$ A. U. and $c = 10.14 \pm 0.08$ A. U. $RbNO_3$ shows $Z = 4$, $Rgr = C_{3v}^5$, $r = 7.36 \pm 0.04$ A. U. and $\alpha = 109^\circ 28' \pm 15'$. The Rb atom forms a face-centered lattice ($u_1 \sim 1/2$, $v_1 \sim 0$) as does also the N atom ($t \sim 1/2$, $u \sim 0$, $v \sim 1/2$). $KClO_3$ gives $Z = 2$, $Rgr = C_{2v}^2$, $a = 4.66 \pm 0.03$ A. U., $b = 5.59 \pm 0.03$ A. U., $c = 7.11 \pm 0.05$ A. U. A close relationship with calcite is evident. $KBrO_3$ gives $Z = 4$, $Rgr = C_{3v}^5$, $r = 4.403 \pm 0.005$ A. U., $\alpha = 86^\circ 0' \pm 5'$, $t = 0.500 \pm 0.015$, $u = 0.58 \pm 0.03$, $v = 0.125 \pm 0.030$, the interval K-O = 2.67 A. U. and 3.11 A. U. and Br-O = 1.68 A. U. In HfO_2 $Z = 4$, parameter no. = 15, $a = 5.53 \pm 0.05$ A. U., $b = 5.92 \pm 0.05$ A. U., $c = 7.75 \pm 0.05$ A. U. In $NaIO_3$ $Z = 2$, $Rgr = V_h^{19}$, $a = 5.75 \pm 0.01$ A. U., $b = 6.37 \pm 0.01$ A. U., $c = 4.05 \pm 0.01$ A. U., the interval Na-O = 2.15 A. U. and I-O = 2.87, 2.95 and 3.18 A. U. This is an *anti-perovskite* structure. The perovskite structures include $CsIO_3$, $SrZrO_3$ and $CdTiO_3$, and in these $Z = 1$, $Rgr = C_{3v}^5$. The interval A-O is 3.926 and B-O is 2.331 for $CsIO_3$, for $SrZrO_3$ these values are 2.891 and 2.047, and for $CdTiO_3$ 2.65 and 1.88. In KNO_3 $Z = 4$, $Rgr = V_h^{16}$, isomorphous with aragonite, $a = 5.40 \pm 0.04$ A. U., $b = 9.14 \pm 0.07$ A. U., $c = 6.41 \pm 0.40$ A. U. In $AgClO_3$ $Z = 8$, $Rgr = V_h^{11}$, $a = 8.475 \pm 0.004$ A. U., $c = 7.90 \pm 0.01$ A. U. For $MgTiO_3$ and $LiCBO_3$ $Z = 2$ and $Rgr = C_{3v}^5$. For these 2 compds. $r = 5.40 \pm 0.02$ A. U. and 5.47 ± 0.03 A. U., while $\alpha = 55^\circ 1' \pm 8'$ and $55^\circ 43' \pm 10'$. The investigation shows that the stability of the various types of lattice in binary compds. A_mX_n depends upon the radius relation R_A/R_X . In ternary compds. the stability depends upon several such quotients and upon polarization properties. Thus the morphotropic transition between 2 such types as rutile and fluorite is conditioned by variation in the quotient R_A/R_X . The transition from MgF_2 to $Mg(OH)_2$ is an example of the type made possible by an alteration in polarization properties. The polarizing effect of an ion is found to decrease with rising temp. The quotient $R_A/R_B = 1$ corresponds to the sesquioxides. By increasing the value of the quotient R_B/R_O , the corundum type is obtained first, then the C -type, the B -type and the A -type. The change from the sesquioxides to the types ABO_3 coincides with an increase in R_A/R_B . In all types of structure the ion B possesses exactly the coordination no. which one would expect from the quotient R_B/R_O , while the coordination no. about the ion A cannot always be derived from the value of the quotient R_A/R_O . The smallest cations, therefore, influence the coordination no. about the larger ions A, while the reverse has in no case been observed. The stability of the arsenolith type and the A -types depend upon the polarization of ions B. The structure of mols. of NH_3 , H_2O , is very similar to the structure of $(ClO_3)^-$, $(BrO_3)^-$ and $(AsO_3)^{3-}$. In compds. ABO_3 the stability zone is characterized by the quotients R_A/R_O and R_B/R_O falling within certain limits as well as the polarization. Isomorphism between 2 compds. ABO_3 is only to be expected if these quotients and polarization properties are so similar that they lie within the limits of the region of stability of these types. The difference in energy of 2 structural types is smallest at the border line between the zones of stability of the 2 types. This

explains polymorphism. At this border line the energy difference is smaller than that produced by a change in thermodynamic factors. CaCO_3 and KNO_3 can crystallize in both the calcite and aragonite forms, depending upon conditions of formation. MgCO_3 and BaCO_3 , however, lie too far from the border line and crystallize in only the calcite or aragonite modification. H. STOERTZ

Existence of two magnetic rotatory powers for a uniaxial crystal along and normal to the axis. J. BECQUEREL. *Compt. rend.* 187, 215-7; *J. phys. radium* 9, 337-45(1928).—The magnetic rotatory power of tysonite, the birefringence of which is very small, has been investigated for the green Hg line 5460.7 Å. U. The rotatory power in the direction of the axis is different from that normal to it. A formula is deduced on theoretical grounds which is in agreement with the results. B. C. A.

The electromotive behavior of single metal crystals. PAUL A. ANDERSON, Yen ching Univ., Peking. *Nature* 123, 49(1929).—The electrode potential of the primary cleavage face (basal pinacoid) of a Zn crystal is const. and reproducible, and is probably a max. G. CALINGBERT

Van der Waals' equation and the principles of thermodynamics; the Maxwell-Clausius relation and the Clapeyron formula deduced from this equation. VASILESCO-KARPEN. *Compt. rend.* 187, 1039-42(1928).—The Maxwell-Clausius and Clapeyron relationships are derived independently of Carnot's principle. H. G. VAN DEN BOSCHE

The thermodynamic equilibrium in the universe. P. ZWICKY, Norman Bridge Lab. of Physics, Pasadena. *Proc. Nat. Acad. Sci.* 14, 502-7(1928).—The actual universe is far from a state of equil. and is running towards a state of higher entropy. By assuming, however, a postulate of thermodynamic equil. special conclusions may be deduced. On this basis, Stern concluded that for all possible temps. matter would disappear into radiation. Lenz, accounting for the change in vol. of an Einstein universe concluded that the radiation would equal the matter. Tolman showed Lenz's error, and concluded that the ratio of H to He was of the order of $e^{10^{10}/T}$, a result not in agreement with their concn. in known stars. Z. classes the different agglomerations of mass as species of mols.; e. g., S_2 , S_8 , etc. For the higher types of agglomerations there is a resemblance to swarms of mols.; this class includes gaseous nebulae, star clusters, and galactic systems. Assume the following equil.: Radiation \rightleftharpoons Protons electrons \rightleftharpoons Higher mols. \rightleftharpoons Dust particles \rightleftharpoons Gaseous nebulae \rightleftharpoons Stars \rightleftharpoons Galactic systems. From a consideration of this equil. Z. deduces equations to account for the relative emptiness of space and the existence of stars of certain size only. High temp. of stars is not in contradiction to av. low temp. of universe. The statistical treatment could be improved by the use of free energies. If the existence of dust particles be treated as evapn., the equil. equation shows that matter is present in considerable amounts below 1000°. The postulate is not justified by facts in the universe. Consistent statistical treatment of the equil. on the basis of the postulate promises to furnish results in agreement with the facts. ARTHUR FLEISCHER

The refraction of carbon monoxide, nitrogen, and nitrous oxide and its dependence on pressures of less than one atmosphere. FR. SCHACHERL. *Spisy Vydavane Prirodovedeckou Fakultou Masarykovy Univ.* No. 99, 29 pp.(1928).—The following values for the refractions were found at 760 mm. and 0°: $\text{CO} = 336.89 \times 10^{-6}$; $\text{N}_2 = 302.83 \times 10^{-6}$; $\text{N}_2\text{O} = 507.79 \times 10^{-6}$ (for $\lambda = 5462.3$ Å. U.). The sp. refraction for these gases is not const. but increases with rise in pressure, at pressures less than 1 atm. E. G. VAN DEN BOSCHE

Refraction of helium and argon and its dependence on pressures of less than one atmosphere. FR. SCHACHERL. *Spisy Vydavane Prirodovedeckou Fakultou Masarykovy Univ.* No. 98, 15 pp.(1928).—The refraction of A at 760 mm. and 0° was found to be 282.70×10^{-6} for $\lambda = 5462.3$ Å. U. The sp. refraction ($r_1 = (n-1)d$) for A, as well as for other monat. gases, increases with rise in pressure, at pressures less than 1 atm.; r_1 for O_2 increases with pressure twice as fast as r_1 for A. No conclusion was reached on the effect of pressure on r_1 for He. E. G. VAN DEN BOSCHE

Control of a new method for the measurement of the temperature of a gas. MARCEL CHOPIN. *Compt. rend.* 187, 935-7(1928); cf. *C. A.* 22, 3340.—C. uses his aerodynamic method to calc. the temp. of a current of air between 350 and 650°. The calcd. value exceeds by 2.9° that indicated by a thermocouple placed 6 mm. away from the orifice and is about 3.5° below that indicated by the thermocouple when it is 20-80 mm. from the orifice. Successive detns. at 600° are consistent within one degree. ALBERT L. HENNE

Ignition of detonating gas by hydrogen atoms. F. HABER AND H. D. VON SCHWEINITZ. *Kaiser Wilhelm Inst. Sitzb. preuss. Akad. Wiss.* 1928, 490-506.—H., at reduced pressure is passed through an arc to obtain a gas rich in at. H (Langmuir method).

This gas is brought into contact with O_2 . Immediate explosion occurs, detected by the sound or by atomizing NaCl in the reaction vessel to color the flame. It is proved that the ignition is caused by H atoms, not by any other agent. Marshall (*C. A.* 20, 3615) failed to obtain similar results because he used too low a concn. of H atoms. The reaction is regarded as a 30-member chain reaction.

Correction to my paper: optical measurement of small degrees of dissociation of metal salt vapors. I. WYNEKEN. *Z. physik. Chem., Abt. A*, 140, 78–80(1929); cf. *C. A.* 23, 1326.—An erroneous heat of reaction was used in comparing the exptl. and calcd. values. The correct one does not accord with the calcd. value. The discrepancy is to be attributed to the presence of Hg_2Cl_2 . A. L. HENNE

Investigation with the Geiger counter of the influence of cathode material on the sparking potential. O. KLEMPERER. *Univ. Kiel. Physik Z.* 29, 947–8(1928); cf. *C. A.* 23, 562.—In contradiction to accepted views, the sparking potential is affected by the metal composing the electrode (here the tip of the Geiger counter). The following variations in limiting potential were observed: in CO_2 , no appreciable difference, V_0 varying between 600 and 650 v., in air, Pt, Au, Ag, Cu and steel (heated or dipped in HNO_3), all gave $V_0 = 600$, untreated steel 580, Al 500; in H a more appreciable variation between metals: Pt, Au 500, Ag, Cu 490, Al 450, steel untreated 570, heated 630, dipped in HNO_3 600. In A great differences are apparent, but they cannot be compared with the above, because the relationship of sparking potential vs. electrode diam. is not rectilinear, and the lines for various pressures do not show a common intersection on the ordinate axis. Thus, Cu and Pt show voltages of 200 and 210 at 10 mm. Hg pressure and 400 and 570 at 75 mm. G. CALINGAERT

Dielectric properties of liquid crystals in electric and magnetic fields. M. JEZEWSKI. *Z. Physik* 52, 878–81(1928); cf. *C. A.* 23, 1031.—The capacity of a condenser filled with *p*-azoxyanisole and *p*-azoxyphenetole is detd. in simultaneously applied elec. and magnetic fields. An elec. field greater than 400 v./cm. causes an increase when the nematic liquid is also in a parallel magnetic field and a decrease when in a perpendicular magnetic field. GEORGE GLOCKLER

Dissociation of liquid crystals. A. MLODZIEVSKII. *Z. physik. Chem.* 135, 429–46(1928).—Liquid crystals having upper and lower disson. temps. have been obtained in which the only stable state of aggregation over a certain temp. range must be the liquid crystal state. Mixts. of cholesterol and cetyl alc. form liquid crystals yielding two solid phases at the lower disson. temp. and a liquid and a solid phase at the upper temp. Liquid crystals formed from cholesterol-glycerol mixts. yield a solid and a liquid phase, and two liquid phases at the lower and upper disson. temps., resp. The possible diagrams corresponding with the above phenomena have been constructed on thermodynamic principles, and from the theoretical data the diagram corresponding with the cholesterol-glycerol system has been identified. The advantages of combining microthermal analysis with the thermodynamic deduction of diagrams in orienting work of the above type are discussed. B. C. A.

The determination of the density of liquids. JOHN GRINDLEY. *Univ. Coll. of Wales. J. Chem. Soc.* 1928, 3297–8; cf. Hartley and Barrett, *C. A.* 5, 2996.—The method of H. and B. will not be accurate to ≈ 0.000005 if variations of temp. exceed 5° or if liquids having large coeffs. of expansion are being weighed. This is due to the fact that the vol. of air displaced is increased enough to make the error appreciable. When the change in d. is small by reason of a small change of temp. or when the change in d. is the same as that of the water used in calibrating the pycnometer, the correction suggested by G. becomes negligible. Hartley corrects the original paper, *C. A.* 5, 2996. In line 13, page 1074, W should read ($W_p - W_0$). F. E. BROWN

Vapor pressures in the systems: diethyl phthalate with ethyl alcohol and with methanol. H. W. FOOTE AND J. K. DIXON. *Yale Univ. Am. J. Sci.* 17, 146–52 (1929).—The vapor pressure-composition curves for diethyl phthalate with EtOH and MeOH have been detd. by the static method. The app. used was described by Zsigmondy (*C. A.* 6, 2565) and Bachmann (*C. A.* 12, 1610). Both binary mixts. exhibit approx. the same deviation from an ideal soln. The 2 systems furnish data for obtaining definite partial pressures of pure alc. vapor at 25° . O. A. NELSON

Methods to determine vapor pressure. VAPOR PRESSURE COMMITTEE, CALIFORNIA NATURAL GASOLINE ASSOCN. *Oil & Gas J.* 27, 186, 188, 190, 209, 210, 212, 214(1929). Five methods for detg. vapor pressures are compared. It is concluded that the most consistent of the methods in general use is that of the Bureau of Explosives. The principle of allowing only negligible evapn. as embodied in the Gard and Wade-Campbell bombs is believed to be correct and may be developed further.

M. B. HART

Saturated vapor pressure and latent heat of vaporization of liquids. M. LEVAT. EZERSKII. *J. Russ. Phys. Chem. Soc.* **60**, 743-63(1928).—For all liquids the relation between satd. vapor pressure and temp. may be expressed by the equation (i); $p = p_0 \times 10^{\alpha\tau}$, where p_0 is the vapor pressure at the f. p. of the soln., α is a const., characteristic of the given liquid, and $\tau = \delta/T$, where δ is the temp. above the m. p. and T is the abs. temp. The value of α can be calcd. from the equation $\alpha = (\log p_2 - \log p_1)/(\tau_2 - \tau_1)$. Equation (i) may be substituted in the Clapeyron-Clausius equation, $d \log p / dT = \lambda/RT^2$, from which the equation $\lambda = m\alpha RT_0$ is derived, m being the conversion factor to natural logarithms, α the above const., and T_0 the f. p. of the given liquid. Values of λ calcd. from this equation are in good agreement with expt., except in those cases where the vapor contains assoc. mols. B, C A

Measurement of the viscosity of fluids. R. O. BOSWALL. *J. Mun. Coll. Loh. Manchester* **13**, 10-21(1928).—A description of a robust viscometer giving continuous readings of the viscosity of fluids under viscous flow. The fluid under examn. passes through a special nozzle from one reservoir to another, vertically below it, through a narrow tube of uniform bore. These reservoirs are fitted with pressure gages and the viscosity of the fluid is obtained from readings of the pressures in the reservoirs, and by making reference to exptl. calibration charts on which the viscosity is expressed as a function of the ratio of the pressures in the reservoirs and of the d. of the fluid B, C A

Equal viscosities. II. W. HERZ. *Z. anorg. allgem. Chem.* **173**, 411-2(1928), cf. C. A. **19**, 3392.—It is shown for 18 liquids that the ratio of the d. at the temp. at which the viscosity is 0.0040 c. g. s. unit to the d. at the critical temp. is approx. a const. The recorded ratios vary from 2.739 to 2.967. B, C A

The Joule-Thomson effect and internal friction of fluids. MARIE KOSINSKA. *Compt. rend.* **187**, 1037-9(1928).—When a fluid moves under pressure, η (the coeff. of internal friction) is increased by the factor $(2 - T\alpha)$ due to the heat of the Joule-Thomson effect, where α is the expansion coeff. at const. vol. E. G. VAN DEN BOSCH

Internal friction of highly viscous substances. H. LEY AND U. KIRCHNER. *Z. anorg. allgem. Chem.* **173**, 395-410(1928).—Closely concordant results for the viscosity of glycerol have been obtained by the transpiration method and by measuring the rate of fall of glass beads through a column of the liquid in a specially constructed app. The mean value of η at 0° is 120.38 and at 20° 14.56 c. g. s. units. In order to det. the effect of mol. configuration on the internal friction (viscosity) of liquids, the value of η for various stilbene derivs. has been detd. at temps. below the true m. p. i. e., in the supercooled viscous state. In the homologous series of α -alkoxyphenylstilbenes the viscosity decreases logarithmically with rise of temp. and increases in the order butoxy-, propoxy-, methoxy-, ethoxy-phenylstilbene, indicating that the side chain of the higher homologs is oriented in the direction of the main groups and thus allows the mols. more readily to slide over one another. The introduction of a second methoxyl group into the mol. of the methoxy compd. to give α -(*p*-methoxyphenyl)-4-methoxystilbene causes a large increase in the viscosity owing to the enlargement of the mol. in two directions. This compd. crystallizes only with great difficulty and readily forms a thick sirup. The α -alkoxyphenylstilbenes are readily obtained by heating with concd. formic acid the phenylbenzyl-*p*-alkoxyphenylcarbinol produced by treating Mg benzyl chloride with the corresponding *p*-alkoxybenzophenone. The following derivs. of α -phenylstilbene are described: α -*p*-methoxyphenylstilbene, b. 240-242°/14 mm., d_4^{25} 1.1015, n_D^{25} 1.6060; α -*p*-ethoxyphenylstilbene, m. 76°, b. 242-244°/14 mm., d_4^{25} 1.0829, n_D^{25} 1.6536; α -*p*-propoxyphenylstilbene, m. 69°, b. 248-250°/14 mm., d_4^{25} 1.0676, n_D^{25} 1.6437; α -*p*-butoxyphenylstilbene, m. 82-83°, b. 259-260°/14 mm., d_4^{25} 1.0551, n_D^{25} 1.6333; α -*p*-methoxyphenyl-4-methoxystilbene, m. 64°, b. 260-262°/14 mm., d_4^{25} 1.1269, n_D^{25} 1.6641. α -Phenylstilbene has d_4^{25} 1.0719 and n_D^{25} 1.6678. B, C A

Viscosity and orientation of flow. S. KYROPOULOS. *Physik Z.* **29**, 942 (1928). The technically refined lubricating oils, "Valvoline oils," are assumed to be composed of straight-chain paraffin hydrocarbons. Their typical viscosity-temp. curves are explained on the following assumptions: (1) The long-chain mols. of non-polar hydrocarbons have their elec. fields spread along the chain. They tend therefore to make felt-like mol. aggregates, which explains the viscosity of the heavier oils. (2) The surfaces of the solid bodies against which the oils flow in a viscosity measurement exert an orienting action on the mols. which is more pronounced as the chain increases in length. This effect decreases with temp. so that at high temps., the viscosities of long and short-chain hydrocarbons become nearly equal. G. CALINGBERT

Current standard of uranium oxide. R. JAEGER. *Z. Physik* **52**, 627-36(1928).—

An air condenser containing V_2O_5 will furnish a const. satn. current, which can be varied from zero to 5×10^{-10} amps. by means of a diaphragm. The standard is especially adapted to the use of compensation methods. GEORGE GLOCKLER

Hall effect in the experiments of Corbino. W. W. SLEATOR. *Physik Z.* 29, 584 5(1928); cf. *Ibid* 12, 561(1911).—Corbino's exptl. results are theoretically examined in the light of Sommerfeld's electron theory of metallic conduction. *Ibid* 628-9.—A theoretical investigation of the work of Corbino on the action on a disk carrying a current of a perpendicular magnetic field. It is shown that this arrangement with a circular plate gives the same value for the Hall const. as is obtained by the usual rectangular foil method. The question is attacked both by the classical method and by Fermi's statistics, and equations are derived which are in agreement with those of Sommerfeld (cf. *C. A.* 22, 1538). B. C. A.

The relation between dielectric constant of technical insulating material and frequency. PAUL BÖNING. Tech. Hochschule, Woosung, China. *Z. tech. Physik* 10, 20 3(1929).—In a previous article (*C. A.* 22, 3572) an equation $\epsilon' = \epsilon + (A/U) - (A/U)e^{-U}$ was developed. By assuming that the "supplementary ions," ions from the dielec. medium, travel over a distance d' during each a. c. period with d' a fraction of d the electrode distance, d'/d being proportional to $fEdt$ over half a period, it is now called that ϵ' , the dielec. const., is $\epsilon + (A/\omega) - (B/\omega^2)$ (ω is the frequency of a. c.). Up to the value $\omega = -(2B/A)$, ϵ' will be const. and equal to ϵ the d. c. value, because $d' = d$, from there on ϵ' drops. Exptl. results of other authors seem to agree with the equation. ϵ' always drops with rising frequency. B. J. C. VAN DER HOEVEN

Study of Faraday effect. J. BECQUEREL AND W. J. DE HAAS. *Z. Physik* 52, 678-94, *J. phys. radium* 9, [vi], 346-56(1928). Former investigations (*C. A.* 2, 1778) have shown that certain minerals of the rare earth group have a large rotatory power of paramagnetic origin. The law connecting rotatory power and field was studied. It was to be expected that at very low temps. rotatory power would no longer be proportional to the field. This was the case with the mineral tysonite; at the temp. of liquid He the following law was found: $\rho = \rho_\infty \tan [(S_\infty H)/(RT)]$, where ρ = rotatory power, ρ_∞ = satn. value of rotatory power, S_∞ Bohr magneton, H = magnetic field in gaussess, R = gas const., T = abs. temp. The satn. value ρ_∞ of the rotatory power is a function of the wave length (rotatory dispersion) and also of temp. The above law is complete proof of the existence of a paramagnetic rotatory power. The form of the law is in accord with theories of Lenz and Ehrenfest (*C. A.* 15, 628, 2782). G. G.

Crystallization of mesomorphic substances in the magnetic field. Obtaining a solid with oriented molecules. G. FOEX. *Compt. rend.* 187, 822-3(1928).—The mol. orientation of the solid, prepd. by almost completely melting *p*-azoxyanisolephenetole in a magnetic field and allowing it to cool, is the same as that of the oriented nematic phase produced as a result of fusion. Crystn. of the smectic phase of ethyl *p*-azoxybenzoate in a magnetic field also gives an anisotropic solid, but the diamagnetism is stronger in the direction of the orientation field than perpendicular to the field. ALBERT L. HENNE

Experiments on a ferromagnetic compound of manganese and arsenic. L. F. BATES. University College, London. *Phil. Mag.* [7], 6, 593-7(1928).—Expts. are described which show the behavior of the p. d. between a ferromagnetic substance, consisting of equal parts of Mn and As, and a soln. contg. a Mn ion. Pronounced changes occur as the substance passes through its magnetic critical temp. (cf. *C. A.* 22, 1267). I. H. REYERSON

The temperature coefficient of the magnetic susceptibility of glass. W. GERLACH AND N. LITTLE. Univ. Tübingen. *Z. Physik* 52, 464-5(1928).—Various glasses (Thüringer, Hartglass, Pyrex and colored glasses) have large temp. coeffs. of susceptibility, which must depend upon the paramagnetic susceptibility of the materials, since their diamagnetic susceptibility is independent of temp. GEORGE GLOCKLER

Capacity measurements by means of piezoelectric oscillators and resonators. G. A. KRANDSKII. *Z. Physik* 52, 743 5(1928).—The circuits are described and the necessary equations given. GEORGE GLOCKLER

Measurement of the reflective power of opaque minerals and of very refringent transparent minerals. J. ORCEL. *Compt. rend.* 187, 1055-7(1928).—Since the absolute reflective power of several metals and isotropic minerals is known O. proposes to use some of them, e. g., diamond and Pt, as standards, using the photo-electric battery previously proposed by O. Values for stionite and molybdenite are given. S. L. B. E.

Linear thermal expansion of calcite. SHUKUSUKE KOZU AND KOICHI MANI. Tohoku Imp. Univ. *The Earth*, 10, 172-8(1928).—The thermal expansion of calcite in the directions parallel to the principal and transverse axes was measured with a differ-

ential dilatometer at temps. up to 1000°. Dissocn. of calcite begins at 800°. The axial ratio detd. from the linear thermal expansion agrees with that measured with a reflection goniometer up to the 4th decimal place.

Calcite and aragonite. CHARLES H. SAYLOR. *J. Phys. Chem.* 32, 1441-60(1928); cf. *C. A.* 22, 4302. E. J. C.

Blue rock salt. F. C. GUTHRIE. Univ. of Liverpool. *Nature* 123, 130(1929) — Blue rock salt, natural or artificial, appears from its heat of soln. to have a slightly greater energy content than the colorless variety. The difference is too small to be measured quant. On heating the blue salt to 350°, a distinct glow was observed, after which the salt was colorless. The colorless salt shows no glow under the same conditions. In dissolving the blue salt, no light or radiation could be detected by a panchromatic plate. On purifying NaCl an alkaline product was always obtained when the salt was fused in air in a Pt crucible, contrary to statements in the literature.

G. CALINGAERT
Diffusion and membrane potentials. IV. A comparison of anion and cation effects. E. B. R. PRIDEAUX. *Trans. Faraday Soc.* 25, 20-3(1929); cf. *C. A.* 21, 3792.—A parchment paper membrane was interposed between solns. of the same weak org. acid, base, or a salt of one of them, in two different concns. The p. d. between the solns. differed in general from the diffusion potential. The ratios, E_m/E_d , of the membrane potentials and the diffusion potentials for 0.1 *N* and 0.01 *N* solns. of the electrolytes investigated are as follows: K benzoate 1.68, K phenylacetate 1.53, piperidine-HCl 0.32, AcOH 1.20, piperidine (hydroxide) 1.10. Since the membrane increases the potential with a salt with a relatively slow anion, and decreases the potential with a salt with a relatively slow cation, the membrane retards the anion more than the cation in both salts. This supports the view that parchment is negative. With AcOH, only a slight increase in potential is effected, probably because the H⁺ discharge slightly the neg. charge on the membrane. With piperidine, a diminution was expected, since the neg. charge should be increased by the OH⁻, and these ions should be retarded more than the cations. Instead, a slight increase was found. M. W. SYMONS

Supermolecular state of polymerized substances in relation to thin films and interfaces. S. E. SHEPPARD, A. H. NIETZ AND R. L. KEENAN. Eastman Kodak Co. *Ind. Eng. Chem.* 21, 126-7(1928).—The mol. condition of rubber, cellulose nitrate, cellulose triacetate, cellulose diacetate, and gelatin was studied. Each was dispersed in a suitable suspension medium, petr. ether, acetone, CHCl₃ or H₂O. A drop of the suspension was permitted to spread on a clean Hg surface. When the dispersing liquid had evapd. the area covered by the dispersed substance was measured and its thickness calcd. The limiting thicknesses in A. U. were: rubber 1.5, cellulose nitrate 2.50-5.00, cellulose triacetate 9.85, cellulose diacetate 3.8-4.2, gelatin 7.0. The behavior of these substances agrees with Staudinger's conception of extended chains of atoms held by homopolar primary valences. The chains may be bound together by forces varying from those of van der Waals to those of electrostatic constraints. Solvents may bring about incipient dissocn.

F. E. BROWN
The electric charge of colloidal carbon. H. R. KRUYT AND G. S. DEKADT. Univ. Utrecht. *Kolloid Z.* 47, 44(1929).—Adsorptive charcoal, even when ash free, may show a pos. or a neg. elec. charge. Heated to 1000° in CO₂ or *in vacuo* C becomes pos. in H₂O and shows little tendency to adsorb NaOH. Heated to 400° in O₂, it becomes neg. and adsorbs NaOH. It is suggested that this is due to the formation of a C-O complex on the surface, preliminary to the formation of mellitic acid. G. C.

The area of the internal surface of charcoal as determined by the adsorption of normal aliphatic alcohols from aqueous solution. W. E. GARNER AND F. L. T. KINGMAN. *Trans. Faraday Soc.* 25, 24-9(1929); cf. *C. A.* 21, 2208. In a previous paper, the adsorption was detd. by measuring the concn. of alc. in the soln. from the surface tension (bubble method). On the basis of a break in the adsorption isotherm at 0.0005 g. mols. of adsorbed alc. per g. of charcoal, certain deductions were made regarding the internal surface of the charcoal. In the present paper, analyses of the solns. were made with the Zeiss interferometer, and no breaks were found in the adsorption isotherms for butyl alc. The discrepancy probably has to do with ash content of the charcoal, and the authors distrust their results at low concns. by the surface-tension method. In the interferometer measurements, corrections were made for the error due to dissolved salt. Both evacuation and admitting air at high temps. increased the adsorption of the charcoal used (Norite, 0.2% ash after purification). A photomicrograph shows the porous structure of charcoal. The total computed pores is obviously much less than the total area of the charcoal. M. V.

The kinetic theory of absorption. THADÉE PĄCZALSKI. *Compt. rend.*

(1928).—For the absorption which takes place when a porous substance is placed in a gas the following equation is developed: $T/T_0 \leq \{l_0/4r[1 - (r/l_0)]\}^{(\gamma-1)/\gamma}$, where l_0 = mean free path of gas mols., r = radius of the porous tube, and γ = the ratio of the sp. heats.

E. G. VAN DEN BOSCHE

The adsorption of fluoride ions. BUN-ICHI TAMAMUSHI. Kaiser Wilhelm Inst., Berlin. *Kolloid Z.* 47, 58-60(1929).—The adsorption of F^- and Cl^- from KF and KCl and from HF and HCl solns. by sugar C is compared. In spite of the greater hydration of the F^- , it is more strongly adsorbed than Cl^- . This is explained by a displacement of the equil. at the surface of the coal, favoring the formation of complexes in the HF soln.

G. CALINGAERT

Measurements of the albedo of artificial mists. ERICH REGENER. Tech. Hochschule, Stuttgart. *Z. physik. Chem., Abt. A*, 139, 416-24(1928).—Measurements are described of the diffuse reflective power of mists of SO_3 , paraffin oil and NH_4Cl produced in the presence of CO_2 . A Martens polarisation photometer was used, a gypsum plate, whose albedo was assumed as 1, being taken as standard. The diffuse reflective power of these mists for sunlight incident at angles of $30-60^\circ$ increases with the concn. of particles, attaining a max. for very dense mists at which the reflective power is nearly equal to that of gypsum. The appearance of a layer of smaller concn. over the dense mist surface immediately reduces the albedo. Dense SO_3 mist overlaid with a more diffuse layer shows an albedo similar to that of natural clouds. W. WEST

So-called rhythmic crystallization. F. BERNAUER. *Neues Jahrb. Min. Geol., Abt. A, Beil.-Bd.*, 56, 342-56(1927-8); cf. *C. A.* 22, 4293.—Rhythmic crystn. phenomena were studied in melts of benzophenone, benzoic acid, benzoin, hippuric acid, santonin, salicylic acid, sulfonal, malonamide, antipyrine, benzonaphthol, asparagine salts, diamionaphthalene, and *m*-diethylaminophenol. The causes for the phenomena are presented in a series of drawings of growing crystals.

J. F. SCHAIER

Combining power of chromic oxide sol with acids and bases. R. WINTGEN AND H. WEISBECKER. *Z. physik. Chem.* 135, 182-98(1928).—The fact that acids and bases have affinity for chromic oxide sol may be due to adsorption or salt formation. The exptl. data agree within the limits of error with equations based on hydrolysis. The conception of chromic oxide sol as a colloidal soln. of an amphoteric electrolyte is confirmed by the fact that the isoelec. point observed agrees with that calcd. from the dissociation consts. of acid and bases. The adsorption isotherm allows results to be obtained which are in tolerably good agreement with exptl. values.

B. C. A.

Action of α -particles on colloidal solutions of gold. J. E. MAISIN. *Ann. soc. sci. Bruxelles* 48B, 48-53(1928).—The flocculation of a Au sol, contg. 0.014 g./l. and prepd. by the method of Zsigmondy, by the α -particles from Rn has been followed by observations of the Tyndall effect in a specially designed app., which is described. The curve obtained by plotting the relative lowering of the Tyndall effect against the quantity of Rn used for coagulation rises somewhat to an arrest and then steeply, indicating a period of induction followed by coagulation proper.

B. C. A.

Electric moment of colloidal particles of vanadic anhydride. J. ERRERA. *J. phys. radium* [6], 9, 307-9(1928).—The elec. moment of V_2O_5 is 415×10^{-18} , a value much higher than that of many other mols.

L. D. ROBERTS

Colloidal chemistry in the system: colloidal ferric hydroxide-hydrochloric acid-water. I. ERICH HEYMANN. Univ. Frankfurt. *Kolloid Z.* 47, 48(1929).—The aging of $FeCl_3$ solns. corresponds to hydrolysis. After long standing, a true equil. is reached between $Fe(OH)_3$, HCl and $FeCl_3$, accompanied by adsorption of HCl on the colloidal $Fe(OH)_3$. The colloidal particles formed when $FeCl_3$ is dissolved in H_2O are dispersions of oxychlorides high in Cl. On aging, they unite to similar products lower in Cl, under the influence of the equil. of the primary hydrolysis. If $Fe(OH)_3$ behaves as a sep. phase the ratio $[HCl]^2/[FeCl_3]$ must be const. This is the case only approx., an increased concn. of $Fe(OH)_3$ corresponding to an increased $FeCl_3$ concn. Particle size also affects the equil., the large particles corresponding to lower $FeCl_3$ concns. Systems which have attained equil. by ageing of $FeCl_3$ solns. show more Cl in the $Fe(OH)_3$ than systems prepd. by mixing $Fe(OH)_3$ with HCl. The addn. of $Fe(OH)_3$ to $FeCl_3$ solns. greatly accelerate the rate of slow hydrolysis.

G. CALINGAERT

A new method of preparation of colloidal copper. SHINJIRO ISHII. *Kyoto Imp. Univ. J. Phys. Chem.* 2, 65-73(1928).—When Cu_2O obtained by reducing Fehling soln with glucose is suspended in aq. gelatin soln. and treated with H_2SO_4 in an atm. of H_2 , a violet colloidal soln. is obtained. When HNO_3 is used instead of H_2SO_4 the soln. is brownish red. The qual. examn. shows the product to be Cu, not Cu_2O . The radii of the particles, detd. by ultramicroscopic count and from measurement of the velocity

of sedimentation, ranged from 9 to $8 \times 10 \mu\mu$. The Cu content of the soln. was measured by oxidizing the colloid and detg. the Cu concn. colorimetrically; the original soln. contained 2×10^{-4} g. Cu per cc.

K. SOMERVA

Study of the quantity and nature of the protecting action of colloids. SUN OGATA. Hokkaido Imp. Univ. *Hokkaido J. Med.* 6, 251-8(1928).—To det. the min. quantity of NaCl, BaCl₂ and FeCl₃ which is necessary to ppt. colloidal Au, solns. of a definite quantity of the salts in varying quantities of H₂O were added to 1 cc. of colloidal Au. The Au pptd. when the concn. of NaCl was greater than 0.032 N, of BaCl₂ greater than 0.001 N; and of FeCl₃ greater than 0.00124 N. Then in order to det. the quantity of glue necessary to protect the sol, a mixt. contg. various quantities of 0.0001% glue soln. and H₂O and a slightly larger quantity of the salts than the threshold value was added to 1 cc. of the colloidal Au soln., the total vol. being 10 cc. Protection was observed when the concn. of glue was greater than 0.00004% for both the NaCl and BaCl₂ soln., and greater than 0.00029% for FeCl₃. But when the same expt. was repeated with acetate or with a phosphate buffer, it was observed that for all 3 salts the threshold value of the glue soln. was the same. Hence O. concludes that the larger threshold value of the glue soln. obtained with the FeCl₃ soln. is due to hydrolysis of FeCl₃, and that when this is prevented, the same amt. of the glue soln. is required, irrespective of the kind of salts. This conclusion was also supported by a similar expts. made with the colloidal Cu ferrocyanide and mastics, the salts used being NaCl and FeCl₃.

K. SOMERVA

Critical potential in the coagulation of colloids by electrolytes. J. N. MUKHERJEE AND S. P. RAICHOU DHURI. *Nature* 122, 960(1928).—If rates of cataphoresis for As₂S₃ sols are plotted against concn. of added electrolyte, curves are obtained which are not in accord with the current view of the coagulation of hydrophobic colloids when the potential of the elec. double layer is decreased. This potential is directly proportional to the cataphoretic speed. Two types of curves are found for sols prepd. in different ways. In one, the cataphoretic speed diminishes regularly with increasing concn. of electrolyte, but in the other type may show either a min., or speeds increasing continuously with concn. These observations show definitely that there is no crit. potential at which coagulation takes place.

W. WEST

Pseudomorphism of gels. M. KRÖGER AND K. FISCHER. Univ. Leipzig *Kolloid Z.* 47, 5-10(1929).—Gels of any metal hydroxide can be prepd. by a suitable technic. Mg(OH)₂ gels are prepd. by adding a small amt. of H₂O to a satd. (3%) soln. of Mg(OMe)₂ in MeOH. The rate of formation of the gel is increased by alkalis. The gel is stabilized with glycerol, glycol or similar compds. Its consistency can be varied by varying the amt. of glycerol added. Pseudomorphic gels contg. the hydroxides of the following metals can be obtained by causing pptn. in the presence of the corresponding nitrates: Cd, Zn, Ni, Al, Co, Pb, Hg, Cu, Mn, Fe. Similar gels are also prepd. from Ca(NO₃)₂ and Ba(NO₃)₂ alone. The limit of absorption of the gels in the ultra-violet varies from 2300 Å. U. to 3100 from pure Hg gel to Mg + Fe, the various metals ranging themselves in the order given above.

G. CALINGAERT

The elastic properties of acid and alkaline silicic acid gels and their internal structure. M. KRÖGER AND K. FISCHER. Univ. Leipzig *Kolloid Z.* 47, 10-4(1929).—The elasticity and plasticity of acid, neutral and alk. SiO₂ gels are measured by bending sticks of the gels. For samples of the same age, the elastic properties of the various gels are very similar. The plasticity and shrinkage increase continuously from the acid to the alk. gels.

G. CALINGAERT

The plastic properties of gels, their temperature coefficient and the method of making lenses of gels. M. KRÖGER AND K. FISCHER. Univ. Leipzig *Kolloid Z.* 47, 14-9(1929).

G. CALINGAERT

Consistency of animal glue. DON BROUSE. *Ind. Eng. Chem.* 21, 242-7(1929).—The consistency of solns. of animal glue was studied with respect to the influence of temp., concn. and glue grade within the range of wood-working practice. The viscosity of the solns. tested is a hyperbolic function of temp. As the grade of the glue tested or the concn. is changed the position of the viscosity-temp. curve changes with respect to the axes but its shape remains the same. Within a very small range of temp. solns. of animal glue change from viscous to plastic. The change is a unique property of the gelatin point and provides a satisfactory means of defining and measuring the gelation point independently of the app. used and the judgment of the operator. The findings provide fundamental principles for glue-room technic.

DON BROUSE

The effect of velocity on the viscosity of dispersoids. G. W. SCOTT BLAIR. Soils Physics Dept. Harpenden, England. *Kolloid Z.* 47, 76-81(1929).—When a dispersoid flows through a capillary, the curve of pressure applied vs. rate of flow is a parabola

An equation derived from theoretical considerations fits well the existing data.

G. CALINGAERT

Viscosity of agar and gelatin solutions in presence of alcohols and salts. A. JANEK AND B. JIRGENSONS. *Latvijas Farm. Zurn.* 1927, No. 3, 9 pp.; cf. *C. A.* 21, 3516; 22, 3564.—Addn. of an alc. increases the viscosity of agar solns.; addn. of a salt reduces it whether alc. is present or not. Gelatin behaves similarly, but the viscosity of alc. gelatin soln. is lowered by KBr, and raised by K_2SO_4 or K tartrate. B. C. A.

Photometric and electrometric measurements of gelatin behavior. M. BRIEFER. *Ind. Eng. Chem.* 21, 266–70 (1929).—By investigating the relation of the isoelec. point of 1% gelatin solns. to their turbidity and jelly consistency, it is found that the characteristics of the gelatin vary with the previous chem. treatment of the raw material and not with its biological source. Any raw stock if originally conditioned with lime will yield a gelatin with max. turbidity on the acid side of the p_H scale. If the same raw materials are originally conditioned with acid the isoelec. point of the gelatin will be on the alk. side. After the original acid or alkali treatment, the ionic state of the animal skins is not changed with respect to the isoelec. point by subsequent treatment with electrolytes. In mixts., the basic gelatinate predominates in reference to turbidity and the isoelec. point and the acid gelatinate with respect to jelly consistency. Gelatin with its isoelec. point in the alk. region may be de-ashed just as can be done with gelatin with the isoelec. point in the acid region. D. B.

A lecture or laboratory demonstration of colloid cataphoresis. WILLARD H. MADSON AND FRANCIS C. KRAUSKOPF. *J. Chem. Education* 6, 334–5 (1929). E. H.

Studies in the qualitative reaction of proteins. III. Study of the ionic series. SUN OGATA, Hokkaido Imp. Univ. *Hokkaido J. Med.* 6, 425–36 (1928); cf. *C. A.* 23, 1147. The quantity of the neutral salts $(NH_4)_2SO_4$, NaCl, KCl, NH_4Cl , $BaCl_2$ and $CaCl_2$ necessary to ppt. gelatin, and the effect of other salts upon the above quantity were detd. The activity of Cl^- in the clear supernatant soln. after pptg. mixts. of gelatin and the above salts with AcOH was measured. Next the effect of these salts upon the soly. of NH_4Cl , and their soly. in alc. were examd. and from the exptl. data it was concluded that the effect of these salts upon the pptn. of gelatin is in contrast with their effect upon the soly. of NH_4Cl . The pptn. of proteins by neutral salts therefore depends upon their electrolytic nature. K. SOMEYA

Mineral "trees." Their formation and significance. MAURICE COPISAROW. Univ. Manchester, England. *Kolloid Z.* 47, 60–5 (1929). The tree-like appearance of slowly formed ppts. is not limited to the well-known cases. The following compds. gave "trees": $CaCO_3$, $CaSO_4$, Ca oxalate, $Ca_3(PO_4)_2$, $BaCO_3$, $BaSO_4$, $BaCrO_4$, BaC_2O_4 , $SrCO_3$, $SrSO_4$, SrC_2O_4 , $Cu_3(AsO_4)_2$, $Co_2(AsO_4)_2$, $Cu_2(AsO_4)_2$, $Mg_3(AsO_4)_2$, Cu, Co and Mg stannates, Ag_2CrO_4 and $CoCO_3$. Many other salts should also be able to give trees. Their formation may bear some relation to that of ivory, mother of pearl, etc. G. CALINGAERT

Solution and hydration velocities of kieserite. B. UEHLER. *Mitt. Kali-Forschungs-Anst.* 1927, 45 69.—The velocity of soln. of a particular specimen of kieserite is increased by diminution of grain size only down to the natural fineness. Generally, kieserite dissolves the more rapidly the purer it is; anhydrite, however, has no marked effect. The soln. velocity in a soln. unsatd. with respect to $MgSO_4$ increases with rise of temp.; the hydration velocity in a soln. satd. with respect to $MgSO_4$ becomes maximal at about 40°, and then falls to zero at 68°. In connection with the effect on the velocity of soln. of the presence of various salts in the solvent, 3 groups are differentiated, (a) dil. solns. of alkali chlorides and sulfates, in which the velocity is greater than in water, (b) concd. solns. of alkali chlorides and sulfates, $MgCl_2$, and satd. $MgSO_4$ solns., in which the velocity is smaller than in water, (c) equil. solns. and concd. $MgCl_2$ solns. in which the velocity is smaller than the velocity of hydration in satd. $MgSO_4$ soln. For the evaluation of a kieserite (a) the apportionment between various grades of fineness, and (b) the content of impurities (particularly sludge-forming) are important. In 4 cases grinding increased the soln. velocity by 20–400%. The tech. significance of the results is discussed. B. C. A.

Azeotropy in the binary systems alcohols-hydrocarbons. M. LECAT. *Ann. soc. sci. Bruxelles* 48B, ii, 105–18 (1928); cf. *C. A.* 22, 1712.—Azeotropic data are given for the 344 systems formed by 29 alcs. and 39 hydrocarbons. Equations of the type $\delta = a - b\Delta + c\Delta^2 - d\Delta^3$, where δ is the azeotropic lowering, Δ the difference in b. p. of constituents, and a , b , c and d are consts., are given for the various alcs. studied. The value of δ decreases rapidly for an equal interval Δ as a series of monohydric alcs. is ascended. B. C. A.

Azeotropy in binary alcohol-ester mixtures. M. LECAT. *Ann. soc. sci. Bruxelles*

48B, ii, 1-16(1928); cf. *C. A.* 22, 1712.—The relation between the azeotropic lowering of b. p. and the difference in b. p. of the constituents for binary alc.-ester mixts. is discussed. For systems contg. MeOH the relation is $\delta = 9 - 0.88 \Delta + 0.033 \Delta^2 - 0.000485 \Delta^3$, and similar expressions hold for other alcs. The azeotropic lowering diminishes as the mol. wt. of the alc. increases. Isomeric alcs. have the same δ/Δ relationship. Esters of mineral acids show greater azeotropic lowering than org. esters. Acetates give smaller lowering than formates and carbonates. Many of the systems show chem. reactivity, particularly at the b. p. B. C. A.

Binary azeotropes. X. M. LECAR. *Ann. soc. sci. Bruxelles* 48B, i, 13-22(1928); cf. *C. A.* 22, 2722.—A further list is given of the properties of mixts. comprising 117 pos. azeotropes (the b. p. of the azeotrope is lower than that of either component), neg. azeotropes, 4 eutectics, 57 nonazeotropic systems, and 4 systems where combination takes place. In each of the neg. azeotropes a phenol is present. Acetamide is a constituent of the mixts. which show the greatest azeotropic lowering of b. p. It is pointed out that in mixts. of an ester of a mineral acid and an alc., double decompn. takes place, and the reaction proceeds in the direction of production of the more volatile ester. XI. *Ibid* 54-62.—The data for 257 binary systems, azeotropic (pos.), eutectic, and euzotropic are tabulated. B. C. A.

Elevation in boiling point of saturated solutions at different atmospheric pressures. A. MITTENBERG. *Ukraine Chem. J.* 3, Sci. Part 119-23(1928).—The elevation of b. p., ΔU_1 , of satd. NaCl solns. at pressures of from 0.04-0.8 atm. is calcd. from the formula $\Delta U_0/\Delta U_1 = U_0^2 C_0 L_1/U_1^2 C_1 L_0$, where ΔU_0 is the elevation at 1 atm., U_0 and U_1 are the b. p. of the pure solvent at 1 atm. and at the given pressure, C_0 and C_1 the concns. of salt, and L_0 and L_1 the corresponding latent heats of vaporization. The calcd. results are in satisfactory agreement with those found by expt. B. C. A.

Determination of molecular weights by the Barger-Rast method. A. FRIEDRICH. *Mikrochem.* 6, 97-102(1928).—The original method of Barger (*J. Chem. Soc.* 86, 286(1904)) is shown to give more satisfactory results than the modification proposed by Rast (*C. A.* 16, 519). An alternative procedure is to use a tube drawn out to a capillary at both ends; this is half filled with the standard soln. by suction, a small air bubble is admitted, and the remainder of the tube is filled with the test soln. by continuing the suction. Both capillary ends are then sealed and the observation of the movement of the bubble is carried out as usual. Various precautions for obtaining accurate results are described and sources of error in the 3 modifications are discussed. B. C. A.

Ebullioscopic determination of molecular weights on small quantities of material. ALFRED RIECHE AND FRANZ QUERBERITZ. *Chem.-Ztg.* 52, 923-4(1928).—R.'s app. (*C. A.* 21, 2) is compared critically with that of Suchardo and Bobranski (*C. A.* 21, 3143). Directions are given for using the Rieche app. so as to improve the constancy of the b. p. obtainable with difficult types of solvents. For solvents of high b. p., such as AcOH, PhCl and pyridine, the app. should be protected by a heat insulating wrapping. When CHCl₃ is the solvent, it should be protected from light. Heating is best done by a bath having a temp. 30-40° higher than the b. p. of the solvent, and kept const. within 0.5°. The use of a heating bath minimizes the decompn. of easily decomposable solvents on the hot walls of the app. Cooling water should flow at a uniform rate. By using proper precautions, b. ps. const. to within 0.003° over a period of about 2 hrs. were observed with solvents of widely differing properties. R. H. LOMBARD.

Some methods of determining Avogadro's number. ARTHUR A. SUNDER. *J. Chem. Education* 6, 299-307(1929). E. H.

Influence of glycoll upon the freezing-point depression. KAORU OGURA, TEI-ICHIRO SHITO AND SEISEI YAMANO. *Hokkaido Imp. Univ. Hokkaido J. Med.* 6, 421-4(1928).—When 0.25 to 0.0625 *M* solns. of AcOH, H₂C₄O₄, or cane sugar are made 0.1 *N* with respect to KCl the f. p. of the soln. is depressed by 0.35-0.37°, which is the f. p. depression of 0.1 *N* KCl in pure water. But when H₂BO₃ or glycoll solns. are made 0.1 *N* with respect to KCl the f. p. of the soln. is depressed by only 0.32-0.33°. Combination between KCl and H₂BO₃ or glycoll is assumed. K. SOMEYA.

Calculation of the fugacities of a solution. G. VAN LERBERGHE. *Bull. sci. acad. roy. Belg.* [v], 14, 349-71(1928).—Mathematical. The formula for the fugacities of a soln. previously deduced (*Compt. rend.* 181, 851(1925)) may be derived by a simpler method. Analogous formulas applicable to special cases of soln. are derived by the asymptotic method of Donder (*C. A.* 19, 3044) and the application of these to the systems: CS₂-methylal, EtI-AcOEt, H₂O-H₂SO₄ are considered. B. C. A.

Thermodynamic activity and biologic action. The disinfectant power of the mercury ion and its activity. A. BENEDETTI AND G. B. BONINO. *Arch. sci. biol.*

(Italy) 12, 401-6(1928).—In a previous paper the authors showed that the concn. and activity of ions are two distinct quantities (cf. *C. A.* 22, 1082). Therefore, a given biologic action does not depend on the no. of ions or concn. alone but on their effective mass or activity. Paul and Krönig (*Z. physik. Chem.* 21, 414) concluded that the disinfectant power of a soln. of HgCl_2 is proportional to the no. of ions present, tacitly assuming that each ion has the same activity even though under different physico-chem. environment. The conclusion is erroneous because there exist in soln. ionic aggregates in which the interionic distances and forces vary in size and strength. The av. activity of Hg^{++} ions may be calcd. by Debye's statistical method. From cryoscopic measurements of HgCl_2 solns. of equal concn. but contg. different amts. of NaCl (which altered the interionic action and the activity of the Hg^{++} ion), an av. value of x was obtained from which may be calcd. approx. by means of Debye's formula: $\log_{10} f_{\pm} = -z^2 0.354 \sqrt{\gamma \phi(x)}$, the av. activity of Hg^{++} ions in soln. The results showed that the av. activity of Hg^{++} diminishes as the concn. of NaCl increases. The disinfectant properties of the Hg^{++} ion should diminish likewise. Paul and Kronig, who worked with solns. of similar compn., found that this is true. The no. of colonies of *B. anthracis* developed after 6 mins. exposure to the solns. is given below:

Concn.	No. of colonies	Activity of Hg^{++} ion
1 mol. HgCl_2 in 16 l. H_2O	8	3.4287×10^{-3}
1 HgCl_2 + 1 NaCl in 16 l. H_2O	32	1.9187×10^{-3}
1 HgCl_2 + 2 NaCl in 16 l. H_2O	124	1.2050×10^{-3}
1 HgCl_2 + 3 NaCl in 16 l. H_2O	228	0.9531×10^{-3}
1 HgCl_2 + 6 NaCl in 16 l. H_2O	803	0.4959×10^{-3}
1 HgCl_2 + 10 NaCl in 16 l. H_2O	1087	0.2755×10^{-3}

PETER MASUCCI

Affinity between asymmetric ions. I. S. W. BERGMAN. *Arkiv Kemi, Min. Geol.* 9, No. 34, 1-21(1926); cf. *C. A.* 22, 3083.—Cond. measurements at $18.0 \pm 0.2^\circ$ have been made with solns. of cinchonine *d*- and *l*-mandelates, cinchonine *d*- and *l*-tartrates, and quinine *d*- and *l*-camphorsulfonates. The values for Λ for each pair of diastereoisomeric salts were approx. equal. Measurements of $[\alpha]_{D_{250}}^{25}$ for cinchonine *d*-, *l*-, and *dl*-mandelates show that the values $[\alpha]_d - [\alpha]_l$ are about the same as $[\alpha]_l - [\alpha]_d$, and $[\alpha]_{D_{250}}^{25}$ the same as for NH_4 *l*-mandelate. There is thus no difference in affinity between optically active acids and bases (cf. Marekwald and Chwollies, *Ber.* 31, 783-90(1898)). The difference in solv. of diastereoisomeric salts is explicable in terms of the energy content of the crystal lattice, and the Bjerrum dissocn. theory affords a satisfactory explanation of the results. B. C. A.

Electromotive forces of uni-univalent halides in concentrated aqueous solutions. HERBERT S. HARNED. Yale Univ. *J. Am. Chem. Soc.* 51, 416-27(1929).—Measurements at 25° of cells of the type $\text{Ag} | \text{AgX} | \text{MX}(m) | \text{M}_2\text{Hg} | \text{MX}(0.1) | \text{AgX} | \text{Ag}$ contg. NaCl , NaBr , KCl and KBr were made. Activity coeffs. are calcd. from the e. m. f. results. E. G. VAN DEN BOSCHE

Influence of pressure on the potential of electrodes charged with hydrogen and on the current-potential curves. G. TAMMANN AND E. JENCKEL. *Z. anorg. allgem. Chem.* 173, 337-57(1928).—In the cell $(\text{Pd})\text{H}_2 | 2 \text{ N } \text{H}_2\text{SO}_4 | \text{CdSO}_4 | \text{Cd}$ the value of $\Delta E/p$ decreases slightly with increasing pressure, the rate of decrease being the smaller the higher is the temp. Similar results are obtained with the cell $(\text{Pt})\text{H}_2, 0.1 \text{ N } \text{HCl} | \text{CdCl}_2 | \text{Cd}$. The effect of pressure on the potential of Pt electrodes in oxidizing and reducing solns. has been measured; the curves are in all cases approx. straight lines. In FeCl_3 and FeCl_2 solns., pyrogallol, and quinhydrone the potential becomes less noble with increase of pressure and in K ferro- and ferri-cyanide solns. more noble. The potential of the quinhydrone electrode becomes more pos. with addn. of neutral salts, LiCl having the most pronounced effect; this effect, however, is relatively small. The potential of Pd feebly charged with H becomes more noble on keeping in consequence of diffusion of the surface H into the body of the metal. The effect of pressure on the current-e. m. f. curves of the cells $\text{Ni} | \text{KOH} | \text{Ni}, \text{Hg} | \text{H}_2\text{SO}_4 | \text{Pt}, \text{Pb} | \text{KOH} | \text{Pt}, \text{Pb} | \text{H}_2\text{SO}_4 | \text{Pt}$ and $\text{Pt} | \text{ZnSO}_4 | \text{Pt}$ is shown in a series of curves; in all cases increase of pressure gives a higher e. m. f. for the same current. B. C. A.

Overpotentials produced by films of hydrogen less than one molecule thick. A. L. MCAULAY AND D. P. MELLOR. *Nature* 122, 170-1(1928).—With a Hg cathode, NH_4SO_4 as electrolyte, and currents of the order of 1 micro-amp./sq. cm., overpotentials of 0.3-0.4 v. were produced when less than one eighth of a unimol. layer of H had been deposited. Complete elimination of O was essential.

Oxidation-reduction potentials. I. The ferric-ferrous electrode. STEPHEN POPOFF AND ADOLF H. KUNZ. Univ. of Iowa. *J. Am. Chem. Soc.* 51, 382-94(1929).—Measurements were made of the cell $Pt, H_2 | HCl | HCl + FeCl_3 + FeCl_2 | Pt$. A method for the reduction of liquid junction potential errors to a min. is given. The normal oxidation-reduction potential of the ferric-ferrous electrode was found to be -0.7476 v. ≈ 0.5 mv.

Derivation of reference values for the calomel electrode used in p_H measurements. D. H. CAMERON. Elk Tanning Co., Ridgway, Pa. *J. Am. Leather Chem. Assoc.* 24, 80-7(1929).—The "true" half-cell e. m. f. is the e. m. f. at any specified temp. measured relative to an arbitrary zero. The "reference" half-cell e. m. f. is used only when the electrode replaces a H electrode in a H concn. cell. The reference e. m. f. is such that when it is subtracted from the total e. m. f. of a cell consisting of the calomel electrode and a H electrode, the difference is the total e. m. f. that would be observed if the H electrode were combined with the normal H electrode at the temp. in question. This explains the statement that the e. m. f. of the normal H electrode is 0 at all temps. In calcg. the reference e. m. f. of the calomel half cell at different temps. it is assumed (1) that the e. m. f. of the normal H electrode is zero at 25°, (2) that H ion concn. of 0.1 N HCl is 0.0816 at 25° and (3) is const. over the range 15-30°. Reference values for the satd. KCl-calomel half cell are calcd. on these assumptions from the data of Fales and Mudge.

Hydrogen-ion determination by modified colorimetric method. D. H. CAMERON. Elk Tanning Co., Ridgway, Pa. *J. Am. Leather Chem. Assoc.* 24, 76-80(1929). To avoid the labor of prepg. the numerous and not very permanent color standards, C. proceeds as follows: First det. the approx. p_H value of the soln. by spotting. Then to 50 cc. in a Nessler tube, add exactly 1 cc. of a 1:5 diln. of the indicator stock soln. Place 25 cc. of the appropriate buffer soln. (0.1 M K H phthalate, 0.1 M KH_2PO_4 , or 0.1 M boric acid) in a second tube of exactly the same diam., add the same quantity of indicator, and titrate with CO_2 -free NaOH until an approx. match is obtained, then dil. nearly to 50 cc. and titrate to an exact match. The vol. of the standard need not be exactly 50 cc. if the 2 tubes are of the same diam. and the solns. are viewed vertically. Obtain the p_H value corresponding to the vol. of alkali added from tables (Clarke). As described, the method is limited to water-white solns. of p_H value 4-10 but is capable of extension to lower p_H values by the use of other buffers than those mentioned.

Revision of the theory of transfer resistance. E. NEWBURY. *Proc. Roy. Soc. (London)* A119, 686-9(1928).—A no. of expts. have been made with a new type of electrolytic cell, designed to eliminate the disturbing effect of the fall of potential through the electrolyte obtained with the type of cell used in previous work. The table showing the relation between transfer resistance and the concn. of the electrolyte, previously recorded (*Ibid* A111, 188(1926)), is found to be incorrect. It is now found that transfer resistance occurs only when a gas is being liberated at an electrode. It is independent of the concn. of the electrolyte and increases with rise of temp. The highest values are obtained with very low c. ds.; at high c. ds., transfer resistances become very small. The theory of the effect is discussed. It is suggested that transfer resistance is the elec. resistance of a film of gas over the electrode surface.

Dispersion of conductivity. H. SACK. *Physik. Z.* 29, 627-8(1928). A method is described for the detn. of the change of cond. of a soln. with the frequency of the current traversing it (cf. Debye and Falkenhagen, *C. A.* 22, 2705). The method depends on the fact that in a tuned circuit consisting of a self-inductance and a capacity with parallel resistance (in this case a condenser with a conducting liquid), any change in the resistance will produce a change in the current strength at resonance which can be measured. The results obtained are of the order of magnitude required by the theory.

The electrical conductivities of some uni-univalent salts in benzonitrile. Evidences for the incomplete dissociation of strong electrolytes and the applicability of the law of mass action to their dissociation. AUSTIN R. MARTIN. *J. Chem. Soc.* 1928, 3270-93.—The solutes were KI, NaI, LiI, LiBr and $AgNO_3$. The concns. varied from about 0.01 M to about 0.000015 M . The temps. were 0°, 25°, 40°, 55° and 70° with some observations at 40° and at 80°. More than 160 observed con-

ductivities are reported. The data agree fairly well with the equation $\Lambda_0 = \Lambda + XC^{0.5}$ and quite well with the equation $\Lambda_0 = \Lambda + AC^N$. In PhCN as well as in H₂O and MeOH, the values of Λ_0 for the iodides of the alkali metals increase with increasing at wt. and vol. The viscosity (η) of PhCN $\times 10^4$ was found to be: 194 at 0°; 124 at 25°; 100 at 40°; 87.6 at 50°; 82.6 at 55°; and 66.6 at 70°. $\Delta\eta$ is a const. for these solns. The ionic mobilities vary from Li, 17.8, to I, 29.5. By assuming (1) that the only resistance to the motion of ions at infinite diln. is the drag of the solvent and (2) that the magnitude of this drag is given by Stokes' law, the mean ionic radii (b) were calcd. The values of $b \times 10^8$ are: KI 2.57, NaI 2.88, LiI 2.96, LiBr 3.63, AgNO₃ 2.58. These values are between 0.5 and 0.08, the corresponding values calcd. from the theory of Debye and Hückel. The divergence increases in the order of mention. In Ostwald's diln. law ($K = \alpha^2/(1 - \alpha)v$), when v varies from 100 l. to 20000 l., the mean values of K are: KI 11, NaI 14, LiI 8, LiBr 0.32, AgNO₃ 0.40. The whole of the cond.-concn. curve can be described by a dissocn. governed by the law of mass action, the mobility of the resulting ions varying with their concns. because of the Coulomb forces between them, in the manner predicted by the Debye-Hückel-Onsager theory. In extremely dil. solns., dissocn. is complete.

F. E. BROWN

Chain reactions. MAX BODENSTEIN. Univ. Berlin. *Sitzb. preuss. Akad. Wiss.* 1928, 490-7.—A review.

ALBERT L. HENNE

Velocity coefficient of a homogeneous bimolecular gas reaction. R. G. W. NORRISH. *Nature* 122, 923-4 (1928).—The critical increment of the thermal reaction $2\text{NO}_2 \rightarrow 2\text{NO} + \text{O}_2$ is 33,200 when calcd. by Hinshelwood's method, and 32,000 when it is derived from the temp. coeff. The satisfactory agreement confirms the theory of kinetic activation.

ALBERT L. HENNE

The decomposition of ammonia on iron. A. MITTASCH, E. KUSS AND O. EMERT. I. G. Farbenindustrie A.-G. *Z. Elektrochem.* 34, 829-40 (1928).—The decompn. of NH₃ on Fe(CO)₅ and on Fe activated with K₂O and Al₂O₃ was studied below 400°. At the lowest temp. at which the reaction starts nitrides are formed and H is liberated. At a higher temp., the gas evolved contains also N in the proportion N:3H. On activated Fe, the formation of nitride and the evolution of the N + 3H mixt. are observed at lower temps. than with ordinary Fe. The reaction velocity was measured by the amt. of N liberated from Fe nitride formed as intermediate product. The decompn. of NH₃ is regarded as a two-step process: (1) metallic Fe and NH₃ give H and Fe nitride, (2) the latter decomposes into N and Fe. The second step is the slower one, and, consequently, it detcs. the velocity of the whole decompn. This second step is affected decidedly by temp. and by the presence of activators. Decompn. occurs almost exclusively on metallic Fe. Pure Fe, coarse Fe carbide and mixts. of Fe with various substances were tested as catalyzers. The active part of the catalyst is always Fe-Fe carbide (coarse or very fine, as obtained from Fe cyanide by reduction) never acts as a catalyst for the decompn. of NH₃. A method is described for detg. the active portion of a catalyst contg. Fe. A new gasometer was devised for the analysis and storage of gases in which the gases come in contact only with glass, porcelain and Hg. This gasometer is specially suitable for the analysis of very pure gases. A. L. H.

Autoxidation and antioxygenic action. XXXIII. Catalytic properties of antimony, bismuth and their derivatives, and some derivatives of vanadium. CHARLES MOUREL, CHARLES DUFRAISSE AND MARIUS BADOCHIE. *Compt. rend.* 187, 1092-6 (1928), cf. *C. A.* 23, 1561.—The metal, Sb and its O compds. have only slight activity in retarding the oxidation of C₆H₅CHO. Sb₂O₃ retards the oxidation of C₆H₅CHO, but accelerates the oxidation of styrene slightly. The halogen derivatives of Sb are usually very active. The chloride and bromide are good antioxygens for PrOH, acrolein, C₆H₅CHO, furfural and turpentine. The iodide has a similar action on all these compds., except turpentine, where it exerts prooxygenic influence. The oxidation of styrene is accelerated by the iodide (2 times), bromide (15 times), chloride (20 times). All halides of Sb are antioxygenic toward Na₂SO₃ in alk. soln. and prooxygenic in a slightly acid medium. (C₆H₅)₃SbCl is a good antioxygen for furfural, and a fair one for the oxidation of C₆H₅CHO, but has slight activity for Na₂SO₃; after an inactive induction period it is prooxygenic toward styrene, and prooxygenic toward Na₂SO₃ in acid soln. (C₆H₅)₃SbCl₂ is very effective in retarding the oxidation of furfural and either acid or alk. Na₂SO₃. but at a certain point of concentration it accelerates the oxidation

retards the oxidation of styrene but is of slight action with Na₂SO₃ in alk. soln. Bi₂O₃ greatly retards the oxidation of styrene, but that of turpentine and of Na₂SO₃ in alk. soln. weakly. The Bi(NO₃)₃, after an induction period, greatly retards

the oxidation of furfural as well as that of alk. and acid solns. of Na_2SO_3 , but is strongly proöxygenic toward styrene. BiCl_3 and BiBr_3 possess little or no activity in general although the chloride is strongly antioxygenic toward Na_2SO_3 in alk. soln., and is a first proöxygenic but finally antioxygenic in acid soln. BiBr_3 retards the oxidation of Na_2SO_3 in alk. soln. but greatly accelerates that of styrene. The iodide is generally very active and is a good antioxygen for $\text{C}_6\text{H}_5\text{CHO}$, furfural and PrOH ; with acrolein it exerts a good antioxygenic effect for the first few days, and then a rapid acceleration occurs; with styrene there is a rapid acceleration; the oxidation of Na_2SO_3 in alk. soln. is strongly retarded. $\text{Bi}(\text{C}_2\text{H}_5)_3$ effectively retards the oxidation of $\text{C}_6\text{H}_5\text{CHO}$, furfural, $\text{C}_3\text{H}_7\text{CHO}$ and alk. soln. of Na_2SO_3 ; it accelerates that of styrene, turpentine and acid soln. of Na_2SO_3 . $\text{Bi}(\text{C}_3\text{H}_7)_3$ and $\text{Bi}(\text{C}_4\text{H}_9)_3$ have about the same effects except that the latter is antioxygenic to styrene while the former is proöxygenic. $\text{Bi}(\text{C}_6\text{H}_5)_3$ is a good antioxygen for acrolein and furfural but only fair for $\text{C}_6\text{H}_5\text{CHO}$. It effectively retards the oxidation of styrene and accelerates that of turpentine after periods of initial activity. V_2O_3 , V_2O_5 , NH_4VO_3 and the VOCl retard the oxidation of Na_2SO_3 in alk. and acid solns. V_2O_5 accelerates the oxidation of $\text{C}_6\text{H}_5\text{CHO}$, turpentine and styrene and is also very effective for furfural and $\text{C}_3\text{H}_7\text{CHO}$. V_2O_5 and NH_4VO_3 are proöxygenic to $\text{C}_6\text{H}_5\text{CHO}$, $\text{C}_3\text{H}_7\text{CHO}$, furfural and styrene. The anhydride is effective for acrolein and turpentine but NH_4VO_3 is without action on turpentine. The oxychloride is antioxygenic to $\text{C}_6\text{H}_5\text{CHO}$, furfural, the alk. and acid solns. of Na_2SO_3 and, after a period of inactivity, to turpentine. It accelerates the oxidation of acrolein and styrene.

J. H. PERRY

A suggestion with regard to antioxygenic action. KENNETH C. BAILEY, Trinity College, Dublin. *Chemistry and Industry* 48, 35-6(1929).—The inhibition of oxidation of PhCHO by S or hydroquinone presents a similarity to the retarding effect of pyridine on the esterification of EtOH by AcOH (*C. A.* 22, 2919). This suggests that the auto-oxidation chain reaction takes place mostly on the walls of the vessel and on the surface of the liquid. The inhibitor is very active because it is coned. at those boundaries.

G. CALINGHEFT

The velocity constant of kinetic processes in heterogeneous systems as a function of temperature and intensity of agitation. WITALI HELLER. *Rozniki Chem.* 8, 465-73(473-4 French) (1928).—The study of solution of Sn and Cd in an aq. soln. of FeCl_3 , and of Mg in an aq. soln. of NH_4Cl showed that the velocity constant of these processes, calcd. according to the equation $K = (2.303 \nu/S \cdot \Delta t) \log [(a - x_1)/(a - x_2)]$, is a linear function of velocity of rotation of agitator (n revolutions/min.) at const. temp. At const. n (n varied from 200 to 600, t from 0° to 35°) K is a linear function of temp. The temp. coeff. is, therefore, independent of the velocity of agitation. The relation between K and temp. can be predicted on the basis of Nernst's diffusion theory and by supposing that the thickness δ of the adhesive layer is independent of temp. if n is const. The agreement of theory with expt. favors the diffusion theory. These relationships can be combined in the expression: $K = (An + C_0)(t - \tau)$, where the parameters C_0 and τ are characteristic for the processes independent of app. used. A depending on the app. and process. A can be also made independent of the app. by introducing the idea of a normal agitator, by comparison with which the effect of agitation for a given process in any app. can be defined. A method is described for establishing a normal scale of intensity of agitation, thus allowing systematic comparison of all kinetic processes in heterogeneous systems, independently of the app. used.

JAROSLAV KRČERA

Calculation of theoretical flame temperature. P. DROSSBACH. *Z. Elektrochem.* 34, 783(1928).—A correction is made of errors in the paper abstracted in *C. A.* 21, 3533. These errors were due to the assumption that certain temps. taken from the literature were Centigrade, whereas they really were abs.

F. R. B.

Velocity of thermal decomposition of malonic acid. J. LASKIN. *Trans. Siberian Acad. Agr. Forestry* 6, No. 1, 7 pp.(1926).—The thermal decomposition of malonic acid is unimol.; the velocity coeff. at 138° is 0.021.

B. C. A.

Calorimetric examinations. II. Benzoic acid as a standardizing material for combustion calorimeters. P. E. VERKADE. *Chem. Weekblad* 25, 666-7(1928).—The heat of combustion of $\text{C}_6\text{H}_5\text{COOH}$ —6319 cals.—(adopted as international standard) is found to be sufficiently accurate and can well be used until a more accurate analysis is made possible.

M. ACHTERHOF

Heat of mixing of molten metals. IV. MASUO KAWAKAMI. Sendai Higher Tech. School. *J. Study of Metals* 5, 346-8(1928); cf. *C. A.* 22, 718. (1) The heat of mixing of solids. K. has deduced thermodynamically the following theoretical formula using the idea of fugacity: $\Delta H = \Delta H' + RT[y \ln(x/y) + (1 - y) \ln(1 - x)]$.

$(1 - y) + yQ_A(T_{0A} - T)/T_{0A} + (1 - y)Q_B(T_{0B} - T)/T_{0B}$, where $\Delta H' = yH'_A + (1 - y)H'_B$ and ΔH , the heat of mixing evolved when the 2 components, A and B , are mixed in the proportion of the mol. fraction of y : $1 - y$ in their solid states to form a solid soln.; R , the gas const., T , abs. temp.; y and x , mol. fractions of A in equil. at T ; Q_A and Q_B , heats of fusion of A and B ; T_{0A} and T_{0B} , m. ps. of A and B ; H'_A , the heat evolved when one mol. of the liquid A is mixed with an infinitely large quantity of the liquid mixt. consisting of x and $(1 - x)$ mol. fraction of A and B , H'_B , the heat evolved when B is mixed with an infinitely large quantity of the above mixt. K. found $\Delta H'$ for the 4 following metals from his own previous measurements of the heat of mixing and calcd. ΔH , finding that in all cases there was a heat absorption (+ in ble means endothermic).

Solute Solvent	Bi Zn	Pb Cd	Pb Sn	Sn Cd
	0.990	0.990	0.990	0.990
	0.970	0.971	0.985	0.959
$T_{0A} - T$	4.4	11.72	2.6	9.2
Q_A	2930	1140	1140	1684
Q_B	1542	1452	1684	1152
$\Delta H'$	+11.6	+15.4	+10.5	+12.3
ΔH	+28.6	+27.3	+12.2	+27.7

(2) *Relation between soly. and the heat of mixing of liquids.* Putting $y = 1$ in the above formula, gives: $RT \ln x + Q_A(T_{0A} - T)/T_{0A} + \Delta H'_A = 0$ which applies to the binary system having no solid soly. Here x designates the soly. of A in B . K. SOMEYA

Constitution and thermochemistry. ALBERT GOSSELIN AND MARCEL GOSSELIN. *Compt. rend.* **187**, 1050 (1928).—Values are given for heats of linkage of 17 at. groups (such as $C-H_2$, $C-NH$, $C-Cl$, etc.) calcd. from known heats of formation of various mpds. in which they occur. From these values heats of formation of other compds. can be calcd. Thus for urea the heat of formation in the gaseous state = $CO + NH_2 + NH + C-NH_2 + C-NH = 26.1 + 12.2 + (64 - 2[N]) + 17 - (47 - 2[N]) = 72.3$ k. E. G. VAN DEN BOSCHE

3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

S. C. LIND

Elementary treatment of the hydrogen atom in wave mechanics generalized for the moving nucleus. J. K. L. MACDONALD. McGill Univ., Can. *Trans. Roy. Soc. Can.* [3], 22, III, 417-22(1928).—A purely mathematical treatment in wave mechanics from which the Rydberg-Ritz formula is shown to follow from the considerations dealt with.

"Packing fractions" of the atoms and their interpretation. ALAN C. BURTON. Univ. of Toronto. *Trans. Roy. Soc. Can.* [3], 22, III, 379-95(1928).—Burton recalculated the at. mass of the atoms, using 1.00778 as the factor for the mass no. 1H, from this and not from the nearest whole number that the actual mass found should be subtracted. The result gives the total loss in mass of the nucleus due to packing. A table showing this quantity as recalculated from Aston's results accompanies the paper. Since the loss in mass due to "packing" of the electrons and protons in a single particle is 0.290 one would expect the loss to be greater if several α particles are bound together. The additional "packing" losses observed are explained on the basis of Rutherford's "neutrons," to each of which a "packing" loss of 0.007-0.008 is assigned. As a consequence of this, the masses of the isotopes of the heavy elements, though not themselves whole numbers, should differ by integers. The negative "packing" effect of those elements not built up of α particles is attributed to the kinetic energy increase in mass of protons rotating in orbits being greater than the loss in mass due to packing.

J. W. SHIPLEY

Atomic syntheses accompanying atomic fission and the theory of the building up of atoms from hydrogen and helium. W. D. HARKINS AND H. A. SHADDOCK. Chicago Univ. *Z. Physik* 50, 97-122(1928); cf. *C. A.* 17, 3131, 3449. Harkins and Ryan worked out a process in 1923 which established disintegrative syntheses of light elements. They showed that a doubly charged He atom (α -particle) combined with the nucleus of the N atom of mass 14 and a positive charge of 7 and assumed that the F atom of mass 18 and positive charge 9 was thus formed which immediately exploded with the expulsion of a proton or H^+ . The process may be represented thus $N_7^{14} + He_2^4 \rightarrow O_8^{17} + H_1^1$. Rutherford also showed that light atoms can be disrupted by bombardment with α -particles and H-particles are ejected. In the development of the photographic method of fog tracks the source of the α -rays was of the utmost importance. Po contg. Th C or Ra C which gave fast rays was chosen. A Shimizu-Wilson fog track app. was used and 24000 photographs were taken. The sieve plate method for measuring the tracks of α -particles is a new method. The app. for this is described in the paper. Particles with velocity of 1.6×10^9 cm./sec. were found, i. e., a little greater than the starting velocity of α -particles from Po; hence it would seem that Po could be used as a source of α particles. To do this a photographic

method must be adopted and Holubek's method is doubtful. The direct addn. of an α particle to the nucleus of a N atom enhances the evidence published in 1915-7 relating to the theory of atom evolution from H and He. It is not a necessary requirement of the theory that in every case the He multiples of the nuclei of light atoms are built up of α particles. More often the claims of the theory are satisfied when it is established that every multiple shows a relatively high stability and abundance and they may be composed of neutrons (pe) or $(pe)_2$, half- α -particles (p_2e) or of other groups or even of protons and electrons. As always, the proof of the direct addn. of a He nucleus to the nucleus of a light atom affords one of the best supports of the theory up to the present. Other supports are given, just as weighty, but not so direct. The law discovered is that the stability and abundance of the occurrence of atoms to a large extent is governed by the oddness or evenness of the no. of nuclear electrons, the $+$ charge no. of the nuclei (ordinal no.), the no. of protons (at. wt.) and the no. of isotopes. When all 4 of these values are high, stability and even nos. are connected. The object of the discussion that follows is to show that the new work on the disruption of at. nuclei, on the isotope formation of elements and on the packing effect confirm the law. 1. (a) Elements of even ordinal no. are more plentiful than those with uneven no. (b) The no. of isotopes is generally much higher for elements with even than with odd ordinal no. That atoms of even ordinal no. are more stable is also supported by Rutherford and Chadwick. 2. (a) Almost all at. nuclei contain an even no. (N) of negative electrons. (b) The no. of neg. nuclear electrons is even for almost all isotopes. About 130 are known of which 111 possess an even no. (N). 3. Excluding H, no isotope is known for which the ratio of negative electrons (N) to positive nuclear electrons is less than $1/4$. 4. About 90% of all atoms of meteorites and 85% of those in the earth's crust have an at. wt. divisible by 4, i. e., by the at. wt. of He. 5. The species of radioactive decompn. can be reproduced by successive α -rays and several β -rays. 6. The isotopic no. has a periodicity of 4. 7. The isotopic no. also has a periodicity of 2. The law of whole nos. or the law of approx. equiv. constancy of the packing effect is explainable only when the protons are proportionately far apart and the neg. electrons are very close. 20000 photographs of the bombardment of an A nucleus were taken and in no case did a disruption yield an α -particle or H-particle. The magnitude of the packing effect from He to A is 0.12%. It is possible that a particle of high velocity may combine with the A nucleus. There are many types of at. stability,

cut from the various types of at. fission. A certain atom, quite unstable because of its composition may become stable upon ejection of a β particle. The abundance of isotopes is conditioned by the ease of attachment of α particles. It is difficult to understand how an α particle which is not ejected from a heavier at. nucleus can attain enough velocity to combine with a particle of a higher positive charge. The number

He groups (neutral α -particles) may be taken as 13 in the heaviest atoms. Data supporting the H and He theory are significant for the history of the earth, as is illustrated in the diagrams of abundance and no. of isotopes. The earth is not considered to have originated from meteors or from smaller planets. S. L. B. ETHERTON

Quantum mechanics of radioactive nuclei. G. GAMOW AND F. G. HOUTERMANS. *Physik* 52, 496-509(1928).—The decay consts. of radioactive elements giving off α -particles are calcd. on the basis of the quantum-mech. theory of α ray disintegration given by G. The energy of the α -particles from expt., the at. no. of the element and certain characteristic nuclear radii are used in the calcn. For one of the elements of a radioactive series the nuclear radius is made to fit the experimentally known decay const. from the decay consts. of the other members are calcd. without making any special assumptions regarding the force field near the nucleus. The calcd. values agree fairly well with expt. GEORGE GLOCKLER

Quantum theory of atomic disintegration. G. GAMOW. *Z. Physik* 52, 510-5 (1928).—On the basis of classical mechanics only very fast α -particles (e. g., from Th C' with A) can penetrate close enough into the nucleus to cause its disintegration. However, on the view of quantum mechanics there always exists some probability that a given α particle may penetrate into the nucleus, which process is the exact reverse of the process described (in the preceding abstr.) as at disintegration. With this fundamental notion a theory of at. disintegration is built up. It is important to notice that the incoming α -particle may have less kinetic energy than corresponds to the potential maximum of the nuclear field. There is found generally good agreement between expt. and theory. GEORGE GLOCKLER

Constitution of germanium. F. W. ASTON. *Nature* 122, 167(1928).—Expts. with Ge tetraethyl and tetrafluoride indicate that Ge has the following isotopes, in order of descending intensity: 74, 72, 70, 73, 75, 76, 71, 77. It is unlikely that any

of these lines is due to H compds., but the intensity of Ge^{76} is in doubt. Of these mass numbers only 72 and 73 are peculiar to Ge.

Isobaric elements. H. HERSZFINKEL. Radiol. Lab. Warsch. Wissensch. Ges. Warschau. *Naturwissenschaften* 17, 50-1(1929).—Meitner has shown that the radioactivity of K and Rb may be related to the isobars of neighboring elements, A and Ca or Kr and Sr. The same holds for the atoms surrounding Br and I and it should be easy to detect traces of the noble gases Kr or Xe formed in the disintegration of the halogen. It is estd. that in minerals 10^7 years old, on the assumption of a radioactivity of Br or I of $1/100$ that of K, about 10^{-5} to 10^{-6} mg. Kr or Xe is to be expected per g.

The average life period of an atom. HAROLD JEFFREYS. St. Johns Collge, Cambridge. *Nature* 123, 87(1929).—J. answers Poole (cf. following abstract). That portion of the heat radiated by the earth which is not accounted for by radioactivity is a relic of the earth's primitive fluid state. The upward concn. of radioactive matter is assumed in order to coordinate the facts of the temp. gradient in the earth's crust, the radioactivity of surface rocks and the law of heat conduction. The cooling of the earth follows as a consequence.

Average life period of an atom. J. H. J. POOLE. Trinity Coll., Dublin. *Nature* 122, 960-1(1928).—In connection with Jean's view of the possibility of spontaneous disintegration of all atoms, P. points out that the av. life of a terrestrial atom must be at least 4×10^{10} years or about 8 times the probable age of the existing universe.

Average life period of an atom. J. H. JEANS. *Nature* 122, 961(1928).—cf. preceding abstract.—J. agrees with the above, and points out he had previously discussed the question.

Diffraction of cathode rays by mica. SEISHI KIKUCHI. Inst. Phys. Chem. Research, Tokyo. *Japan J. Physics* 5, 83-96(1928).—A more complete account of results covered by C. A. 22, 4052-3; 23, 1567.

The loss in velocity of α -rays in passing through metal foils. S. ROSENBLUM. Radium Inst., Paris. *Physik. Z.* 29, 737-9(1928).—According to Bohr the decrease in velocity of the α - and β -rays in penetrating metal foils is conditioned chiefly by the charge of these corpuscles. This is in agreement with the exptl. facts of R.

Ranges of β -rays. B. W. SARGENT. Queen's Univ., Kingston, Ont. *Trans. Roy. Soc. Can.* [3], 22, III, 179-90(1928); cf. C. A. 22, 1272.—The ranges of β -rays having initial energies up to 1,363,000 equiv. v. have been calcd. from data respecting the loss of energy suffered by β -rays in passing through matter. The quality of the rays issuing from Pb and passing through paper were detd. By plotting transmission against thickness of Pb foil it was found that the curve passed through a max. This is explained on the assumption that β -rays of Ra E are sorted out by the Pb, the softer rays being absorbed or scattered back on the side of incidence, and the issuing β radiation was on the av. more penetrating. As the thickness of the foil was increased, multiple scattering between layers of atoms became more effective. The simultaneous loss of energy and scattering effect compensates for the filtering out of the soft rays and results in a flattening of the curve near the max. which occurs at 0.0764 g./sq. cm. of Pb foil. At this point the issuing rays are apparently more penetrating than the incident rays. Calcs. over the intervals 156,000-209,700 and 209,700-256,300 equiv. v. indicated that the range increased 0.03 g./sq. cm. when β -radiation passed through Al. At 156,000 equiv. v. initial energy the range is 0.0512 g./sq. cm. correct to 10%. Expts. with Ra E indicate that for β -rays passing through Pb the ratio of the stopping power of an atom to its at. no. decreases slowly with increasing at. no.

The rate of flow of heat of β - and γ -radiation. ALICJA DORABIALSKA. *Rozzniki Chem.* 8, 475-85(485 French)(1928).—The energy of β - and γ -radiation of Ra was measured in the radioactive equil. with its decompn. products by an adiabatic microcalorimeter of special construction (C. A. 22, 514). The inner calorimeter was a metallic cylinder divided into two parts, by means of which the absorption of the calorific system could be changed. The measurement was performed either in the whole calorimeter or in one-half, or in one-half with addn. of a metallic screen. The following rates of flow of heat were measured: $Q_1 = q\alpha + q\beta + q\gamma$; $Q_2 = q\alpha + 1/2q\beta + 1/2q\gamma$; $Q_3 = q\alpha + q\beta + 1/2q\gamma$. The system absorbed either the sum of α -, β - and γ -radiation or $\alpha + (\beta + \gamma)/2$ or $\alpha + \beta + (\gamma/2)$. From the numerical results thus obtained it was concluded that the heat of β -radiation in equil. with the decompn. products (Ra D, Ra E, Ra F) constitutes 9.5% of the calorific effect of α -radiation, while that of γ -radiation of the same substance is equal to 12.4% of the same heat effect, the absorbing mass of calorim.

eter being 37.85 g. per sq. cm. The results are in agreement with the theoretical calcs. of L. Meitner.

Pyrex glass as a radium container. S. C. LIND *Science* 68, 643-4(1928).—Results of Curtiss (C. A. 21, 3820) are confirmed. L. placed in a Pyrex system 265 mg of Ra (RaCl₂ soln.) for collection of Rn. Both longitudinal and transverse cracks developed in 1 year in the upper half of the 250-cc. flask. The flask was half full of RaCl₂ soln. Conclusion: The cracks were due to the relief of preëxisting strains, by expanding under α -radiation. Scaling accompanied by interference colors is indicated. Contraction is possibly caused by α -particle bombardment. Glass of high silica content resembles fused silica in becoming cracked by α -radiation. L. D. ROBERTS

Change of resistance of lead by the action of radium. K. PRASAD AND S. BASU. *Nature* 112, 610(1928).—A temporary change in the resistance of Pb takes place when a thin plate of the metal is exposed to the action of β -particles and γ -rays from Ra.

B. C. A.

General relativity quantum theory of the electron. H. TETRODE. *Z. Physik* 50, 333-46(1928); cf. *Ibid* 49, 858-64(1928).—Dirac's theory is extended from the point of view of the general theory of relativity. A direct derivation of the impulse-energy principle is obtained.

B. C. A.

The charge of an electron. A. S. EDDINGTON. *Proc. Roy. Soc. (London)* A122, 358-69(1929).—The exptl. value of $hc/2\pi e$ is 137.1 (Millikan's data). According to the theory proposed by E., it should be the integer 136. Although the discrepancy is about three times the probable error attributed to the exptl. value, the fault does not seem to be with the theory. The basis for this argument is the Exclusion Principle in the form given by Fermi and Dirac, that the ψ -functions pertaining to a pair of electrons must be anti-symmetrical. Combined with the theory of relativity, this appears to lead in an unforced manner to the value 136, i. e., the no. of symmetrical terms in a array of 16 rows and columns.

FRANK V. JOHNSON JR.

The motion of electrons in an electron tube with the production of short-wave oscillations of the Barkhausen and Kurz type. N. KAPZOV. *Physik Inst. I. Staatl. Univ., Moskau. Z. Physik* 49, 395-427(1928); cf. C. A. 14, 1780.—The influence of a variable field, resulting from potential variations of the anode and grid of an electron tube, on the motion of electrons is discussed. In a special case numerical integration of the equations of motion is undertaken. The variable grid and anode potentials lead to periodic irregularities in the electron streams between the filament, grid and anode. These irregularities explain the origin of the oscillations of the Barkhausen and Kurz type.

J. E. SNYDER

Critical potentials of light elements for simultaneous transitions. B. B. RAY AND P. C. MAJUMDER. *Univ. Coll. of Science, Calcutta. Nature* 123, 49(1929).—Critical potentials have been detd. for the elements Cr to Cu between 40 and 200 e.v.

Eight out of 10 can be explained on the assumption that 1 cathode particle can simultaneously eject 2 electrons, either from the same or from different energy levels.

G. CALINGAERT

Suitable gas mixtures for various Wilson cloud experiments. LISE MEITNER. *Physik. Chem. Abt. A*, 130, 717-21(1928).—An analysis of the conditions for the production of clouds by the Wilson method. For a given vapor in a given gas the expansion ratio depends only on the ratio k of the mean sp. heats for the mixt. If the k 's of the components of the vapor-gas mixt. are different, the min. expansion ratio varies with the pressure of the mixt. Since water vapor and CO₂ have nearly the same k , these form a mixt. which has the same expansion ratio at diff. pressures. For at. disintegration expts. where it is advisable to avoid the use of H. compds., CCl₄ vapor has been successfully used; if this is mixed with air, the min. expansion ratio is large, but it can be reduced by substituting argon for air.

W. WEST

Cathode evaporation of the mercury arc. J. VON ISSENDORFF. *Physik. Z.* 29, 857-64(1928).—An app. is described which makes it possible to measure separately the amts. of Hg evapd. and ejected at the cathode of a Hg vacuum arc, at different surface temps. Evapn. depends greatly on the temp., and only slightly on the current. The entire cathode surface is involved. For the evapn. in the bright spot and its immediate neighborhood, limiting values of +1.3 mg./amp. sec. and -0.3 mg./amp. sec. were found. This indicates a minute loss at the cathode, possibly even a gain by incoming ions. The amt. of Hg ejected in droplets increases faster than the current. A critical discussion involving the energy balance follows.

FRANK URBAN

The refractive index for electrons and diamagnetism. L. ROSENFELD. *Inst. theoret. Physik., Göttingen. Naturwissenschaften* 17, 49-50(1929).—Bethe (C. A. 23, 332) has calcd. the lattice potential (external exit work) V_0 causing the n for electron

waves by $V_0 = (2\pi/3)\nu\theta$, ν being the no. of atoms per cc., $\theta = \int_0^\infty \rho(r)r^2dr$ for $\rho(r)$ the d. of charge (in wave mech. terms) of the electrons of the individual atoms. The same "moment of inertia" θ of the charge, however, is closely related to the diamagnetic susceptibility χ_d of the material by $\chi_d = e/6mc^2\nu\theta$; therefore, $\chi_d = (e\nu_0/4\pi mc^2)$ (approx.). R. gives exptl. material to check this relation taking the exptl. χ_{exp} as equal to $\chi_p - \chi_d$ (para- and diamagnetic susceptibility) with χ_p dependent on the spin of the (π) cond. electrons and equal to $(n.606)/a^{1/2} \cdot 0.221 \cdot 10^{-8}$ (Pauli) for a the at. vol. For Cu, Ag, Au and Pb the χ_{exp} and $\chi_p - \chi_d$ check very satisfactorily; for Al and Cr the agreement is not so good.

B. J. C. VAN DER HOEVEN

The influence of positive ions on the electron space charge between two parallel plates. H. COHN. *Ann. Physik* 87, 543-69(1928).—The decrease in space charge due to positive ions is proportional to no. of gas mols., and their mass is inversely proportional to the absorption of electrons. For small pressures the voltage necessary for neutralization of space charge is greater than the ionization voltage. It depends on the electron current. Pressure has an inverse effect. Space charge neutralization does not depend on cathode satn. current. For gases of the same ionizing potential space charge neutralization depends on the mass. Introduction of K^+ decreases space charge.

F. R. BICHOWSKY

Positive ion currents in the positive column of the glow discharge in the noble gases. W. UYTERHOEVEN. Princeton Univ. *Proc. Nat. Acad. Sci.* 15, 32-7(1929).

C. L. READ

The cuprous iodide detector. ERICH HABANN. *Z. tech. Physik* 10, 25-8(1929).—Pressed CuI powder against a Cu wire of 0.1 to 0.2 mm. diam. (loose contact) proved to be an excellent detector-rectifier; its optimum lies at 0.26 v. Electrolytic conduction (of Cu^+ and I^- ions) through the salt does not play a role; the conduction is mainly by electrons, partly also by the positive CuI⁺ residue. CuI pressed in a Cu tube with a Cu wire along the axis, wire negative, wall positive, will give a concn. of CuI near the wire and consequently a resistance decreasing with time. Actually when the potential was more than 3 v., the current increased from 45 to 57 milliamps. in one min. The opposite effect occurs (45 to 9.7 milliamps.) for a positive wire potential. If in the detector the wire is not loosely in touch with the CuI but applied with force the current-potential characteristic no longer shows the considerable rectifier curvature but instead a steady rise. It is assumed that for loose contact (wire negative) the CuI ions are discharged at and concentrate around the contact point, building up; this explains why after some time (4 hrs.) with steady current (0.3 milliamps.) flowing the characteristic of the detector changes and becomes linear. The detector effect is detd. by the min. potential required to liberate electrons from the wire. Those metal wires that seem to have no adhesion to CuI, as Cu, Pb, Al and Zn, give good detector action, those that appear to stick to the CuI, good adhesion. Mo, W and Pt give a linear characteristic, no detector effect. For Al wire the rise in the characteristic starts at 0.42 v., for Pb wire at 0.46 v. The results are considered to confirm Schottky's theory of the contact detector.

B. J. C. VAN DER HOEVEN

Photoelectric effect with submicroscopic drops. K. SCHARF. *Z. Physik* 49, 827-57(1928).—The photoelec. properties of Hg, Bi, Se and S particles, produced by vaporization of the element in an atm. of pure Ni have been investigated by Ehrenhaft's condenser method. These substances show a predominant normal photoelec. effect. Inverse charging appears only rarely in single particles, but to a much greater extent in the clouds of very small particles produced by strong heating of the substance. The no. of negatively charged particles in a cloud was inversely proportional to the normal sensitivity of the element, which decreases with the different elements in the order given above.

B. C. A.

The saturation of photoelectric current. J. A. BECKER. Bell Telephone Lab. N. Y. *Naturwissenschaften* 17, 12(1929).—Regarding a recent controversy of Suhrmann and Gudden (*C. A.* 22, 2512, 3830, 3831), B. assumes that his theory (*C. A.* 22, 1535), is applicable to the case. It explains why the photoelec. current for long waves increases with applied potential and is almost satd. for short waves; also why an atomic film of K radiates differently from compact K. The surface elec. fields are used for the qual. explanation. The case of K is compared with that of adsorbed Th, which has been shown to exhibit additional surface forces.

B. J. C. VAN DER HOEVEN

Photoelectric effect at low temperatures. J. C. MCLENNAN, L. A. MATHIESON AND C. D. NIVEN. Univ. of Toronto, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 279-87(1928).—The change in the photoelec. effect of a K photoelec. cell with changing temp. was observed for low temps., light filters being used to obtain the effect for various

wave lengths. The K was purified by successive distn. *in vacuo* and finally into the evacuated cell. The source of light was a 21-c. p., 6-v., N_2 -filled bulb operated from a storage battery of high capacity. This made it possible to obtain const. voltage across the lamp filament. The photoelec. current was measured by a Lindemann electrometer provided with resistance leaks. Current-voltage curves were taken at 300° K., 80° K. and 21° K. The current for each band of the spectrum decreased with the temp. For longer wave lengths the variation is greater. With the deep red the current stopped at 21° K. Low temps. were obtained by liquid air and liquid H_2 . The spectral distribution of sensitivity was quite altered by the cooling. With a new filter one of the cells used gave a gradual decrease in the emission, but between 80° K. and 21° K. the emission increased even above that at room temp. From the results obtained, an intimate relation appears to exist between the coeff. of extinction of light in a substance and the photoelec. threshold. Below the point where the light quantum of energy exceeds the energy necessary to eject totally an electron from the metal, a photoelec. absorption band sets in. Light is not photoelectrically absorbed until the electron can be totally ejected from the metal. Other theories explanatory of photoelec. phenomena are discussed by the authors.

J. W. SHIPLEY

Photoelectricity of water and aqueous solutions. L. COYNSON AND A. MOLLE. *ib. sci. phys. nat.* 10, 231-42(1928).—An app. is described for studying the photoelec. t. Distd. H_2O is photoelec. towards light between 2000 and 1300 Å. U.; this property is not due to impurities on the surface. Concd. solns. of halides are less photo- than H_2O ; salts contg. O are more so. It seems then that the source of emitted electrons may be O atoms.

E. G. VAN DEN BOSCHE

Laue photograph taken with convergent x-rays. T. FUJIWARA. *Mem. Coll. Sci. Imp. Univ.* 11, 283-301(1928).—Some of the spots in the Laue pattern from a W crystal, obtained by using white radiation from a Mo target, show the spectrum of the K radiation of Mo, from which the orientation of the crystal can be detd. By using a convergent beam of white x-rays the sharpness of the Laue spots is destroyed but the chance of obtaining the spectrum lines is increased. The method is developed for detg. the reflecting planes and orientation of the crystal.

B. C. A.

Hemihedry of zinc blende and x-ray reflection. SHOJI NISHIKAWA AND KYUZI MATSUKAWA. *Inst. Phys. Chem. Research, Tokyo. Proc. Imp. Acad. (Japan)* 4, 96-7(1928).—Friedel's law that hemihedrism due to lack of a center of symmetry cannot be revealed by the x-ray diffraction method was tested in zinc blende. Tungsten L radiation, the spectral lines of which cover the range including the K crit. absorption limit for Zn atoms, was reflected from (111) and ($\bar{1}\bar{1}\bar{1}$) polished surfaces. Differences in the intensity of the lines were noted; these might, however, be due to difference in the degree of polish. Preliminary expts., with a cleavage plane, also showed differences in the relative intensities.

C. J. WEST

Absolute intensity of x-rays. T. E. AURÉN. *Medd. K. Vetens. Nobel Inst.* 6, No. 13(1927). The abs. intensity of x-rays has been measured by the heat excited in metals on absorption of the rays. No difference in the energy measurements was found on using plates of Cu, Ag and Pb. Up to 100 kv., the intensity is exactly proportional to the current through the tube. The relationship between the total intensity of the energy radiated as x-rays and the voltage applied to the tube has been detd. The effect of an Al filter also was studied. The energy necessary to produce a pair of ions is not found to increase with decreasing wave length.

B. C. A.

Raman effect with liquid oxygen and with liquid nitrogen. J. C. McLENNAN AND I. M. McLEOD. Univ. of Toronto, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 413-16(1928). *Nature* 123, 160(1929).—The "Raman Effect" was studied from photographs taken of the spectrum of scattered light emitted from the surface of liquid air, liquid O_2 , and liquid N_2 . Six sharply defined lines $\lambda\lambda$ 4317.7 Å. U., 4674.3 Å. U., 5026.5 Å. U., 4468.1 Å. U., 4849.3 Å. U. and 4980.3 Å. U. were observed for liquid air. Liquid O_2 gave only the first 3 lines, and liquid N_2 the last 3. Two Raman lines are found with each liquid. These are examples of homopolar mols. endowed with power to absorb light having frequencies equal to that of fundamental vibrations of their nuclei.

J. W. SHIPLEY

Ultra-violet Raman spectrum of water. I. RAMAKRISHNA RAO. *King's Coll., London. Nature* 123, 87(1929); cf. *C. A.* 23, 338.—Using an all-quartz app., R. obtained the Raman effect for water in the ultra-violet region in 2 hrs. Eleven bands are clearly noticeable, corresponding to every bright line in the Hg spectrum. Measurements of the wave lengths of the bands show that water has an absorption band at $2.97 \pm 0.05 \mu$, in close agreement with the values of 2.95 to 3.06 reported previously from infra red absorption measurements.

F. CALINGAERT

The Raman effect in alcohols. S. VENKATESWARAN AND A. KARL. *Z. physik. Chem., Abt. B*, 1, 466-74(1928); cf. *C. A.* 23, 337.—The Raman effect was detd. for H₂O, MeOH, EtOH, Am alc. and allyl alc. Water gives a broad band, which is narrowed in Me and Et alc., while allyl and Am alc. give sharp lines. An examn. of the spectrum of the Am alc. soln. with a Nicol prism showed that the modified, unmodified and continuous spectra were polarized.

WALLACE R. BRODE

The Raman effect of quartz. M. CZERNY. Univ. Berlin. *Naturwissenschaften* 17, 12-3(1929).—A table gives the results of 4 authors on the Raman effect of quartz. The principal μ values of characteristic wave lengths are approx. 8.6, 12.5, 14.2, 21.5, 24.7, 38.2, 48.0, 80, 94, 118. The occurrence of values over 30 μ is surprising in view of the fact that for waves longer than 30 μ quartz is supposed to be transparent (Rubens). C. examd. quartz with a grid spectrometer in the long-wave infra-red range and found absorption effects around 38 and 78 μ , no absorption more than the exptl. error was found at 48 μ . Measurements beyond 80 μ were omitted because of exptl. difficulties. Whereas, according to Pringsheim and Rosen (*C. A.* 23, 39), the 80 and 48 μ Raman lines are equally strong, the 38 μ line considerably weaker, it was here found that the 38 μ line is more intense than the 80 μ line; the 48 μ line is too weak to be measured.

B. J. C. VAN DER HOEVEN

Raman effect in x-ray scattering. K. S. KRISHNAN. *Nature* 122, 961-2(1928).—In addn. to the Compton effect, assocd. with a free electron, in which the wave-length shift depends on the direction of observation, a Raman effect should exist for x-rays in which the scattering electron shifts from a level E_K to a level E_L within the atom, the frequency of the scattered radiations being given by $\mu^1 = \mu - \frac{E_L - E_K}{h}$ and being

independent of direction of observation. Observations of Davis and Mitchell (*C. A.* 23, 765) may be regarded as a demonstration of its existence. Three new lines are found in the scattered radiation from graphite excited by MoK α , corresponding to changes of energy level of the scattering electron by 279, 57 and 34 v. The first and last may be identified with the transition of a K and an L electron, resp., to a level of very loose binding within the C atom, while the 57 v. shift may be identified with the case in which both L electrons are shifted outwards.

W. WEST

The significance of spectroscopy for modern physics. G. H. DIEKE. *Physica* 9, 15-32(1929).—A lecture.

B. J. C. VAN DER HOEVEN

Wave length measurements in the vacuum spark spectrum of lead from 220 A. U. to 5000 A. U. STANLEY SMITH. Univ. of Alberta, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 331-6(1928).—Measurements of the vacuum spark spectra of Pb by means of a grating with 15,000 rulings to the in. were taken at intervals where 2600 A. U., 3600 A. U. and 4600 A. U. were at the center of the spectrograms. This allowed for considerable overlapping of the plates. Lines from a superposed Fe arc spectrum were used as standards. Tables of wave lengths with intensities accompany the paper, from which assistance in detg. the structure of the spectra of Pb III and Pb IV may be derived.

J. W. SHIPLEY

Temperature of the under-water spark as computed from distribution of intensity in OH absorption bands. E. D. WILSON. *J. Optical Soc. Am.* 17, 37-46(1928).—Measurements of the wave lengths of the OH bands absorbed in the under-water spark show that the bands at λ 2811, 2875, 3064, and 3126 are developed nearly as completely as in emission. Measurement of intensity in branches of the bands at λ 3064 gives a max. at about $m = 10.2$ and from this the effective temp. of the under-water spark has been calcd. From Birge's formula this is found to be 5115° under the conditions of the expt. Details are given of the exptl. methods: the elec. circuits employed, the spectrographic and photometric procedure, and the measurement of the wave lengths.

B. C. A.

Spectra excited by active nitrogen. JOHN H. FINDLAY. Queen's Univ., Kingston, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 341-51(1928).—An attempt was made to det. whether the spectra excited by active N are due to chemiluminescence. An electrodeless discharge through purified N₂ in the presence of Ca, Hg and In was observed by means of spectrograms. No Ca lines were observed in the after-glow spectrum, probably because of the formation of stable nitrides of Ca, but Na and K lines appeared. The excitation of the spectrum of Hg by active N gave the highest energy level as 43 D, which corresponds to an excitation potential of 9.51 v. This agrees with the observations of Okubo and Hanrada, but differs from those of Ruark. The vapor pressure of Hg when the blue glow appears does not preclude the possibility of chemiluminescence as being the origin of spectra excited by active N₂. No lines were obtained when an

attempt was made to excite the spectrum of In by active N_2 . Probably In does not form a nitride under these conditions.

First spark spectrum of thallium, Tl II. J. C. McLENNAN, A. B. McLAY AND M. F. CRAWFORD. Univ. of Toronto, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 241-5(1928).—The spectrum of the Tl spark with and without inductance was photographed with a quartz spectrograph, and in H_2 at atm. pressure with a fluorite prism spectrograph. Al and Zn spark wave lengths were used as standards. The lines photographed are classified in tables of their frequency, intensity and term combinations. Evidence of a group of terms expected was found lacking and this constitutes an anomaly similar to that found in the spectra of Hg I.

Second spark spectrum of mercury, Hg III. J. C. McLENNAN, A. B. McLAY AND M. F. CRAWFORD. Univ. of Toronto, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 247-51(1928).—A re-investigation of the extreme ultra-violet spectrum of a Hg spark in H_2 with a fluorite-prism instrument was made and lines between λ 1935 A. U. and λ 1350 A. U. were recorded and classified. The spectrum of an a. c. discharge through Hg vapor in vacuum also was studied, a one-meter vacuum grating spectrograph being used. An inductance in series reduced the no. of lines between λ 1750 A. U. and λ 700 A. U. from about 500 to about 100 and those lines are attributed to the Hg^{++} spectrum rather than to spectra of more highly ionized Hg atoms. Classified tables of wave lengths accompany the paper.

Light scattering and the hydrogen spectrum. H. S. ALLEN. St. Andrews Univ., Scotland. *Nature* 123, 127(1929).—The H radiations of the Balmer series are partially scattered by the surrounding H_2 mols., giving the typical Raman effect. This explains the secondary spectrum of the Balmer lines. Examm. of this spectrum for the 5 lines from H_α to H_ϵ shows differences between the primary and secondary radiations of approx. 13, 26, 34 and 52 A. U., which must correspond to the infra-red rotation spectrum. The direct spectrum shows also intermediate lines every 6.5 A. U., the first one, however, being displaced to 7.0 A. U.

Intensities of the light of the oxygen green line of the night sky. J. C. McLENNAN, J. H. McLEOD AND H. J. C. IRETON. Univ. of Toronto. *Trans. Roy. Soc. Can.* [3], 22, III, 397-412(1928); cf. *C. A.* 21, 1225, 1756.—Night-sky photographs were made to det. the intensity of blackening produced by a narrow band, including wave lengths of the green line radiation. Comparison of the intensities of the auroral green spectral line as recorded on spectrograms taken during different portions of a night was also obtained. Exposures were made at Toronto, Ont., Esterhazy, Sask., and Flagstaff, Ariz. Most of the exposures were obtained at the Lowell Observatory at Flagstaff, between April 15th to 24th. The intensity of the auroral green radiation was found to increase to a max. about 1 hr. after midnight, and then to fall off with the lapse of time to sunrise. The variation in intensity of the radiation was not the same on successive nights. The explanation of the max. intensity in the depth of shadow may be due to the effect of wave lengths less than 2070 A. U. upon the O in the upper atm. The O_2 passes into the at. state from which the spontaneous transitions take place that give rise to the auroral green line. If it is assumed that the origin of the radiation is from beams of sunlight just grazing the earth's atm., the greatest intensity would be expected at the zenith of the earth's shadow.

The spectrum of doubly ionized fluorine (F III). HERBERT DINGLE. *Proc. Roy. Soc. (London)* A122, 144-61(1929).—When discharges of gradually increasing intensity are passed through a vacuum tube contg. SiF_4 , the lines attributable to F appear successively in 4 compact groups. Between the first 3 of these groups it is possible, by careful control of the conditions of discharge to make a clear sepn.: the fourth, though distinguishable from the third, is less easily isolated. The first group has already been identified as the spectrum F I of the neutral atom of F. It is probable therefore, that the others are assignable to F II, F III, and F IV, resp. The present paper contains an account of the F III spectrum in which the wave lengths of 314 lines extending from 2206.94 A. U. to 3267.202 A. U. have been measured and tabulated. The spectrum has 1 partially analyzed into quartet and doublet systems of terms, which have been correlated with the terms to be expected on the Heisenberg-Hund theory, and 82 lines have been classified. The resemblance between this spectrum and that of singly ionized O, which has the same electron structure as doubly ionized F, confirms the assignment of the former to F^{++} .

The arc spectrum of chlorine. K. MAJUMDAR. Univ. of Allahabad, India. *Nature* 123, 131(1929).—By means of a special Cl_2 tube, the infra-red lines of the spectrum were photographed on a neocyanine plate. They correspond exactly to the transition $4M_2(N_1 \leftarrow O_2)$. The ionization potential of Cl_2 is estd. at about 13 v. The infra-

red lines observed seem to be identical with some of the unidentified lines in the solar spectrum.

Broadening of spectral lines by the Doppler effect. G. POLVANI. *Nuovo cimento* 4, 365-70 (1927).—At the abs. zero spectral lines should have a finite width. B. C. A.

Rotation dispersion and circular dichroism of caryophyllene nitrosite. STOTHERD MITCHELL. Univ. Glasgow. *J. Chem. Soc.* 1928, 3258-60.—The rotation dispersion curve of caryophyllene nitrosite has a max. of approx. 2200° at 6250 A. U. becomes zero at 6800 A. U. and is thereafter neg. The max. of its absorption band is at about 6800 A. U. The soln. shows the cotton effect, left-handed circularly polarized light being absorbed more than right-handed circularly polarized light. W. R. B.

Pleochroism of tourmaline. P. LE ROUX. *J. phys. radium* [vi], 9, 142-52 (1928). Absorption measurements on two sections of tourmaline cut parallel and perpendicular to the optical axis have been made for the Hg arc lines 5790-3655 A. U. with a photo. elec. cell and quadrant electrometer. When absorption is no longer small, the coeff. of absorption varies with the direction of propagation of the light, the value being less in the direction parallel than in that perpendicular to the axis of the crystal. This has been confirmed with a second sample of yellow tourmaline. The different values obtained in this case for the coeff. of absorption indicate that the coloration of tourmaline is due to an impurity. B. C. A.

Ground-terms in the spectrum of nickel II and proposed standard wave lengths in the Schumann region. A. C. MENZIES. *Proc. Roy. Soc. (London)* A122, 131-43 (1929).—The method of the fuse-spectrum devised by M. (C. A. 22, 728) is particularly suited to the investigation of ground-terms, and is here applied to the elucidation of those belonging to Ni II. Many lines obviously connected on account of their length and strength belong to the hitherto unknown ground-terms 1D_2 and 3D_2 of Ni II. These levels are -8392.9 and 6886.0 cm^{-1} lower than the 4F_3 level, which was the zero level of Shenstone's table of terms (cf. C. A. 21, 2845). Since the combining middle terms are known with accuracy a detn. of the values of 1D_2 and 3D_2 allows the calcn. of conveniently spaced lines, which can be used as standards in the Schumann region. A list of 100 lines ranging from 1164.5 A. U. to 1965.35 A. U. is published; the term combinations are given for about half of them. W. F. MEGGERS.

Intensity measurements in the secondary spectrum of hydrogen. II. W. KAPUSCINSKI AND J. G. EYLLERS. *Proc. Roy. Soc. (London)* A122, 58-68 (1929).—In an earlier paper (C. A. 22, 2716) intensity measurements of a portion (4500-4900 A. U.) of the secondary spectrum of H_2 were given. The same exptl. methods are used to extend the measurements to longer and shorter waves. Relative intensities of 1448 lines ranging in wave length from 3652.46 to 6441.50 A. U. are given; the theoretical discussion will be submitted later. W. F. MEGGERS.

Absorption in excited helium. J. C. McLENNAN, R. RUEDY AND ELIZABETH ALLIN. Univ. of Toronto, Can. *Trans. Roy. Soc. Can.* [3], 22, 273-7 (1928).—The absorption spectrum of He excited by d. c. discharge from Mg electrodes in a capillary Geissler tube was observed through an observing column 30 cm. long and 2 cm. diam. also provided with Mg electrodes and d. c. discharge. Exposures with and without filters and with varying discharge conditions were made. Absorption of 4713 A. U. and 4121 A. U. was too small to be observed. Lines 4922 A. U. and 3905 A. U. gave about 5% absorption. Absorption of the infra-red line 10830 A. U. was about 95%. The fall in the strength of absorption is comparable with the rate of decrease in intensity in the Balmer series. J. W. SHIPLEY.

Absorption of ultra-violet light by metastable atoms. W. DE GROOT. N. V. Philips Gloeilampenfabrieken, Eindhoven. *Naturwissenschaften* 17, 13 (1929).—For ionization of metastable atoms of Ne and A, resp., 4.9 and 4.2 v. are required, corresponding to 2550 and 2950 A. U. light. It was calcd. from the work of several authors that in an absorption tube of Pyrex glass, 40 mm. wide, with quartz windows, 90 cm. light path, 5 mm. Ne or A filling, the most ideal conditions would give a max. yield of metastable atoms, i. e., about 10^{13} per cc., which should give an absorption coeff. of around 10^{-2} (10% decrease in light intensity over 100 cm.). The light of a W spiral at 3400° abs. (3500° color temp.) in a quartz balloon was sent through the absorption tube, the spectrum was photographed for dark absorption tube and for the absorption tube lighted by a 2-amp. current. No trace of absorption in either Ne or A was found. The $2s$ to $2p$ lines showed intensive absorption even at 50 milliamps. current. It is concluded that at the most a 10^{-4} fraction (10^{-4} is the upper limit of the absorption coeff.) of the energy used in the tube serves to ionize metastable atoms, actually the fraction is probably 0.01 as large as this, if it is assumed that this energy comes from

short-wave resonance radiation of the gases (1000 A. U. in A, 700 in Ne); it corresponds to 10^{-7} watt per sq. cm. or a 10^{-3} μ amp. electron current. B. J. C. VAN DER HOEVEN

Device for measuring spectrum photographs. R. FRISCH. *Z. Physik* 49, 608 (1928).—A simple device is described suitable for the rapid detn. of distances segg. lines in a spectrum photograph with an accuracy of 0.01 mm. B. C. A.

Absorption of ultra-violet rays by the hydrolytic products of sucrose. L. KWIECINSKI AND L. MARCHLEWSKI. *Biochem. Z.* 204, 192-6(1929).—The absorption bands in the ultra-violet range due to products of inversion of sucrose by 0.5 N HCl do not coincide with the absorption bands of levulose from the point of view of either the intensity or the position of the maxima. It is suggested, therefore, that glucose and levulose are probably not the only products. S. MORGULIS

Structure and stages of excitation of the molecules of some nitriles determined from the ultra-violet absorption spectra of the vapors. (FRL.) H. E. ACLY. *Z. physik. Chem.* 135, 251-90(1928).—The absorption spectra of benzonitrile and *o*-, *m*-, and *p*-toluonitriles have been studied for the vapors, and the data interpreted according to the methods of Henri. In each case the absorption is of 2 kinds, a banded structure and a region of continuous absorption. Equations are given which cover the data with considerable accuracy and show the occurrence of doublet series throughout. Comparison of these with earlier analyses of the spectra of benzene and benzene derivs. discloses the dominance of the benzene ring, a conclusion which is confirmed by the investigation of the absorption spectrum of cyanogen. The latter is a vibration-rotation spectrum situated in the far ultra-violet, and the oscillation periods are different from those of the nitriles and from the bands shown in the emission spectrum of N and the C arc. From the data on nitriles it is shown that the mol. exhibit high deformability, indeed the distances between oscillating atoms are increased by about 3% on excitation. The moment of inertia of benzonitrile is approx. $I = 38.8 \times 10^{-40}$ from the structure of the bands. The predissocn. phenomena (Henri) occur with the toluonitriles after the first excitation and with benzonitrile after the second. Two electron states of activation have been ascertained for each of the substances studied, one deduced from the banded spectrum and the other from the continuous absorption. Numerical values for the different states are calcd. B. C. A.

Penetration of ultra-violet light into pure water and sea-water. F. O. HULBURT. *J. Optical Soc. Am.* 17, 15-22(1928).—An app. consisting of a quartz spectrograph, a Na hydride quartz photoelec. cell and a quadrant electrometer is described. With this arrangement measurements have been made of the mol. absorption coeff. of sea-water and aq. solns. of the principal salts in the sea. The coeff. A is defined by $(\alpha - \alpha_0)/C$, where α is the absorption coeff. of the soln., α_0 that of the pure solvent (water), and C is the concn. in g.-mol. per l. of soln. Measurements were made in the region λ 4000-2500, and the salts investigated were KCl, NaCl, $MgCl_2$, $MgSO_4$ and $CaSO_4$. It was found that the transparency decreases rapidly with decreasing wave length in the ultra violet and becomes quite small below λ 3000; that from λ 3400 to 3000 $CaSO_4$ contributes about one-half to the absorption of sea-water, water about one-quarter and the other salts the rest. From λ 3000 to 2500 $MgCl_2$, $CaSO_4$ and water each contribute roughly one third, the other salts giving but little absorption. A close analogy is traced between the decrease of the transparency of the sea with decreasing wave length in the ultra violet and the special energy curve of sunlight. A possible function of the part played by the actinic effects of sunlight on the concn. of the sea and the air is suggested by these facts. B. C. A.

Absorption of light by solid and dissolved salts and absorption by ions. H. LEY AND W. HEIDBRINK. *Z. anorg. allgem. Chem.* 173, 287-96(1928); cf. *C. A.* 22, 738.—The absorptive power of $CuSO_4$ solns. for ultra violet light between 0.30 and 0.25 μ deviates appreciably from Beers' law; a similar result is obtained with concd. solns. of Cu perchlorate. The absorptive power of the solid pentahydrate is appreciably less than that of the soln., showing that the hydrated ion $[Cu4H_2O]^{2+}$ is present in the crystal lattice and that this forms a more normal and more optically satd. system than does the soln., the deviations in the absorptive power of which are ascribed to the formation of complex anions. The change in the color of solns. of $NiSO_4$ and $CuSO_4$ produced by the addn. of H_2SO_4 is shown by examn. of the absorption spectrum to be due to dehydration of the colored cation. B. C. A.

Structure of the violet bands of silicon nitride. FRANCIS A. JENKINS AND HENRY DE LASZLO. *Proc. Roy. Soc. (London)* A122, 103-21(1929).—The violet SiN band spectrum excited by active N has been photographed in the second order of a 21-ft. concave grating, and measurements of the structure lines of the 10 strongest bands are tabulated. These include 4 bands in which the vibrational quantum no. decreases

by one during the emission, (3,2) to (6,5), and 6 in which it is unchanged, (0,0) to (5,5) they include practically all the lines of any intensity in this spectrum between 4000 and 4300 Å. U. Each band has a doublet *P* and a doublet *R* branch, and there is one missing line, in complete accord with the theoretical predications for a band system of $^2S \rightarrow ^2S$ type. Several perturbations are found in the rotational terms of the initial state. The combination relations between *P* and *R* lines are applied to find the term differences, from which the rotational consts. are evaluated. The isotope effect is well marked for $Si^{28}N$ $Si^{29}N$ and $Si^{30}N$ and from this effect in 3 bands of the strongest sequence, quant. evidence is adduced in support of the quantum mechanics expression for the vibrational energy, which is developed in powers of $(n + 1/2)$, i. e., half quantum numbers.

W. F. MEGGERS

Band spectrum of chlorine or hydrogen chloride. E. B. LUDLAM. Univ. of Edinburgh. *Nature* 123, 86-7(1929).— Cl_2 burning in H_2 at a quartz jet gives a band spectrum from about 2600 to 4800, with a max. of intensity around 3850 Å. U. These bands are produced in the outer zone of the flame, and are, therefore, ascribed to HCl

G. CALINGAERT

A new band system of carbon monoxide. RANGA K. ASUNDI. King's College, London. *Nature* 123, 47-8(1929)—Four new bands, 3681.1, 3893.2, 4125.0 and 4380.3, have been obtained and completely resolved for CO on a 21-foot concave grating. The first is mixed with a spurious band of unknown structure, the second is completely isolated and the two others are mixed with 2 known spurious bands. The last three have been analyzed. Each consists of a *P*, a *Q* and an *R* branch.

G. CALINGAERT

Energy distribution in band spectra, especially in nitrogen bands. G. HERZBERG. *Z. Physik* 49, 761-73(1928).—The parabolic energy distribution in a band spectrum required by Condon's theory (*C. A.* 21, 1062) is attained only when the distribution of the mols. over the various vibration states in the initial condition is uniform. Generally this is not the case. From the theory developed by Franck (*C. A.* 20, 548) considerable deviations would be expected, although at great activations approximations to the Condon distribution law can be attained. This has been shown experimentally with the N bands. This fact is explained by supposing that in the case of collisions between high-velocity electrons, Franck's rule is broken and vibrations of higher quantum no. can be stimulated to a greater extent.

B. C. A.

The band spectra of the alkaline earth halides. I. CaF , SrF . R. C. JOHNSON. *Proc. Roy. Soc. (London)* A122, 161-88(1929).—A complete quantum analysis of the whole of the band spectra of the mols. CaF and SrF has been made. Formulas which express them have been obtained by the method of least squares. For this purpose a remeasurement of some 250 band heads has been made from first order plates taken with a 21-ft. Rowland grating. The mols. give rise to at least 3 band systems each, which are analogous in almost every respect. These are assigned to the electron transitions $3^2S \rightarrow 1^2S$, $2^2S \rightarrow 1^2S$ and $2^2P \rightarrow 1^2S$. Although these mols. have features common to all those of the one-valence electron type, there exist several exceptional features such as (a) the occurrence of strong *Q* branches in $^2S \rightarrow ^2S$ transitions and (b) a definite discrepancy in $\langle n'' \rangle$ as evaluated from the $^2S \rightarrow ^1S$ and $^2P \rightarrow ^2S$ systems. These point to some unusual feature in the 2S states of all these mols. The energy of dissocn. of the CaF mol. is approx. 3.36 v., and that of SrF is of the same order. In the former mol. the sudden termination of a sequence at the 20th member has been satisfactorily explained on the basis of this value for the energy of dissocn. **II. BaF , MgF .** *Ibid* 189-200.—In part I (above) an analysis of the gross structure of the band spectra of the CaF and SrF mols. was given. The second paper deals with the spectra of 2 mols. of precisely the same external character but one is simpler and the other more complex in its internal structure. MgF has one shell of 8 electrons less than CaF , while BaF has a shell of 18 electrons more than SrF . A complete quantum analysis of the gross structure of the band spectra of the BaF and MgF mols. is presented. BaF bands in the green region are believed to constitute 2 systems, attributed to electron transitions $2^2S \rightarrow 1^2S$ and $3^2D \rightarrow 1^2S$. The suggested transitions of the type $^2D \rightarrow ^2S$ are believed to be new to band spectra. The absence of the $2^2P \rightarrow 1^2S$ transition in BaF is remarkable. The recorded emission bands of MgF constitute a $2^2P \rightarrow 1^2S$ system and definite evidence of the vibrational isotope effect occurs in some faint heads which are assocd. with a D_1 sequence. The observed value of the isotopic coeff. agrees within the limits of error with that calculated on the basis of 2 isotopes of Mg of masses 24 and 25.

W. F. MEGGERS

The band spectra associated with zinc, cadmium and mercury. J. M. WALTER AND S. BARRATT. *Proc. Roy. Soc. (London)* A122, 201-10(1929).—The band spectra of the alkali metals are now well known, and it has been established that they are due

to a small proportion of diatomic mols. which are normally present in the vapors of these metals. It is as yet uncertain how many other metals, with vapors which, by ordinary methods of measurement appear to be monatomic, give similar spectroscopic proof of assocn. Throughout a large no. of expts. with the satd. vapors of the alk. earth elements, up to 1200° , no evidence of band spectra which can be attributed to diatomic mols. has been found. The elements of group II b of the periodic table are much more interesting in this respect, and expts. on the absorption spectra of these have led to the following conclusions: The majority of the supposed band absorption spectra of Zn and Cd, and one band system previously attributed to Hg, appear to be oxide and chloride spectra. The only bands which can be attributed to Zn and Cd themselves are 2 weak and diffuse bands, one for each metal. They occur at 3050 A. U. for Zn, and at 2212 A. U. for Cd. The absorption spectrum of Hg is much richer and there is no doubt that Hg vapor contains diatomic mols. The bromides of the 3 metals, together with the iodide of Cd, all yield absorption bands analogous to the chloride bands.

W. F. MEGGERS

Observations in connection with the band systems of the fluorides of beryllium and magnesium. W. JEVONS. *Proc. Roy. Soc. (London)* **A122**, 211-27(1929).—Until quite recently only 2 band systems had been attributed to compds. of Be, BeF being the emitter of one system, which occurs in the ultra-violet, and BeO of the other system, which lies in the visible region. A modified interpretation of the BeF band heads is suggested, and new bands due either to BeF₂ or to an oxide of Be are described. No bands due to BeCl and no further bands of BeF were found. With MgF₂ in the C arc in air the outer flame develops, in addn. to the previously known MgF doublet system, a new ultra-violet system of 3 sequences of apparently single-headed bands. This new system is also due to MgF₂; it may have for its final state the initial state of the doublet system.

W. F. MEGGERS

Kinetics of absorption of ultra-sonic waves. D. G. BOURGIN. *Nature* **122**, 227-28(1928). The attenuation of ultra-sonic waves in passing through CO₂, H or He and the accompanying frequency variation of velocity are correlated with the mechanisms of collisions of the first and second kinds.

B. C. A.

Fluorescence of resins to filtered ultra-violet light. G. T. DRAGONE. *Attitud. Lincei* **8**, 602-4(1928).—The fluorescence of resins from many coniferous plants was studied by means of the Hanan lamp and "Uviol" filter. Blue fluorescence was noted from resins of *Podocarpus macrophylla*, *Sequoia gigantea*, etc.; violet from *Cupressus obtusa*, green from *Pinus excelsa*; yellow from *Cedrus deodara*, etc. A. W. C.

The excitation of luminescence by the agitation of mercury in glass and transparent fused-silica tubes and vessels. W. L. LEMCKE. *Science* **69**, 75-8(1929).

J. A. KENNEDY

Nitrogen afterglow. J. C. McLENNAN, R. RUDY AND J. M. ANDERSON. Univ. of Toronto. *Trans. Roy. Soc. Can.* [3], **22**, III, 303-21(1928); cf. *C. A.* **21**, 20, 3313; 22, 2325. The spectrum of the afterglow of N₂ prepd. by the Br₂-NH₃ method was found under different conditions of discharge and in the presence of the inert gases. N₂ was not found to be excited when mixed with active N₂, although the energy necessary was less than that required for spectral lines by metallic vapors when acted upon by active N₂. The character of the afterglow was affected in the same way by each of the inert gases when present in high percentages. If the afterglow is to be accounted for by the simple transfer of energy, the kinetics of the process leads to conclusions not in agreement with the exptl. evidence. The bands observed in the afterglow when the N₂ was mixed with inert gases can be explained by the theory of the intensity distribution in a band system, and was applied by the authors to their exptl. results.

J. W. SHIPLEY

Wave-length shifts in scattered light. W. H. MARTIN. *Nature* **122**, 506-7(1928).

H. L. D.

Fluorescence excited in oxygen and nitrogen by ultra-violet light of short wave length. J. C. McLENNAN, R. RUDY AND F. H. CLEMENTS. Univ. of Toronto. *Trans. Roy. Soc. Can.* [3], **22**, III, 253-5(1928); cf. *C. A.* **22**, 4066. —Ultra-violet radiation was discharged through a quartz capillary into a small metal chamber contg. the gas. Short Al rods were used as electrodes and ten Leyden jars put in parallel with the transformer, and a spark gap was introduced in series with the main discharge. O₂ gas was obtained by heating KMnO₄ and the pressure of the gas reduced at will by a diffusion pump backed by its oil pump. A faint greenish cone of light proceeded from the opening illuminated by the spark discharge. The N₂ spectrum showed up strongly in fluorescence, indicating that the O₂ was not free from N₂. A Geissler tube filled with the same gas did not indicate any N₂. Mol. N₂ bands appeared but no mol. O₂ bands. At. O₂

lines at $\lambda 8422$ A. U., $\lambda 772$ A. U. and $\lambda 6171$ A. U. were quite intense and the Balmer lines appeared together with a strong line or band at $\lambda 4780$ A. U. The auroral green line did not show up. The observations confirmed the relatively greater stability of the N_2 mol. as compared with the mol. of O_2 . J. W. SHIPLEY

Action of light and x-rays on ammonium thiocyanate. C. G. PATTEN AND H. D. SMITH. Univ. British Columbia, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 221-4 (1928).—Concd. aq. solns. of NH_4CNS on exposure to light turn bright red but the color disappears again in the dark. This action was found to be due to the presence of traces of Fe in the salt which became oxidized in the light and was reduced in the dark. The oxidized Fe formed the red ferric thiocyanate. On recrystg. the purest NH_4CNS available the red coloration was more marked in material recovered from the mother liquors than in the purified crystals. To one of two solns. to which 0.001% of ferrous Fe was added as sulfate, the red coloration on exposure to light was more marked than in the soln. to which no Fe was added. H_2O_2 produced the red coloration in a soln. and $SnCl_2$ removed it. Metallic Fe prevented the formation of the red color in the presence of light but on the removal of the Fe the soln. became deeply colored. In the dark the solns. became colorless. Wave lengths less than 5400 A. U. produced the coloration and those between 4000 A. U. and 4300 A. U. were most effective. X-rays brought about the same coloration as sunlight. Photooxidation of traces of impurities by x-ray radiation may help to explain the coloration produced in glass by x-rays and the variation in optical transparency of glass exposed to intense ultra violet light may have a similar explanation. J. W. SHIPLEY

Light, its possible use in the Congo for chemical syntheses. J. VAN HOUT. *Ing. chim.* 16, 182-91 (1928).—H. illustrates by well-known examples the influence of light on chem. reactions and proposes the further study of this subject with the object of utilizing the strong African sun for industrial purposes. P. THOMASSET

Optical excitation and dissociation of metallic halides. K. BUTKOV AND A. TERNIN. *Z. Physik* 49, 865-84 (1928).—In continuation of previous work (*C. A.* 20, 2788, 21, 3833) the optical dissocn. of the CsI, TlBr and TlCl and CuI mols. into the excited metallic atom and neutral halogen atom has been investigated. The limiting frequencies at which the lines characteristic of the metallic atom are emitted when the vapor of the halide is irradiated with an intense beam of short ultra-violet light were detd. and the heat of dissocn. of the mols. so deduced was found to be in satisfactory agreement with those calcd. from thermochem. data. In the case of TlI vapor, optical excitation causes the emission of a band spectrum of the TlI mol. besides the atomic lines. From this, the various dissocn. processes are related with the energy levels in the mols. The data obtained are compared with those found previously. B. C. A.

Photochemical cell containing potassium ferrocyanide solution. S. IMORI. *Sci. Papers Inst. Phys. Chem. Res. Tokyo* 8, Suppl. 11-3 (1928).—A cell contg. $K_4Fe(CN)_6$ soln. and having Pt electrodes in the 2 compartments, which are sepd. although not completely, by a porcelain diaphragm, yields at a time t after commencement of illumination of one of the compartments a p. d. $\pi = \lambda (1 - e^{-\delta \sqrt{t}})$, while on discontinuing the illumination $\pi = \lambda (1 - \gamma t) / (1 + \delta \sqrt{t})$, where λ is the equil. potential, and γ , δ and k are consts. The e. m. f. is due to displacement to the right of the equil. $[Fe(CN)_6]^{4-} + 2H_2O \rightleftharpoons [Fe(CN)_6H_2O]^{2-} + OH^- + HCN$ (cf. *C. A.* 22, 551). The displacement is dependent only on the light intensity, and does not obey the law of mass action. The photochem. effect is greatest at 440-450 μ . B. C. A.

Photochemical cells with complex cyanides of nickel or platinum. S. IMORI. *Sci. Papers Inst. Phys. Chem. Res. Tokyo* 8, Suppl. 14-5 (1928); cf. preceding abstract. A cell contg. K nickelocyanide or platinumocyanide yields an e. m. f. expressed by $\pi = \lambda (1 - e^{-kt})$ during illumination and $\pi = \lambda e^{-kt}$ when the illumination is stopped. The e. m. f. may be due to the temporary formation of some kind of concn. cell by a change of complex dissocn. or by polymerization of complex ions or mols. B. C. A.

Structure and activation of the formaldehyde molecule: analysis from the point of view of the ultra-violet absorption spectrum of the vapor. V. HENRI AND S. A. SCHOU. *Z. Physik* 49, 774-826 (1928); cf. *C. A.* 22, 2325.—The ultra-violet absorption spectrum of CH_2O vapor has been investigated and 35-40 bands have been located between 3700 and 2500 A. U. The absorption max. is at 2935, as for other aldehydes. The bands can be divided into 11 groups, the first 7 groups contg. rotation bands, while the other groups are indefinite and continuous and are attributed to the pre-dissocd. mol. A double fine structure was found in the first 7 bands and is explained by assuming a doubly-quantised rotation of the mol. corresponding with 2 moments of inertia J and K , the former about the C—O axis of the mol. and the latter at right angles to it. The values deduced for the moments of inertia of the normal mol. are $J_0 = 1.38 \times$

10^{-10} , $K_0 = 23 \times 10^{-40}$. From this the configuration of the mol. is deduced as of γ -form with the following inter-atomic distances: $H-H = 1.38 \times 10^{-8}$ cm.; $C-O = 1.09 \times 10^{-8}$; $C-H = 1.3 \times 10^{-8}$ cm. Similarly, there are 2 vibration numbers α and β , corresponding with $C-O$ vibrations and $H-H$ vibrations, resp. For the normal mol. $\alpha_0 = 1572.3$ and $\beta_0 = 441$ cm.^{-1} , while for the excited mol. $\alpha' = 1231.3$ and $\beta' = 398$ cm.^{-1} . The band structure shows a triplet system, and the lines in each band can be arranged very exactly according to 9 parabolas. The sepn. of the bands in these triplets is independent of the state of vibration of the atoms and is almost equal to the value calcd. from the emission spectrum of the CO mol. The CO mol. is supposed to exist normally in the 1S state, from which it was predicted that it would have a new absorption band at 2060.6 arising from the $^1S + ^3P$ change. This was found at 2060.8 \AA . The deductions are drawn that the CH_2O mol. exists normally in the 3P state and passes through 7 successive stages of vibrational activation into a pre-dissocd. substance. At higher temps. the latter condition appears at lower degrees of excitation than at normal temps. Observations of the absorption spectrum of CH_2O in soln. showed that in water the CH_2O mol. is completely hydrated, while in hexane at -70° it remains in the unimol. state.

B. C. A.

Altitude of the ozone layer. J. C. McLENNAN, R. RUEDY AND MRS. V. KROTKOV. Univ. of Toronto *Trans. Roy. Soc. Can.* [3], 22, III, 293-301(1928); cf. C. A. 21, 13, 2097. —The O_3 layer in the atm. lies at altitudes beyond the possibility of sampling, but cannot extend indefinitely since there must be a sufficient density of O_2 mols. being dissociated by ultra-violet radiation and of O atoms colliding with O_2 mols. to form O_3 . The thickness of the O_3 layer can be calcd. from absorption coeffs. of ultra-violet radiation. A series of spectrograms of the zenith of a clear sky were taken with a Hilger quartz spectrograph in the time of about one and a half hours, following sunrise and preceding sunset. The time of exposure was 10 mins. The d. of the ultra-violet part cont., the Huggins bands was measured and from these measurements the altitude of the O_3 layer above Toronto was detd. as 47-57 kilometers on Sept. 5 and 6, 1927. The results of the calcs. on the O_3 layer in the atm. are not in accordance with what would be expected from the $2\text{O}_3 \rightleftharpoons 3\text{O}_2$ equil. observed under lab. conditions. There is too high a concn. of O_3 in the atm. Traces of org. dust in the upper atm. would vitiate the results of absorption measurements.

J. W. SHIPLEY

Lattice energies and photochemical decomposition of the silver halides. S. E. SHEPPARD AND W. VANSELOW. *J. Phys. Chem.* 33, 250-73(1929).—Consideration of the energy steps in the Born cycle for calcg. the lattice energies of Ag halides leads to the following conclusions: (1) The photolysis of solid Ag halide might occur directly to give halogen and metallic Ag. This requires only a quantum at 800 $\text{m}\mu$ or longer, equal to the heat of formation of the halides from the elements. (2) This photolysis must occur indirectly, by way of sepn. of electrons from halide ions, followed by acceptance of the electrons by Ag ions. This course would require (a) a quantum at $\lambda = 130$ $\text{m}\mu$, or beyond, to disrupt the lattice, then a quantum at $\lambda = 300$ $\text{m}\mu$, or beyond, to liberate electrons. In subsequent reactions of electron acceptance, etc., energy might be freed, either as radiation quanta or by radiationless collisions, so that the final difference of energy equals the heat of formation. In this case (b) primary absorption of 2 quanta appears necessary at thresholds much higher than those known to be operative in the photochem. decompn. of Ag halides. The contradiction might be dismissed by abandoning the view that the photolysis involves the intermediate liberation of photoelectrons from halide ions—a hypothesis suggested independently by K. Fajans and S. E. Sheppard. The phenomena of photoelec. conductance definitely point to a relative freeing of photoelectrons. F. C. Toy has shown that the discrepancy between the photoelec. conductance absorption spectrum of Ag halides and the spectrum photographically active is removed by consideration of the thickness factor. The authors have recently obtained independent evidence of the liberation of photoelectrons, concomitant with the production of free halogen, in a study of the photoelec. potentials of Ag—Ag halide electrodes in electrolytes. The difficulty of the energy quanta required cannot be dismissed. The exptl. evidence obtained with these cells led to a modified theory of the inner photoelec. effect which is consistent with Sheppard's orientation theory of photographic sensitivity and latent-image formation. By considering that both the lattice energy and electron affinity are lowered at interfaces, particularly at true interfaces with conductors, it seems possible for the inner photoelec. effect to occur at the lower wave lengths in question.

S. E. SHEPPARD

Rate of photochemical combination of chlorine and hydrogen in glass capillary tubes. DAVID L. CHAPMAN AND PHILIP P. GRIGG. *J. Chem. Soc.* 1928, 3233-5.—The catalytic union of H and Cl seems to be due to an ephemeral catalyst formed by

the action of light (cf. *C. A.* 22, 4378 for Br + H). The detns. were carried out in a U-tube, of which one limb had a bore of 1 mm., and the other limb had a bore of 2.5 cm. The fraction of the H and Cl which united under equal exposure was larger in the larger tube. The catalyst is destroyed by contact with glass or water. F. E. B

Quantum yield in the photochemical decomposition of light-sensitive diazo compounds. J. EGGERT. *Z. Elektrochem.* 34, 602-5(1928).—The photochem. decompn. of the diazo compds. of 2,1-aminonaphthol-4-sulfonic acid and of *p*-aminodiphenylamine sulfate, followed by measuring the evolution of N₂ in a microeudiometer, showed the following characteristics. In aq. soln. there is an induction period, followed by a range in which N₂ is evolved linearly with time. The gas evolution, once started by exposure to light, does not cease immediately on stopping the illumination, but continues for a considerable time at a gradually diminishing rate. The quantum efficiency in aq. soln. is 0.36. This value is independent of light intensity, within the range 0.4 to 5 Hefner candles of λ within range 436 and 365 μ , of the temp. between 20° and 40° and of the concn. of the soln. The solid decomposes on exposure to light with the same quantum yield. X-rays do not cause the evolution of N₂, but produce some other, unknown change in the substance. W. WEST

Photochemistry of iron carbonyl compounds and the absolute absorption spectrum of respiration enzyme. OTTO WARBURG. *Naturwissenschaften* 16, 856-61 (1928).—The action of light has recently been studied on 3 complex Fe carbonyl compds. CO-pyridine-hemin with Fe on the tetrapyrrole nitrogen in an FeCO group, CO-ferrocystine with Fe on the S atom of an amino acid in an Fe(CO)₂ group, CO compd. of respiration enzyme with an FeCO group. For the first 2 quant. work was possible, they decomp. with light intensities of 1/10,000 sunlight; for the third compd. an indirect respiration method was used for measurements. It was found that the Einstein law of equivalence holds; 6 different wave lengths were used (366, 405, 436, 492, 546 and 578). From the relation $\gamma_1/\gamma_2 = \lambda_1/\lambda_2$ the relative absorption spectrum of the compds can be detd.; the absorption coeff. β follows from $\beta_1/\beta_2 = (i_2\lambda_2)/(i_1\lambda_1)$ for i_1 and i_2 intensities of equal action. By intermittent periodical irradiation with light of known intensity, i , the rate of the photochem. reaction can be detd. and from it follows, since $h\nu$ is equiv. to 2 atoms Fe, the abs. absorption coeff. by $-(1/c)(dc/dt) = 2(i\lambda\beta/h\nu)$. For the respiration enzyme the irradiation period was varied from 1 to 6000 per min. β was found to be 10⁸ sq. cm. per g. atom Fe. A curve of the $\beta - \lambda$ relation is given, it is over about 20 μ shifted from the CO-hemin curve. From comparison with the spectrum of CO-ferrocystine and Fe(CO)₅ it is evident that these spectra depend largely on the carrier mol.; it is entirely different for the latter 2 compds. The typical Fe-carrying group in the respiration enzyme is therefrom concluded to be a tetrapyrrole group. It was found that for cleavage of Fe(CO)₅ again one quantum per 2Fe atoms was required. B. J. C. VAN DER HOEVEN

The influence of deformation on the internal photoelectric effect of rock salt crystals. M. N. PODASHEVSKII. *Phys. Inst., Odessa. Naturwissenschaften* 16, 653(1928).—It was found that plastic deformation (slip over cleavage planes) influences considerably the photoelectric effect of rock salt crystals, colored by x rays. The current drops rapidly under load, approaching an asymptotic value sometimes zero. Increasing the load causes this value to drop to a lower limit. The original effect can be reestablished to a certain extent by repeated x ray irradiation. B. J. C. v. H.

The normal photoelectric effect. P. LUKIRSKII AND S. PRIEZAIEV. Technical Institute, Leningrad. *Z. Physik* 49, 236-58(1928).—The metals Al, Zn, Sn, Ni, Ag, Cd, Pb, Cu and Pt have been studied under radiation of Hg lines of $\lambda = 2302, 2400, 2537, 2653, 2802, 2967, 3022$ and 3130 Å. U. in a spherical condenser. From the max. electron velocity an av. value for Planck's const. h of 6.543×10^{-27} erg. secs was detd., and the $h\nu_0$ of the Einstein equation and the contact potential found to be the same for sprayed films down to 10⁻⁶ cm. in thickness as for massive metals. The av. velocity of the photo-electrons approaches closer to the max. the thinner the film. From this and a study of emission from active through thin films of less active metals the authors conclude that the photo-electrons are identical with the conductivity electrons and that the distribution in velocity is caused by work expended in getting to the surface. Fluorescent screens. L. A. LEVY and D. W. WEST. Brit. 295,078, May 19, 1927. A non-fluorescent or but feebly fluorescent dye or pigment is added to or used with a fluorescent substance in order to modify the color of the fluorescence. ZnCd sulfide mixed with vermilion oil paint gives a scarlet fluorescence, or if mixed with a dope or varnish such as nitrocellulose lacquer, which has been dyed with rhodamine or magenta, gives a crimson-scarlet fluorescence. Other examples also are given.

4—ELECTROCHEMISTRY

COLIN G. FINK

Manganese-steel production in the electric furnace. J. TRANTIN, JR. *Foundry* 57, 32 5(1929); cf. *C. A.* 23, 1354. The usual heat treatment for Mn-steel castings is to quench from 1010°. If the C content is greater than 1%, higher temp. must be used. Phys. tests on castings contg. 1.24% C and 12.20% Mn showed that the best properties were obtained by quenching from 1024° to 1066°. Micrographs confirm the phys. tests, showing more uniform structure for material quenched from the range noted. *Ibid.* 128-31. Reheating Mn-steel castings, as in shrinking on liners, or in welding, will lead to the pptn. of carbide if the temp. goes over 482°. This impairs the phys. properties and wear resistance, as shown by tests and micrographs. If it is necessary to reheat to the danger point, it is advisable to carry the heating to 1038° and then quench.

BENJAMIN MILLER

Electric melting of alloy steels. H. M. GERMAN. *Blast Furnace Steel Plant* 17, 274 6(1929). Three methods of making steel from a cold charge in an elec. furnace are briefly outlined, viz., melting with complete oxidation, melting with partial oxidation, and melting with little or no oxidation. Compn. of the refining slag, the proper manipulation of the bath and the correct tapping temp. of the metal are important factors in the production of steel of good quality.

DOWNES SCHAAF

Manufacture of hollow drill steel in the electric furnace. THOMAS M. PUGSLEY. *Chem. Eng. Mining Rev.* 21, 131 2(1929). Sound ingots are secured by using a feeding head 38 cm. high, and pouring in metal repeatedly until the head is full. The ingots are worked to billets 51 cm. long and 11.4 cm. in diam. A smooth hole, 3.8 cm. in diam., is bored through the billet, and a graphite-covered Cu bar inserted. The composite billet is rolled to the desired size, and then the Cu may easily be removed. B. M.

Electrometallurgy of gold. W. GRAFLICH. *Chem. Fabrik* 1928, 678-80.—The current, electrode spacing, voltage, electrolyte impoverishment, pulling-time for electrodes, and interest-charges are calcd. for a Au refinery, assuming appropriate values for anode compn., c. d., no. and size of cells and electrodes, electrolyte compn. and resistance, etc. The method of calcg. cell voltage is novel: the potential drop in the soln. is calcd. in the regular way from the sp. resistance of the electrolyte, the c. d. and the spacing, 50% of this voltage is added to allow for contact drops; the decompn. potential of auric chloride is calcd. from the heat of formation, and this is added as the cathode voltage; the decompn. potentials of the chlorides of the metals found in the anode are calcd. in the same way, and each is multiplied by the weight percentage of the metal in the anode, the sum of the values found being subtracted at the anode voltage. The compn. given is Au 66.2, Ag 6.4, Cu 6.0, Zn 12.1, Fe 1.8, Ni 1.5 and Pb 6.0%.

BENJAMIN MILLER

Method of electrolytic gold refining adopted by the Hitachi Copper Works. TAISEI KIMATA AND TEIICHI YAMAMOTO. Hitachi Copper Mining Works. *Japan J. Mining* 44, 785-814(1928).—In recovering Au and Ag from the electrolysis of crude Cu, the slime contg. Au and Ag has formerly been treated by HNO_3 and H_2SO_4 to obtain pure Au. When the metal contains Pt-group metals it has been found difficult to make the standard Au grade higher than 99.8%, the addnl. disadvantage being that the color of the refined product makes it liable to be mistaken for a low-grade gold. Hence K. and T. studied the applicability of the Wohlwill electrolytic method. Impure Au contg. Ag and Pt-group metals is used as anode. They succeeded in producing a pure Au, recovering at the same time all of the Pt-group metals. The greatest difficulty was found in preventing the anode showing a passive state when the c. d. exceeded a certain limit. They studied to what extent the c. d. might be increased by the addn. of HCl , by the elevation of bath temp. and also by the combined use of a. c. and d. c. When the temp. is raised the luster and the crystal appearance of the deposited Au become better, but the rate of deposition decreases, at the same time increasing the amt. of slime. The best results were obtained by working at 70° . The increase in the HCl concn. has a similar effect as that of raising the bath temp., but above a certain limit the effect is not remarkable, 5% of HCl being the best. The use of a. c. superimposed permits of a much larger increase in c. d.; the deposited Au becomes very fine and almost all of the Au adheres firmly to the electrode. When an a. c. is used, which is 1.3 times larger than the d. c., the highest c. d. at the anode can be used, and the amt. of slime is considerably lessened. (In practice about 12 amp./sq. dm. is used.) The authors then describe the details of operation for 108 kg. of anodes, electrolyzed for 20 hrs., and noted some of the characteristics of the Au produced (99.97-99.99% grade). In electrolysis, all of the Pt-group elements enter into soln. while such insol. metals, as Ir, enter the slime and are easily sepd. Economically speaking, this method has the disadvantage that the amt. of Au which has to be "tied up" for the electrolysis must be larger than in the HNO_3 method. But this disadvantage may be offset by the lower cost of refining and the higher price of the product obtained, the added advantage being the recovery of the Pt-group metals. In addn. the operation is simple and sanitary, and the initial cost of the plant is small.

K. SOMIYA

Investigations on the electrolytic precipitation of metals. K. ARNDT *Ber.* 62B, 80-4(1929); cf. C. 4, 17, 931.—In continuation of the work on throwing power, expts. were conducted with a pierced celluloid sheet between the anode and the cathode. The celluloid sheet was 10 mm. from the anode and 2 mm. from the cathode, and the hole was 1 mm. in diam. A silvered Cu cathode was used, in a soln. of 150 g. $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, 50 g. H_2SO_4 , and 50 g. $\text{C}_2\text{H}_5\text{OH}$ per l. A current of 22 milliamp. was passed for 20 min. The deposit consisted of a dark circle, surrounded by 5 concentric rings, alternately light and dark. The outside diam. of the outermost ring was 16 mm. Under the microscope the circle showed fungiform structure buds pressed together. This structure appeared also in the second zone, where the c. d. was somewhat less. Under the microscope the boundary of the outermost ring consisted of single crystals, with the Ag background showing. Individual crystals appeared outside the ring system, getting scarcer as the distance from the center increased. If the plate be sighted on from different angles, the illumination being kept vertical, the appearance changes, and zones which appear light on vertical examn. appear dark on oblique examn. and vice versa. A suggests that the crystals tend to deposit with their bright faces parallel to the current lines. As the distance from the center increases, the direction of the current lines becomes ever more oblique. The ability of the crystals to follow the current line influence is limited, so that they remain oriented in one direction until the obliquity reaches a limiting value, and then suddenly assume a new orientation. All crystals were about the same size, 0.005 mm. The crystal nuclei, which deposit in favorable places, grow at the expense of their neighbors. The mechanism suggested is that the unfavorably-placed nuclei react with cupric ions to form cuprous ions, and that the reverse reaction deposits Cu on the favorably placed nuclei. In another series of expts. the effects of c. d., temp. and concn. on the no. and size of the crystals in the deposit were detd. A silvered Cu plate 4 cm. square was used as cathode between 2 anodes in the soln. mentioned above. A current of 8 milliamp. was passed for 5 min., at about 18° . Other deposits were made under similar conditions, but with the current strength ranging from 4 milliamp. to 20 milliamp. Another series of deposits was made at the 8 milliamp. rate, at 0° and at 35° . A third series at 18° and at the 8 milliamp. rate was made with the soln. diluted tenfold. The deposits were examd. under 500 diam. magnification, a counting chamber being used to get the no. of crystals per unit area and the approx. dimensions. The smallest av. diam. observed was 0.5 μ ; the largest, 5 μ . High

c. d., cooling and diln. favored the formation of many small crystals, while low c. d. and warming favored the formation of few and large crystals. The addn. of 0.1% of gelatin made the crystals too small to be seen under the microscope. B. M.

Variation of the resistivity of thin coats of platinum with respect to the thickness. A. FÉRY. *Compt. rend.* 187, 819-21(1928).—Pt films 287 mu thick are produced by cathodic sputtering; their resistivity is 4.19×10^{-4} . These films are considered to be composed of massive Pt. They differ from ordinary Pt, but will transform into the latter form by adequate heating. By sputtering at 340° , ordinary Pt is obtained. The thin films have strong catalytic properties. The change in catalytic properties and in resistance properties leads to the conclusion that many intermediate steps exist in the transformation of Pt black into bright Pt.

ALBERT L. HENNE

The rate of evaporation of tungsten in the presence of salt vapors. H. ALTER-TIM M. *Z. tech. Physik* 9, 285-8(1928).—The rate of evapn. of W was measured by the Langmuir method (C. A. 8, 870) with filaments of 50 mu, 70 cm. long, previously ignited in N_2 with some H_2 to remove impurities. They were weighed on microbalances. Different salts were sprayed on the filaments in 10% aq. soln. or in aq. suspension. With proper precautions and corrections for cold ends, etc., the decrease in wt. was found to be for pure W 1.83×10^{-8} g. per sq. cm. per sec. at 2685° , 4.63 at 2770° , 19 at 2875° . At 2770° addn. of P gave 6.66, of NaCl 6.9, of KBr 10.6, of CaF_2 6.7, of Na_2SiF_6 4.8, of Na_2PF_6 6.7, of K_2AlF_6 7.0, of BPO_4 $4.5 \cdot 10^{-8}$ g. per sq. cm. per sec. evapn. Similar increases were found at other exptl. temps. The results on pure W are in good agreement with those of Forsythe and of Zwicker. All halogen salts apparently attack the W, increasing the evapn. rate by 40 to 50%. Decrease in blackening of the walls of incandescent lamps containing these salts must therefore be attributed to reactions on the walls, not to diminished evapn.

B. J. C. VAN DER HOEVEN

Chromium plating on a printing surface. I. The condition of electrolysis with a mixture of chromic oxide and chromic sulfate. MASATAKA NAGANO AND ASAJIRO ANICHI. Research Lab. Printing Bureau of Government. *Bull. Research Lab. Printing Bureau Government* 19, 23-53(1928). (In English).—N. and A. Cr-plated printing surfaces having a fine pattern on them, and studied the most satisfactory conditions for obtaining the best current efficiency, the effect of the compn. of the bath, the effect of temp., c. d., duration of electrolysis, ratio of the area of the 2 electrodes, the current efficiency as affected by different electrodes, the surface luster of the deposit, and finally the brittleness of the deposit. **Results** (1) The bath must contain the right quantity of CrO_3 and acid. The best results were obtained when the ratio of $CrO_3/Cr_2(SO_4)_3$ was 0.15, a good plating surface being obtained when this ratio was reduced to a certain extent by actual electrolysis. The following results were obtained with the electrolyzing soln. contg. 10% CrO_3 :1% $Cr_2(SO_4)_3$. (2) With the rise of temp. the current efficiency increases, but there is a temp. for each electrolyzing soln. A good plate with a beautiful surface luster is obtained at $35-45^\circ$. (3) The current efficiency and the c. d. increase or decrease proportionally with each other, the best result being obtained at 0.08-0.1 amp./cc. (4) The effects of the duration of electrolysis, the ratio of electrode surface and the kind of the electrode metal upon the current efficiency are not great, but the appearance of the plated surface is influenced very largely by these factors. Thus, with the increase in the duration of electrolysis, or that of the electrode surface, a large crystal grain grows at the edges of the plated surface and the power of covering at an equal depth decreases. In regard to the choice of electrode material, the anode metal has no influence, but the kind of the cathode metal has a profound influence upon the plated surface. Best plating results were obtained up to the 7 hrs. as the duration of electrolysis when the ratio of the area of the electrodes was 1:12 (anode area/cathode area). For anode metal Fe and Pb and for cathode metal Fe, Ni, Cu and Sn were found to be suitable.

K. SOMEYA

Production of chromium surfaces for retarding the corrosion of nickel at high temperatures. G. F. SAGER. *Diss., Rensselaer Polytech. Inst.* [20], 31 pp.(1927).—For Cr plating Ni articles the surface is first cleaned by cathodic electrolysis in a bath contg. 50 g. of Na_2CO_3 , 15 g. of NaOH and 5 g. of KCN per l., a c. d. of 20 amp./sq. dm. being used for 15 min. Cr is then deposited in a bath contg. 250 g. of CrO_3 , 3 g. of chromic sulfate and 7 g. of chromic carbonate per l., a c. d. of 340 amp./sq. dm. being used. The initial voltage of 5.8-6.2 drops to 3.3-3.7 v. within a few hrs.; the current efficiency for continuous work is about 10% and the rate of increase of thickness of the deposit is 0.018 mm./hr. With a coating of half this thickness the metal remains unaffected for 30 min. in SO_2 at 800° . Attempts to deposit a Ni-Cr alloy from sulfate and chloride baths yields coatings which contain no Cr. Prolonged annealing of Cr-plated Ni wires in H and *in vacuo* at $1100-1300^\circ$ results in only slight interpenetration of the 2 metals.

and the resistance to corrosion by SO_2 at a high temp. is somewhat reduced. "Chromising" Ni in a mixt. of Al_2O_3 and powdered Cr at $1050\text{--}1150^\circ$ produces a highly resistant alloy layer which is unaffected by subsequent cold work. B. C. A.

Electrolytic precipitation of a glass-like film of alumina on aluminum and aluminum alloys. V. P. IL'INSKII AND N. P. LAPIN. *J. Applied Chem. (Russia)* 1, 112-4(1928).—Expts. carried out by I. and L. lead to the following conclusions. Al and its alloys can be protected against corrosion when in contact with ordinary water or moist air by an electrolytic pptn. of an Al_2O_3 film, which does not protect the Al when other more noble metals are in contact or when the film is damaged. The best films are obtained through an anodic polarization in a soln. of $1/2$ to 3% CrO_3 and an applied e. m. f. of 40-50 v. followed by a high-excess voltage. C. FABIAN.

Removing carbon dioxide from air by electrolytic transport. ERICH MÜLLER, HANS MARKERT AND FR. HEINRICH. *Z. Elektrochem.* 35, 3-13(1929).—The object of the investigation was the development of an app. for the removal of CO_2 from the air with the continuous regeneration of the KOH used for absorption. In the scheme adopted, a soln. 10.5 N in K_2CO_3 and 1.06 N in KOH flows by gravity from the cathode chamber of a 2-compartment cell to the air-inlet chamber of an air-lift pump. The air to be treated is used to lift this soln. to an overhead chamber from which it can flow back to the cell. All of the CO_2 is absorbed by the soln., which, as a result, has its hydroxide concn. reduced to some lower value dependent on the rate of air supply and CO_2 content. In the cathode compartment of the cell H is discharged by the current, regenerating the OH. The current is adjusted to the value required to keep the carbonate-hydroxide ratio approx. 10, as expt. showed that 90% current efficiency would be obtained with this ratio. In the anode compartment is a soln. 0.245 N in K_2CO_3 and 2.055 N in KHCO_3 . This soln. was found by expt. to be in equil.; that is, CO_2 is discharged at the anode at the same rate that it enters the compartment by electrolytic transport. Water is added to maintain const. level, so that the only net result is the transfer of K_2CO_3 from the anode compartment to the cathode compartment, because of the migration of K ions. The catholyte is practically satd. with K_2CO_3 , so that the excess crystallizes out, and the crystals fall into a settling chamber from which they are periodically removed to the anode compartment. K salts are used rather than Na salts because of their greater soly.; if Na salts were used the anode would be coated with crystals. Several metals were tried for electrodes, but it was found that Fe was perfectly satisfactory if the chloride content of the K_2CO_3 was kept below 0.05%. The capacity of the lab. app. could not be detd., as the pump available could not supply air at a rate high enough for a severe test. BENJAMIN MILLER.

The Cottrell-Moeller process. PIERRE VER ECKE. *Bull. fédération ind. chim. Belg.* 7, 293-305, 341-64, 389-402(1928).—Gas is purified electrically. A. L. HENNF.

Electrolysis of cyanogen halides. R. H. CLARK AND H. R. L. STREIGHT. Univ. of British Columbia, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 323-9(1928). Cyanogen halides, ClCN , BrCN and ICN , were prepd. in a pure condition and electrolyzed, with various solvents, in order to det. whether the halide might be deposited on the cathode. Twenty-one org. solvents were used and in only one case was a deposit of a halogen on the cathode noted. ICN dissolved in pyridine gave AgI on Ag cathode. In all the other cases the halide traveled to the anode. The authors believe that ICN behaves

as an electromer, $\text{ICN}^+ \rightleftharpoons \text{ICN}^-$, the I reacting entirely positive when pyridine is the solvent. J. W. SHIPLEY.

The operation of radio receiving-tube filaments on alternating current. I. K. H. KINGDON AND H. M. MOTT-SMITH, JR. *Gen. Elec. Rev.* 32, 139-48(1929). Inherent disturbances in using a. c. to heat the filament of a triode vacuum tube are (1) fluctuating potential drop along the filament, (2) fluctuating magnetic field around the filament and (3) fluctuation in filament temp., which causes corresponding disturbances in the plate current-primary potential, magnetic and temp. ripples. In addn., if a tube is used as a detector with grid leak, there are similar grid-current disturbances—secondary potential, magnetic and temp. ripples. Quant. theories of the above types of ripple are developed and compared with exptl. measurements on com. radio tubes. "201-A" tube is an example of practically pure primary potential ripple; a tube with heavily coated Cs filament was used for magnetic ripple test; in "226" tube, potential and magnetic ripples are of equal importance; "199" supplies a good example of temp. ripple. M. McMAHON.

The manufacture of barium oxide filaments. B. HODSON, L. S. HARTLEY AND O. S. PRATT. *Electrician* 102, 160-1(1929).—Four methods of prepg. oxide-coated

filaments for radio tubes are described: (1) melting or fusing a Ba compd. to the core wire, (2) application to the wire of resinous or paraffin paste contg. a Ba compd., (3) evapn. of the soln. of the Ba salt painted on the wire and (4) depositions of Ba on the filament from the vapor. Precautions for the use of each process are outlined. Process (4), which is the newest, is considered in some detail. Core wire is first oxidized before evacuating the bulb, a piece of Ba metal is attached to the side of the anode towards the filament and, when a good vacuum is reached, the anode is heated by high-frequency induction, Ba evaps. and surrounds the filament, reducing WO_3 and forming a layer of BaO. A second vapor method uses BaN_3 in soln. which is painted on the anode and decompd. at about 225° into Ba and N. Advantages claimed for process (4) are more rapid formation of the filament and a better control of the thickness of the layer. M. McMAHON

Light sensitivity of commercial selenium cells. G. P. BARNARD. *Proc. Phys. Soc. (London)* **40**, 240-8(1928); cf. *C. A.* **23**, 1062.-For com. Se cells the change in conductance C due to an intensity of illumination I is given by $C \propto I^x$, where x varies from cell to cell, depending on the construction. A sensitivity curve for a Fournier d'Albe type of cell is given. The change in conductance of Se cells is shown to depend on the amt. of radiant energy received, and not on the no. of foot candles incident on the cell. For equal radiant energy the action of the infra-red is relatively much weaker than that of some shorter waves. The light sensitivity of Se is attributed to changes in cryst. structure. B. C. A.

Some practical applications of quartz resonators. G. W. N. COBBOLD AND A. E. UNDERDOWN. *J. Inst. Elec. Eng. (London)* **66**, 855-71(1928).—A wide field of usefulness for the application of quartz resonators is found in wireless work, particularly when they are employed as frequency stabilizers, and as reference standards in checking wave meters. The temp. coeff. is less than 18 parts per million per degree for longitudinal resonators in which the length is several times as great as either of the other dimensions. This coeff. increases as the length is reduced and may exceed 60 parts when the 3 dimensions are of the same order. The effect of variations in the air gap between the quartz crystal and the electrodes is studied. Thus with an air gap of 0.05 mm. the frequency of oscillation is 144.144 kilocycles/sec., with a gap of 0.50 mm. it is 144.408 kilocycles/sec., and with a gap of 1.20 mm. it is 144.500 kilocycles/sec. Above this gap the valve ceases to oscillate. To obtain the greatest possible constancy, the crystal should be mounted in a vacuum. Practical applications in connection with wave meters are described. H. STOERTZ

Piezoelectric frequency control. R. E. HITCHCOCK. Westinghouse Elec. & Mfg. Co. *Elec. J.* **25**, 503(1928).—When used under the proper conditions, quartz-crystal oscillators are now recognized to be one of the most reliable means for controlling radio broadcast-station frequencies, where a precision better than 0.1% is desired. Frequency precision as good as 0.001% has been attained in lab. oscillators. Under the more severe conditions of const. use and with less care than is usual in a lab. a radio station affords a good test of the reliability of a quartz-crystal oscillator. H. reports results of measurements made of KDKA's 950 kc. frequency for a period of six months. C. G. F.

Brief personal recollections in connection with the jubilee of the invention of the carbon incandescent electric lamp by Sir Joseph Wilson Swan in 1878. J. A. FLEMING. *J. Inst. Elec. Eng. (London)* **67**, 293-5(1929).—1928 marks the centenary of the birth of Swan as well as the jubilee of the public exhibition of his C incandescent elec. lamp at Newcastle on Tyne. F. reviews Swan's professional career. W. H. BOYNTON

Apparatus for electrophoretic deposition of rubber (Brit. pat. 294,153) 30. Treating tin ores, etc. (Brit. pat. 294,703) 9. Heat resisting alloy of Al and Cr [for electric resistors](U. S. pat. 1,704,733) 9. Deposition of rubber (Fr. pat. 645,779) 30. Resistor guds (U. S. pat. 1,703,707) 9.

Comp. A. MORTIMER: **Primary Cells.** London: Sir Isaac Pitman and Sons, Ltd. 124 pp. 5s. net.

Electric battery. N. K. CHANEY (to National Carbon Co.). Brit. 294,476, July 23, 1927. Gases liberated in a battery are conducted to the atm. through a porous

cathode, which may be formed of C prep'd. by satg. it with a soln. of lubricating oil or other suitable non-volatile substance in a volatile solvent such as CCl_4 or naphtha. Various structural details of the battery are described.

Electric batteries. GEORGE ANTONOFF. Fr. 644,709, Nov. 29, 1927. Leclanché cells contain an electrolyte which is gelatinized with starch so that in use it becomes transformed into a porous mass resembling cheese, allowing aeration. The Zn used is of a very high degree of purity. Cf. C. A. 22, 4389.

Dry cell. THEOFIL HOLUB. Austrian 112,020, June 15, 1928. A dry cell of the kind in which the container forms the pos. electrode is constructed with an easily ruptured, preferably transparent, closure, e. g., of mica, through which the neg. electrode is introduced immediately before use. The neg. electrode may have a rim at the top engaging an annular channel at the top of the cell.

Dry cell, to be subsequently filled. L. DESMÉT. Belg. 349,587, April 30, 1928. The metal tube constituting the neg. electrode is provided with a water-absorbent lining impregnated with exciting salts. An auxiliary wall is soldered outside the tube to form a side chamber. The tube is filled with a depolarizer and introduced inside the positive electrode. The assembled cell is covered with an insulator, leaving only 2 openings in the side chamber. It keeps indefinitely when dry; when required for use, the side chamber is filled with water. A battery can be made by omitting the side chamber and placing a no. of elements, connected in parallel, in a suitable container, which is filled with water just before use.

Photoelectric cell of the selenium type. H. J. KÜCHENMEISTER. Brit. 294,108, July 16, 1927. Structural features.

Selenium cell of the condenser type. HANS THIRRING. U. S. 1,703,798, Feb. 26. Metal plates are used which are formed of metal such as Cu, which is capable of being wetted by liquid Se, and these plates are sep'd. by insulating plates which may be formed of mica.

Dichromate cell. RICHARD SCHUSTER. Ger. 470,945, Dec. 1, 1923. Addn. to 453,204. The electrolyte is converted by addn. of silicates to a solid or gelatinous form and is enclosed in paraffined asbestos paper, porous cells or Pb tubes, preferably in cartridge form so as to facilitate replacement.

Storage battery. JOHN M. LEA. U. S. 1,705,021, March 12. Structural features.

Storage battery with perforated celluloid separators. CONCORDIA ELEKTRIK-FÄRS.-A.-G. and W. GOSMANN. Brit. 294,458, March 19, 1928. Structural features.

Gas-actuated float device for indicating the charging state of storage batteries. ALFRED B. HALL and JAMES H. QUILHOT. U. S. 1,703,233, Feb. 26.

Electric rectifier plates. SIEMENS-SCHUCKERTWERKE AKT.-GES. Fr. 614,821, Oct. 29, 1927. Plates for elec. rectifiers are made by heating Cu plates to a temp. between 1040° and the m. p. of Cu, and plunging them in hot water. The temp. of the water varies from 40° to 70° according to the size of the plates, a higher temp. being used for the smaller plates.

Electric rectifier elements from copper blanks. PAUL H. GEIGER and WARREN S. BROWN (to Union Switch & Signal Co.). U. S. 1,704,734, March 12. A Cu blank is heated to form a coating of Cu_2O , which is thicker on one side of the blank than on the other side, and an outer coating of CuO ; the blank is then treated with an alkali metal cyanide soln. to dissolve the CuO from the entire blank and to dissolve all the Cu_2O from the side having the thinner coating, leaving a layer of Cu_2O on the other side.

Hermetic seal for mercury-vapor rectifiers, etc. E. B. SHAND and I. SWEDE (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 294,880, July 30, 1927. A seal between metal and ceramic parts is formed by applying a ceramic glaze to the ceramic material and superposing a metallic glaze on this and then soldering the metal part to the metallic glaze. Details and compns. are described.

Resistances for protecting electric-supply systems against overloads. K. KIPPERS. Brit. 294,549, July 25, 1927. Supply systems have connected in circuit ohmic resistances having a high temp. coeff. such as Fe, Ni or W wires which may be contained in evacuated spaces or spaces filled with inert gases. Artificial cooling may keep the resistance value low at normal loads.

Electric heating resistances. B. CHIABERGE and O. BIGLIA. Brit. 295,159, Nov. 18, 1927. A compn. for embedding metallic elec. resistances is formed of Al_2O_3 and retort charcoal, which may be made into a paste with water and steatite, spread in place and then baked at 400 – 500° . A second layer contg. water glass as an addnl. ingredient may then be applied and the materials further baked together at about 800° . Kaolin may be added to the compns.

Electric-resistance heater for water-heaters, cooking utensils, etc. E. FRENOT and M. GRONIER. Brit. 294,884, Aug. 3, 1927. Structural features.

Electric water-heater. CHARLES F. ROGERS (to Electromatic Mfg. Co.). U. S. 1,705,417, March 12.

Hydrogen peroxide. I. G. FARBENIND. A.-G. Brit. 295,137, Feb. 16, 1927. See Fr. 636,330 (C. A. 23, 47).

Protecting electric motors against acids. GABRIEL ZWICKY. Fr. 644,817, Oct. 28, 1927. The windings of elec. motors, particularly those used in a *refrigerating plant*, are protected against acids by a coating of a double silicate of K and Na in which powdered glass is incorporated while still damp.

Over-tension indicator for electrical precipitators. METALLGES. A.-G. (Paul Antrup, inventor). Ger. 470,728, Mar. 7, 1926. Visual indication of the melting of the fuse is given by 2 pith balls tied to, and normally repelled by, 1 of 2 electrodes arranged in a glass case and forming a disruptive discharge circuit in parallel with the electrode held.

Mercury-vapor lamps. F. W. GILLARD and D. L. WEST. Brit. 294,949, April 1, 1927. That part of the lamp vessel through which emission occurs is made of a material transparent to ultra-violet rays and opaque to visible rays; the end bulbs through which the electrodes pass are made of lead glass. The emissive glass may be formed from SiO_2 50, K_2O 16, BaO 25 and Ni oxide 9%, and a small quantity of Cu oxide may be added to reduce any transparency to red rays. An intermediate glass may contain a higher proportion of BaO.

Electric incandescent lamp bulbs. PATENT-TREUGAND-GESELLSCHAFT FÜR ELEKTRISCHE GLÜHLAMPEN (to General Electric Co., Ltd.) Brit. 294,212, July 21, 1927. Vacuum lamp bulbs are aged by passing a current through the filament to heat it to incandescence and passing an elec.-gas discharge through the glass of the bulb (which is heated to render it conductive unless of cond. glass such as Mg glass) by applying a high potential to an electrode placed on its exterior. Cf. C. A. 23, 1578.

Electric incandescent lamps. SIEMENS ELECTRIC LAMPS & SUPPLIES, LTD., and P. D. OAKLEY. Brit. 295,072, May 13, 1927. Gas-filled W filament lamps, in addition to the usual gas filling, contain also Cl substitution products of aliphatic hydrocarbons such as MeCl , CH_2Cl , CHCl_2 or CCl_4 (which may be formed in the bulb from a hydrocarbon and Cl or HCl).

Antimony by electrodeposition. NORDDEUTSCHE AFFINERIE. Brit. 294,143, July 18, 1927. Pure Sb is deposited from an electrolyte comprising a soln. of SbF_3 contg. 100-600 g. H_2SO_4 per l. and contg. a small quantity of free HF . Alkali metal fluorides and bisulfites also may be used in the electrolyte and various details of the process are given. Anodes of crude Sb contg. up to 5% Pb and 8% Sn may be used.

Plating non-metallic surfaces with metal. HARRY C. FISHER (to Richardson Co.). U. S. 1,704,125, March 5. A bituminous coating is applied to a surface such as *sheet roofing or metal* and is rendered tacky by means of a solvent; the product is then brought into contact with a film of finely divided metal supported on a body of water by surface tension and the surface is subsequently electroplated to unite the metal particles picked up by the tacky surface. An app. is described.

Chromium plating on other metals. H. LEISER. Brit. 294,484, July 21, 1927. Bright coatings are produced on articles such as knives, forks, or spoons of iron, steel or Al, by coating with Cr after preliminarily applying intermediate coatings of other metals such as Sn and brass. The Cr is deposited electrolytically but the underlying coatings may be applied in molten form.

Nickel plating. LOUIS F. NELISSEN. Fr. 645,155, Dec. 5, 1927. See Brit. 282,748 (C. A. 22, 3847).

Forming thin sheets of metal such as copper on rotating cathodes. HERBERT C. HARRISON. U. S. 1,704,247, March 5. An app. is described in which a porous partition serves to space the sol. anode material uniformly away from the surface of the cathode; the metal sheet formed is continuously stripped from the cathode and the stripping serves to cause the rotation of the cathode.

Electrolysis. JOSEPH L. WOODBRIDGE. Fr. 644,970, Dec. 1, 1927. Means for keeping the electrode elements sep. are described.

Preparing alumina for electrolysis. CONWAY VON GISEWALD, HANS SIEGENS and MARTIN MARSCHNER (to Metallgesellschaft A.-G.). U. S. 1,704,599, March 5. Discrete cryst. particles of alumina of small size are prepd. by quenching atomized fused alumina. An app. is described.

Coloring aluminum surfaces. PLATEN-MUNTERS REFRIGERATING SYSTEM AKTIE-GESELLSCHAFT (to Electrolux, Ltd.). Brit. 294,237, July 22, 1927. Al articles are subjected

to anodic treatment in a bath contg. a fluoride such as NaF, KF or NH_4F , and the color produced may be varied by adding an acid or alkali. Various details of procedure are given.

Improving objects of aluminum or its alloys. BOHUMIL JIROTKA. Ger. 471,053 and 471,054, June 18, 1926. Addns. to 469,534. The method of Ger. 469,534 (C. A. 23, 1104) is modified by connecting the object during its immersion in the acid bath with C or metals so that a closed elec. circuit is formed. The walls of the vessel contg. the bath may act as electrodes (471,053). The acid treatment may be preceded by treatment in alk. baths contg. metal salts, e. g., CuSO_4 , and may be followed by a usual electroplating process (471,054).

Apparatus for the electrolytic production of caustic soda. THE JESSUP & MOORE PAPER Co. Fr. 645,312, Dec. 3, 1927.

Electrolytic condenser. HARRY N. MILLER (to Fansteel Products Co.). U. S. 1,703,680, Feb. 26. An electrolyte comprising a substantially dry soln. of an ionogen such as NaHCO_3 and LiOH in glycerol is used with a filmed Al electrode and a cond electrode such as iron. Various structural features are described.

Electrolytic apparatus (with rotating cathodes) for the manufacture of metal sheets and tubes. E. KELSEN. Brit. 294,541, July 25, 1927.

Automatic control for electrolytic gas-generator. SIEMENS & HALSKE A.-G. (Karl Wiesenthal and Hans Klimitz, inventors) Ger. 470,931, May 13, 1928. A float in a tank surrounding the cell operates a switch so that the current is cut off when the liquid level is too high or too low.

Controlling electric furnaces. AKT.-GES. BROWN, BOVERI, & CIE. Swiss 127,396, June 17, 1927. App. is described for automatically regulating the energy supplied to an elec. furnace when the surface of the charge reaches a predetd. temp.

Tubular electric furnace for annealing wire, bars, tubes, etc. ÖSTERREICHISCHE SIEMENS-SCHUCKERT-WERKE. (Franz Berger, inventor.) Australian 112,116, Sept. 15, 1928.

Acetylene and other products in the electric furnace. I. G. FARBENIND. A. G. Brit. 294,494, Jan. 24, 1927. In the treatment of gases, such as in the production of C_2H_2 from H and CH_4 , in a furnace having a central electrode and an annular or tubular electrode through which the gases pass, an insulating mantle is arranged between the electrodes to prevent the arc taking the shortest path and to bring it to the length most favorable for the reaction. Various details of the app. used are described. H₂ is added from the gases leaving the reaction zone, mixed with addnl. CH_4 and again passed through the furnace, or the H may be caused to react with CO to form CH_4 for continuing the process. The yield of C_2H_2 is increased by the addn. of C_2H_6 , C_2H_4 , or oil gas. CH_2 and HCN may be obtained from the residual gases obtained in the synthesis of NH_3 from the gases obtained in the destructive hydrogenation of coal, tar or mineral oils, or coke-oven gas; in the latter instance the CO in the gas is first converted to CH_4 or C_2H_6 .

Electrodes for electric furnaces. V. C. DOERSCHUK (to Carborundum Co.) Brit. 294,176, July 19, 1927. Molding of electrode material is effected by sintering it in a mold. Manuf. of electrodes from a mixt. of coarse petroleum coke 35, fine petroleum coke 43, ground electrodes 10, pitch 9 and tar 3% and from other compns. is described, as is also an app. C linings for metallurgical furnaces may be similarly formed.

Electrode mounting for electric furnaces. SOC. ELECTRO-METALLURGIQUE DE MONTRICHER. Brit. 294,837, Oct. 13, 1927. Structural features.

Flame protectors for the electrodes of electric furnaces. COMPAGNIE DES FORGES ET ACIÉRIES DE LA MARINE ET D'HOMÉCOURT. Fr. 645,756, Dec. 15, 1927.

Electrodes. I. G. FARBENIND. A.-G. Fr. 644,966, Dec. 1, 1927. Electrodes for Edison storage batteries are made from metallic powder or flakes obtained by the decompn. of the corresponding metal carbonyls. Examples are given of the prepn. of Fe and Ni electrodes.

5—PHOTOGRAPHY

C. E. K. MEES

Photochemistry of silver halide. I. H. H. SCHMIDT AND F. PRETSCHNER. Z. wiss. Phot. 25, 293-307 (1928).—S. and P. have worked out a special quant. gravimetric method for the investigation of large quantities of photographic emulsions, in all cases investigated there is not an exact equiv. between Ag and halogen, but there is always a slight excess of Ag, although the emulsion is made with excess of halogen salt. This excess of Ag is relatively high with AgCl and extremely low with AgI . No rela-

tionship has yet been found between the excess of Ag and speed, ripening, and method of prepn. AgCl and AgI having approx. equal sensitivity contain different quantities of excess Ag. In their investigations of the equivalence law, Eggert, Noddack and Leszynski have overlooked the presence of this excess of Ag in photographic emulsions so that the equivalence law is not yet established. Weigert and Lühr have published a titrimetric method for the detn. of excess Ag. They do not seem to have considered the amt. of halogen salts in com. photographic plates. Correction appears necessary for their values. II. Decomposition of photographic layers with neutral acid, and with alkaline hydrogen peroxide and with ammoniacal ammonium sulfide. *Ibid* 354-62. —Decompn. with H_2O_2 is a function of the H-ion concn. Disintegration with H_2O_2 occurs in acid soln., the action taking place just as with acid alone. H_2O_2 assists only the action of the acid, so that the concn. can be lowered considerably. Neutral H_2O_2 decomposes the gelatin very quickly and the Ag halide ppts. The decompn. products of gelatin partly reduce the Ag halide. Alk. H_2O_2 reduces Ag halide to metallic Ag with or without gelatin. This process takes place quantitatively with AgCl and AgBr and reaches an equil. with AgI. The disintegration of photographic layers with H_2O_2 is not a function of the reduction potential of the alk. H_2O_2 but depends on the sensitivity of the photographic layer.

A. P. H. TRIVELLI

Problem of determination of the silver nucleus of ripening. H. KIESER. *Z. wiss. Phot.* 26, 305-10(1929).—A criticism of the publications of H. H. Schmidt and F. Pretschner (cf. preceding abstract).

A. P. H. TRIVELLI

Solarization with silver bromide. LÜPPO-CRAMER. *Z. wiss. Phot.* 25, 224-9 (1928).—A quant. investigation on the solarization and the action of some Br absorbers used with various photographic plates to prevent solarization.

A. P. H. TRIVELLI

Optical sensitization of silver iodide. K. BAUKLOH. *Z. wiss. Phot.* 25, 233-62 (1928).—Pure AgI can be made color sensitive by various dyes. The color sensitivity is about equal over the whole visible spectrum. The hypothesis of Wiener and Scholl, that for the max. sensitivity of a daguerreotype plate the anti-node of a stationary wave for yellow light has to lie at the surface of the AgI layer, could be supported by investigations with yellow sensitized plates. AgI-gelatin emulsions can be made color sensitive with the same dyes used for color sensitizing pure AgI layers. Old AgBr, gelatin plates become highly color sensitive when changed into AgI-gelatin plates. The sensitivity reaches to the extreme red. Increased color sensitivity was shown to be caused by Hg vapor.

A. P. H. TRIVELLI

Spectral distribution of the internal photoelectric effect in the silver halides. E. A. KIRILLOW. *Z. wiss. Phot.* 26, 235-48(1929).—A study of the photoelec. cond. of AgI, AgBr and AgCl over the entire visible spectrum, with exposures ranging from a few min. to several hours, shows that the max. photoelec. cond. corresponds with the greatest photochem. sensitivity. With AgI the photoelec. effect is always reversible after exposure. A nearly total regeneration of AgI takes place. With AgBr the effect is different. In the beginning the photoelec. cond. increases with shorter wave-length exposure until a decrease occurs, going over from a zero effect into a neg. effect. This neg. effect is irreversible. This was investigated further in relation to the pos. effect. AgCl reacts similarly to AgBr. An explanation of the phenomena is offered on the basis of the hypotheses of Trivelli Sheppard and Fajans.

A. P. H. TRIVELLI

Contribution to the study of the photolysis of silver bromide. (Bromine determination.) E. MUTTER. *Z. wiss. Phot.* 26, 193-233(1929).—It has been detd. by both qual. and quant. methods that the photolysis of AgBr in the presence of H_2O liberates Br which is finally present as a Br ion. A modification of Volhard's halogen detn. is a satisfactory titration method for this investigation. Soln. expts. show that HNO_3 reacts only in a very small degree on the photolytically formed Ag and that the degree of regression is a function of time and concn. of the reacting soln. H ions in concn. quantity and free O are formed. The much stronger photochem. decompn. of AgBr in the presence of nitrite than in the presence of H_2O is explained as a halogen absorption effect. A relation is detd. between the relative sensitivity of AgBr and the concn. of the soln. from which it is pptd. The process of photolysis with measured energies shows that the quantum equiv. of AgBr with nitrite is about one. The same relation is also found for Ag salts. No relation is found between the amt. of liberated Br and the density of the photochemically formed Ag.

A. P. H. T.

Formation of the photographic latent image. S. E. SHEPPARD. *Phot. J.* 68, 397-413(1928).—An introductory portion reviews latent image and sensitivity theories. It is pointed out that the balance of evidence leads to the conclusion that the latent image consists of development centers composed chiefly of colloidal Ag. These centers are formed by photochem. reduction of preëxisting sensitivity nuclei. These nuclei

sensitize for light but not for x-rays, and are furnished by gelatin. They consist probably of Ag_2S or Ag , or both, in specks too small to induce developability. The crystal character of the Ag halide grain implies a certain lattice energy. It is shown that this enters into the initial energy required to shift an electron. This initial energy quantum is much greater than that of photographically active light. Consequently, if the primary photochem. change is $\text{Br}^- + h\nu = \text{Br} + \ominus$, or $\text{Ag}^+ + \ominus \longrightarrow \text{Ag}(\text{met.})$, then the AgBr first reduced cannot be under normal lattice constraints. Investigations (with Vanselow) of the photoelec. potential of $\text{Ag}:\text{AgBr}$ electrodes in KBr solns. demonstrate that electrons and Br are released together by light acting on AgBr . The potential change consists of an initial inertia-less negativization passing over into a positivization. The positive potential rise can be reduced or eliminated by Br acceptors, or replaced by Br diffusion. It is concluded that the inner photoelectric effect occurs at sensitizing interfaces where the Ag halide is disoriented. The formation of the latent image may be interpreted as a concn. effect, because of the orientation of sensitizing specks and Ag halide at the interfaces. It is shown that the orientation hypothesis is adequate to explain the transition between general and optimum sensitizing by Ag_2S , Ag , or similar nuclei. As the no. of nuclei per grain increases, and their size diminishes, the general sensitizing (concn. effect) decreases, the optical sensitizing (wave-length shift) increases. The special features of reciprocity failure and incomplete summation are also accounted for. Thus the existence of threshold intensities is deducible from deficiency of nucleus concn. for poorly sensitized grains. The existence of an optimum intensity is also explained by dispersity considerations. As the light intensity is increased, i. e., the quantum density, so is the chance of formation of new independent nuclei competing with preëxistent ones in latent-image concn. At very high intensities, therefore, the grain behaves more as with x-rays, where preëxistent nuclei are ineffective.

S. E. SHEPPARD

Use of chloramine to remove traces of sodium thiosulfate from photographic plates and papers. J. M. EDER. *Phot. Ind.* 26, 347-8(1928); *Z. wiss. Phot.* 25, 401-2.—A 0.2% aq. soln. of chloramine is recommended for removing the last traces of $\text{Na}_2\text{S}_2\text{O}_3$ from plates and papers.

C. E. MEULENDYKE

Economic preparation of silver gelatino-bromide plates, and the duration of their sensitivity. HERVÉ. *Bull. soc. franç. phot.* 15, 70-4(1928).—H. has used gelatino-bromide plates and papers which he had prepd. in the years 1881-9. The emulsions ripened in NH_4OH had become useless, but the emulsions ripened by cooking still gave excellent results with an exposure 3 or 4 times longer than with a new plate. Some films exposed in 1889 and not developed had not kept their latent image but could be exposed again and gave excellent negatives. The com. emulsions of the same age were deteriorated greatly.

C. E. IVES

Development after fixation of photographic plates reversed by solarization. H. BELLIOU. *Compt. rend.* 187, 1289-92(1928); cf. *C. A.* 22, 921.—The theory proposed in the preceding paper has been used to explain the effect of phys. development, after fixation, on a plate part of which has been reversed and solarized. Some of the results conform with the previous hypothesis. One of the results is not in harmony with it, and shows that the hypothesis is not yet sufficient. It is now considered that the $\text{Na}_2\text{S}_2\text{O}_3$ extends the reduction to the metallic state of active mols. to a small no. of those surrounding them, thus behaving as a feeble and slow developer. The threshold of solarization is remote, but not infinitely so, as it would have to be according to the previous hypothesis.

E. P. WIGHTMAN

Use of tartrates and borotartrates as restrainers. L. LOBEL. *Bull. soc. franç. phot.* 70, 167-9(1928).—Boric or borotartaric acid when added to an elon-hydroquinone carbonate developer was found to produce an effect similar to that caused by the addn. of alkali bromide.

C. E. I.

Dye toning with single solutions. J. I. CRABTREE AND C. E. IVES. *Am. Phot.*

of these formulas has been satisfactory. A bath has been devised which contains a heavy metal, but only $\text{K}_3\text{Fe}(\text{CN})_6$, AcOH , a basic dye and acetone. Acetone is a necessary solvent to maintain the dye in soln. Nearly 200 basic dyes were examined and 10 were chosen as suitable for use in this bath. The optimum dye concn. varies with the dye used. A typical formula follows: Victoria green, 0.4 g.; acetone, 100 cc.; $\text{K}_3\text{Fe}(\text{CN})_6$, 1.0 g.; AcOH (glacial), 5.0 cc.; H_2O , to make 1 l. The time of toning varies from 5 to 15 min. at 70°F ., according to the depth of tone desired. The image

does not intensify appreciably during toning so that it is possible to commence toning with images of normal photographic quality. This process of toning seems to have a less propensity to produce rack marks when toning by the rack and tank systems than the usual 2-soln. dye-toning method. Intermediate tones can be obtained by using a suitable mixt. of the dyes.

C. E. IVES

Dyes in photographic reduction and oxidation processes. A. STEIGMANN. *Z. wiss. Phot.* 26, 299-304(1929).—A general discussion of the subject. Various chem. reactions are compared.

A. P. H. TRIVELLI

Short wave-length limit of the Herschel effect. E. MAUZ. *Z. wiss. Phot.* 26, 289-91(1929).—The short wave-length limit of the Herschel effect on Satrox paper was detd. to be about 600m μ .

A. P. H. TRIVELLI

Further investigations on the Herschel effect. LÜPPO-CRAMER. *Z. wiss. Phot.* 26, 249-59(1929); cf. *C. A.* 22, 3361; 23, 1069, 1070, 1359.—Further investigations on the Herschel effect in blue light indicated that this phenomenon is doubtful on account of infra-red transparency of the blue filters used. Eleven new dyes were investigated as sensitizers of the Herschel effect on Satrox paper in the presence of Br ions. It was found that this paper contains Cu salts which are sensitizers for the Herschel effect.

Cinematographic films. SOC. INDUSTRIELLE D'APPLICATIONS PHOTOGRAPHIQUES (S. A.). Fr. 645,357, Dec. 7, 1927. Thin films less than 0.06 mm. thick sensitized throughout or through part of the mass are used. Films from 0.02 to 0.06 mm. may be sensitized in the mass by the usual processes, or by the oxalid process by means of diazo compds. and phenol, development being effected with NH₃ or other vapor. The films may be sensitized during manuf.

Cinematographic and other films. SOC. INDUSTRIELLE D'APPLICATIONS PHOTOGRAPHIQUES (S. A.). Fr. 645,358, Dec. 7, 1927. Films of regenerated cellulose are made non-inflammable by aq. solns. of incombustible products used in such proportions that no discolorance or other injurious action takes place. The film may be impregnated with the soln. during manuf. before the first drying. A 10% soln. of NH₄ phosphate, with or without glycerol, may be used, or 8% solns. of (NH₄)₂SO₄ or NH₄Cl may be used. The film may be sensitized with diazo compds. and phenol and developed with NH₃ or other vapor.

Color films. SPLENDICOLOR (Soc. anon.). Fr. 644,803, Oct. 19, 1927. A cinematographic film in 3 colors is obtained from 3 monochrome negatives. The pos. film has on one side a layer of gelatinobromide and on the other a layer of pure gelatin. The blue image is obtained by toning the image due to the development of the gelatinobromide. The yellow and red images are obtained by dichromating the 2 layers, by simultaneous exposure of the 2 faces behind the red-orange and green positives, and by simultaneous dyeing of the 2 layers by contact with 2 gelatinized bands impregnated with yellow and red dyes, resp.

Photographic emulsions. I. G. FARBENIND. A.-G. Fr. 645,104, Dec. 3, 1927. Photographic emulsions of Ag salts are made with substances obtained by treating gelatin or other albuminoid material with S or S-contg. compds., which, by themselves, are not capable of increasing the sensitivity, *e. g.*, alkali or alk. earth sulfides or CS₂. Thus, in making a gelatin emulsion, 1 part of Na₂S is added to 500,000 parts of gelatin soln. An excess of Na₂S may be neutralized by a cautious oxidation with perchloric acid. Cf. C. A. 23, 1360.

Photographic emulsions. I. G. FARBENIND. A.-G. Fr. 645,471, Dec. 9, 1927. Org. substances which contain one or more atoms of S in simple combination, in neighboring position or not, and which, decomposing to form difficultly sol. compds. of Ag or in reaction with Ag salts, have the effect of increasing sensitivity, are added to photographic emulsions of Ag salts. Suitable substances are: (1) org. bisulfides of acid character, such as dithiobiscetic acid, and α, α' -dithiobispropionic acid; (2) org. sulfhydryls or their salts, such as thiomalic acid; (3) org. ring S compds. such as the bisulfide of β -mercaptothiocinnamic acid, and phenylthiobiazoline sulphydrate.

Photographic emulsions. MARIO ZYPPERMAYR. Fr. 644,666, Nov. 28, 1927. Colloids, particularly photographic emulsions, are hardened by heating them at the fusion temp. with simultaneous evacuation of the solvent vapors formed so that the fusion of the layer does not take place.

Photographic diazotype process. F. VAN DER GRINTEN and CHEMISCHE FABRIK L. VAN DER GRINTEN. Brit. 294,972, May 3, 1927. In a process in which layers, containing diazo compds., which are decomposed by light, are exposed under a transparent organic layer and then developed, discoloration of the background of the finished print is avoided by adding a reducing agent, such as an aldehyde, a compd. of CH₂O and NH₃, or a polyhydroxy compd., either to the sensitive layer or during or after development of the print. A stable layer, which is developable with alkali only, is obtained by adding the diazo compd. and to the reducing agent a noncoupling compd. which is converted into an azo-coupling component when the print is developed with an alkali. Numerous examples and details and modifications are described.

Photographic diazotype processes. KALLE & Co. A.-G. Brit. 294,247, Feb. 16, 1927. Premature coupling in light-sensitive layers contg. a diazo compd. and an azo dye coupling component is prevented by including in the layer H₂SO₄ together with an org. acid such as an hydroxycarboxylic acid as described in Brit. 210,822 (18, 1619) and Brit. 234,818 (C. A. 20, 716). An example is given of the use of the double salt of the SnCl₄ double salt of 4-diazo-1-dimethylaminobenzene, phloroglucinol and tartaric acid. Similar layers also may be used, which contain diazo compds. that couple with their own decompn. products when the latter are produced by light.

Photographic sensitive material. I. G. FARBENIND. A.-G. Brit. 294,161, Feb. 16, 1927. In prepg. antihalation supports for sensitive photographic layers, dyes are incorporated uniformly in one or more layers of the support 2 or more distinct absorption gaps such that the gap of one corresponds with a maximum absorption of one or more of the others; *e. g.*, malachite green may be used together with magenta or MnO₂ and washing blue may be used together. Gelatin, cellulose, or resins may be used as carriers of the dyes. Cf. C. A. 23, 781.

Sensitized photographic line-print sheet. WALTER N. BAKER and ARTHUR BAKER. U. S. 1,704,356, March 5. A flexible material such as cloth or paper is sensitized with a collodion or lacquer compn. and with an overlying coating comprising 28-35 oz., a pigment 1-5 oz., glue 5-9 oz., K₂Cr₂O₇ 75-100 grains and a light sensitive dichromate such as (NH₄)₂Cr₂O₇ 375-425 grains.

Light-sensitive resist for photographic etching. ALEX. B. DAVIS (to Watch Case Co.). U. S. 1,703,512, Feb. 26. Animal glue is used with an monohydroxy aldehyde such as hydroxybutyric aldehyde. U. S. 1,703,513, Feb. 26. A resist comprising a protein material such as animal glue, an alkali dichromate, and hydroxybutyric aldehyde.

Steel etching plates. JOHN C. JAMES (to T. V. Allen Co.). U. S. 1,703,512, March 12. A backward positive image is formed on a film; the surface of the film to be etched is sensitized, and the film is applied to the sensitized surface. After exposure and development, the unexposed parts being removed so that the image is etched; it is then treated with acid for etching.

Pictures visible by reflected or transmitted light. A. BLUMENHEIM. Brit. 294,161, Feb. 16, 1927. Pictures are produced on a transparent support such as glass, the transparency of which is reduced by means of an emulsion of a light sensitive material opaque.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

Nomenclature of inorganic compounds. ANON. *Ann. chim. applicata* 18, 557-65 (1928).—A review of the report of the Intern. Union of Pure and Applied Chemists the nomenclature of inorg. compds.

A. W. CONTIERI

Microscopic characteristics of the oxides of manganese and natural manganites. ORCEL AND S. PAVLOVITCH. *Compt. rend.* 187, 1295-7 (1928).—The oxides and manganites studied are: polianite, manganite, hausmannite, hollandite, romanechite, manganite, chalcophanite, hetaerolite, crednerite, sitaparite, manganosite, cesarolite and psilomelane. A table of optical characteristics and behavior towards etching reagents is given.

E. G. VAN DEN BOSCHE

Oxygen compounds of rhenium. I. AND W. NODDACK. *Naturwissenschaften* 16, 4 (1929).—A short review of recently detd. data on Re. The oxides of this metal are: (1) White oxide, Re_2O_8 , formed by continuous oxidation of Re or other oxides in O_2 below 150° . It m. 150° , going over into yellow oxide; it is sol. in water, and in ether and insol. in ether. The aq. soln. is weakly acid; it has peroxide qualities (discolors Ti and V solns., discolors KMnO_4). (2) Yellow oxide, Re_2O_7 , from metal and above 150° , yellow hexagonal crystals, m. 200° , is sublimable, b. 450° , is undecomposed (in O_2 or N_2), is water sol., hygroscopic, forming a strong acid, perrhenic acid.

The latter were analyzed (Na, NH_4 and Ba), the Na salt m. 300° undecomposed; the NH_4 or Na salt in H_2 at 400° gives black ReO_2 . $\text{Ba}(\text{ReO}_4)_2$ is sol., 30 g. in water. Aq. solns. of Re_2O_7 are easily reduced by Zn, HPO_2 , or SO_2 with yellow color to (3) red oxide, ReO_3 . A soln. of black ReO_2 in dil. HNO_3 gives a yellow solution, yellow with NaOH , from which $\text{Ca}(\text{OH})_2$ or $\text{Ba}(\text{OH})_2$ ppts. bright yellow precipitates, stable only in alk. soln. ReO_3 in soln. goes over on standing or heating to Re_2O_7 . (4) Violet and blue oxides formed by the action of SO_2 on dry or Re_2O_8 ; their compn. is variable and around Re_3O_8 ; they are assumed to be Re_3O_8 with ReO_3 or Re_2O_7 . (5) Black oxide, ReO_2 , formed from NaReO_4 heating in H_2 ; it is reducible in H_2 (800°) to metal.

B. J. C. v. D. H.

Studies on the higher oxides of some rare earth elements. H. ARMIN PAGEL AND H. M. P. BRINTON. Univ. of Minn. *J. Am. Chem. Soc.* 51, 42-56 (1929).—Generally accepted that the sesquioxides are the normal oxides of the rare earth elements. There is much uncertainty and contradiction in the literature on higher oxides.

For the methods of purification of La, Pr, Nd, Sm and Gd compds. cf. C. A. JONES. The compn. of the oxide of Pr obtained by ignition in air varies with the conditions of ignition and cooling, but with a given set of conditions reasonably constant oxides are obtained. PrO_2 of 99.2% purity was prepared by heating lower oxides in pure oxygen at high pressures. No definite explanation for not reaching a higher purity is given. The stability of PrO_2 at different temps. and pressures are presented. The effect of ceria in promoting formation of higher oxide by Pr is negligible at ordinary pressures, but is marked in high concns. of O_2 .

H. C. JOYNER

Action of bromine on phosphorus trichloride. T. MILOBEDZKI AND S. KRAKOWSKI. *Roczniki Chem.* 8, 563-7 (567 French) (1928).—The Br could not be combined with PCl_3 to form PCl_2Br_2 . The products of the action of Br on PCl_3 are yellow crystals of PCl_2Br formed according to the reaction: $2 \text{PCl}_3 + \text{Br}_2 \rightarrow \text{PCl}_2\text{BrCl}_2 + \text{PCl}_2\text{Br}$. Only free Br but also PBr_3 acts on PCl_3 in an analogous manner. BrCl derives PCl_2Br_n and PCl_2Br_n , where $n = 2-10$, seem to be derivs. of PCl_2Br and PCl_2Br , $\text{PCl}_2\text{Br}_7 + \text{PCl}_2\text{Br} = \text{PCl}_2\text{Br}_8$, $\text{P}_2\text{Cl}_4 + \text{Br}_2 = \text{PCl}_2\text{Br} + \text{PCl}_2\text{Br}_2 + \text{Br}_2$, etc.

J. K.

The action of bromine on strontium oxide and its hydrates. HORACE B. DUNN, HARNAM DAS SURI AND KISHEN LAL MALHOTRA. *J. Chem. Soc.* 1928, 3106-11.—The action of Br both as a vapor and in soln. in CCl_4 on anhyd. SrO (I), $\text{Sr}(\text{OH})_2 \cdot \text{H}_2\text{O}$ (II) and $\text{Sr}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ (III) has been studied. In neither case is there any chem. reaction between Br and I. II (prepd. from III by extrn. with alc.) reacts with Br vapor to give a substance contg. bromide (IV) and hypobromite (V). This substance on exposure to air contains only IV and bromate (VI). With Br in CCl_4 , II gives an appreciable amount of V. III reacts quantitatively with Br vapor to give IV and VI (no V); when dissolved in CCl_4 , crystals of IV appear after several weeks (their formation is retarded by isolation). Studies on the rate of this latter reaction show that there is an initial rapid chem. reaction followed by a slower one (apparently unimol.). The effect of the concn. of the Br soln. has been studied. Conclusion: VI is formed and almost immediately, but, up to 2 hrs., the rate of formation exceeds the rate of disappearance. At the end of the reaction, V is negligible or absent. The results show

that in the presence of sufficient water, the excess of Br oxidizes some of V to VI directly. Rama Krishna Bahl made similar expts. with iodine. There is no action with I, and small interaction with II, while the reaction of 5% iodine in CCl_4 with III is slow and not quant. Iodide and iodate are the main products with traces of hypiodite. The latter probably arises by the reaction of absorbed I on free $\text{Sr}(\text{OH})_2$ in soln.

W. C. F.

Action of water on tricalcium silicate and β dicalcium silicate. T. THORVALDSON AND V. A. VIGFUSSEN. Chem. Lab., Univ. of Saskatchewan, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 423-31(1928); cf. C. A. 21, 3259.—The ratio of hydrolysis of tricalcium silicate and β -dicalcium silicate was studied to det. the chem. compn. of the products formed. The silicates were prepd. from marble and flint; after purification they were ground to pass a 200-mesh sieve and then treated with water in steel tubes until no evidence of unhydrolyzed particles could be obtained. Checks were made using gold tubes in place of the steel tubes. Tricalcium silicate hydrolyzed much more rapidly than the dicalcium silicate, and the rate of the latter after falling off increases again very rapidly. There was no indication of the existence of a stable hydrated dicalcium silicate. From comparisons of the lime-silica ratio the product of hydrolysis highest in lime which can exist in equil. with a soln. of $\text{Ca}(\text{OH})_2$ below satn. has approx. the compn. $3\text{CaO} \cdot 2\text{SiO}_2$. An inflection of the curve of hydrolysis at a point where the lime-silica ratio is about 1:1 indicates the formation of a hydrated monocalcium silicate. The products of hydrolysis of the 2 silicates examd. were identical.

J. W. SHIPLEY

Some new reactions of fusible and infusible white precipitates of mercury and their constitution. PRIYADARANJAN RAY AND PARESCHANDRA BANERJI. Univ. Coll. of Science, Calcutta. *J. Indian Chem. Soc.* 5, 715-9(1928).—According to Franklin's view (*J. Am. Chem. Soc.* 27, 820(1905); 29, 35(1907)) the infusible white ppt (I) of Hg is regarded as an ammonobasic compd., $\text{H}_2\text{N} \cdot \text{HgCl}$ (II) and the fusible white ppt (III) as $\text{HgCl}_2 \cdot 2\text{NH}_3$. To test this theory certain reactions of I and III were studied. Dry I heated on the water bath with EtSH in EtOH gave NH_3 , $\text{Hg}(\text{SEt})_2$, EtS HgCl and NH_4Cl . These results indicate that I acts both as II and as $[\text{H}_2\text{N} = \text{Hg}] \cdot \text{Cl}$ (IV). With $\text{SC}(\text{NH}_2)_2$ in EtOH or H_2O I gave NH_3 , NH_4Cl , H_2NCN , HgS and $\text{HgCl}_2 \cdot \text{SC}(\text{NH}_2)_2$. Here I acts both as II and as IV. With $\text{SC}(\text{NHPh})_2$ in EtOH I gave HgS and $\text{ClH}_2\text{N} = \text{C}(\text{NHPh})_2$. In this case I acts as IV. In each of the above cases the reactions of III were very similar to those of I. I is evidently an equil. mixt. of II and IV.

LOUISE KELLEY

Decomposition of alkaline earth sulfates. IV. J. ZAWADZKI, I. KOWALCZAKSKI AND S. ZEROMSKI. *Roczniki Chem.* 8, 359-68(1928); cf. C. A. 21, 2232.—Gypsum passes irreversibly and with considerable velocity into anhydrite at temps. above 1000° . Measurements of the decompn. pressures of gypsum indicate that the influence of the irreversible subsidiary reaction increases with rise in temp. The decompn. pressures of anhydrite between 1100° and 1220° are considerably lower than for gypsum, and are equal to those given by gypsum after long heating. The thermal decompn. of anhydrite is reversible, anhydrite being obtained by the action of SO_2 on a mixt. of 6 parts of CaO with 1 part of sulfate. Anhydrite decomposes to form the basic sulfate, $2\text{CaO} \cdot \text{SO}_3$, the heat of reaction being -109.36 g.-cal. The pressures of gas in equil. with basic sulfate at temps. up to 1200° are lower than those found for anhydrite, and the same pressures have been attained by the partial satn. of CaO with SO_3 .

B. C. A.

The decomposition of thiosulfates by hydrochloric acid. ORTWIN VON DRINES. Univ. Berlin. *Z. anorg. allgem. Chem.* 177, 13-16(1928).—About 80-90% of the salt is decompd. in accordance with the reaction $\text{Na}_2\text{S}_2\text{O}_3 + 2\text{HCl} = \text{SO}_2 + \text{S} + 2\text{NaCl} + \text{H}_2\text{O}$, but at the same time there are formed polythionic acids by parallel reactions. Various explanations are quoted to account for the facts, but D. advocates the following (I) $\text{H}_2\text{S}_2\text{O}_3 = \text{S} + \text{SO}_2 + \text{H}_2\text{O}$; (II) $\text{H}_2\text{S}_2\text{O}_3 = \text{SO} + \text{H}_2\text{SO}_3$; and from (II) are formed H_2S_x , H_2S and S, which interact with SO_2 to yield pentathionic acid and polythionates.

W. C. EBAUGH

Ion exchange of zeolite silicates with hydrolytically dissociated salts. II. Experiments with natural silicates. H. KAPFEN AND B. FISCHER. Landwirt. Hochschule Bonn-Poppelsdorf. *Z. Pflanzenernähr., Düngung u. Bodenk.* 12A, 8-37(1928); cf. C. A. 22, 200.—The naturally occurring zeolites, chabazite, stilbite (desmine), natrolite and apophyllite together with serpentine, wollastonite and talc were treated with solns. of hydrolytically dissocd. salts of Fe, Al, Cu and Zn. The "exchange acidity" developed in the minerals by this treatment was detd. by a subsequent handling with KCl. Chabazite and stilbite (desmine) showed the greatest tendency to exchange their cations for the cations of hydrolytically dissocd. salts. The titratable acidity

developed upon the subsequent handling with KCl soln. of the minerals which had previously been heated with the hydrolytically dissocd. salts was equiv. to that developed by the metallic ion which had exchanged with the K of KCl. The especial constitution of these silicates (*i. e.*, aluminosilicate nature of the combinations) substantiates the ideas of Gausson upon the relationship between the mol. proportion of SiO_2 , Al_2O_3 , bases and the acidity. Fe^{++} ions did not form a product with these minerals by the exchange reaction; the Fe^{++} was pptd. as $\text{Fe}(\text{OH})_2$ in the mineral powder. The entrance of cations, Fe^{++} , Al, Cu and Zn into the cryst. zeolites by the ion exchange reaction was not nearly so complete as their entrance in permutites and soil zeolites. The exchange acidity of these cryst. zeolites in which the action had been replaced by Fe^{++} , Al, Cu, or Zn was low at room temp., but increased at higher temps. The time required for the system to reach equil. was 24 hours or more. In soils and permutites, decreasing the size of the particles did not have an influence on the ion exchange, while with the natural silicates, decreasing the size of the particles increased the ion exchange greatly—*i. e.*, by increasing the surface exposed. An exchange acidity was developed in these natural zeolites by treating with acids. The more recent conceptions of Wiegner on the exchange reaction are discussed. The amts. of replaceable H ions in permutites and zeolites is very small in comparison with the other cations. The exchange reaction of other cations with the H ion probably does not take place until a relatively high concn. of H ion is present in the zeolites or permutites. The cations, especially Al, which give hydrolytically dissocd. salts are more responsible for the so called exchange acidity.

R. M. BARNETTE

New salts of tervalent iodine cations. FR. FICHTER AND SALOMON STERN. *Helv. Chim. Acta* 11, 1256-64 (1928).—Earlier research on tervalent I has expanded, supplying 7 new I salts. Iodine phosphate (IPO_4) is prepd. from a mixt. of I, H_3PO_4 and Ac_2O oxidized with fuming HNO_3 . Methods of prepn. of the following salts of tervalent I are given: trichloroacetate and its double salt with iodine iodate, monochloroacetate, dichloroacetate, monobromoacetate and methanesulfonate. The role of tervalent I as a cation was proved by its sepn. from a soln. of 5 g. iodine acetate in 35 cc. of Ac_2O by electrolysis.

C. SCOTT

Dehydration and density of magnesium nitrate. L. LE BOUCHER. *Annales soc. espagn. fis. quim.* 26, 223-7 (1928).— $\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ was dehydrated at atm. pressure over H_2SO_4 , giving stable $\text{Mg}(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$ without loss of HNO_3 . $\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ and $\text{Mg}(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$ m. 89° and 120° to 125° , resp., and have a d. 1.6363 and 2.0256, resp. The d. of the hexahydrate given in the literature is incorrect. The course of desiccation for 164 days is shown in a table.

E. M. SYMMES

Comment on the note by L. Boucher. VII. Note on the law of additivity of volumes. E. MOLES. *Annales soc. espagn. fis. quim.* 26, 228-33 (1928); cf. preceding abstr. The results obtained by Boucher for $\text{Mg}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$, as well as those obtained by M. for nitrates of Ni, Co, Mn and Zn eliminate anomalies shown previously (C. A. 20, 1343, 22, 1919) in mol. vols. of nitrate salts of rare earths. For these the law of additivity of vol. holds true if the general formula $[\text{M}^{++}(\text{H}_2\text{O})_6(\text{NO}_3)_3]_3 \cdot [\text{M}^{+++}(\text{NO}_3)_2(\text{H}_2\text{O})_2]_2$ is assumed. The systematic lowering of mol. vol. with increasing at. wt. from the central atom is remarkable and suggests errors in the values of the d. of the nitrates.

E. M. S.

Constitution of several compounds analogous to the polythionic acids. J. A. CHRISTIANSEN. *Z. Elektrochem.* 34, 638-40 (1928); *Nord Kemistmölet (Finland)* 1928, 177-9. The tri-, tetra-, penta- and hexa-thio compds. of thionic acid, contg. *p*-toluyl as the substituted group, were prepd. to answer the question as to whether I and II or IV and V are more probable for the acids: (I) $\text{HO}_2\text{S-S-S-SO}_3\text{H}$ and (II) $\text{HO}_2\text{S-S-S-S-SO}_3\text{H}$ or (IV)

and

The prepn. of a new isomeride of the penta- compd., m. 160° , and the absence of the expected increase in dipolar moments from the tetra- to the hexa-compds. argue in favor of formulas IV and V. The K-absorption x-ray spectra are given for 8 compds.

MARY E. LEAR

The preparation and study of two ammonium molybdotellurates. V. W. MELOCHE AND WILLARD WOODSTOCK. Univ. of Wis. *J. Am. Chem. Soc.* 51, 171-4 (1929).—The object of this expt. was to see if the possible combinations between telluric and

molybdic acids might furnish a basis for the *detn. of a small amt. of Te* in a procedure similar to that used for the small amts. of P. It was found not possible. An NH_4 molybdotellurate was prepd. when an aq. soln. contg. equimolar portions of telluric acid and molybdic acid was treated with sufficient NH_3 to satisfy 3 of the H atoms of H_6TeO_6 . Clear white crystals sepd. upon evapn. and cooling. Analysis indicated the formula $3(\text{NH}_4)_2\text{O} \cdot 2\text{TeO}_3 \cdot 6\text{MoO}_3 \cdot 10\text{H}_2\text{O}$. When the soln. contained 1 mol. of telluric acid to 4 mols. of molybdic acid and enough NH_3 to satisfy the telluric acid, evapn. and cooling yielded white crystals of the compn. $3(\text{NH}_4)_2\text{O} \cdot \text{TeO}_3 \cdot 6\text{MoO}_3 \cdot 7\text{H}_2\text{O}$. Both compds. decompose upon heating at 550° , giving a residue of TeO_2 and a small amt. of MoO_3 .
H. C. JOYNER

Some derivatives of trimethylethylstannane (BULLARD, VINGER) 10.

7—ANALYTICAL CHEMISTRY

W. T. HALL

Microanalysis. Methods of dealing with small quantities of materials. W. GARNER. *Ind. Chemist* 4, 287-90, 332-5(1928). --A review. E H

Inorganic microanalysis. I. W. GARNER. *Ind. Chemist* 4, 357-62(1928).--The identification of inorg. compds. by the microscope differs from identification by the usual qual. methods in 3 main respects: (1) the most usual reagents used in the former produce double salts, the solv. of which is low, but not too low. Too low solv. results in an amorphous ppt. or in very minute crystals; (2) the double salts are usually formed independently of the other elements that may be present. Thus, when Cu and Cd are both present, $\text{KCNS Hg}(\text{CNS})_2$ would give immediate and definite evidence of both elements; (3) microchem. methods are more rapid. Detailed instructions for carrying out pptn. methods are given. The double thiocyanate reaction is very important for Zn, Cu, Cd and Co and of some importance for Ag, Pb, Au, Mn, Ni and Fe. The procedure for each is described. CsCl double salts are formed with the chlorides of Mg, Cu, Bi, Cd, Mn, Ni, Co, Zn, Sn, Pb, Sb and Hg. The reagent is chiefly of value for the last 4 of these. Cs_2SO_4 is of value in detecting Al and Cr. NH_4F gives double salts with Al, Cr, Ti, Fe and V; KNO_3 with Co; $\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2$ with Mg, Na and K; Na_2HPO_4 or $(\text{NH}_4)_2\text{HPO}_4$ with Mg, Mn, Ni and Co; $\text{Bi}_2(\text{SO}_4)_3$ with Na, K, NH_4 and Bi (with Na_2SO_4); H_2PtCl_6 with K, NH_4 and Na. The functions of the reagents KI , NH_4OH and HCl are also given. Eight photomicrographs are included. **II.** *Ibid* 410-14(1928) --G discusses the reagents H_2SO_4 (for Ca, Sr, Ba, Hg, Bi, Ag), oxalic acid (for Ca, Sr, Ba, Xn, Cd, Mn), HClO_4 , K_2CrO_4 (for Mn), Na bismuthate for Mn, dimethylglyoxime (for Ni), $\text{K}_4\text{Fe}(\text{CN})_6$ (for Fe, Cu, Ca, Sr, Ba, Mg), $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$ (for Ag, Pb, Hg, Bi, Ca, Sr, Ba), Na_2CO_3 (for Zn, Ca, Sr, Ba), Na nitroprusside (for Zn, Cd, Mn, Cu, Ni, Co, Fe, Hg(ous)) and metallic Zn (for trees with numerous metals). A systematic scheme for the detection of the common inorg. and org. acids is given which is too lengthy and detailed to abstract. Eleven photomicrographs are included.
E. G. R. ARDAGH

Quantitative analysis depending on change in density. A. ZHESKOV. *J. Chem. Ind. (Russia)* 4, 762-3(1927). --The quantity of solid pptd. or gas evolved in a reaction is detd. by measurement of the d. change of the solns. The method can be applied to oxidation reactions by pptn. of an ionic product of the reaction. B. C. A.

Fajans' method of titration. H. A. J. PIETERS. *Chem. Weekblad* 26, 6-9(1929). --P. has extended the application of Fajans' method to several ions other than Ag, and investigated the suitability of many other dyes as indicators. Cl^- and I^- ions can be titrated in the same solution, with diiodofluoresce in (I) and eosin (II) as indicator for I^- , and fluorescein for $\text{I}^- + \text{Cl}^-$. In acid solns., NaCl can be titrated in the presence of Victoria violet (III), chromium green (IV) and tetrahydroxyanthraquinone, and KI in the presence of I, III, or IV. $\text{Pb}(\text{NO}_3)_2$ can be titrated with $\text{K}_4\text{Fe}(\text{CN})_6$ (standardized against KMnO_4) with the following indicators: Na alizarinsulfonate (V) (pink to yellow), bromocresol purple (VI) (yellow to peach), methyl red (red to yellow), rosolic acid (yellow to pink), bromothymol blue (VIII) (yellow to blue), cochineal (blue to

pink), or **III** (red to salmon). The results are about 1% high, making it necessary to standardize the $K_4Fe(CN)_6$ against Pb. These indicators are sensitive to free acid, making it necessary to neutralize the Pb solns. with 0.1N NaOH, using nitrophenol as indicator. $Pb(NO_3)_2$ can also be titrated with Na oxalate, using phenol red, brilliant yellow, **II**, **VI** or **VII**, or with $Na_2NH_4PO_4$ using **V** or **VIII**. G. CALINGAERT

New indicators. N. A. ZAITZEV. *J. Chem. Ind. (Moscow)* 5, 722-3(1928).—Azo derivs. of *N*-arylnaphthylamine-8-sulfonic acids often represent dyestuffs more or less sensitive to acids and to alkalis. Thus diazotized benzidine with 2 mols. of *N*-phenyl-1-naphthylamine-8-sulfonic acid (phenyl peri-acid) presents an indicator (**I**), [5,5'-*p*-biphenylenedisazobis(8-anilino-1-naphthalenesulfonic acid)]. A paper satd. with a soln. of the NH_4 salt of this indicator is pink; acids turn it to blue. On combining diazotized acetyl-*p*-phenylenediamine with phenyl peri-acid an indicator (**II**), [5-(*p*-acetamidophenylazo)-8-anilino-1-naphthalenesulfonic acid], is obtained, which is less sensitive to acids (not sensitive to acids like benzoic, salicylic, etc.) and, on account of its lack of sensitivity to $PhNH_2 \cdot HCl$, is *very suitable for $PhNH_2$ titrations* by HCl . A paper satd. with the NH_4 salt of this indicator (1:1000) was used for $PhNH_2$ titrations; it is red-orange in alk. soln., and blue in acid soln. When combining naphthalene acid with phenyl peri acid, an indicator (**III**), [5-(4-sulfo-1-naphthylazo)-8-anilino-1-naphthalenesulfonic acid], is obtained, which is less sensitive to acids but can be used for titrating OH^- -acid combined with phenyl or tolyl peri-acid (sulfonic blue R or B) gives an indicator (**IV**), [4-(4-anilino-5-sulfo-1-naphthylazo)-5-hydroxy-2,7-naphthalenedisulfonic acid], suitable for titrating free alkali. A paper permeated by a soln. of this dyestuff is blue, but changes to red by the action of alkalis, ammonia and $Ca(OH)_2$; the red changes back to blue by the action of atmospheric CO_2 . BERNARD NELSON

An examination of possible indicators to determine the pH of alkaline solutions. I. R. MCCRUMB AND W. R. KENNY. LaMotte Chemical Products Co., Baltimore, Md. *Ind. Eng. Chem., Anal. Ed.* 1, 44-6(1929).—The pH control by colorimetric methods for values above pH 10 was studied on buffer mixts. at about 0.2 pH intervals up to pH 14 over 30 dyes being used as indicators, but most of the said dyes proved to be decidedly unsatisfactory for the purpose. W. C. EBAUGH

Use of ammoniacal salts of mercury in quantitative analysis. I. A new method for the quantitative separation of aluminum from nickel. BOGDAN SOLAJA. *Archiv. Hist. Exptl.* 2, 136-41(1928) (141-2 French).—As CH_3NH_2 could not be used for the quant. sepn. of Al^{+++} from Ni^{++} in the presence of an excess of Cl^- (*C. I.* 22, 1238), the action of $Cl_2Hg(NH_3)_2$ on the cations of the third group has been studied systematically. The procedure is the same as the pptn. with CH_3NH_2 . $Cl_2Hg(NH_3)_2$ is added to the soln. in the form of a fine aq. suspension; $Al(OH)_3$ is pptd., however, in the presence of $(NH_4)_2SO_4$ and not in the presence of NH_4Cl , if the chloride ion is present, it must be expelled by means of concd. H_2SO_4 and the excess of H_2SO_4 neutralized by NH_4OH . The results obtained show a max. error of ± 0.6 mg. Al and ± 0.8 mg. Ni. The mechanism of the reactions involved and the application of this method for the sepn. of Al from Co and of Cr and Fe from Ni, Co and Zn is the object of further study. JAROSLAV KUČERA

Use of oxalic acid in microchemical analysis. K. I. MALJAROV. *Mikrochemie* 6, 92-6(1928).—The property of oxalic acid of expelling volatile acids from their salts affords a useful method of sepg. alkalis from alk. earths and both these groups from the heavy metals. Thus, if a chloride or nitrate soln. is evapd. with an excess of oxalic acid and the residue is heated until the excess is expelled, the alk. earths are converted into insol. carbonates and the alkalis into sol. carbonates. To sepg. alk. earths from magnesia the oxalate residue is ignited to obtain the oxides, from which the alk. earths may be extd. with water free from CO_2 . Zn, Cu and Mn are dissolved from the admixt. with Fe and Al by extg. the ignited oxalate residue with dil. HCl . Cr and Mn solns. are freed from chlorides by evapn. with oxalic acid and by ignition of the residue. B. C. A.

Uncombined iodotannic reagent. Iodotannic value of waters. G. CARPENTIER AND J. FRECHON. *Union pharmaceutique* 60, 259-61(1928); *Chimie et industrie* 20, 1071-2(1928).—Combined iodotannic soln. prepd. by warming 0.4% tannic acid soln. with 0.2% I does not give any color with distd., spring or river water. Uncombined reagent prepd. by adding 30 g. of Codex tincture of I (contg. $1/15$ of its wt. of I) to 1 l. of 0.4% tannic acid gives no color with distd. water; with natural waters it gives a carmine rose color which gradually changes to yellowish on adding excess of reagent. The no. of drops of reagent required to color 10 cc. of water and then render it colorless or yellowish depends on the compn. of the water, and can be used to det. it. It is sug-

gested that this be called the iodotannic no. The reaction is due to the presence of neutral and alk. salts which, in dil. soln., have a p_H value appreciably higher than 7. The reagent therefore constitutes a very sensitive indicator in alk. soln. The nature of the I complex formed has not been detd.

A. PAPINEAU-COUTURE

Determination of cadmium as metal in the analysis of organic and inorganic substances. H. TER MEULEN AND M. L. H. J. RAVENSWAAY. *Rec. trav. chim.* 48, 198-200(1929).—By heating 0.1-0.5 g. of an org. substance in a stream of pure H_2 , any Cd present is reduced to metal which can be deposited in a weighed tube. If the substance contains halogen or S, it is necessary to mix some NH_3 with the H_2 and some $CaCO_3$ with the substance. This method can be applied to Cd compds., even alloys. An attempt to apply the same procedure to the detn. of Zn, which is also quite volatile, was not entirely successful.

W. T. F.

Determination of minute quantities of lead by electrolysis. A. SEISER, A. NECKE AND H. MÜLLER. *Z. angew. Chem.* 42, 96-8(1929).—The method is suitable for detg. Pb in blood, etc. For the destruction of org. matter it is recommended to mix the substance with 5% by vol. of concd. H_2SO_4 and heat in a muffle at about 500° . There is no loss of Pb if the temp. does not exceed 500° . After the heating, there are likely to be some particles of C which can be removed by digestion with H_2SO_4 in a Kjeldahl flask, with occasional dropwise addn. of concd. HNO_3 . Cool, dil. to 100 cc., boil, neutralize with NH_4OH ; from a dil. H_2SO_4 soln., filter off the $PbSO_4$, taking the usual precautions. Dissolve the $PbSO_4$ in hot 20% HNO_3 , evap. the soln. to dryness, add 1-1.5 cc. of HNO_3 (which is free from nitrous acid), add 5 cc. of 1% $CuSO_4$ soln., and electrolyze with a current of 2 amp. at 3.3 v. Pt-gauze electrodes are recommended. After 45 mins. remove the anode, wash with water, shake off as much of the water as possible, and dip it into a soln. of tetramethyldiaminodiphenylmethane in AcOH. Compare the blue color with that similarly developed with PbO_2 obtained by the electrolysis of $Pb(NO_3)_2$ solns. of known concn.

W. T. H.

Sensitive color reactions for magnesium. H. D. BARNES. *J. S. African Chem. Inst.* 11, 67-8(1928).—A neutral Mg-salt soln. contg. 0.5 mg. of metal/l. yields a definite orange color when 10 cc. of the soln. is treated with 0.2 cc. of a 0.1% soln. of Clayton yellow and 0.5 cc. of 4N-NaOH soln. With more concd. solns. of Mg salts (5 mg./l.) a brick-red color is obtained. Ca in concns. not exceeding 300 mg./l. does not interfere, but larger amts. produce opalescent solns. with the alkali.

B. C. A.

Volumetric determination of potassium. G. JANDER AND O. PFUNDT. *Chem. Fabrik* 1928, 435-6, 446-8.—An account of work already published (*C. A.* 21, 3852), with a description of modified apparatus.

B. C. A.

Microchemical determination of sodium. E. DI BENEDETTO AND A. D. MARENZI. *Rev. centro. estudiantes farm. bioquim.* 16, 592-5(1927).—In Nau's modification of Blanchetière's method, the uranyl Mg Na acetate is pptd., sepd., and washed in the centrifuge tube.

B. C. A.

Nitrogen determination in ammonium sulfate and ammonia liquor. J. H. SRIJNS. Gasfabriek "Keilehaven," Rotterdam. *Het Gas* 48, 540-3(1928).—The NH detn. by the aldehyde method is described; it has been used in plant practice satisfactorily for over 5 years. The method of Sander (*C. A.* 16, 1057) consists in uniting NH_3 with formaldehyde and titrating the liberated acid. For the sulfate detn. 25 cc. of the aq. soln. (0.1 to 0.2 g. salt) is neutralized with 0.1 N NaOH, methyl orange being used as indicator. From 5 to 10 cc. of com. formaldehyde dild. with 20 cc. of water is neutralized to phenolphthalein with 0.1 N NaOH and then added to the above soln. The mixt. is then titrated with 0.1 N NaOH, phenolphthalein being used as indicator. In ammonia liquor, 10 cc. in an Erlenmeyer flask is diluted with water, and the volatile NH_3 detd. by titration with 0.1 N H_2SO_4 (methyl orange). The soln. is then boiled for 5 mins., the flask corked and cooled. To it is added 10 cc. of neutralized formaldehyde soln. and the mixt. is titrated with 0.1 N NaOH to a permanent pink.

B. J. C. VAN DER HOEVEN

Sulfur determination. N. DE VOOGD. *Het Gas* 49, 50(1929).—Time is saved over the Eschka method with the following procedure (Parr): Mix 0.5 g. coal with 14 g. Na_2O_2 and 1 g. $KClO_3$ and ignite in a Ni or V. A. steel bomb. Wash into a 250-cc. beaker, filter, dil. to 250 cc., make acid with HCl, boil and add 20 cc. of 10% $BaCl_2$ soln.

B. J. C. VAN DER HOEVEN

Spectrographs for the analysis of metals. EWALD. *Chem. Fabrik* 1928, 501-3.—A description of a no. of com. types.

H. G.

Determination and separation of rare metals from other metals. XII. Separation of lithium from potassium, sodium and magnesium. LUDWIG MOSER AND KARL SCHURR. *Tech. Hochschule, Wien. Monatsh.* 51, 23-42(1929).—Of all the methods

ested, the best results were obtained in the sepn. of Li from Na and K by a modified procedure similar to that recommended by L. W. Winkler, which depends upon the fact that anhyd. KCl and NaCl are insol. in isobutyl alc. It is necessary, however, to make sure that both the chlorides and the alc. are absolutely anhyd. Detailed directions are given for carrying out the sepn., using 3 extns. each with 10 cc. of isobutyl alc. (dissolving the residual chlorides and dehydrating between the extns.). Then, by ignition with a mixt. of 3 parts NH_4Cl and 1 part $(\text{NH}_4)_2\text{SO}_4$, both the Li and the K-Na mixt. can be weighed as sulfates. It is necessary to deduct 0.5 mg. from the wt. of Li_2SO_4 and to add the same value to the wt. of $\text{Na}_2\text{SO}_4 + \text{K}_2\text{SO}_4$. Sepn. methods based on (1) treatment with concd. HCl, (2) pptn. with H_2SiF_6 , (3) treatment with anhyd. pyridine and (4) treatment of the perchlorates with butyl alc. and EtOAc proved unsatisfactory. For the sepn. of Mg from Li, heating with HgO and treatment with NH_4 carbonate and alc. proved unsuccessful, but excellent results were obtained by pptg. Mg with *o*-hydroxyquinoline. For the analysis of a mixt. of Mg, Li, Na and K, therefore, it is recommended to ppt. first the Mg with the above reagent in the presence of NH_4OH and NH_4Cl , then remove NH_4 salts and treat the anhyd. chlorides with isobutyl alc., eventually weighing the 3 alkali metals as sulfates. W. T. H.

Direct detection and determination of alkali sulfate in certain other metal sulfates. ALFRED WÖHLK. *Dansk Tids. Farm.* 2, 315-9(1928).—Dissolve 1 g. of the sulfate in 100-150 cc. H_2O and ppt. with an excess of $\text{Ba}(\text{OH})_2$ (0.25 N or approx. 4%). Boil for at least 10 mins. in an open dish, adding H_2O to make up for loss by vaporization. Filter while hot. To the filtrate add 0.5 cc. 1% phenolphthalein indicator, and then pass in CO_2 until the red color disappears. In a large dish boil the soln. until excess CO_2 is driven off and the bicarbonate is partly or completely changed to carbonate. Cool and filter. Using methyl red as indicator, titrate the filtrate with 0.1 N HCl from red (from phenolphthalein) over yellow and to red. Blank expts. with $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ gave less than 1 cc. 0.1 N HCl. With K_2SO_4 100% was recovered. O. A. N.

Analysis of calcium citrate. BENIAMINO MELIS. *Rivista ital. essenze profumi* 9, 32-40(1927).—Warrington's method is not recommendable for detg. Ca citrate without extractive substances because of the slight soly. and the difficulty in calcining. By modifying the method, the calcining is avoided by redissolving the Ca citrate in HCl, neutralizing with NaOH, pptg. CaCO_3 in the cold with a Na_2CO_3 soln. and titrating in the usual manner, after washing. A more speedy method is as follows: Decompose the still moist citrate with dil. H_2SO_4 , boil, cool and add more dil. H_2SO_4 , dil. with H_2O and titrate with 0.1 N KMnO_4 . The citric acid equiv. is obtained on the assumption that 1 mol. of acid is oxidized by 9 atoms of O. R. SANSONE

Determination of potassium cyanate. Application of the method to the detection and determination of cyanate formed by the action of copper sulfate on an alkali cyanide. J. LEBOTCO. Faculté Pharm., Paris. *Ann. fals.* 21, 595-600(1928).—See C. A. 21, 3154; 22, 364. A. PAPINEAU-COUTURE

Estimation of potassium as perchlorate. A. TORSTENSEN DALSGAARD. V. Stein's Laboratory, Copenhagen. *Dansk Tids. Farm.* 2, 258-73(1928).—Detailed directions for carrying out the analysis are given; they differ only slightly from those usually followed. O. A. NELSON

Volumetric determination of potassium and sodium ferrocyanides by means of zinc sulfate solution. ANON. *Przemysl Chem.* 13, 65-6(1929).—This method is applicable to the analysis of industrial salts, and compares well with the electrometric method. The soln. is titrated with 0.2 N ZnSO_4 . The end point is reached when no blue color is produced at the meeting of the spreading drops of the soln. titrated and of a ferrous ammonium sulfate soln. both placed on ash-free and Fe-free filter paper. The ZnSO_4 soln. must be standardized against that alkali ferrocyanide for the analysis of whose salts it will be used later. This method can be used also for the detn. of ZnSO_4 . The moisture in the ferrocyanides can best be detd. by drying the salt at 125° and later correcting for the water of crystn. A. C. ZACHLIN

Standard method for the examination of potassium ferrocyanide. H. MOLL. *Chem. Weekblad* 25, 657-8(1928).—Three usual methods are mentioned, namely, (1) conversion to HCN by acids and collecting over KOH, (2) oxidation with KMnO_4 , (3) pptn. with sol. salts of metals such as Zn or Cu. Only the last method using ZnSO_4 gives consistent and satisfactory results. An unknown soln. is acidified slightly and titrated with 0.2 N ZnSO_4 soln., Fe^{+++} being used as an outside indicator. Lack of a blue color indicates that the end point is reached. M. ACHTERHOF

Stability of ferrous sulfate solutions and their use in standardizing permanganate. JOHN A. N. FRIEND AND ERIC G. K. PRITCHETT. *J. Chem. Soc.* 1928, 3, 27-32.—The use of a trap contg. NaHCO_3 soln. can be avoided in the standardization of KMnO_4 .

by Fe if the Fe is dissolved in a flask with a vertical tube as reflux condenser. The following directions are recommended: Dissolve 1.4 g. of Fe in 150–200 cc. of 4 N H_2SO_4 in a 500-cc. flask fitted with a stopper carrying a 20-in. tube of 0.2 in. diam. Heat on the water bath until the Fe is dissolved, cool rapidly, make up to 250 cc., mix and use 25 cc. for the titration. F. E. BROWN

Titration of bleaching powder with nitrite solution. Z. KERTÉSZ. *Z. anal. Chem.* **74**, 105–8(1928).—K. has already published a method for titrating hypochlorite solns. with NaNO_2 soln. (*C. A.* **18**, 797, 2301). The method succeeds with normal bleaching powders or those which have weakened by standing in the air. If, on the other hand, the sample is high in lime, it is necessary to add some NaHCO_3 . In the analysis of NaClO and KClO solns. a little H_3BO_3 should be added. W. T. H

The detection of chloramine-T and its differentiation from hypochlorites. H. VAN URK. *Chem. Weekblad* **26**, 9–10(1929).—Chloramine-T is used extensively as a substitute for hypochlorites. It is similar to NaOCl in many reactions, particularly in liberating I from KI. The following table gives reactions which will differentiate between the two:

Reducing agent	Chloramine	NaOCl
thalleoquinine reaction	negative	positive, green coloring
guaiacol tincture	neg. at room temp. decolorized by boiling	immediate decolorization
resorcinol	green, then yellow; red by heating	purple-red, immediately
naphthol	colorless, yellow by boiling	blue-green
reduced indigo-carmin solution	blue	decolorizes the blue solution
alkaline pyrogallol	reddish brown	dark reddish brown
MnCl_2	negative	brown

Also the presence of sulfate can be ascertained in the ash of chloramine. G. C.

Conductometric titration of phosphoric acid with caustic soda. MISS J. C. LANE AND L. J. VAN DER WOLK. *Rec. trav. chim.* **48**, 83–92(1929). (In English.) The conductometric expts. here described show that H_3PO_4 can be titrated with accuracy by this method only when NaOH free from carbonate is used, when the cell is kept 25° out of contact with air contg. CO_2 and when the titration is stopped at the inflection point corresponding to the neutralization of 1 H in the H_3PO_4 mol. W. T. H

Fatal thallium poisoning, and determination of thallium in cadavers as thallous iodide. R. FRIDL. *Ber. ungar. pharm. Ges.* **4**, 43–9(1928).—The Tl was detd. titrimetrically with 0.1 N KI soln. Of 2.5 g. of Tl acetate taken *per os*, there were found 3.3 mg. in 100 g. of liver, 1.6 mg. in 98 g. of kidney, 5.0 mg. in 100 g. of urine, the greater part having already been eliminated in the urine. B. C. A

The detection of thallium in the organs of small animals which have been poisoned with "Zelioweizen." JOSEF SCHNEE. *Tierärztl. Hochschule, Vienna. Beitr. ges. Med.* **7**, 14–31(1928); *Ber. ges. Physiol. exptl. Pharmacol.* **45**, 732.—The organs are ashed with ClO_3^- and HCl , the resulting soln. is neutralized with NH_4OH and pptd. with H_2SO_4 . The sulfides are ignited so that the aq. insol. Fe_2O_3 can be sepd. from the sol. Ti_2SO_4 . For further detn. of Tl, the method of Browning and Palmer is used. In poisoned animals (5 rats, 1 dog) 60 mg. Ti_2SO_4 per 100 g. was found in the organs. The musculature contained only a small amt., the brain and blood only a trace. R. C. WILLSON

Sources of error in organic elementary microanalysis. I. Determination of nitrogen by Dumas' method. F. BÖCK AND K. BEAUCOURT. *Mikrochemie* **6**, 69–8(1928).—The occasional slightly high results obtained in Pregl's microchem. method of detg. N are attributed to incomplete removal of adsorbed gases in the CuO packing in the tube by a cold current of CO_2 . This source of error is avoided by carrying out a blank analysis at the beginning of a series of tests and using the same coarse CuO for a no. of tests, changing only the fine CuO with every test. There is no advantage in arranging the Cu column at the end of the tube as recommended by Duhskev, for Pregl's original arrangement of this column between two columns of CuO is equally satisfactory. B. C. A.

Analysis of acetic anhydride in the presence of strong acids by thermometric titration. TAKAYUKI SOMIYA. Tokyo Imp. Univ. *Proc. Imp. Acad. (Japan)* **5**, 34–7(1929); cf. *C. A.* **21**, 3030.—The analysis depends on the fact that PhNH_2 combines

immediately with Ac_2O , liberating considerable heat. As standard solns. 2.780 N Ac_2O (150 cc. 20% Ac_2O , 100 cc. 93% Ac_2O , and 200 cc. C_2Cl_4 or 100 cc. 100% AcOH , 120 cc. 93% Ac_2O and 200 cc. C_2Cl_4) and 2.743 N PhNH_2 (100 cc. PhNH_2 and 300 cc. C_2Cl_4) were used. Strong acids retard the velocity of acetylation of PhNH_2 ; addn. of $\text{C}_6\text{H}_5\text{N}$ helps to overcome this difficulty, but the amt. of $\text{C}_6\text{H}_5\text{N}$ added should be less than that of AcOH in the soln. to be titrated. Details are given of the app. used and of the method.

C. J. WEST

Determination of small quantities of carbon monoxide and methane in mixtures of nitrogen and hydrogen. K. KELLER AND W. KLEMP. *Ber. ges. Kohlentech.* **2**, 246 (1927).—The gas mixt. is passed successively through a porcelain tube contg. CuO at $500\text{--}520^\circ$ whereby H and CO are oxidized, through CO_2 absorption app. contg. Ba(OH)_2 soln. (1 cc. = 1 cc. CO_2 at 20° and 760 mm.), through a CuO tube at 850° to oxidize the CH_4 , through a second CO_2 absorption app., and into a buret in which the N is collected and measured over water.

B. C. A.

A new reaction of urea. F. PISANI. *Ann. chim. applicata* **18**, 555-6 (1928).—A new reaction for the identification of urea depends on the action of hypobromite in alk. soln. oxidizing urea to hydrazine as follows: $\text{NH}_2\text{CONH}_2 + \text{NaOBr} = \text{NH}_2\text{C(ONa)NBr} + \text{H}_2\text{O}$; $\text{NH}_2\text{C(ONa)NBr} = \text{NH}_2\text{N.C(ONa)Br}$; $\text{NH}_2\text{N.C(ONa)Br} + \text{NaOH} = \text{NH}_2\text{NHCOONa} + \text{NaBr}$; $\text{NH}_2\text{NHCOONa} + \text{H}_2\text{O} = \text{NaHCO}_3 + \text{NH}_2\text{NH}_2$. The hydrazine is readily identifiable. The reaction is effected by adding NaOBr drop by drop to the alk. soln. of $\text{CO(NH}_2)_2$, one drop being enough for 2-3 mg. urea. Then 5% H_2Cl soln. is added in slight excess, and the soln. is filtered. Four cc. of 50% NaOH soln. is then added to the filtrate, when the Hg^{++} is reduced to the metal. This is a characteristic reaction, as it is not shown by NH_4 salts, ureides, etc. It is not obtained by using other oxidizing agents as KMnO_4 and H_2O_2 . It is a very sensitive reaction, 2-3 mg. urea being sufficient.

A. W. CONTIERI

Method for determining total nitrogen in urea-nitrate mixtures. R. LUCAS AND W. HIRSCHBERGER. *Z. angew. Chem.* **42**, 99-100 (1929).—A mixt. of urea and nitrate offers difficulties in the ordinary Kjeldahl detn. because of the 2 states of oxidation of the N . The following procedure overcomes the difficulties and serves to give correct N values even in a mixt. of urea, NaNO_3 and CaCN_2 . Dissolve 10 g. of the mixt. in water and dil. to 1 l. Take 50 cc. of the well-mixed soln. in a Kjeldahl flask, add 5 g. of Fe powder and 50 cc. of 9 N H_2SO_4 . Place a funnel in the neck of the flask and allow the reaction to take place at room temp., cooling if it becomes violent. When no more H_2 is being evolved, evap. till FeSO_4 begins to sep. Cool, add 25 cc. of concd. H_2SO_4 and evap. to fumes. Cool, dil., neutralize and distil off the NH_3 as in the usual Kjeldahl method.

W. T. H.

Two new methods for the determination of phenol in waste liquors. H. DERE. *Unt. Inst. of Food Chemistry, Frankfurt.* (*Chem.-Ztg.* **52**, 983-5 (1928).—(Method 1.) To 20 cc. of well shaken, waste liquor, add 10 cc. of satd. Zn(OAc)_2 soln., 40 cc. of a 1% NaNO_2 soln. (or more if necessary), 10 cc. of dil. H_2SO_4 (1:3) and shake for 3-5 hrs. Filter, acidify the filtrate with dil. H_2SO_4 , add a few drops of H_2O_2 and distil with steam until the distillate no longer gives a positive test for phenol with Millon's reagent and FeCl_3 . Make the distillate alk. with NaOH and evap. Transfer the residue to a 100 cc. volumetric flask and fill to the mark. Mix 10 cc. of this soln. (or more if phenolic content is low) with H_2O and warm to $50\text{--}60^\circ$. Add 15 cc. of 0.1 N I soln. (more if phenolic content is high), let cool, acidify with dil. H_2SO_4 and titrate back with 0.1 N thiosulfate soln. (Method 2.) Mix 55-60 cc. of the soln. (in the 100 cc. flask) with a knife-point full of baryta. Shake and allow to stand a few mins. Filter and mix 25 cc. of the filtrate with about 10 drops of dil. H_2SO_4 . Filter off the BaSO_4 and wash the filter 2-3 times with the least possible CO_2 -free H_2O . Add exactly 0.2 cc. of a 0.1% alizarin yellow soln., and first with strong NaOH and dil. H_2SO_4 and then with 0.1 N alkali and acid, run, to a pH 11.04 with the aid of a suitable buffer soln. Then add about 0.1 cc. of 1% phenolphthalein and titrate with 0.1 N H_2SO_4 to pH 8.4, again using a buffer. From 0.1 cc. of 0.1 N acid used, the correction for pure H_2O is subtracted. One cc. of 0.1 N acid is equiv. to 9.4 mg. phenol. Under normal conditions the no. of cc. of 0.1 N acid used multiplied by the factor 2.09 gives g. of phenol per l. R. C. E.

A new metallic nitrosophenylhydroxylamine internal complex and its application to microchemical analysis. ARDINO MARTINI. *Anales asocn. quim. Argentina* **16**, 117-24 (1928).—Cupferron is a very sensitive specific reagent for U and Ba , and can be used for the detection of Cu , Cd , Ca and Sr . To differentiate between Cd and Ca , or Sr , after ppt. the three cations by cupferron, NaBr and brucine acetate are added; as a result, characteristic crystals can be seen under the microscope (*C. A.* **21**, 3327). By repeating the test, but adding to the ppt. a drop of a satd. Na_2SeO_3 soln., lenticular

crystals of CaSeO_3 are obtained (*Rev. Universidad Nacional Cordoba* 12, No. 10-2(1925)). In these tests the original solns. must first be neutralized with alkali or NaOAc .

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

List of publications on the geology of Illinois. M. M. LEIGHTON. *Ill. Dept. Registration and Education, Division State Geol. Survey, January 1929*, 3-71. E. H.

Crystal structure of cinnabar and covellite. B. GOSSNER AND F. MUSSGANG. *Centr. Min. Geol.* 1927A, 410-13.—Cinnabar has a 4.17, c 9.50 A. U.; space-group D_3^4 or D_2^6 . Covellite, CuS , has a 3.81, c 16.46 A. U.; space-group D_{6h}^4 , with 6 mols in the unit cell. B. C. A.

Formula and crystal structure of tetrahedrite. F. MACHATSCHKI. *Norsk geol. Tidsskr.* 10, No. 1, 10 pp.(1928).—Debye-Scherrer diagrams for tetrahedrite are very similar to those for sphalerite; the bivalent metals are supposed to be present as admixed isomorphous sulfides, and the ratio $\text{R}^{\text{I}}:\text{R}^{\text{III}}:\text{S}$ is 3:1:3. Silver fahl ore from Colquechaca, Bolivia, has a_0 10.41 A. U., and fahl-ore from Felsöbanya has a_0 10.29 A. U. The unit cell contains 8 mols. $\text{R}_3^{\text{I}}\text{R}^{\text{III}}\text{S}_2$ (56 atoms), while in a ZnS cell 64 atoms are present. The following ds. are computed: Cu_3SbS_2 4.88, Cu_3AsS_2 4.31, $75\text{CuSbS}_2 + 25\text{Ag}_3\text{SbS}_2$ 5.28, $75\text{Cu}_3\text{AsS}_2 + 25\text{Ag}_3\text{AsS}_2$ 4.74. Tetrahedrite is hexakis-tetrahedral, space-group T_2^3 ; distance $\text{Sb}-\text{S}$ 2.45 A. U., $\text{Cu}-\text{S}$ 2.24 A. U.; shortest distance $\text{Cu}-\text{Sb}$ 3.25 A. U., $\text{Cu}-\text{Cu}$ 3.65 A. U. B. C. A.

Synthetic spinel. F. RINNE. *Fortschritte Mineral. Kryst. Petrog* 12, 68⁹ (1927).—Skeletal formation is responsible for a recognizable gleam. At the lower end of a crystal the form of octahedra lacking upper octahedral faces may be noticed. Icositetrahedral faces form at the bottom of the pear instead of at the top. These phenomena are explained by differences in temp. between the top and bottom of the same crystal. Using a melt of KHSO_4 , compds. acting as solvents may be obtained from the synthetic spinels. When there is an excess of $\text{MgO}.\text{Al}_2\text{O}_3$ and the spinel is exposed to 1000° , crystals of corundum are formed. A large series of artificial spinels with an excess of Al_2O_3 is available so that optical properties and chem. compn. can be correlated, and there is a regular connection between compn. and n . S. L. B. E.

Arrangement of microcrystals in the banded "supposed aragonite (Arareishi)." H. FUKUSHIMA. *Mem. Coll. Sci. Kyōtō Imp. Univ.* 11, 223-7(1928).—X-ray analysis shows that the banded mineral "arareishi," previously supposed to be aragonite, consists of calcite crystals, the principal axes of which are perpendicular to the surfaces of the layers. B. C. A.

Olivine of Linosa (Pelagic Islands). G. CAROBBI. *Atti accad. Lincei* [vi], 7, 654-60(1928).—Crystallographic and analytical data are given for 2 specimens of transparent olivine, one greenish yellow (d 3.410), the other reddish yellow (d 3.402). These contained, resp.: FeO 12.43, 11.06, NiO 0.12, 0.18, CoO 0.13, 0.10%; and, more noteworthy, PbO 0.20, 0.26%. It is suggested that the Pb occurs as the result of an isomorphous substitution of Mg. The 2 compds. $(\text{Fe}, \text{Co}, \text{Ni}, \text{Mn})_2\text{SiO}_4$ and $(\text{Mg}, \text{Ca}, \text{Pb})_2\text{SiO}_4$ constitute 77.5% and 22.5%, resp., of the specimens analyzed. B. C. A.

Dumortierite. S. F. GLINKA. *Min. Resources and Tech., Moscow* 1927, No. 3, 189-91. H. L. D.

Julenite. A. SCHÖEP. *Natuurwetensch. Tijds.* 10, 58-9(1928).—Blue microscopic needles, forming a thin layer on a white talcose schist at Chamibumba, near Katanga,

having n_s of 1.645 parallel to and 1.556 perpendicular to the elongation, resp., and readily sol. in cold water, appear to consist of a hydrated Co chloronitrate.

B. C. A.

Chemical and spectrographic studies on Tasmanian crocoite and wulfenite from Bleiberg. G. CAROBBI. *Ann. chim. applicata* 18, 485-94 (1928).—The wulfenite was found to contain, besides W, many rare earths with La predominating, and considerable Ce. The crocoite was also found to contain these rare earths, La again predominating. Traces of many others, such as Ga, Eu, Nd and Y were noted.

A. W. CONTIERI

The Duchesne meteorite: An undescribed find from Duchesne County, Utah. H. H. NININGER. *J. Geology* 37, 83-7 (1929).—The meteorite, which is an octahedrite, originally weighed 50 lbs. and is roughly lens shaped. An analysis shows: Fe 89.26, Ni 9.20, Co 0.41, Cu 0.08, Cr trace, Mg trace, P 0.21, S 0.01, SiO_2 0.15, C 0.07, O 0.44%. Nodules encountered, which analyzed Fe 62.96 and S 36.25 and were thought to be troilite, were found, however, to be difficultly sol. in HNO_3 .

W. F. HUNT

A new meteorite from Ballinger, Texas. H. H. NININGER. *J. Geology* 37, 88-90 (1929).—The total wt. was about $2\frac{1}{4}$ lbs., and externally it resembles a typical octahedrite. When cut and etched the surface showed intragranular Neuman lines. A few thin plates of schreibersite and several irregular masses of troilite were observed. An analysis shows: Fe 91.48, Ni 6.54, Co 0.48, Cu 0.07, Cr trace, Mg trace, P 0.26, S 0.01, SiO_2 0.12, C 0.09, O 1.03%. Pt was present to the extent of 0.19 oz. per ton.

W. F. HUNT

The iron ores of South Africa. E. KRENKEL. *Naturwissenschaften* 17, 57-63 (1929).—The South African republic has around 122 million tons of high-quality Fe ore, the total amt. of ore being about $10\frac{1}{2}$ billion tons; good coking coals, Mn ore, limestone and CaF_2 are also present. The occurrences are subdivided in groups: (1) the magmatic ores, (2) sedimentary ores, (3) metasomatic ores, and (4) surface formations. In group (1) the Bushveld complex in Transvaal consists of 1-20 ft. layers of magnetite, maghemite and hematite, accompanied by ilmenite, contg. 52 to 60% Fe, 13 to 20% Ti, 0.4 to 3.3% Si, no P or S, occasionally up to 1% V. The Kromdraai ores of contact metasomatic origin are mostly layers of specularite and hematite, up to 13 ft. thick, 67.8% Fe (94.0% ferric), 1.82% Al_2O_3 , 0.118% P_2O_5 , 0.07% S; about 4 million tons of high-quality ore is available. The "banded ironstones" of Witwatersrand and Swaziland in up to 800 ft. layers are partly siliceous, partly ferrous (mostly hematite) and of quality, Fe of 15 to 44%; around 20 billion tons are present. The most important Fe ores is the Pretoria series, a conglomeration of ores of the same type with separate Transvaal and West Griqualand facies. As described in detail, it has 41 to 54% Fe, 14.5 to 30% SiO_2 , up to 5.8% Fe^{++} , 0.01 to 0.06% S. The magnetite-quartzite is easy to recover, about $2\frac{1}{4}$ billion tons being present of which 100 million are close to the surface. Of the metasomatic occurrences the hematite of the Crocodile River (little magnetite) is of great purity (Bessemer iron): 69.5% Fe, 6.32% SiO_2 , 0.84% P_2O_5 , 0.39% S, and easily recoverable, 10 billion tons being present. The same type of ore, the Blink Klip brekzie of West Griqualand, has: 64.5% Fe, 3.10% SiO_2 , traces TiO_2 , 0.20% P_2O_5 , 0.30% S, too much P for Bessemer use; about 16 million tons are present in 1000 feet depth.

B. J. C. VAN DER HOEVEN

Bentonite. Its properties, mining, preparation and utilization. C. W. DAVIS AND H. C. VACHER. *Bur. Mines, Tech. Paper* 438, 51 pp. (1928).—Pulverized bentonite (hereafter abbreviated to B.) is fine grained, light colored, dark or black. After firing, the color is white, buff or brown. Fracture may be conchoidal, platy or shale-like or none at all. Its affinity for H_2O is strong, it being able to absorb up to 10 times its vol. with consequent increase in bulk. It presumably represents a volcanic ash or lava altered to a hydrous silica-alumina complex. Much of the substance of B. has not progressed beyond colloidal state as fully $\frac{1}{2}$ of the particles in certain samples were of ultra-microscopic size. Other investigators state that the natural product contains no real colloids but is composed of montmorillonite, $(\text{Mg}, \text{Ca})\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 5\text{SiO}_2 \cdot n\text{H}_2\text{O}$, (n = approx. 8) and sometimes beidellite, $\text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2 \cdot x\text{H}_2\text{O}$, (x = 4 approx.). Colloidal properties are attributed to felted texture and micaceous structure in which the crystals have appreciable size in 2 dimensions but thickness of colloidal magnitude. Four types of B. were studied. The relative amt. of swelling in H_2O was found to be a rough method of classifying B.; swelling may be controlled by the addn. of NaCl, other salts also affecting the swelling, as does p_H . Heat destroys the colloidal properties of the mineral. Regulated heat treatment differentiates B. in the same order as does swelling in H_2O . This order was also followed in the adsorption of dyes and the temporary osmotic pressures developed. Com. B. was classified as (1) Alk.-B.: contg. easily

replaceable alk. bases, and having original properties not permanently destroyed with H_2SO_4 . (2) Alk. sub.-B.: same as (1) except having original properties permanently destroyed with H_2SO_4 . (3) Alk. earth-B.: same as (1) except for contg. alk. earth instead of alk. bases. (4) Alk. earth sub.-B.: Same as (2) except contg. alk. earth instead of alk. bases. Three tests and a scheme for classifying B. are given. Mining B. is mostly done by stripping the overburden and breaking up the beds with plows, although in some sections where the overburden is 50-100 ft. the main haulage ways are timbered. Under the present and proposed uses for B., D. and V. discuss the value of the product as a filler in manufacture of paper, oilcloth, linoleum, rubber, ceramics, portland cement, road building materials, greases, putty, foundries, phonograph records, elec. insulation, paste, glue, size, etc. B. may be used as adsorbent, emulsifier or peptizer, in soaps and detergents. It is also used in refining of oils and fats, sprays, insecticides and fungicides, roofing materials, waterproofing, desiccating agents, manuf. of dynamite, drugs, cosmetics, etc. O. A. NELSON

Microchemistry of lignite. II. KAMETARO OHARA. Trade High School, Nagoya, Japan. *Braunkohle* 28, 1-8(1929); cf. C. A. 20, 811.—A Japanese lignite, which showed various wood fragments, was studied, a piece of *Sequoia sempervirens* being used for comparison. It was found that Ru colored chemically altered cellulose or oxy-cellulose red, and so is not a satisfactory reagent for pectins. This was demonstrated on oxidized cotton and ramie. For the detection of lignin, the Maule and acid-fuchsinsulphuric-acid reactions were used effectively. The latter was better adapted for its detection in the tracheid walls. The aldehyde reactions, with Schiff's reagent, Fehling's soln. and ammoniacal Ag soln., were not conclusive for showing the distribution of membrane substances in the tracheid walls, since the reactions occur with various materials. The participation of lignin in these reactions was shown after removal of the cellulose by ammoniacal Cu soln. The lignite sections yielded osazone crystals on long treatment with phenylhydrazine acetate, indicating the presence of sugar. After removal of the undecomposed portion of the tissue, by acetyl bromide, this reaction was still distinct, showing that the sugar may come from the decomposed portion. Lignin was detected in the middle lamella of every portion of the lignite. It gave a brown color in Maule's reaction and was completely dissolved by 6% perhydrol and ammonia. Ru always gave a red coloration with wood but not with lignite. Of the 3 lamellas of the tracheid walls, the secondary lamella of the early wood in the outer part of the lignite was altered to the greatest extent. It consisted principally of lignin, being colored yellow by $ZnCl_2 \cdot I_2$ and dissolved by oxidation with 6% perhydrol and NH_3 . Frequently lamellas were found which showed partly lignin and partly cellulose reactions. In contrast to the early wood, the secondary lamellas of the late tracheids, on oxidation, always remained undissolved, owing to the presence of much cellulose. These lamellas, after oxidation, dissolved completely in ammoniacal Cu soln. and were colored indigo blue by $ZnCl_2 \cdot I_2$. The primary and tertiary membranes remain almost unaltered during coal formation, appearing as a double ring, in the cross section, after oxidation. Chemically considered, both lignin and cellulose undergo extensive alteration during coal formation, so that they do not occur as such in lignite. Chem. alteration does not occur to the same extent in all tissues during the coal-forming process. F. S. G.

The origin of the fossil rubber in middle German brown-coal. K. A. JURASKY. Bergakademie, Freiberg. *Braunkohle* 27, 1130-2(1928).—This material, long known as "monkey hair," was identified by Gothan, in 1925, as the fossilized latex of rubber trees existing in middle Europe during the tropical climate of the Eocene period, but attempts to identify the particular tree, from the bark remains, in which the material principally occurs, have proved fruitless up to the present. J., studying the leaf remains, however, which also contain it, finds the definite characteristics of the *Urostigma* section of *Ficus*, especially *Ficus multinervis* of Tertiary Europe and *Ficus elastica* of modern tropical Asia, the familiar household rubber plant, which also furnishes a considerable portion of the rubber of commerce. F. S. GRANGER

Salt domes and petroleum reservoirs. A. BENTZ. *Petroleum Z.* 24, 1157-61 (1928).—The potential oil supply of Germany is discussed as shown by the presence of salt domes. The geology and oil reservoirs of various parts of northern Germany, the Texas-Gulf region and southern Rumania are discussed. Literature references for each section are cited. M. B. HART

Occurrence of hydrocarbons in volcanic rocks. J. FRIEDLÄNDER AND E. SALVATORE. *Z. Vulkanol.* 8, 73-83(1924-5).—Extn. of 0-0.007% of hydrocarbons and 0.002-0.028% S is reported. B. C. A.

Mount Monadnock, Vermont—a syenite hill. JOHN E. WOLFF. *J. Geology* 37, 1-16(1929).—Mount Monadnock is a stock of quartz-nordmarkite with an interior

core of essexite and assoc. dikes of bostonite and camptonite. New chem. analyses are given of hornblende, syenite and essexite. The optical properties of hornblende are $\alpha = 1.693$; $\beta = 1.711$; $\gamma = 1.713$; $\gamma - \alpha = 0.020$; $2V = 43\frac{1}{2}^\circ$. γ = deep grass green, β = deep olivine-green, α = light yellow. $c:\gamma = 20-21^\circ$. W. F. HUNT

Colloid substances formed by abrasion. P. MARSHALL. *Trans. Proc. New Zealand Inst.* 59, 609-13(1928).—Abrasion of greywacke gravel yields a small amount of colloidal matter. The consequences of this fact in geological processes are discussed.

ALBERT L. HENNE

Zeolites as fossilizing substances. H. UDLUFT. *Amer. Kemi Mineral Geol.* 9, No. 33, 15 pp.(1926).—Fossilized wood from the basaltic tufa on the lower slopes of Mt Elgon in British East Africa was found to contain crystals of natrolite, mesolite and apophyllite, while calcite had apparently played a part in building up the structure and a certain amt. of the original org. wood substance was still present. It is suggested that the wood was dehydrated above 150° in the tufa beds and then subjected to the action of hydrothermal epimagmatic solns. which deposited in succession natrolite, apophyllite and calcite. The mineralization appeared to have been affected by the original structure of the wood in that the mineral crystals were elongated in the direction of the circulation along the wood fibers and the wood cells seemed to be filled first

Shell beds on the Skagerack. ERNST ANTEVS. *Geol. Foren. Forh.* 50, 479-750 (1928) (In English).—This is a very comprehensive study of the shell deposits in the Skagerack. The formation, movement and compn of the different beds are treated in minute detail. Numerous tables and lists accompany the paper. The role played by the temp. of the water is studied, with the conclusion that the compn. of the fauna of a shell bed may be taken as a measure of the water temp. at the time of formation.

W. SEGERBLÖM

The geochemistry of iodine. II. GULBRAND LUNDE. *Gerlands Beitr. Geophysik* (reprint) 10, 99-103(1928); cf. *C. A.* 22, 1785.—It is possible that I occurs in the Fe kernel of the earth since it has been found in all Fe products examd. The atmophile characteristics of I are more pronounced than the lithophile and chalcophile ones. I is found in all spheres of the earth, the concn increasing from kernel to crust. During the magmatic differentiation of rocks, I becomes enriched in the residual solns. Pyrometallurgical minerals show a relatively high I. The low I content of mineral salts is explained by the fact that the easily sol. iodides, enriched in the mother liquors, are broken down by photooxidation and escape into the air.

D. J. DEMOREST, R. H. ABORN

The concentration of the ores of Western Quebec. J. S. GODARD. *Bull. Am. Zinc Inst.* 11, No. 11-2, 1-9(1928).—Methods have been developed for the concn. into marketable products of the ores of this district, which are primarily mixts. of base-

metal sulfides carrying values in the precious metals. The data of various flotation concn. and amalgamation tests are given: T. P. KELLER

Use of Ganelin's method in the treatment of Altai lead ores. N. N. EFREMOV AND E. M. YAKIMETZ. *J. Chem. Ind. (Moscow)* 4, 662-4(1927).—Preliminary expts have been made on the practicability of applying Ganelin's method (cf. description of Ganelin's method in Liebig's book "Zink und Cadmium" and in the following 2 German patents: 97,943, year 1897; 124,846, year 1899) to the treatment of Altai Pb concentrates which contain Pb 45.3, Zn 12.70, Cu 0.77%, a little of Ag and Au. The method consists in treating Pb, or Pb-Zn ore by ZnCl_2 and afterwards reducing the PbCl_2 formed by Zn: $\text{ZnCl}_2 + \text{PbS} = \text{ZnS} + \text{PbCl}_2$; $\text{PbCl}_2 + \text{Zn} = \text{ZnCl}_2 + \text{Pb}$. When Cu, As, Sb and Ag are present in the ore they are sep'd. with the Pb and therefore larger amts. of ZnCl_2 are required. The expts. were carried out by melting ZnCl_2 in a graphite crucible, adding the finely pulverized PbS ore and letting the ingredients react for 1½ hrs. at various temps.; after the reaction the mass was boiled with a large quantity of water and filtered hot to sep. PbCl_2 . When operating with theoretical amts. of ZnCl_2 at 280° (near the m. p. of ZnCl_2) only 9.3% Pb reacted, at 330° (near the m. p. of Pb) 14.7% of Pb was transformed into PbCl_2 , and at 450° (temp. of noticeable volatilization of ZnCl_2) 23.85% of Pb entered into reaction; the reacting mass was so viscous that it was impossible to stir it, and the product of reaction, on being reduced with metallic Zn, was so viscous that Pb could not sep. and settle at the bottom. When operating with treble amts. of ZnCl_2 the yields in reacted Pb were as follows: at 280° 10.2%, at 330° 16.09%, at 450° 31.70%, the reaction mass being liquid enough to permit some stirring; after reduction with Zn the Pb obtained was less embroiled in the mass than in the previous cases. Finally, when operating for the same length of time with the theoretical amt. of ZnCl_2 in the presence of an equiv. amt. of NaCl the reaction mass was very fluid, easy to stir and gave the following yields in reacted Pb: at 280° 16.1%, at 330° 19.21%, at 450° 42.06% (ZnCl_2 non-volatilizing in presence of NaCl). BERNARD NELSON

Flotation process in the Moctezuma Copper Company, Nacoar, Sonora, Mexico. C. BRUCHHOLD. *Z. Ver. deut. Ing.* 73, 26-8(1929).—The ore treated is a mixt. of quartz and Cu and Fe pyrites with 2.5 to 3.0% Cu, 30 g. Ag and 0.075 g. Au per ton. Crushing is effected in ball mills, with rod mills for fine grinding, after which the material is sent through the flotation circuit. The pH value is very accurately maintained at 8.5 by means of automatic electrometric indicators. Xanthate and 80% o-toluidine and 20% thiocarbanilide are the reagents used. The concentrate contains 26% Cu and only 7% moisture. HANS C. DUES

Experimental demonstration of the refining of metals by oxidation. JAMES SILBERSTEIN. *Ind. Eng. Chem.* 21, 172(1929).—A lab.-scale expt. is described to illustrate clearly the procedure of the refining of metals on a practical basis. T. P. K.

The agglomerating of unfused, pulverulent substances and its causes, as the kind of heating, material, degree of pressing and chemical reactions. J. ARVID HEDVALL AND E. HELIN. *Jernkontorets Annaler* 1927, 265-342; *Chem. Zentr.* 1927, II, 2098-9.—In continuation of their former studies (cf. *C. A.* 21, 2620, 3293), which they discuss thoroughly in the preface of the present paper. H. and H. investigated the changes brought about by various factors on briquet-shaped, pulverulent substances in regard to their strength. H. and H. intended to find a method of forming briquets of red iron ore by heating it in a reducing atmosphere, e. g., in the blast furnace, without reducing it to metallic Fe. The cooling of the briquets in air and the mild reoxidation involved in this stage should cause increased strength of the briquets. The expts. were made on lozenges of Fe_2O_3 and Fe_3O_4 (diam. 10.2 mm), and on samples as pure as possible of iron glance, magnetite, hematite and limonite. The compressive strength was tested before and after the treatment with the aid of a special lab. app.; thus no absolute but comparable relative results were obtained. In the various preps., the influence of the following factors was studied: temp., period of heating, size and shape of particles, initial strength, compn. of the reducing gas and the influence of chem. reactions. The substances were heated in an elec. "shot" furnace, the reducing gas consisted of a mixt. of CO_2 and CO. The "after-oxidation" was accomplished by cooling the prepn. in air. In the original paper, the complete detailed results are recorded in curves and tables. Generally, it may be said that on heating the vol. decreases, while simultaneously the strength increases. The contraction and the recrystn. occurring in the heating process are discussed thoroughly, and the break in the curve representing the increasing strength is explained. Prolonged heating gives increased strength. The smaller the size of the particles of the lozenge material, the more durable the lozenges. At higher temps., the values for the strength of the

finer and coarser powders become more similar to each other. As to the shape of the particles, the intimate contact of the particles has an important influence on the strength, e. g., Fe_2O_3 prep'd. from $\text{Fe}_2(\text{SO}_4)_3$ has greater strength than Fe_2O_3 made from Fe oxalate, the tendency toward agglomeration being greater in the case of the "sulfate oxide" than in that of the "oxalate oxide." Lozenges having a greater initial strength still show it after the treatment, though the effect is not additive, but only relative. In studying the effects of chemicals, the effect of a reducing and oxidizing atmosphere, in which the lozenges were heated, was exam'd.; further on, the effect of adding CaO and SiO_2 was studied. Gas mixts. of 10% CO + 90% CO_2 , 15% CO + 85% CO_2 , and 25% CO + 75% CO_2 were employed. The reduction of Fe_2O_3 to Fe_3O_4 was more intensive with gases contg. CO and in connection with this, a stronger agglomeration of the lozenges resulted. Reduction to FeO and Fe only occurred to a certain degree at temps. exceeding 887° . A greater velocity of the current of the reducing gas also caused increased strength. After cooling the Fe_2O_3 - Fe_3O_4 lozenges in air, those lozenges which were exposed to the air at the highest temps. show the greatest strength, thus making possible an effective after-oxidation. With iron glance, similar conditions arise. The heating curves of pure Fe_3O_4 and magnetic lozenges are normal, while, if the oxidation progresses too quickly, the lozenges obtained are brittle on account of recrystn. processes. Thus, in order to obtain the max. strength, the velocity of oxidation has to be kept within certain limits. Adding 4.3% SiO_2 to Fe_2O_3 helps to increase the strength; with pptd. silicic acid, this action already starts at 887° , while with vitreous silicic acid, it starts at 1039° . Small quantities of CaO do not increase the strength. No difference exists between lozenges contg. 4.3% SiO_2 + 0.17% CaO, and lozenges to which only SiO_2 had been added. Adding SiO_2 to Fe_3O_4 also causes an increase in strength, while CaO reacts with the Fe_3O_4 at 520° , causing the formation of an agglomerating mass. Addn. of 5% CaO produces an increase in strength. Synchronous addn. of 5% SiO_2 and 5% CaO does not result in getting higher strength values. Expts. with hematite showed that by heating lozenges having the strength 0 kg./sq. cm. at 1265° for 30 mins. in a gas current contg. 15% CO and 85% CO_2 , and by subsequent cooling in air, the strength may be raised to about 185 kg./sq. cm. A value of 409 kg./sq. cm. may be obtained, if the heating is done in a gas current of 25% CO + 75% CO_2 , and the lozenges are not allowed to cool quickly, but with mild heating (after-oxidation). Also in expts. with technical limonite, the view that oxidation of Fe_3O_4 to Fe_2O_3 is important for prep'g. durable briquets, was confirmed by the expt.

Recent investigation methods for determining the structure of slags. OTTO GLAUFER. *Archiv. Eisenhüttenw.* 2, 73-9(1928).—A review of the customary methods for detg. the viscosities, m. ps., heat contents and transformation points of slags. The systems $\text{CaO-Al}_2\text{O}_3\text{-SiO}_2$, $\text{MnO (FeO)-Al}_2\text{O}_3\text{-SiO}_2$, CaS(MnS)-SiO_2 and $\text{CaO-MgO-Al}_2\text{O}_3\text{-SiO}_2$ are discussed, 2 diagrams being given.

J. BALOZIAN

Contribution to the question of the citric acid solubility and hardness of Thomas slags. HELMUT WEISS. *Archiv. Eisenhüttenw.* 2, 81-5(1928).—The factors influencing the citric acid soly. of Thomas slags (I) are investigated. A plot of about 300 analyses shows that I increases rapidly with the silicizing factor ($\text{SiO}_2/\text{P}_2\text{O}_5$) to a max., const. between 0.12 and 0.45. The silicizing factor in the slag should approx. 0.423 as nearly as possible. If this cannot be done by increasing the Si or decreasing the P in the crude Fe, sand must be added. To study the influence of the fine powder content of the slag on I, 200 analyses having silicizing factors of 0.42-0.55 (to exclude variations in I due to it) are plotted. The straight line slope obtained indicates a 0.33% increase in I for each percent increase in fine powdering. Charges blasted with a good, SiO_2 -poor CaO give a larger portion of total P and, in spite of a smaller silicizing factor, a higher I due to a more exact calcn. of the CaO. A good soft CaO, in not too great an excess, and a clear hot slag increase I. The influence of cooling on I is slight, decreasing I and hardening the slag when sharp. Expts., covering a 2-month period, show that hard slags occur mostly when the crude Fe is very hot and Si-rich. Hard slags always contain much FeO and little Fe_2O_3 , besides higher Si and Mn. The unfavorable influence of slag hardness on I is largely mech.

J. BALOZIAN

The use and properties of slag wool. ARTHUR GUTTMANN. *Stahl u. Eisen* 49, 97-101(1929).—Among the products obtained from blast-furnace slag, slag wool is the most important. Only 2 of the plants in Germany are mixing the slag before blowing; the rest of the plants obtain it during granulation. For the manuf. of slag wool, a long thinly liquid slag, with high SiO_2 content and low S content, is best. Five samples of different sources were investigated; the color ranges from white to brown; 3 of the samples consisted of large balls like cotton wadding; 2 consisted of small lumps.

Automatic blast-gate control for cupolas. H. V. CRAWFORD. *Foundry Trade J.* 40, 91-3(1928). See C. A. 23, 1373. E. H.

New experiments in the preparation of synthetic forms from metal powder. E. SAUERWALD. *Z. Metallkunde* 21, 22-3(1929).—Improved phys. characteristics are obtained if, in the manuf. of objects by pressing metal powder, the pressing operation is carried out at elevated temps. rather than pressing at room temp. followed by heat treatment. With a pressure of 3600 atm., followed by heat treatment at 610°, a tensile strength of 14.2 kg./sq. mm. is obtained with Cu; at 715° 13.2 kg./sq. mm. is obtained with Cu and 6.6 kg./sq. mm. with Fe; at 810°, 10.3 with Cu and 11.5 with Fe and at 920°, 14.7 kg./sq. mm. with Fe. When the heat treatment is coincident with the pressure, the values for tensile strength obtained with Cu and Fe, resp., are at 610°, 26.3 and 19.7 kg./sq. mm.; at 715°, 24.1 and 29.3 and at 810°, 23.5 and 39.8. H. S.

Physical-chemical basis of soldering. L. ROSTOSKY AND E. LÜDER. *Z. Metallkunde* 21, 24-6(1929).—A discussion of the processes of soldering. Three different types of diffusion are encountered: the solder and the soldered object form mixed crystals, a purely phys. diffusion; the solder and soldered object form intermediate compds., a chem. diffusion; the solder dissolves in the soldered object only when molten, decomposes into its constituents when chilled. A still different type occurs when the solder and soldered object do not mix even in a molten condition. Such a joint is weak. H. S.

Sherardizing. MASAO KURODA. *Bull. Inst. Phys. Chem. Research* 8, 12-8(1929); *Abstracts* 2, 1.—The influences of time and temp. upon sherardizing have been studied. When sherardizing is conducted statically, the oxidation is harmless both to the powder and to the product. The layer of powder is sintered to a depth of only a few mm., beyond which the oxidation does not proceed, the product bearing a brilliant silver luster. The best method is to apply heat at 370-80° during 30 min. The tensile strength, elongation, hardness and toughness do not decrease considerably by this heating. ALBERT L. HENNE

Technological significance of gases in metals. E. H. SCHULZ. *Z. Metallkunde* 21, 7-11(1929).—A discussion of the nature and form of gas absorption by metals, including the effects upon the properties of the metals and some methods of overcoming the defects produced by the gas. Where bubbles are formed in the interior with no cracks leading to the surface, rolling frequently closes the bubbles satisfactorily. Access of air or O₂ to the interior, however, would produce oxidation upon the surface of the bubbles and cementation would not result on rolling. Addns. of Si, Al and Ti to steels are very effective in reducing gas bubbles, the action of Ti being very marked since it takes up N₂ as well as O₂ to form a high-melting compd. The improvement in mech. characteristics on addn. of Ti is due to this removal of gas rather than to the formation of a Ti-Fe alloy. O₂ reduces the elec. cond. of Cu from about 59 to about 57 with 0.16% O and 56 with 0.28% O. H. STOERTZ

Technical properties of metals melted in a vacuum. W. ROHN. *Z. Metallkunde* 21, 12-8(1929).—A discussion of the value of melting and casting metals and alloys under vacuum, and the application of such vacuum-melted alloys. The large vol. of gases evolved is explained as due to chem. reaction initiated by the disturbance of equil. produced by the reduced pressure, rather than to the liberation of physically or chemically dissolved gases. Thus C will react with oxides present to produce CO. Vacuum melting has made possible the close control of the compn. of such alloys as the ternary Cr-Ni-Co alloy used in thermoelements. Improved mech. properties are also obtained as shown by the notch test values obtained on a Cr-Ni alloy in a Charpy machine (10 × 10 × 60 mm.). Melted in the ordinary way the sample as cast gave a value of 3.4 mkg./sq. cm., while rolled from 200 to 15 mm. it gave 11.0 mkg./sq. cm. Vacuum melted, the same alloy gave for the cast specimen 10.4 slowly cooled and 13.9 quickly cooled, while for the rolled material the values obtained were 22 and 26. H. STOERTZ

Solubility and diffusion of hydrogen in metals. G. BORELIUS. *Metallwirtschaft* 8, 105-8(1929).—H dissolves in the following metals, given in the order of increasing soly.: Ag, Pt, Cu, Fe, Ni, Pd, V, Ta, Ti, Zr, Th and Ce. From Pd on, H-rich phases are obtained which are probably metallic hydrides. In general the concn. (*c*) of H in soln. in the metal is given by the expression $c = \text{const.} \sqrt{p}$, in which *p* is the pressure of H₂ in the gas phase. Curves are given in which log *c* is plotted against 1/*T* for different metals (*T* = abs. temp.), while in another set of curves *g*, atoms H/g. atoms metal is plotted against temp. These curves show that for Th, over 3 atoms of H per atom of Th can be taken up at atm. pressure. The relation between the concn. of H in the metal *c* to that of monatomic H in the gas phase *γ* is given by the equation $c/\gamma = Ae^{-b/T}$, in which *A* and *b* are consts. The quantity of H per

sq. cm. per sec. (M), which diffuses into a metal, is given by the expression $M = \eta/d(c_1 - c_2)$, in which d is the thickness of the metal, c_1 and c_2 are the H concns. on each side of the metal, and η is the diffusion const. If the H_2 supply at the metal surface is more rapid than the diffusion into the metal, then c_1 and c_2 equal the equil. concns.

at the partial pressures p_1 and p_2 and the expression reads $M = \text{const.} \frac{\sqrt{p_1} - \sqrt{p_2}}{d}$.

Deviations from this are found with Fe and Ni at low temps. For $p_2 = 0$, the diffusion of H increases with \sqrt{p} in a linear manner but is not proportional to it. The relations are qualitatively the same as in the diffusion of gas through a porous substance. Where H is liberated electrolytically or by chem. action at the surface of a metal, enormous quantities can be absorbed. In electrolysis the concn. of H taken up by the metal is proportional to a const. $\times \sqrt{I}$, where I is the c. d. Calcn. of the pressure equiv. of c. d. shows that for Fe in 2% NaOH with a c. d. of 1 amp./sq. cm. the pressure equiv. is 17,000 atm., and for Pd in 0.2 N H_2SO_4 at 90° and 1 amp./sq. cm. the pressure equiv. is 12,000 atm., illustrating the enormous effectiveness of this manner of loading metals with H. Fe contg. C deviates considerably from both the \sqrt{I} and \sqrt{p} laws. H. S.

The stability of metals at elevated temperatures. CLAUDE L. CLARK AND ALBERT F. WHITE. Univ. of Mich., *Eng. Research Bull.* No. 11, 7-122(1928).—The objects of this investigation were to correlate the results of short-time tensile tests with service under stress at high temp., and to explain the effects of alloying elements on such service. The literature of this subject is reviewed, with special attention to the effect of time, or rate of testing. For correlating the results of long- and short-time tests, 2 plain steels contg. 0.13 and 0.38% C, resp., and an alloy steel contg. 0.09% C and 16.7% Cr were tested. High-temp. tensile tests were made in the usual way, and expansion tests were made by heating tubes contg. N gas under const. pressure. The app. and methods are described in detail, and all results tabulated. The 0.38% C steel gave the highest strength at all temps. used (room temp. to 816°), but the high-Cr steel gave the highest proportional limit at all temps. above 21°. The expansion tests were run at various pressures, giving stresses up to 23,000 lbs. per sq. in., for each of several temps. from 482 to 816°, and continued until marked deformation occurred. At the higher temps. oxidation interfered with the reliability of results on the plain C steels. The high-Cr steel resisted oxidation well, and at 677° withstood 4 times the stress causing failure at 816°. Mathematical analysis of the results showed that the curve plotted from stress and time-for-rupture values did not approach a limiting value above zero stress, but was of the form $y = a x^b$, a and b being consts., for temps. above the equil. cohesive temp. At lower temps., the limiting creep stress is at or above the proportional limit. Logarithmic plotting of creep results gave straight lines, nearly parallel to the time axis at room temp., and with increasing neg. slope at higher temps. At temps. from 530 to 820°, the proportional limit as detd. by short-time tests was roughly similar to the safe working stress, at which failure would not be expected within 10,000 hrs. The expansion tests, however, showed that above 540° there was some continuous creep, and the metals tested did not have true proportional limits. This was because of flow in the amorphous material between the crystals. Slip-interference and increase of amorphous intergranular material by decreased grain-size are effective in improving load-carrying ability only below the equi-cohesive temp. The 0.38% C steel showed better load-carrying ability at high temp. than the 0.13% C steel, and the high Cr steel was still better. The presence of carbide probably strengthened the amorphous intercryst. layers in the 0.38% C steel as compared with the 0.13% C steel; and the same explanation was assumed to hold for the high-Cr steel, Cr being recognized as a carbide-forming element. Ni in steel did not cause an improvement in strength at high temp. because by decreasing the grain-size, more amorphous metal is formed and hence there is easier flow under load. Ni, however, is of value in reducing oxidation. W, Mo, V and Mn were shown to benefit the strength at high temp., similarly to Cr. Short-time tensile tests of various alloy steels at temps. up to 850° are reported in support of these deductions and are discussed in an appendix. A list of references to the literature is also given.

Annealing metals. LÉON GUILLET AND ALBERT ROUX. *Rev. métal.* 26, 1-11 (1929); cf. C. A. 21, 1085, 1953 —A more detailed account. A. P.-C.

Annealing of metals by a new sensitive differential dilatometer. SAKUICHI TOGINO AND KEIJI YAMAGUCHI. *Bull. Inst. Phys. Chem. Research* 8, 34-43(1929); *Abstracts* 2, 3. For soft metals without any transition point, the usual differential dilatometer cannot be of much service, on account of insufficient sensibility as well as susceptibility toward deformation due to the spring. In the new differential dilatometer, the spring

is dispensed with, and a component of gravity acting on a pendulum is used. The pressure sustained by the test piece is reduced to the order of 0.3 g./mm.², so that for such a soft metal as Al, measurements can be made near the m. p. When the specimen is 10 cm. in length, the rod to be rotated by the difference of dilatation is 1 mm. in diam., and the scale is 120 cm. from the plane mirror. Thus the difference in the change of the length per cm. of specimen can be magnified 24,000 times for reading. The relations of the differential dilatation as taken from its curve when cold worked Al and Cu wires are heated, the changes in hardness occurring at the same time, and those in the internal structure, as shown by Laue photographs, are discussed.

ALBERT L. HENNE

Influence of various gases upon the graphitization of cast iron. HIROSHI SAWAMURA. Kyoto Imp. Univ. *Iron and Steel* 14, 741-55(1928).—S. devised an app. for measuring the thermal expansion of white cast iron in a stream of gas and examd. the influence of various gases at 1 atm. pressure upon the graphitization of cast iron. The sample used contained 2.4% C, 1.02% Si, with small amts. of other impurities; the gases used were H₂, NH₃, CH₄, N₂, O₂, CO, CO₂, and air. H₂, NH₃ and CH₄ retard the graphitization remarkably, CO and CO₂ moderately, others being indifferent. The time required for completing the first step of graphitization in these gases is shortest with CO₂, then air, N₂, O₂ and CO in order; it is longest with CH₄, NH₃ and H₂. The same method was then applied to the annealing of a sample having the compn. of malleable cast iron at 895°, 935°, and 978° and the relation between the annealing temp. and the time of the completion of the first step of graphitization was investigated. The graphitization proceeds most rapidly in CO₂, while it is retarded remarkably in H₂, NH₃ and CH₄ gases. In these cases N₂ influences graphitization. Similar expts were made with mixts. of some of the above gases.

K. SOMEYA

Production of malleable castings. F. H. HURREN. *Foundry Trade J.* 40, 33-6 (1929).—In the production of malleable castings, the following subjects are considered in some detail: (1) the compn. and class of Fe charged into the cupola; (2) liquid metal shrinkage in mold, and contraction allowance on patterns; (3) feeding and gating the casting; and, (4) annealing process.

Design of engineering castings in relation to tests. J. G. PEARCE. *Foundry Trade J.* 40, 67-71(1929).—In order to rationalize gray Fe casting design, the author gives figures and curves showing the variations in tensile, compression, torsion, and transverse strength with cross-section (cast diam.). The relationship between chem. compn., Brinell hardness, and shear strength, with tensile strength, are also shown by curves. The following conclusions are drawn: (1) in gray cast iron there is a continuous increase in strength as cast section diminishes for tensile, compressive, torsion and transverse tests; (2) the relationship between compression and transverse tests to tensile tests may be taken as 1.8 to 2 for $\frac{\text{transverse}}{\text{tensile}}$ and as 4 for $\frac{\text{compression}}{\text{tensile}}$; (3)

the change in strength with section can conveniently be followed by transverse testing of bars of different diams. from the same melt; (4) if a series of size-strength curves is prepd. for different mixts., it becomes possible to chart the connection between strength and those elements of compn. which usually vary as between different mixts in the same foundry.

Centrifugally cast pipe (metal-mold process) versus sand-cast pipe. F. N. MENEFEE AND A. E. WHITE. Univ. Michigan, *Eng. Research Bull., Reprint Series* No. 4, 37 pp.; *Proc. Am. Soc. Testing Materials* 28, Part II, 221-57(1928).—Physical, chemical and metallographic tests were made on 48 piece. of cast-Fe pipe, some having been cast in stationary sand molds, and the others in rotating steel molds. The centrifugally cast pipe requires annealing. Both 6-in. and 8-in. pipes were tested. The wall-thickness variation in the centrifugally cast pipe was less than 1/3 that found in

the sand-cast pipe. The tensile strength of the former was over 50% greater than that of the latter, and the bursting strength, based on min. wall thickness, of the former was also superior. The factors of safety for the 2 kinds of pipe, based on the usual catalog pressures for the different classes, all lay on the same smooth curve. Impact tests on the Izod and Olsen machines gave better results for the centrifugally cast pipe only when unnotched specimens were used. With notched specimens, the sand-cast pipe showed better impact resistance. The impact resistance of centrifugally cast pipe was improved by annealing. Radial compression on 1-ft. samples showed that the sand-cast pipe withstood on the av. a slightly heavier load than the centrifugally cast-pipe, but deflected less. The results of transverse tests were similar. Centrifugally cast pipe, being necessarily annealed, should have less internal strains, and they were found smoother on the inside. The graphite was finer, and the combined C less, in the centrifugally cast samples, and they were slightly harder. Tensile strength, variation in thickness, freedom from strain, impact resistance and radial compressive strength are considered of primary importance, and the 2 kinds of pipe are of about equal value on these 5 points in general. Conclusion: The centrifugally cast pipe would be favored if it cost less. In discussion, J. T. MacKenzie emphasized the effect of the greater wall thickness of the sand-cast samples on the results, and claimed that annealing centrifugally cast pipe does not remove all internal strains. Some of the methods of testing were also criticized in the discussion.

The cementation test of Ehn. R. WASMUTH AND P. OBERHOFFER. (*Stahl u. Eisen* 49, 74-7(1929). The well-known cementation test developed by Ehn (cf. *C. A.* 16, 2241) was used to det. the quality of low- and high-C steel, Cr steel and dynamo plates. The cementation test did not give definite information on the mech. (working) characteristics of the steel samples tested. Besides the C content, the grade of decarburization, enclosures, grain size and other factors are influencing the results of the test.

J. A. SZILARD

Effect of temperature on stainless iron. R. SERGESON. (*Central Alloy Steel Corp. Heat Treating and Forging* 15, 55-9(1929).—The effect of temp. on the phys. properties of a stainless Fe (*Enduro*, with 18% Cr and 8% Ni) was studied. A quenching cycle (substantiated by tensile and impact tests) shows that heat treating does not increase the hardness and strength of *Enduro*. Only on cold working is there an increase in these properties, but a continued decrease in the ductility and impact strength. When used above 1200° F. there is no advantage in cold drawing, as shown by "short time" tests. The strength previously gained by cold drawing is lost by reheating to 1450°. With increase in normalizing temp. the tensile strength decreases slowly, the elongation and reduction in area increasing correspondingly. The changes are negligible from 1850° to 2200° F. Photomicrographs show that only at and above 1850° F. is the effect of cold work removed. Reheating below 1000° F. does not reduce the hardness of cold-drawn stock, while above this the hardness varies with the temp. and the time. The impact strengths of "hot-rolled" and cold-drawn bars reheated to 1200° F., only, are different, those of the latter being lower. At 700° F. the impact resistance is max., falling off at 900° F. The max. temp. for using *Enduro* continuously is 1800° F.

J. BALOZIAN

The recrystallization (of ingot steel) during hot rolling. W. TAFEL, H. HANEMANN AND A. SCHNEIDER. (*Stahl u. Eisen* 49, 7-12(1929).—The work of Hanemann and Lucke (cf. *C. A.* 20, 1582) is reviewed; in it a space diagram was developed, representing the grain size of small steel and electrolytic Cu cylinders, compressed at various temps., as a function of the temp. and the rate of deformation. The development of a similar space diagram for the evaluation of the hot rolling of ingot steel was undertaken by T., H. and S., in order to det. which rates of deformation during hot rolling cause a coarsening of the grain and corresponding decrease in the quality of the steel. The grain size was detd. in the center line of the test pieces according to the method of Jeffries. Owing to the difficulty of rolling accurately to a definite rate of reduction detn. of the grain size was not only carried out on test pieces after rolling, but also "in transition" (obtained when the rolls are stopped before the test pieces leave them); for such an interruption of the rolling the Techn. Hochschule in Breslau, where part of these expts. were carried out, has a special exptl. rolling mill). Preliminary expts. showed that at a given rate of reduction, the recrystn. and the final grain size of the

test piece are not influenced by the grain size before rolling but are detd. by the pressure and temp. of the last pass. Above 900° the grain size of the rolled bars is the same in both longitudinal and cross sections. Below 900° the grain size is larger in the longitudinal section. A mild (Krupp; 0.03% C, 0.03% Si, 0.08% Mn, 0.01% P, 0.012% S) ingot steel was used; bars were rolled at 680°, 700°, 750°, 850°, 925°, 1000°, 1100° and 1200°. The results are given in a diagram for each temp., the grain size being plotted in μ^2 against the rate of reduction in %. These diagrams are used in the construction of a space diagram, which shows that the danger of large grain size for mild steel is between 750° and 850°, where at 15% reduction the grain size is 12,000–17,000 μ^2 . At 900° the values for the grain size are between 400 and 1200 μ^2 for reductions up to 50%, which is practically the limit during rolling. If the amt. of reduction during the last pass is 16%, the corresponding grain sizes for 750°, 850°, and 925° are 13,500, 11,000 and 825 μ^2 , which indicates that the temp. of rolling should not go below a certain limit, which for the mild steel used in these tests is 925°.

J. A. SZILARD

Troostite. A. E. CAMERON AND I. F. MORRISON. Univ. of Alberta, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 289-91(1928).—Heat treatment carried out on a low-carbon (0.1% C) steel, a medium-carbon (0.5% C) steel, and a high-carbon (0.8% C) steel, with quenching operations up to 1000° followed by tempering and drawing at 100°, 200°, 300°, 400° and 500°, and accompanied with photomicrographic observations before and after each treatment, indicated that globular troostite is not a decomposition product of martensite, but a primary decomposition product of austenite. Globular troostite is not formed by reheating quenched steel, but rather the troostite-like structures developed by tempering operations are fine-grained sorbite. The observations suggest that martensite tends to granulate or sorbitize as soon as re-heating is applied. Granulation of the troostite depends upon the C content. In the medium C steel troostite remained unchanged until tempered at 300°, while the high-C steel, the globular troostite was observed to granulate appreciably at 200°. Several photomicrographs accompany the paper.

J. W. SHIPLEY

Annealing processes in hardened steel and the influence of silicon and nickel. HANS BERNBAUM. *Archiv. Eisenhüttenw.* 2, 41-7(1928).—The effects of Si and N on the linear contraction occurring at 100° (I) and at 300° (II) on annealing hardened steels are studied. With Si I occurs at 80–150°; it is of influence only in displacing the temp. of II (the temp. of appearance of II increasing with the Si content). With N steels, the temp. of appearance of II and the amt. of I is due to the Si and C contents resp. From further investigations on the decrease of hardness of steels on annealing and of the influence of C on the annealing processes in hardened steel, it is concluded that the phases in martensite are: (1) the ϵ -phase of Hanemann and Schrader (a solid soln. of C or cementite in α -Fe, on annealing, cementite sepg. out without vol. change, contg. 0–0.115% C; (2) that contg. 0.115–0.33% C (only II being detd., this increasing with the C content); (3) that contg. over 0.33% C; (4) γ -Fe. In the steels investigated, the decrease in hardness accompanying I is first noticeable at 140°, that accompanying II being indefinite. The C concerned in I goes over first into a form corresponding to the ϵ -phase, and on further annealing sepg. out as cementite. The shortening at 180° is a decomposition of the martensite phase, the C concn. of which is greater than 0.33%. The expansion at 220° is due to a conversion of austenite into an end-product corresponding to that of I. The explanation given by Hanemann and Traeger for the changes taking place during annealing, and the theory of Honda for the changes on quenching of steel, could not be confirmed.

J. BALOZIAN

The influence of phosphorus on the mechanical properties of metals. S. S. NEKRUT. *Messageur russe ind. métaux* 35-42(Sept., 1927); *Rev. métal* 26 (Extraits), 11-2 (1929).—Comparative tests on 2 sets of samples of malleable Fe having the same compn. (C 0.99, Si 0.47, Mn 0.17, S 0.12%) except for P content (0.14, 0.70%, resp.) showed that the Fe with higher P content had better mech. properties than the one with lower P content. N. considers that the prevailing idea that P is a harmful impurity is unfounded, and he is inclined to think that, within certain limits, P can improve the quality of Fe and steel. It is only on account of the lack of systematic investigations of the effects of P on Fe-C alloys that metallurgists must put up with the cost of dephosphorization instead of taking advantage of the qualities of P. A. PAPINEAU-COUTURE

The effect of tin on the nature, notably on the rolling characteristics, of Siemens-Martin ingot steel. W. KELLER. *Stahl u. Eisen* 49, 138-40(1929).—The effect of Sn on the quality of the Siemens-Martin steel is of importance, where scrap Fe is being used in the manuf. The following analytical method was developed to det. the Sn in steel samples. Dissolve 2-5 g. of borings in 70 cc. in 1:1 HCl, in a CO_2 atm., cool and titrate with 0.1 N I soln., using a starch soln. as indicator. For routine tests the values

so obtained are sufficiently accurate. If, however, greater accuracy is desired, ppt. Cu and Sn with H_2S , filter, ignite the residue, dissolve Cu with HCl , fuse the residue with MnO_2 , dissolve in HCl , reduce with purest Fe and titrate as above. Melts of mild and hard steel were prepd. with 0.2-2.2% Sn, analyzed, and tensile strength, elongation, welding qualities, and tendency to develop fissures during rolling were detd. Steel with 0.6-0.7% Sn could be rolled without the formation of fissures. It is in welding that Sn has the most undesirable effect. Cold bending tests gave satisfactory results up to a Sn content of 0.6%. The malleability was decreased, if the Sn was above 0.8%. No difference in the effect of Sn, on mild and hard steel, could be observed. It seems, that in general the injurious effect of Sn has been somewhat exaggerated.

J. A. SZILARD

The influence of nitrogen upon special steel and a method of surface hardening by means of nitrogen. SHUN'ICHI SATO. *Iron and Steel* 14, 683-93(1928).—S. gives the results of expts. of the influence of N on the hardness of the alloys of Fe contg. Al, Ti, Mn, that of various Cr steels, and that of special steels made by adding to a steel contg. 0.1-0.2% C and 1-2% Cr, various quantities of Al, Ti, Mn, Zr, Mo, W and U, and then of alloy steels contg. B, Mg, Cu and Ce. NH_3 gas was passed for 4.5 hrs. over the above samples heated to 580° or for 15 hrs. upon the samples heated at 560° and the Brinell hardness measured before and after the expt. The increase of C and Cr increases the hardness; Cr forms the nitride of Cr and gives very satisfactory results. In Cr-Al steels max. hardness is shown with a certain quantity of Al, while in Cr-Ti steel the hardness increases with the Ti content. The other steels mentioned increase the hardness to different degrees. Expts. with 5-15 hrs. heating in the atm. of NH_3 shows that for the first 5 hrs. the increase in the hardness is remarkable, but not considerable with longer hrs. of heating. By coating the electrodes used for elec. arc welding with Ni the N₂ content in the welded Fe is decreased. K. SOMEYA

Repeated stress, structure, and damping (of special steels). W. HEROLD. *Arch. Eisenhüttenw.* 2, 23-39(1928-9).—The structure of a pearlitic steel at the point of fracture by fatigue under repeated stress shows that the cementite has been forced toward the grain boundaries, while lamellar pearlite has been crushed and converted into granular pearlite giving the metal a very coarse-grained structure. In martensitic steels the hard η phase becomes crushed into small particles which are forced through the softer α phase toward the grain boundaries. In some austenitic steels after fracture by fatigue, cementite may be observed at the grain boundaries, although the presence of this constituent is not visible in the original structure; in other cases the fatigued metal has a nodular structure which cannot further be resolved. Generally, steels which have been hardened and tempered lose their capacity for damping (*i. e.*, for converting energy into heat by internal friction) after subjection to repeated stress sufficient to produce failure by fatigue. B. C. A.

Magnetic characteristics of tungsten steel. K. G. BRECHT, R. SCHERER AND H. HASSELMAN. *Stahl u. Eisen* 49, 41-2(1929).—The effect of heat treatment on the magnetic, mechanical and metallographic characteristics of W steel (0.67% C, 0.26% Si, 0.25% Mn, 0.01% P, 0.011% S, 0.40% Cr and 6.62% W) was investigated. Tests were carried out by annealing samples between 550° and 800° , in steps of 50° , for 2 hrs., followed by slow cooling in the furnace. With increasing temp. of annealing, the coercive force increases and in the same ratio, the martensite structure is gradually decomposed with the sepn. of cementite. The min. value of the coercive force was obtained at an annealing temp. of 750° , slightly below the A_{c3} point, which for this W steel was found to be at 765° . At 800° there is a small increase of the coercive force. The assumption is made that the austenite \rightarrow pearlite transformation, which normally is completed below the A_{c1} point, is being hindered by W. The best annealing temp. for shearing was 650° . In order to det. the best hardening temp. samples were heated between 780° and 920° , in 20° intervals, then quenched in water and oil. The best magnetic properties were obtained after quenching from 820° in water. The test pieces annealed at various temps. were all quenched from 820° in water. Plotting the coercive force as a function of the annealing temp., the curve so obtained shows that the former decreases with increasing annealing temp.; the min. value is at 750° , followed by a slight increase at 800° . The more the cementite is dissolved before hardening the better are the magnetic qualities of the steel. In general it is advisable so to regulate the temp. and time of the annealing and hardening, that the separation of cementite is suppressed as far as possible. Two carbides, the double carbide $4Fe_3C.WC$ of Honda (*cf. C. A.* 11, 2766; 12, 1753) and Fe_3W_2C of Hultgren (*cf. "A Metallographic Study on Tungsten Steels," C. A.* 16, 3462), were observed on the specimen etched with Nipicrate. The large double carbides are dark colored. The very hard WC is not at-

tacked by etching, and the crystals stand out of the surface of the specimen in relief, showing dark edges.

A process for obtaining a clear sulfur print. SOJI MAEDA. Japan Steel Works *Iron and Steel* 14, 705-8(1928).—M. examd. the Baumann method of obtaining a S print. Expts. made on samples of different S contents, with various concns. of H_2SO_4 , various kinds of dry films, degree of removal of the printing liquids, time required for printing, showed that the best conditions are obtained by polishing well, with "Peacock B" as printing paper, the paper being wiped lightly with flannel cloth after dipping it in 1% H_2SO_4 , and sticking the surface to be examd. on the printing paper for 3 mins.

J. A. SZILARD

Equilibrium diagram of the iron-vanadium system. SHÔKICHI OYA. Tohoku Imp. Univ. *J. Study of Metals* 5, 349-56(1928).—O. first studied the prepn. of metallic V by the thermite process. NH_4VO_3 was heated to 200-300° in a muffle furnace to obtain V_2O_5 , Na_2CO_3 being used as the flux. By reducing the quantity of metallic Al powder for reduction, replacing it by Na_2CO_3 and suitably adjusting the proportion of $\text{Na}_2\text{CO}_3 + \text{Al}$, metallic V of 98.5% purity was obtained. To avoid the difficulty of ignition caused by the addn. of Na_2CO_3 a mixt. of 40 parts of KClO_4 , 7 parts of BaO_2 and 10 parts of Al powder was used to start ignition. Next the changes in the solid phase of the Fe-V alloys were studied by means of thermal analysis, magnetic analysis and microscopic examn to det. the equil. diagram. The result agrees with that of Vogel and Tamman (cf. *C. A.* 2, 2367) in that the alloys of the system form a solid soln. for all ranges of compn. The A_1 point of Fe is rapidly lowered with the addn. of V, while the A_2 point rises rapidly to unite and form a loop at 2.5% V. The A_2 point of Fe at first rises gradually, becomes a max. at 15% V is lowered very slowly at about 20%, and with more V is lowered rapidly to room temp. at 35% V.

K. SOMEYA

Transformations of the β -phase in the copper-zinc system. P. SALDAR AND J. SCHMIDT. *Z. anorg. allgem. Chem.* 173, 273-86(1928).—The boundaries of the β phase in Cu-Zn alloys have been detd. by tempering at various temps. for 81 days followed by quenching and examn. of the microstructure. Below 600° no decomposition into $\alpha + \gamma$ was observed. Below 440° the limiting compn. of β is 55.01-51.39 at-% Cu in cast alloys and 54.63-49 at-% Cu in tempered alloys. At 480° the field of pure β in tempered alloys extends from 56.01 at-% Cu to 51.39 at-% Cu, above 480° the field broadens on both sides. In the temp. interval 440-480° a discontinuity occurs in the equil. diagram indicating the existence of two modifications of β , β_1 and β_2 , stable below 440°, and β , stable only above 480°. The discrepancies found by previous workers in the limiting compns. of the β -field are ascribed to insufficient time of annealing to obtain complete equil. being used in their work.

B. C. A.

Anomalies of annealing copper and brass after cold-hardening. F. EUGENE. *Rev. métal* 25, 685-706(1928); 26, 29-42(1929); cf. *C. A.* 23, 586. Micrographic examn. seems to show that the last particles of the cold-hardened phase disappear at A_2 and that the intercryst. tensions should disappear when the cold-hardened crystals have been sufficiently isolated from one another by the recrystn. products. The d. of Cu is appreciably affected by annealing: the differential d. curve of cold hardened and annealed Cu shows that the material undergoes a "reabsorption" at A_1 and A_2 , and the discontinuity in the mech. properties seems to follow from this "absorption." The tests with the Chevenard differential dilatometer indicate that the phenomenon of annealing is quite different in Cu and in brasses: with Cu the metal undergoes a contraction both in the direction of rolling and at right angles thereto; addn. of Zn results in a contraction of the metal at right angles to the direction of rolling and expansion in the direction of rolling, which increases with the Zn content. Accurate thermal analysis showed that the recrystn. of cold-hardened Cu and brasses takes place without absorption or evolution of heat, either at A_1 or A_2 or in the "germination zone" proper. This can apparently be explained by the fact that Cu and brasses have the same sp. heat in the annealed and cold-hardened states. The anomalies A_1 and A_2 resist a change of state and their intensity increases with the initial degree of cold-hardening, and they are more or less affected according to the temp. and time of annealing, thus apparently following the law of displacement of equil. This interpretation would facilitate the acceptance of the amorphous phase theory which has proved so fruitful in explaining the phenomenon of crystn.

A. PAPINEAU-COUTURE

The effect of aluminum on brasses. JAMES SILBERSTEIN. *Metal Ind.* (London) 34, 5-6(1929).—S. explains the behavior of Al in brasses and bronzes and indicates when its addn. is desirable and when undesirable. Al, in solid and in molten condition, is covered with a thin, tenacious film of oxide, a property imparted to brasses and bronzes in the molten state when Al is added to them. Traces of Al are detectable by observing

the appearance of the surface of ingots. The larger the rough areas in comparison to the smooth areas the smaller is the Al content. Al as small as 0.001–0.003% can be so detected. Al bronzes (contg. Zn) are well fitted for permanent mold castings, while Al improves the mech. properties of Cu-base alloys. The phys. properties of several alloys are given. Al causes segregation in leaded bronzes and bronzes. It is difficult to secure good metal from borings, drillings, floor spillings, and other scrap material contg. Al. Also, the alloys are likely to be porous. W. H. BOYNTON

Age-hardening of silver-copper-cadmium alloys. W. FRAENKEL AND L. NOWACK. *Z. Metallkunde* 20, 243(1928); cf. *C. A.* 22, 3874.—With up to 20% Cd, Ag does not harden on quenching from 700° to 800° and annealing at 280°. The addn. of Cd to Ag-Cu alloys considerably retards the age-hardening at 280° and reduces the max. hardness obtainable; thus, for the alloy with 8% Cu and 12% Cd, max. hardness is obtained only after 10 hrs. at 280°. B. C. A.

Destruction of single crystals of aluminum by rolling. T. SAKAO. *Mem. Coll. Sci. Kyōto Imp. Univ.* 11, 279–82(1928).—Single crystal sheets of Al were reduced 10% in thickness by rolling in small steps, and Laue patterns obtained after each pass. From the progressive distortion of the Laue spots it appears that a rotation of the crystal fragments takes place about an axis parallel to the direction of rolling, irrespective of the orientation of the original crystal. B. C. A.

Recrystallization of aluminum. K. TANAKA. *Mem. Coll. Sci. Kyōto Imp. Univ.* 11, 229–32(1928).—The orientations of 192 single crystals of Al were detd. and the crystals then extended 4–20% and annealed for 5 hrs. at 600°. No relation between the orientation of the grains formed on recrystn. and that of the original crystal could be found. B. C. A.

Investigations regarding the effects of remelting, rolling and annealing on aluminum. II. Influence of rolling and annealing. E. MAASS AND W. WIEDERHOLT. *Korrosion Metallschutz* 4, 272–7(1928).—Rolled and annealed aluminum were examd. for various properties (*C. A.* 23, 1094). Al annealed after rolling was found to be more resistant to acids. No appreciable difference was noticed in any of the other media. B. E. ROETHELI

New investigation of refinable aluminum alloys. W. FRAENKEL AND L. MARX. Frankfurt a. Main. *Z. Metallkunde* 21, 2–6(1929).—Five alloys having the following compn. were examd.: (A) — Al + 4% Cu; (B) — Al + 4% Cu + 0.5% Mg; (C) — Al + 8% Zn; (D) — Al + 8% Zn + 0.5% Mg; (E) — Al + 8% Zn + 0.2% Li. The alloys were heated to 500°, quenched in H₂O and hardened at room temp., 50°, 100° and 150°, with a special hardening also in boiling water for varying time intervals followed by aging at room temp. The course of the hardening was followed by Brinell hardness, tensile strength and elec. cond. measurements, and the results are as follows: Hardened at 100°, hardness of A rises from about 36 to about 78 in 80 hrs.; B rises from about 60 to 90 in 20 hrs. and to about 92 in 80 hrs.; C stays const. at about 26; D rises from about 36 to about 79 in 20 hrs. and to 85 in 80 hrs.; E rises from about 35 to about 44 in 80 hrs. Hardened at 150° A has a hardness of about 88, B 115, and E 44 in 80 hrs., while D rises sharply to 78 in 20 hrs. and then falls gradually to about 73 in 80 hrs. With hardening at 50°, sp. elec. cond. of C rises from 26.0 to 26.6 in 80 hrs., while for E it rises from about 23.4 to 23.6 in 80 hrs. At 100° A rises from 24.0 to 24.3, B from 21.8 to 22.2, C from 26.0 to 26.8, D from 24.9 to 25.2 and E from 22.8 to 24.2 in 80 hrs. Hardened at 150°, B rises from 22.4 to 23.8 and D from 25.0 to 27.0 in 80 hrs. With alloy B, the effect of the temp. of heat treatment upon tensile strength was studied. Heated at 450°, the tensile strength quenched was 22.4 kg. per sq. mm., and aged 7 days 32.3 kg./sq. mm. At 500°, tensile strength quenched was 26.2, aged 7 days 36.6; at 530° these values were 26.8 and 37.9 and at 560°, 20.8 and 26.5. H. STOERTZ

Aluminum-silicon alloys: their properties and some applications. I. Properties. R. B. DECLEVY. *Foundry Trade J.* 40, 29–32, 49–51; *Metal Ind.* (London) 34, 75–8, 103–6 (1929).—The effect of the modifying treatment on com. Al-Si alloys contg. from 9 to 14% Si and of varying Fe content is shown by photomicrographs and mech. properties. The various theories advanced to explain the mechanism of modification are discussed. The superior foundry properties of the alloy are attributed to the fact that it is an all-eutectic alloy. Mech. properties are given for the 12% Si modified alloy for both chill and sand cast bars. The Si alloy behaves very much like Al in corrosion tests. DOWNS SCHAAP

Duralumin, its properties and usefulness in airplane construction. GUNNAR STÅHL. *Tek. Föreningens Finland Förhandlingar* 49, 1–9(1929).—A general discussion. HANS C. DUUS

Corrosion of metals by industrial benzene. SRI FUJIO. Naval Fuel Store-house. *Bull. Naval Fuel Store-house Lab.* 2, 65-85(1928).—F. found by analysis that industrial C_6H_6 contained 0.14% of CS_2 and 0.10% of C_6H_5S . Samples of steel, Cu and Al were suspended in the benzene and were allowed to stand in a sealed bottle for 50 days, the change of the color of the soln. and the microscopic examn. of the degree of corrosion then being made; C_6H_6 contg. CS_2 corrodes most strongly; C_6H_6 contg. C_6H_5S not so strongly. Al and steel have a strong resistivity toward corrosion. No appreciable corrosion takes place with C_6H_6 completely freed from CS_2 , H_2O and CS_2 so that the corrosion of metals by industrial C_6H_6 is attributed to the presence of these compds. Expts. made with the mixt. of other S compds. with C_6H_6 show that the degree of corrosion of metals increases in the order of free S, mercaptan, $(C_2H_5)_2S$ and CS_2 . When H_2O is present or when the temp. is raised, the corrosion is accelerated. CS_2 and C_6H_5S cannot be removed by simple boiling in the presence of metallic Na. K. SOMEYA

Corrosion of steel in dilute acids. HIKOZÔ ENDO AND KIYOSHI NAKAWAGA. Tohoku Imp. Univ. *J. Study of Metals* 5, 301-13(1928).—The effects of various special elements and of heat treatment of steel upon corrosion were studied. The acids used were 5% H_2SO_4 , HCl and HNO_3 . The specimen was turned into a round rod 4 mm. diam., 20 mm long, and was dipped in 500 cc. of the above acids. First the effect of C content was examd. by using the sample made from normalized steels of 0 to 1.3% C. For examg. the influence of special elements, CO, Ni, Cr, Mn, Mo, V, W, Cu, Ti, P, Si and S were added to 0.3 and 0.6% C Swedish steel. The steel used contained 0.09% Si, 0.024% P, 0.08% Mn and 0.065% S as impurities. CO, Ni, Mo, V, P and a large quantity of Si increase the resistance to acid, while C, Mn and S decrease this resistance. Cr and Ti increase the resistance to corrosion, especially by HNO_3 . For examg. the influence of quenching and annealing of ordinary C steel, 0.5% and 0.9% C steels were selected, and after heating them to 900° for 45 hrs. they were quenched in H_2O at 0° . The various samples, one as quenched, and the others annealed after the above quenching at 100° , 200° , 250° , 300° , 350° , 400° , 450° , 500° , 550° , 600° and 700° for 1 hr., resp., were allowed to stand in 1% H_2SO_4 for 24, 48, 72 and 120 hrs. and the wt. decrease was detd. with each of the samples. The relation between the annealing temp. and the wt. decrease shows that up to 100° the curves for the two steels are almost identical, a slight decrease in corrosion being apparent. Beyond 100° , loss in wt. increases, reaching a max. at 400° ; the increase occurs in 2 steps. At 450° to 550° corrosion again rapidly decreases, practically no change occurring between 550° and 700° . These phenomena were explained on the basis of Honda's theory of quenching. K. SOMEYA

Corrosion of chemical lead. D. W. JONES. *J. Soc. Chem. Ind.* 47, 161-7T(1928).—Sb is regarded as a very injurious impurity, and Cu is one of the few metals which can practically be introduced into Pb with any hope of beneficial results. Chem. lead is examd. by immersion in either plain H_2SO_4 (d. 1.72) or nitrous vitriol (2.5% N_2O) of d. 1.72. The general behavior and loss in wt. are recorded. $PbSO_4$ has an important bearing on corrosion, and the method can give a value to this form of protection. Addn. of 0.027% Cu to Pb contg. 0.008% Bi has the effect of correcting a loss. In plain H_2SO_4 pure Pb can show a "protective coating value" of over 100%. A second immersion of pure Pb after cleaning and exposing a fresh surface had the effect of reducing corrosion losses, possibly due to a state of passivity, or a measure of passivity, having been brought about in the lead. When HNO_3 or HNO_2 is involved, a great decline is shown in the figure which represents the "protective coating value;" the average for all leads in plain acid was 70, whereas in nitrous vitriol it was only 3. Of the 4 leads which lost most by corrosion, 3 contained Cu, while the fourth, a pure lead, failed to pass the "flash" test. There was no evidence to prove that selective action had proceeded with respect to the soln. of Cu in any Pb. Over longer periods the "protective coating value" of coppered Pb in plain H_2SO_4 can exceed 100%, and this type of Pb resists plain H_2SO_4 at atm. temp. rather better than pure lead. The latter over long periods of immersion resists corrosion in nitrous vitriol to a greater degree than a coppered lead. A high standard of purity in Pb (99.99%) is essential—except for Cu, which is permitted in some cases to the max. extent of 0.05%. Casting previous to rolling sheet must be conducted so that no "cold setting" takes place, and there must be no excessive shrinkage in the cast block which would show cleavage of Pb crystals at those places which solidify last of all. Too much reliance is sometimes placed on the self-annealing characteristic of lead with the result that it may be subjected to excessive working. Rupture has been brought about by severely straining cold-worked lead. Aspects of corrosion related to users of chem. Pb are: (1) Pitting, which is attributed in some cases to a too liberal use of niter. (2) The necessity of properly supporting lead wherever

applied because under stress or strain with or without the aid of a corrosive agent intercryst. failure is induced. A grave danger lies in the introduction of Cu to mask a fault, and uniformity in the final product may be lacking. B. C. A.

Corrosion and residual current. I. The importance of residual currents in metal solution. F. TÖDT. *Z. Elektrochem.* 34, 586-91(1928); cf. *C. A.* 23, 588.—(I.) Various metallic couples were immersed in 0.1 N HCl and 0.1 N standard acetate solns. The current flowing was measured both when the soln. was quiescent and agitated. C. d. increased with agitation and the current fell off with time. C. d. varied with the area of the noble metal and was independent of the area of the anode. Introduction of air and O_2 or oxidizing agents increased the c. d. When distd. H_2O was used as the liquid medium the current did not change upon agitation. The loss in weight checked values calcd. from Faraday's law. Auto-soln. only took place in Zn-Pt couples. These facts show that the function of noble metals coupled to others is to provide a larger area for O depolarization rather than to a change in the e. m. f. of the cell. The currents developed are likened to residual currents except that the O_2 comes from the air rather than the anode and hence the current is independent of the e. m. f. The elements investigated were Cu, Pb, Pt, As, Cd and C. II. The importance of residual currents in metal deposition. *Ibid* 591-5.—Cd deposits on Pt were immersed in solns. and the e. m. f. was measured. Thin layers of Cd caused the Pt to exhibit the Cd potentials. After a time the Pt potential was again obtained. The Cd dissolved and the rate of reversion to Pt potential was dependent upon the time of deposition and the c. d. at which it was deposited. The deposition and soln. of the Cd are influenced primarily by the residual current. A layer of Cd melted on Pt on immersion gave a much more sudden reversion of potential to that of Pt. Voltages were measured by means of an especially constructed vacuum tube voltmeter. B. E. ROETHELI

Investigation on the corrosion of a galvanized iron hot-water cylinder. H. F. RICHARDS. *Iron and Steel Ind.* 2, 45-6(1928).—A galvanized-Fe hot-water cylinder failed by perforation after two years. The H_2O was high in CO_2 and $Ca(HCO_3)_2$ and contained Cl^- and NO_3^- . The presence of basic Zn carbonate in the corrosion products showed the Zn to be attacked by the hot H_2O . The tendency for Zn to go into soln. is augmented by the irregularity of the Zn-Fe alloy layers which causes the partial exposure of alloys having different potentials causing electrolytic corrosion. B. E. R.

The preparation of iron electrodes in corrosion experiments. W. VAN WÜLLEN-SCHOLTEN. *Korrosion u. Metallschutz* 4, 205-72(1928).—The potential of iron was found to change according to the preliminary treatment of the electrode. Coarsely and finely polished iron electrodes were connected in a NaCl soln. The finely polished metal became anodic, while washing the polished electrode in alc. caused the current to flow in the opposite direction. E. m. f. measurements were made on corroded Fe; on Fe with corrosion products removed by normal cleaning (H_2O + sand) and on the same after polishing with emery and after filing. The e. m. f. increased with treatment in the order named. The e. m. f. decreased with time upon allowing the electrodes to remain in air prior to immersion. The phenomena observed are attributed to one or more of three things: change in Fe potential, change in O_2 potential or changes in the ionization const. B. E. ROETHELI

Intercrystalline corrosion of nickel. W. KÖRNER. *Z. Metallkunde* 21, 19-21(1929).—Flexure tests of 1 mm. thick Ni plate heated in O_2 and in SO_2 show that brittleness is produced by absorption of S rather than O_2 . The no. of flexures to produce fracture in O_2 remains const. at about 17 up to 700° , and then only falls slightly, being still about 15 at 900° . In SO_2 , however, the no. of flexures to break falls from 17 to about 14 at 600° and then falls very rapidly, being about 10 at 700° and only about 1 at 800° . Identical specimens heated in N_2 and SO_2 showed marked difference in appearance, those in SO_2 being obviously very brittle. Microscopic action shows the attack to be intercryst., and diffusion into the inner part of the specimen to be slow. Heating at 1000° to 1100° in an inert atm. partly remedies the defects produced by S attack, the sulfide inclusions being driven away from the grain boundaries and distributed through the crystals. Heating in H_2S produces harmful attack more quickly than in SO_2 . The no. of flexures to fracture for a wire heated 1 hr. at 800° in scale, iron rust and other S-contg. materials shows the effect of S as follows. It falls from 33 with no S to 30 with a S content of 0.015%, to 14 with 0.41% S and to only 8 with 0.49% S. H. S.

Corrosion of metals in water distribution systems (SPELLER, CHAPPEL.) 14. Permeability to gases of SiO_2 bricks, mortar joints and masonry in the Siemens-Martin furnace (BANSSEN) 19. Changes in the specific gravity of Cu and Ag after heat treat-

ment (RUER, KUSCHMANN) 2. The automatic formation of a protective film from cold water in Fe pipes (TILLMANS, *et al.*) 14. Iron-containing rings of smaller effective permeability (RETZOW) 2. Aging phenomena in thermoelements (LÉNT, KOFLER) 1. Hartmann spiral bricks (TORNBLAD, MITCHELL) 19. "Blast stoves" and regenerators, etc. (Brit. pat. 295,075) 1. Slime classifier (Ger. pat. 470,734) 1. Apparatus for separating mineral materials (U. S. pat. 1,705,342) 1. Roasting ores, etc. (Brit. pat. 294,194) 20. Apparatus for heating molten type metal or other materials and treating them with gaseous or liquid hydrocarbons, etc. (Brit. pat. 294,697) 1. Sintering granular refractory material for hearths, heating rings or the like of metallurgical furnaces, etc. (U. S. pat. 1,704,902) 19. Refractory bricks (Brit. pat. 295,051) 19. Grinder for ores, etc. (Fr. pat. 645,385) 1. Determining ash in coal, etc. (Fr. pat. 645,665) 21. Apparatus for drying air by refrigeration (for use in blast furnaces, etc.) (Brit. pat. 294,354) 1. Apparatus for washing coal and other minerals (Fr. pat. 645,630) 1.

Apparatus (operating under suction or pressure) for sintering or roasting ores. COMPAGNIE DES METAUX OVERPELTLOMMELE. Brit. 294,197 and Brit. 294,198, July 20, 1927.

Grate for ore sintering apparatus. JOHN E. GREENAWALT. U. S. 1,704,681, March 5.

Briquetting ores. E. A. A. GRÖNWALL. Brit. 294,470, July 23, 1927. Ores such as those of Fe or Mn are briquetted with powdered granulated iron (which may be prepd. by pouring molten iron into water while stirring and afterward crushing), powdered C and water, with or without addn. of an acid or salt or a slag-forming ingredient such as lime or CaCO_3 . For producing alloy steels the briquets may also contain ferro-Si, ferro-Cr, ferro-Ni, ferro-V, etc.

Purifying solutions resulting from leaching ores. ARCHER E. WHEELER. U. S. 1,703,435, Feb. 26. A soln. such as that formed from Cu ore and H_2SO_4 contg. pptd. impurities such as those contg. Fe and Al is treated with ore particles slightly larger than the particles of the pptd. impurities and the coarser ore particles are then sep'd from the assoc. pptd. impurities and are further treated, *e. g.*, for Cu recovery.

Leaching copper ores. MINERALS SEPARATION, LTD. Brit. 294,921, April 1, 1927. Ores such as oxidized Cu ores which have been treated by processes such as those described in Brit. 185,242 (C. A. 17, 53), Brit. 190,246 (C. A. 17, 2860), Brit. 233,029 (C. A. 20, 574) and Brit. 237,964 (C. A. 20, 1781) are treated to sep. the slimes, either before or after heat-treatment, the slimes are conc'd. by flotation and the flotation concentrates are leached either separately or together with the coarser material. In the flotation operation reducing gases such as producer gas may be used instead of air.

Treating ores containing copper or lead in oxidized form. FERDINAND DIETZSCH. U. S. 1,703,763, Feb. 26. Ores such as oxidized Cu ores are treated with SO_2 and water and an aq. thiosulfate soln.

Copper from ores. ANGLO AMERICAN CORP. OF SOUTH AFRICA, LTD. Brit. 294,868, Dec. 7, 1927. Cu is extd. from ores with an ammoniacal solvent such as a soln. of $(\text{NH}_4)_2\text{CO}_3$ in an app. of compact form without exposure of the solvent soln. or undue diln. of the soln. Numerous details of procedure are given.

Treating tin ores, etc. F. L. WILDER, E. MORRIS, E. SCHIFF and R. S. KING. Brit. 294,703, Feb. 6, 1928. Sn-bearing materials such as ores or slimes, preferably after drying and preheating, are heated to about 200–300° in S vapor or a sulfuretted gas. The solid products or residues are passed into an alk. polysulfide soln. and the dissolved Sn is recovered by electrolysis; any Sn sulfide volatilized with excess S vapor is condensed in an alkali soln. (preferably $(\text{NH}_4)_2\text{CO}_3$) and the sludge thus obtained is washed free from carbonate and treated with a polysulfide soln. An app. and various details of procedure are described.

Treating zinc-bearing ores or like materials. CONRAD MATZEL (to Fried. Krupp Gusenwerk. A.-G.). U. S. 1,705,128, March 12. The material mixed with C is subjected to a retort distn. until the Zn content of the charge is reduced to 10–20%, and the C-contg. residue is then subjected to a continuous volatilizing treatment in a heated rotary furnace in which (during the continued rolling over of the charge) the Zn is reduced within the layer of material and driven out as vapor and then oxidized by the oxidizing atn. maintained in the furnace and the ZnO is recovered. An arrangement of app. is described.

Distilling zinc. NEW JERSEY ZINC CO. Brit. 295,115, July 8, 1927. See Fr. 385,619 (C. A. 23, 368).

Distilling zinc in a vertical muffle furnace. A. ROITZHEIM and W. REMY. Brit. 294,127, April 6, 1927. In the operation of an externally and internally heated vertical muffle, any ZnO formed is sepd. from the Zn vapors before the latter are condensed (suitably by condensation of the oxide in a mass of coke). The app. used is described.

Precious metals from sea water. H. BARDT. Brit. 294,655, July 29, 1927. For the purpose of recovery of precious metals such as Au and Ag and halogens such as Br and I, sea water is treated, successively or simultaneously, with reducing agents such as SO_2 or sulfite lye, and a mixt. of activated C with metal powder such as Cu, Al, Fe or Zn.

Apparatus for separating gold from a pulp comprising gold-bearing sand and water. GEORGE KETTLE. U. S. 1,704,746, March 12. The pulp is agitated in contact with the bottom of a box formed of or covered with rough bark. Various structural features are described.

Apparatus for concentrating gold ore, etc. JOSEPH STEPHAN. U. S. 1,704,265, March 5.

Device for agitating molten babbitt metal, etc. SALEM SMITH (to Federal Mogul Corp.). U. S. 1,703,966, March 5.

Granulating molten slags or converting them into porous products with water or air. P. OHRT (to T. Giller). Brit. 294,175, July 19, 1927. Mech. features. An app. is described.

Smelting manganese. ANSON G. BETTS. U. S. 1,703,657, Feb. 26. An ore or similar material contg. Mn and silica is smelted with the addn. of a sulfide such as iron pyrite to produce fused Mn sulfide, fused metallic Fe and fused siliceous slag; the Mn sulfide is converted to Mn oxide and the latter is reduced to Mn.

Dephosphorizing iron in the converter. P. RIES and F. BICHEROUX. Belg. 30,809, May 31, 1928. Powdered CaO is injected continuously during the decarburization period. The CaO may be introduced either toward the middle of the converter by means of a compressed inert gas, or else at the bottom with the air blast.

Reducing metals such as copper and nickel from their oxides or other compounds. VACUUM-SCHMELZE GES., H. GRUBER, W. ROHN and O. H. WEBER. Brit. 294,795, Sept. 22, 1927. Compds., such as oxides and sulfides, which are capable of being dissociated at elevated temps. are subjected, in a solid or fused condition, to a vacuum exceeding the dissociation tension corresponding to the temp. of the compds. until dissocn. into solid or molten metal and volatile metalloids is completed. Molybdic acid contained in tungstic acid can be removed at a temp. of redness prior to dissocn. of the tungstic acid to produce W free from Mo. Various details and examples of the process are given.

Metals free from carbon. THE INTERNATIONAL NICKEL CO. Fr. 645,406, Dec. 8, 1927. Molten metal such as Ni is given an oxidizing treatment to remove C and the gases formed, and then to a reducing treatment with a substance which does not form gas, e. g., Si or Mg.

Casting iron. R. MAYER and L. MAYER. Belg. 349,546, May 31, 1928. The mold is provided with a vent-hole at the bottom so that the first portion of metal poured does not stay in the mold and carries off any dirt present. Sand cores are replaced by solid or hollow metal cores, coated so that they may be withdrawn from the casting. The hardness of the casting may be varied by varying the thickness of the core.

Casting magnesium and its alloys. JOHN A. GANN and JOHN E. HOY (to Dow

Chemical Co.). U. S. 1,704,384, March 5. An app. is specified comprising separable mold parts, one of which is provided with a chamber in which a nonoxidizing gas may be generated (suitably by combustion of S) in a chamber which is sealed off by the other mold part except for a vent into the mold cavity.

Metal-casting plant. FELIX MÜLLER. Ger. 470,863, July 11, 1925. Plan is described for the continuous manuf. of metal castings of various forms with the use of a no. of corresponding molding boards serially arranged, a single sand-distributor and a single press.

Apparatus for melting and casting metals and for preparing the molds so used. W. A. LOTH. Brit. 294,239, July 21, 1927.

Mold for casting metals. L. E. INGENBLEEK. Belg. 348,247, Feb. 29, 1928. The mold is made of asbestos, or of a material having an asbestos base; or it is lined with asbestos sheet or with asbestos-base pulp.

Molds for die-casting from metal, gypsum, etc., coated with iron. KUNO WELSCHER. Ger. 470,862, Feb. 26, 1926.

Ingot mold. HERAEUS-VACUUMSCHMELZE A.-G. Ger. 471,044, Dec. 10, 1927. Addn. to 442,446.

Ingot mold. DAVID J. GILES (to Latrobe Electric Steel Co.). U. S. 1,703,442, Feb. 26. Molds for casting steel ingots are formed of a cast-iron alloy containing 0.25-3.00% (the remainder of the alloy being principally cast iron).

Header for ingot molds. ANDREW FORREST (to Interstate Iron and Steel Co.). U. S. 1,703,523, Feb. 26. Structural features.

Steel ingots. D. WILLIAMS. Brit. 294,440, Jan. 18, 1928. Steel which evolves considerable gas when cast into ingots is improved by adding a small quantity of fluor-spar or the like to the metal, in the ladle or in the mold. Use of baking powder, chrome ore, roll scale and NaCl is also mentioned.

Conveyor band for castings and used sand. VEREINIGTE SCHMIRGEL- UND MASCHINEN-FAB. A.-G. VORM S. OPPENHEIM & CO. UND SCHLESINGER & CO. Ger. 470,957, Mar. 3, 1928.

Apparatus for blending molding sand for foundry use. GEORGE F. ROYER. U. S. 1,703,956, March 5.

Apparatus for regenerating foundry sand. WILLARD J. BELL. Fr. 645,053, Dec. 2, 1927.

Furnaces. SIDNEY E. MAJOR and EMRYS F. BAKER. Australia 12,464, Mar. 23, 1928. In a metal-melting furnace a lower or flame chamber is provided with a tangential flame inlet and the crucible is so placed in the chamber that the width of the space between the wall and the crucible gradually diminishes from the inlet.

Construction of furnace walls, especially metallurgical furnace walls. ÉTABLISSEMENTS F. LABESSE. Ger. 470,811, June 26, 1925.

Metallurgical cupola furnace with a movable inclined bottom. DANIEL CUSHING. U. S. 1,703,337, Feb. 26.

Cupola furnace construction. FREIER GRUNDER EISEN- UND METALLWERKE GKS. Brit. 294,234, July 21, 1927. Slag and metal are discharged through a single aperture into an open separator from which the 2 substances are continuously discharged at different levels.

Ore-roasting furnace. ANTON APOLD and HANS FLEISSNER. Fr. 645,212, Dec. 6, 1927.

Furnace suitable for calcining and reducing ores. EDWIN B. THORNHILL (to Thornhill-Anderson Co.). U. S. 1,705,039, March 12.

Shaft type furnace for reducing ores of zinc or other metals. THADDEUS F. BAILY. U. S. 1,704,029, March 5. A reaction chamber is surrounded by a combustion chamber and an aerating pump is provided for feeding materials such as air carrying ore in suspension to the reaction chamber; gaseous products are removed from the latter and are conducted to the combustion chamber.

Blast-furnaces. BROKEN HILL PROPRIETARY CO., LTD. Fr. 645,473, Dec. 9, 1927. Constructional details.

Blast furnace construction. JAMES P. DOVEL. U. S. 1,703,517, Feb. 26. U. S. 1,703,518-9-20 also specifies various details of blast-furnace construction.

Distributor for blast furnaces. HARRY L. WEATHERS (to Freyn Engineering Co.). U. S. 1,704,715, March 12.

Furnace for melting or agglomerating finely divided materials such as blast-furnace dust. A. DAWANS. Brit. 294,639, July 29, 1927.

Induction furnace. HERAEUS-VACUUMSCHMELZE A.-G. and WILHELM ROHN.

U. S. 1,703,859, Feb. 28, 1925. In an induction furnace for melting metals and alloys, the receptacle for the metal is made of a Cr-Fe alloy rich in Cr.

Furnace for heating metal blanks. SVEN T. NELSON (to Sullivan Machinery Co.). U. S. 1,703,776, Feb. 26.

Furnace for heating packs of metal sheets. LEIF LEE. U. S. 1,703,676, Feb. 26. Structural features.

Continuous furnace for heating and "normalizing" thin sheets of metal. FORREST MANKER (to Surface Combustion Co.). U. S. 1,703,943, March 5.

Furnace for annealing or heat treating wire or similar materials. FRANK T. COPE (to Electric Furnace Co.). U. S. 1,704,036, March 5. The wire is passed through a vertically sealed tube and fluid conductors such as baths of lead are provided for passing elec. current through the wire and tube.

Liquid seals for annealing furnaces for wire, etc. FRITZ GIESECKE. Ger. 470,939, pr. 15, 1927.

Furnace practice. FIRMA CARL STILL. Ger. 469,426, Dec. 21, 1923. The thermal capacity of air for furnaces, particularly of the blast of blast furnaces, is improved by suitable addns., e. g., of CO₂ or hydrocarbons.

Process and apparatus for iron manufacture. SOCIÉTÉ ANONYME D'OUGRÉE-JARHAYE. Belg. 347,746, Feb. 28, 1928. A fluid or finely pulverized solid is introduced into the blast furnace at a point approx. $\frac{1}{4}$ of the total height above the tuyères. Solid material is introduced by means of a mixt. of compressed hot and cold air.

Malleable iron. NATIONAL MALLEABLE AND STEEL CASTINGS CO. Fr. 645,859, Dec. 17, 1927. See Brit. 282,671 (C. A. 22, 3622).

Malleable iron having a black fracture. C. E. KLUIJTMANS. Belg. 348,616, March 31, 1928. In order to maintain the compn. const., progressive doses of Fe-Si and Fe-Mn are used according to the diam. and the temp. of the lining of the cupola during melting. A small quantity of fresh ore is added during annealing to reduce the C content. The time of annealing is reduced as the Si content increases.

Spongy iron. HÖGANÄS-BILLESOLMS AKTIEBOLAG. Fr. 645,328, Dec. 7, 1927. Spongy Fe is prepd. by adding lime or MgO and C, the latter in excess of the quantity required for reduction, to the ore and reducing in the absence of air at a temp. below fusion and finally cooling the mass; this cooling may be accelerated.

Heat treatment and working of iron and steel. VEREINIGTE STAHLWERKE A.-G. Brit. 294,216, July 21, 1927. Iron or steel contg. at least 0.1% of Al or Si, Mn, Ti, Mg, Zr or a similarly acting metal or one of these metals in addn. to Al is worked at temps. below the A3 or the Al point and then annealed at above the A3 point. Examples are given, and the metal may also contain Cu, Cr, Mo or like metals.

Iron and steel. VEREINIGTE STAHLWERKE A.-G. Brit. 295,022, Aug. 6, 1927. By suitable compn. of the charge used and highly accelerated melting the metal-forming bath is kept as low in O as possible during the smelting and is purified in several stages by different purifying media. The smelting may be effected in a basic hearth furnace and the charge may be formed of iron as low as possible in O such as iron or iron shavings free from rust and the purifying materials may be Mn, Si, Ti (successively added in the order mentioned). The metal thus produced may be rendered, by suitable working and heat treatment, non-sensitive to cold brittleness, etc.

Steel. ROBERT A. HADFIELD. U. S. 1,704,385, March 5. See Brit. 273,855 (C. A. 22, 1946).

Lathe tools made of tungsten containing over three per cent carbon. O. DIENER. Brit. 294,086, Feb. 15, 1928. B up to 0.2%, Si up to 1.5% (or both B and Si in any proportion up to 1.5%) may be present and the material may be prepd. from W powder contg. the desired C, under high temp. and pressure.

Treating materials comprising tin, lead, copper and antimony in a shaft furnace. HETTENWERK NIEDERSCHÖNWEIDE A.-G. Brit. 294,487, July 21, 1927. A deep layer of the material is smelted in a shaft furnace heated from above, so that there is obtained at the bottom first an alloy consisting mainly of Sn and Pb with small proportions of Cu and Sb. The temp. may then be raised to obtain an intermediate alloy which is subsequently added to a fresh charge, and the residue is finally drawn off at a still higher temp.

Pulverizing metals. EMIL PODSZUS (to Hartstoff Metall A.-G. (Hametag)) U. S. 1,703,634, Feb. 26. In pulverizing Cu, Al, Sn or other metals in the dry state, the metal particles are caused repeatedly to impinge upon each other by the action of opposed fluid currents such as gas eddies continually circulating within an enclosed space and about 2% of a fatty substance such as olive oil or stearin or paraffin is added to the metal particles to coat them with a thin film and maintain them in dry condition.

Heating and rolling metal sheets. JOHN B. TYRUS (to American Rolling Mill Co.). U. S. 1,704,640, March 5. Mech. features. An arrangement of app. is described.

Apparatus for quenching metals after heat treatment. EDWARD F. KENNEY and LOUIS H. WINKLER (to Bethlehem Steel Co.). U. S. 1,704,327, March 5.

Torch (with a plurality of heating and chilling nozzles) for use in "torch hardening" the surfaces of metal articles. G. H. FLETCHER, C. L. SUMPTER and METROPOLITAN-VICKERS ELECTRICAL Co., LTD. Brit. 294,709, May 3, 1927. Structural features.

"Antifatigue alloy." VICTOR N. HYBINETTE (to Hybinette Patents Corp.). U. S. 1,704,251, March 5. An alloy comprises at least 95% Al, metals of the Cr group less than 1%, Ni less than 2% and less than 0.5% each of Cu, Mg and Si; the alloy is quenched at about 480° and aged at 90-205°.

Heat-resisting alloy of aluminum and chromium. FRANK A. FAHRENWALD. U. S. 1,704,733, March 12. An alloy which is suitable for use in making crucibles or elec. resistors comprises Al 3-20 and Cr 97-80%.

Heat-resistant alloys containing chromium, nickel and iron. NOAK V. HYBINETTE. U. S. 1,704,087, March 5. Cr 10-15, Ni 30-35 and Fe 50-60% are smelted together in an open-hearth reverberatory furnace, and the C content of the alloy is regulated so that it is about 0.50-0.75% in the finished product. Alloys thus prepd. are suitable for making malleablizing boxes or other app. used at high temps.

Aluminum alloy. PIERRE BERTHELEMY and HENRY DE MONTBY. Fr. 33,500, Jan. 20, 1927. A light highly resistant alloy of Al is made by melting Cu 42, Mn 2, Fe-Si 5.35, W 1 g., adding Al 9.65 and incorporating the whole in Al 840 g. with stirring and finally adding an alloy contg. Al 58, Mg 20, Cd 22 g.

Aluminum alloy resistant to corrosion. VICTOR N. HYBINETTE (to Hybinette Patents Corp.). U. S. 1,704,252, March 5. An alloy which is suitable for plumbing fixtures or ship propellers contains Al together with less than 2% Ni, less than 1% of metals of the Cr groups and between 0.2% and 0.5% each of Cu and Mg, and is quenched at about 480° and aged at 90-205°. Cf. C. A. 23, 1104.

Highly plastic strong aluminum alloy. VICTOR N. HYBINETTE (to Hybinette Patents Corp.). U. S. 1,704,253, March 5. In making an alloy which is suitable for rivets, piston rods, sheets, etc., Al is first alloyed with less than 2.5% of heavy metals such as Ni, Cr, W, Mo, Mn, Fe and Zn and less than 0.5% Cu and 0.5% Mg to make the resulting alloy only slightly responsive to heat treatment, and the strength and plasticity are developed by working the metal after it is quenched and before it is fully aged, in intermittent periods of aging and working.

Copper-nickel-tin alloys. A. B. DAVIS (to Barber Asphalt Co.). Brit. 204,233, July 21, 1927. Alloys are described which contain Cu 80-90, Ni 2-10 and Sn 1-8% and which are modified by the addn. of one or more of the elements Si, Cr Sb and Mn (usually within the proportions of Cr 0.1-3.0, Sb 0.5-3.0 and Mn 0.2-5.0% and Si sufficient to give substantial satn.)

Lead alloy. JOHN V. O. PALM (to Cleveland Graphite Bronze Co.). U. S. 1,704,208, March 5. An alloy which is suitable for bearings comprises Pb 82, Sn 9, Sb 4, Zn 3, Cu 1.5 and Al 0.5%.

Lead alloys. LE MATÉRIEL TÉLÉPHONIQUE (SOC. ANON.). Fr. 645,745, Dec. 15, 1927. A small % of Cu is added to an alloy of Pb and Sb used for making tubes for elec. cables. An example contains Pb 98.92, Sb 1, and Cu 0.08%, the Cu being alloyed with the Sb before addn. to the Pb.

Tungsten alloy. HEINRICH FALKENBERG. U. S. 1,703,577, Feb. 26. Metallic W is melted with approx. an equal quantity of an alloy of Pb and Sb in the presence of small quantities of Fe, the mixt. is dild. by the addn. of further quantities of Pb-Sb alloy and the resulting mixt. is fused with a mixt. of metals contg. Pb and a metal such as Sn, Sb and Cu of higher m. p. than Pb. The resulting alloy is suitable for bearings or ammunition.

Separating copper from nickel. ISRAEL W. WILENCHIK. U. S. 1,703,329, Feb. 26. An alloy contg. Cu and Ni is melted together with a mixt. of S, Na₂SO₄, CaSO₄ and coke and the molten mass is poured into a settler so that on cooling the sulfides of Cu and Ni sep. by gravity and may be sepd. and converted successively into oxides and metals.

"Antifriction metal." ROBERT J. SHOEMAKER (to S. & T. Metal Co.). U. S. 1,703,212, Feb. 26. An alloy suitable for bearings, bushings, etc., comprises Pb together with Sn 1-5, Ca 0.1-1.0, Mg 0.02-0.3 and Al 0.02-0.1%.

Refractory metals such as uranium and thorium. JOHN W. MARDEN, THOM

P. THOMAS and JOHN E. CONLEY (to Westinghouse Lamp Co.). U. S. 1,704,257, March 5. In order to obtain metals such as U or Th from their difficultly reducible oxides, the latter are heated to a reacting temp. with Ca or other alk. earth metal and an alk. earth metal halide such as CaCl_2 .

Apparatus for mixing the ingredients of type metal. B. D. WARNE and S. CALVER. Brit. 294,276, April 21, 1927.

Material for marine cables. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 294,464, July 23, 1927. A marine telephone cable with coil loading is made with nonmagnetic armoring over the coil pieces. A metal may be used comprising Fe 75-85, Ni 9-15, Cr 3-5 and Mn 3-5%.

Telephone-cable armor. ERNST BRANDUS. U. S. 1,705,057, March 12. In order to form a telephone-cable armor capable of excluding magnetic stray fields from the cable strands, Pb alloy for the cable is finely comminuted and intimately intermixed with finely comminuted Fe particles and the mixt. is molded under high pressure in forming the cable. An app. is described.

Resistor grids. VERA B. BROWNE. U. S. 1,703,707, Feb. 26. Resistor grids are formed of strip material composed of an Fe-Cr-Al alloy which is heated to above 37° but below hot working temp. and then bent and coiled into the form desired for the grid.

Composite material suitable for safe and vault walls. JOSEPH G. DONALDSON and HENRY L. COLES (to Guardian Metals Co.). U. S. 1,703,661, Feb. 26. A core of material such as ZrO_2 , Zr silicate and graphite which is refractory and highly resistant to drilling and to local high heat is surrounded by a metal of higher heat conductivity such as steel, a portion of which impregnates the core to greater than a weld depth and is chemically combined with at least one of the constituents of the core. U. S. 1,703,662 specifies mixing ZrO_2 and SiO_2 , adding graphite in greater quantity than is absorbed by the mixt., heating the mixt. to fusion, cooling, preheating, and pouring molten metal such as steel around the preheated material so that the metal unites with it.

Composite metal walls for safes and vaults. JOSEPH G. DONALDSON (to Guardian Metals Co.) U. S. 1,703,416, Feb. 26. A casing of metal such as Mn steel contains a core of substances such as Zr or its compds or mixts. which are poor conductors of heat when cold but become good conductors when locally highly heated.

Composite safe and vault walls. JOSEPH G. DONALDSON (to Guardian Metals Co.) U. S. 1,703,417, Feb. 26. A core comprising Zr oxide together with Zr silicate and graphite is fused, cooled and heat treated and then surrounded while hot by a casing of metal such as iron which is applied while molten.

Composite laminated metal stock of gold and platinum layers suitable for jewelry. FRANK B. FRY (to H. A. Wilson Co.) U. S. 1,704,126, March 5.

Making metal tubes by extrusion of pierced metal blanks. F. SINGER. Brit. 291,198, March 24, 1927. Mech. features. An app. is described.

Cutlery of rust-proof metal. G. HAMMESFAHR (trading as the firm of G. Hammesfahr). Brit. 294,573, July 26, 1927. Articles such as knives and scissors are forged and ground to shape, then hardened in a salt bath furnace, and polished.

Preserving metals. THE GOODYEAR TIRE & RUBBER CO. Fr. 644,988, Dec. 1, 1927. The corrosive action of acids on Fe and steel is prevented by treating the metal with an acid soln. contg. the product of reaction of an aldehyde with H_2S or an alkali metal sulfide. Suitable substances include methylene mercaptan, thiodimethylene mercaptan, dithiotrimethylenemercaptan, methylene bisulfide and trithioaldehyde.

Protecting metals. SOC. ANON. DES HAUTS FOURNEAUX ET FONDERIES DE PONT-A-MOUSSON. Fr. 645,095, Dec. 3, 1927. Fe metals are protected against corrosion and rust by submitting them to the action of a warm soln. of carbolic acid or phenols to form a very adherent and resistant corrosion film. Strong acids or their ferrous salts may be added, and the soln. may be used as an electrolyte; the metal to be treated forms the anode and Fe or other metal the cathode.

Coating metals with lead. OSKAR SPENGLER. Ger. 470,904, Apr. 2, 1925. The base metal is smeared with a soln. of a halogenide of Zn contg. a small amt. of a halogenide of Sn, and heated to the m. p. of Pb; molten Pb is then poured over it.

Device for protecting the interior of iron and steel pipes from corrosion. RONALD V. MILLS (to Peter Q. Nyce). U. S. 1,705,197, March 12. A removable coupling located intermediate adjacent lengths of the pipe is formed with an outer steel shell and an interior casting of Zn, of substantial thickness, the steel shell being of about the same thickness as the pipe and the interior diam. of the coupling being about the same as that of the pipe.

Surfaces of aluminum. SPRENGER CORP. M. B. H. Fr. 645,341, Dec. 7, 1927. The surface of Al or its alloys is protected against the action of air and moisture by a treatment with HNO_3 . An iridescent surface may be obtained by adding salts of Cr, Cu, Co, Ni or Zn to the bath. The above treatment also facilitates the plating of Al with Ni, Cu or Co, or a coating of resin, celluloid, varnish, etc., may be applied to the treated surface.

Branning apparatus for cleaning tin plate. SAMUEL E. DIESCHER (to S. Diescher & Sons). U. S. 1,705,177, March 12.

Cleaning and annealing metals. NOAK V. HYBINETTE. U. S. 1,704,086, March 5. Ni or its alloys, metals contg. Cr and the like are freed from oxide by the action of a molten slag capable of dissolving the oxide and which contains boric acid together with other ingredients such as soda, Na_2SO_4 and Na silicate which give a slag which is elastic while hot but brittle when cold. This treatment may serve for simultaneous deoxidation and annealing.

Annealing sheet steel. HARRY M. NAUGLE and ARTHUR J. TOWNSEND (to Columbia Steel Co.). U. S. 1,704,015, March 5. The steel is uniformly and quickly heated to annealing temp., maintained at this temp. only until the microstructure of the steel is corrected, and then quickly cooled to avoid grain growth.

Annealing sheet steel. PAUL A. MEEHAN (to American Dressler Tunnel Kolls, Inc.). U. S. 1,703,630, Feb. 26. In annealing in layers, diatomaceous earth is placed between each pair of sheets.

Welding steel rail joints. CURT STEDEFELD. U. S. 1,704,410, March 5. See Brit. 273,326 (C. A. 22, 1948).

Solder. WILHELM REUSS. Fr. 645,549, Dec. 10, 1927. See U. S. 1,675,664 (C. A. 22, 3129).

Applying solder. JOHN KARMAZIN. U. S. 1,704,539, March 5. Joints of automobile radiators or other materials to be soldered are covered with a suspension of soldering flux such as ZnCl_2 and pulverized solder, and, after removal from the suspension, heated to melt the solder.

Soldering salt. A. GILLESSEN and A. CUGINI. Belg. 348,710, March 31, 1928. The salt consists of NH_4Cl and ZnCl_2 prep'd. by dissolving Zn in HCl to neutrality, adding a wt. of NH_4Cl equal to that of the Zn, and crystg. the mixed salt.

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

Theory of the meso-structure of organic compounds. I. KOTČKOV. *Bull. Siberian Inst. Tech.* 48, No. 1, 35 pp. (1927).—The strength of linkings is considered to change quite gradually in the series CH_4 , C_2H_2 , C_2H_4 , C_2H_6 , the stronger the affinity claim of one C atom for others, the smaller is the affinity remaining for the neighboring H atom. If the C-H linking is weak, the H possesses a residual affinity called "meso valency." The view is applied to the explanation of *cis-trans*-isomerism, ease of hydrolysis, polymorphism, etc.

Thermal decomposition of methane. TOKISHIGE KUSAMA and UNO YUKIO. *Bull. Inst. Phys. Chem. Research* 8, 1-11 (1929); *Abstracts* 2, 1.—Methane has been pyrolyzed on several catalyzers: (a) pure Ni, (b) Ni + Kieselguhr, (c) same as (b) but deprived of its activity by being used to reduce C_2H_4 , and (d) reduced Fe; (b) and (c) are equally suitable. X-ray spectrograms show that C thus obtained is graphite, which was also proved by the graphitic acid method. This graphite has catalytic properties which are due to the presence of small amounts of Ni from the catalyzer. By detg. the S content of the catalyzer before and after a run, it was ascertained that natural gas contains a certain quantity of S, but only a negligible amount. HCl is better than HNO_3 to recover the catalyst, and a new catalyzer produced by the reduction of NiCl_2 is as active as one obtained from $\text{Ni}(\text{NO}_3)_2$. H obtained by the pyrolysis of CH_4 always contained some CH_4 , that could not be removed, but the mixt. can be used very satisfactorily to reduce C_2H_4 .
ALBERT L. HENNE

Slow combustion of triacontane. LANDA STANISLAS. *Compt. rend.* 187, 948-9 (1928).—Slow combustion of triacontane yields aliphatic acids (formic, butyric and valeric), aldehydes (hex- and heptaldehyde), small amounts of unsat'd. hydrocarbons and C oxides, but no alcs. nor ketones. This agrees with the theory that the last named products arise only from branched-chain hydrocarbons.

Production of gaseous, liquid, and solid hydrocarbons from methane. I. Thermal

Composition of methane. H. M. STANLEY AND A. W. NASH. *J. Soc. Chem. Ind.* 48, T(1929).—The use of comparatively long heating periods causes CH_4 to decomp. C and H, the decompn. being increased by the use of large heating surfaces and by catalysts such as Fe and Ni, but not affected appreciably by porcelain, silica, or beryllia. Short heating periods (as low as 0.4 sec.) at 1000–1200° result in numerous products, among which were identified C_2H_2 , C_2H_4 , C_2H_6 , a higher olefin, C_4H_6 , and higher aromatic hydrocarbons, the formation of C and H being almost negligible. % conversion of CH_4 into higher hydrocarbons increases rapidly with increasing rate and rapidly reaches a max. at a given temp. A further increase in rate results first in a rapid, and later a more gradual, decline in yield of higher hydrocarbons. Increase in temp. increases the optimum velocity for max. yield. The ratio of C_2H_2 to C_2H_4 increases with the gas velocity, attaining a sharp max., and then declining rapidly. The accumulation of C in the reaction tube lowers the yields of higher compds. The presence of steam does not influence the course of the reaction. At 1150°, gas flow of 13.8 ls./hr., using 12 cm. silica tube (5 mm. bore), corresponding to a heating period of 0.6 sec., the yield of light oil and tar based on the CH_4 used was 11.0%, C_2H_2 and C_2H_4 8.8%, H(C) 6%. The theories of the mechanism of the formation of the higher hydrocarbons from CH_4 are discussed.

FREDERICK C. HAHN

The action of atomic hydrogen on hydrocarbons. H. V. WARTENBERG AND G. MÜLTZE. *Techn. Hochschule, Danzig. Z. physik. Chem., Abt. B* 2, 1–9(1929).—attempting to measure the heat of reaction when atomic H reacts with inorg. substances, i. e., Cl, it was found that the H attacked the reaction product of the primary action. The latter reaction was not expected to occur with hydrocarbons. The hydrocarbons and the atomic H were mixed in a U-tube in a Dewar flask which served as a calorimeter. The reaction products were frozen out for analysis at –189° to –193°. Of the hydrocarbons studied, only C_2H_4 was hydrogenated. Besides C_2H_6 , C_2H_2 , H_2 , and unchanged C_2H_4 were the reaction products. Four expts. give the following values for the reaction $\text{H} + \text{H} = \text{H}_2$; 2.4×10^5 cal, 1.7, 5.3 and 4.9. The value found by other methods of measurement is 1×10^5 . C_2H_2 and C_2H_4 in the presence of atomic H give a greater heat development than N_2 or CH_4 . The former cause combination of the atomic H without being changed themselves. In the cases of C_2H_4 , C_2H_2 and H_2 , spectroscopic examn. of the blue gas near the U tube showed $-\text{C} \equiv \text{C}-$ and $-\text{CH}$ bonds at 430μ . The illumination from CH_4 and N_2 was very weak. The following mechanism is suggested for the ethane-hydrogen reaction: $\text{C}_2\text{H}_6 + \text{H} = \text{C}_2\text{H}_5 + \text{H}_2$; $\text{C}_2\text{H}_5 + \text{H} = \text{C}_2\text{H}_6$.

ARTHUR FLEISCHER

Principles of polymerization. J. SCHEIBER. *Chem. Umschau* 35, 181–90(1928).—various examples of polymerization (simple and complex) are considered in an endeavor to derive general principles of the mechanism. The presence of an unsatd. grouping is recognized as the activating factor in polymerization, the degree of which depends on external conditions (temp., catalysts, etc.) as well as on the state of aggregation. The effect on polymerizing power of substituent groups in the mol. is discussed and general rules for their action are derived.

B. C. A.

A study of the synthesis of methanol. E. AUDIBERT. *Soc. nationale de recherches sur le traitement des combustibles. Chimie et industrie* 20, 1015–22(1928).—See A. and Rameau, *C. A.* 22, 4461.

A. PAPINEAU-COUTURE

Formation of allyl alcohol. Pyrolysis of glyceryl formates. RAYMOND DELABY AND PIERRE DUBOIS. *Compt. rend.* 187, 949–51(1928); cf. *C. A.* 23, 1107.—Glyceryl monoformate has been obtained by glycerol esterification: 1 mol. decomps. smoothly at 235° to yield C oxides (22.4 g.), H, satd. hydrocarbons, and 57% allyl alc., partly as allyl formate. Glyceryl monoformate contg. 72% of the α -ester decomp. suddenly below 220°, yielding only 4% allyl alc. Hence the esterification product must consist mainly of the β -ester. Similarly, 1 mol. of α,γ - and α,β -diformates yields 44.8 g. of C oxides, and 43 and 48 g., resp., of allyl alc. at 255–310°. The diformate obtained by esterification contains probably a preponderance of the α,β -ester.

A. L. H.

Catalytic reductions of geraniol and citronellal by means of nickel. KANJI SUZUKI. *Bull. Inst. Phys. Chem. Research* 3, 44–51(1929), Abstracts 2, 3.—The rates of catalytic hydrogenation of geraniol and of citronellal have been observed under certain conditions. In all cases, the 1st mol. of H was attached much more rapidly on citronellal than on geraniol, while the 2nd mol. reacted only very slowly. A minute addn. of FeSO_4 causes a fall of velocity in the case of geraniol, but has little effect upon citronellal. The exptl. conditions were: 5 g. of substance in 25–100 cc. of 70–81% alc., 2–6 g. of catalyst, temp. 25–8°, 1.1 atm. H pressure. After exactly 1 mol. H_2 had been absorbed, the reduction products had the following properties: from geraniol: b_D^{20} 101.5–102.5°, d_4^{20} 0.8523, n_D^{20} 1.4542, $[\alpha]_D^{20}$ 1.17°. from citronellal: b_D 104–6,

d_4^{21} 0.8545, n_D^{22} 1.4541, $[\alpha]_D^{22}$ 4.59°. It is concluded that both products are impure citronellol contg. a certain amount of dehydrocitronellol.

ALBERT L. HENNE

Affinity of hydrocarbon radicals for oxygen. II. RAGNAR LYDÉN. *Finska Kemistisamfundets Medd.* 37, 53-71(1928); cf. *C. A.* 22, 3880.—Equimol. quantities of 2 ethers and AcBr are caused to react in a sealed glass vessel and the resulting mixt is analyzed. The hydrocarbon radical which forms the larger quantity of Br-substituted hydrocarbon and whose bond with the ether O is therefore more easily broken is less strongly bound by O than the other ether hydrocarbon radical. The result of this and the previous paper are summarized in a table in which are given the ratio of the mols. of Br-substituted hydrocarbon formed by the 2 ethers. Et₂O (I) (iso Am)₂O (II), 1:0.456; I:PhOEt (III), 1:1; II:III, 1:0.094; I:iso-AmOPh (IV), 1:0.011 III:IV, 1:0.335; II:IV, 1:0.528; iso-AmOEt (V):IV, 1:0.182; V:III, 1:0.852; Et₂O:PrOPh, 1:0.753; Bu₂O:BuOPh, 1:0.610.

HANS C. DREYER

Isomorphism in oxonium compounds. D. McINTOSH. Dalhousie Univ., Halifax, N. S. *Proc. & Trans. Nova Scotian Inst. Sci.* 17, Pt. 2, 8-9(1928); cf. *C. A.* 22, 2308. The 2 classes of oxonium compds. formed from halogen or halogen hydrides and org substances contg. O₂ differ much in their properties. In order to prove that these 2 classes have different chem. constitutions M. made use of the fact that isomorphism and chem. constitution are sometimes related. A supercooled melt may crystallize if a crystal of an isomorphous compd. is added. M. examd. the following systems: Et₂O with HCl, HBr and HI; EtOH, Me₂CO and AcOEt with HBr; Et₂O, EtOH, Me₂CO and AcOEt with Br and I; Me₂O with HBr and HI. Supercooled Et₂O-HCl (I) crystd. upon addn. of I, Et₂O-HBr, or Et₂O-HI; the effect of the latter was not immediate. Addn. of other compds. had no influence. Et₂O-2HCl (II) was pptd by crystals of II or Et₂O-2HBr. Et₂O-5HCl was brought to crystn. only by low temps. M. concludes that compds. of each class made with the same org. substances are probably isomorphous.

G. SCHWACH

Tetraethylphosphonium nitrite. PRAFULLA C. RAY AND NIRMALENDU SAHU RAY. Univ. College of Science, Calcutta. *J. Indian Chem. Soc.* 5, 733-4(1928). Treatment of Et₄PI (I) with an excess of Ag₂O gave the hydroxide, which was then neutralized with dil. H₂SO₄. The sulfate, when treated with the requisite quantity of pure Ba(NO₃)₂, gave Et₄PNO₂ (II), light yellow, very deliquescent. An attempt to prep II from I and AgNO₃ gave a low yield.

LOUISE KELLEY

Some incidental factors affecting the starting of Grignard reagents. HENRY GILMAN AND R. J. VANDERKWAAL. Iowa State College, Ames. *Rec. Trav. chim.* 48, 160-2(1929).—A study has been made of the effect of negative catalysts in the formation of Grignard compds as well as of some incidental factors in connection with the reaction. The study on negative catalysis is to be published shortly, while in the present paper an account is presented of the influence of some incidental factors. The technique used consists essentially in measuring the time required for 2 cc. of BuBr and 0.5 g. of Mg turnings in 5 cc. of dry ether to give the positive color test described by Gilman and Schulze (*C. A.* 19, 2473; 22, 942). The av. time for such a test, in the absence of a catalyst, is 7.25 mins. at 26°. On replacing 0.5 cc. of the anhyd. ether by ether satd. with water, the time was 33 mins.; with 50% of the dry ether replaced in this way, 2 hrs., and with 5 drops of water satd. with ether, there was no reaction at all. Com. dry ether without any treatment, required 20 mins., but after standing for a few days with Na wire, again 7.25 mins. Powd. glass and globules of Hg are without effect, while the only effect of the residue from BuMgBr that had been allowed to undergo atm. decompn. was to use up part of the Grignard reagent, as it was formed, because of the active H, present in such a decompd. reagent. Seasoned rubber or rubber cut from the inside of a rubber stopper was also found to be without effect, but outside slices of new rubber stoppers were found to delay the reaction to 17 mins. Accordingly, it is recommended that new rubber stoppers be cleaned by scraping or by alkali treatment prior to use. Dry N and air freed of CO₂ are without effect, but satn. of the ether with dry O gave a retardation to 11 mins. CO₂ also had a slight negative effect, probably due to the formation of the compd. RCO₂MgBr while HCl showed a more retarding effect than CO₂. Benzene and petroleum ether, b. 43-86°, exercised a significant retarding effect, while MgBr₂-etherate acted as a positive catalyst, the av. time being 4.3 mins. In the latter case the usual turbidity, which just precedes the formation of most Grignard compds., was absent. At 0-5° the normal time was 24 mins., at 17° 11.9 mins. and at 26° 7.25 mins., thus showing that there is no harm in allowing the ether soln. to reflux during the entire prepn. of the reagent.

C. F. VAN DUIN

The reaction between organomagnesium halides and some salts. HENRY GILMAN

ND JAMES E. KIRBY. Iowa State College, Ames. *Rec. trav. chim.* **48**, 155-9 (1929); *C. A.* **22**, 4504.—The general expression for the reaction between organomagnesium halides and salts is: $MX_n + mRMgX \rightarrow MR_mX_{n-m} + mMgX_2$ (I), either new organometallic halides or simpler organometallic compds. of the type MR_n being formed. Secondly, the reaction may take place to give a product formed by coupling such as $R-R:MX_2 + 2RMgX \rightarrow R-R + MX$ (or M) + MgX_2 (II); this reaction may be preceded by I, such as in the reaction between $PhMgBr$ and $AgBr$, where $AgPh$ is first formed according to reaction I, and then decomps. with the formation of Ph_2 and metallic Ag (*C. A.* **22**, 217, 760). In the present investigation G. and Kirby studied the possibility of the addn. of a $RMgX$ compd. to a functional group, like the CN group, attached to a metal; if the Grignard reagent would add to the CN group, the formation of a $C:O$ compd. was to be expected, but such compds. never were obtained. Instead, a significant coupling reaction took place in accordance with the scheme II, although in a few reactions pronounced qual. evidence was obtained that reaction I took place also. In the reaction between $Cu_2(CN)_2$ and $PhMgBr$ the yield of Ph_2 is greatly dependent on the solvent used; with ether, 6.5%, with benzene, 64% and with toluene a quant. yield of Ph_2 being obtained; with $AgCN$ and $PhMgBr$ and $PhCH_2MgCl$ Ph_2 and dibenzyl were obtained in good yields, 36-89% and 74-78%, resp., while the interaction of $Hg(CN)_2$ and $Ni(CN)_2$ with $PhMgBr$ only gave a trace of Ph_2 , but a good yield of $PhHgBr$, m. 273° , in the former case. With $PhMgBr$, $AgCNO$ gave 73%, $CuCNS$ 70% and $AgCNS$ 52% Ph_2 , no other compds. being isolated. $Hg(OAc)_2$ and $PhCH_2MgCl$ did not give dibenzyl, but $PhCH_2HgCl$; Ag_2CO_3 and $PhMgBr$, 71% of Ph_2 , Ag_2CrO_4 , 26%; Ag_3PO_4 , 19%; and Ag citrate only a trace of Ph_2 when acted upon by $PhMgBr$. Unless another solvent is mentioned, ether was the solvent used throughout this investigation.

C. F. VAN DUIN

A miscellany of quantitative studies involving organomagnesium halides. HENRY GILMAN AND J. MERRIAM PETERSON. Iowa State College, Ames. *Rec. trav. chim.* **48**, 247-50 (1929). This paper presents the results of the expts. on the effect of heat and light on $EtMgBr$, the absence of reaction with N_2O , Ph_3CH and some compds. contg. an active H atom, the reaction with Ph_3CCl , Ph_3PO and Ph allyl ether, and the non-addn. of several Grignard compds. to the ethylenic linkage of $Ph_2C:CH_2$. In these expts. the Grignard reagent was estimated quant. according to the procedure of G. and his co-workers (*C. A.* **17**, 530; **20**, 2473). On heating $EtMgBr$ at various temps. during 1 hr. the following decompn. was noticed: at 100° and 150° , none; at 200° , 6.7%; at 300° , 14.3%; at 300° for 2 hrs., 17.8%. On refluxing $EtMgBr$ during 45 mins. with *p*-cymene after removal of the ether, there was no change in the quantity of the Grignard reagent. On direct exposure of $EtMgBr$ to sunlight of the summer during several weeks or to the rays of a Hg arc lamp for 24-36 hrs., an essential loss of the Grignard compd. could not be observed (analysis by the "gas method"). There is practically no reaction when Ph_3CH_2 is refluxed with $EtMgBr$ for 30 mins.; with Ph_3CH , there is a slight reaction (2%) and with Ph_3CCl the reaction is complete. The same reagent showed no reaction with pure $NaHCO_3$, with *p*- $MeC_6H_4As[CH(OH)Ph]_3$, with Ph allyl ether a 5% reaction and with Ph_3PO a 10% reaction (reaction time 30 mins.), while neither a reaction, nor chemiluminescence was observed on bubbling a stream of dry, pure N_2O for 20 mins. through a boiling soln. of $EtMgBr$. $PhC:CH_2$ did not react with $PhCH_2MgCl$ (5 hrs.); *p*- BrC_6H_4MgBr (12 hrs.); $Ph-CaI$ (10 hrs.) and $EtMgCl$ (10 hrs.); for the technic of these expts. (cf. *C. A.* **20**, 1605; **22**, 1963).

C. F. VAN DUIN

Further observations on the qualitative color test for reactive organometallic compounds. HENRY GILMAN AND LLOYD L. HECK. Iowa State College, Ames. *Rec. trav. chim.* **48**, 193-7 (1929).—The qual. color test of G. and Schulze (*C. A.* **19**, 2473; **22**, 942) makes it possible to avoid a great deal of arbitrary and frequently useless operations; i. e., in Grignard reactions the test is only shown when the MgX group is attached to C and accordingly, when equiv. quantities of $RMgX$ compd. and another reactant are brought into reaction, an easy way to control the course of the reaction is to make the color test with a small sample (0.5-1.0 cc.) of the reaction mixt. In this way unpublished results of G. and H. have shown that many of the more commonly used compds. react quite rapidly with Grignard reagents. Secondly, the color test gives information as to the no. of equivs. of Grignard reagent necessary for the completion of certain reactions (cf. *C. A.* **21**, 1800). Again, the color test may be used to detect whether an organometallic compd. is formed from a metal and an RX compd. In the present paper expts. are described which have been carried out with the view to reducing the time and quantity of reaction mixt. required for making the test and to increase its sensitiveness. A method with test papers, a spot-plate method, and a test-

tube method with 1 drop of soln. were tried but all these were inferior to the test-tube method with 1 cc. of soln., used originally, which gives reliable results with concns. as low as, and in some cases lower than 0.03 *M*. The sensitiveness of the test is given in the original paper for 14 Grignard compds., *sec*-BuMgBr being the most sensitive compd. (0.01–0.02 *M*). The sensitiveness of the test increases with the use of a hot, satd. soln. of the Michler's ketone in benzene and the test is obtained with larger quantities if 1 cc. does not give a test or gives only a poor test. For details, concerning the several tests, the original paper must be consulted.

C. F. VAN DUIN

The (independent) preparation of allylmagnesium bromide. HENRY GILMAN AND J. H. McGLUMPHY. Iowa State Coll. *Bull. soc. chim.* 43, 1322–8(1928).—Attempts to prep. C_3H_5MgBr (I) by the usual methods give $C_3H_7C_3H_5$. Using the app. of G. and Meyers (*C. A.* 17, 531), 90.3% of I was obtained when 0.5 mol. of C_3H_5Br in 285 cc. of Et_2O was added to 3 equivs. of 30-mesh Mg in 100 cc. of Et_2O with rapid agitation during a period of 2 hrs. The yield was materially decreased by a decrease in the quantity of Et_2O ; when Mg turnings were used the yield was 79%. Increasing the period of addn. of the bromide to 3 hrs. gave 91.9% and 4 hrs. gave 93.6%. I was treated with $PhCH_2Cl$ giving 90.5% of 1-phenyl-3-butene; with Ph_3CO , 74.9% of allyldiphenylcarbinol, b. 165–70°, was obtained; and with $PhCOAc$, 80.2% of allylmethylphenylcarbinol resulted. Poor yields (21.7%) of vinylacetic acid are obtained from treatment of I with CO_2 , owing to side reaction.

A. S. CARTER

Some derivatives of trimethylethylstannane. RALPH H. BULLARD AND RAYMOND A. VINGER. Hobart College. *J. Am. Chem. Soc.* 51, 892–4(1929).— Me_3EtSn is obtained in 80% yield from Me_3SnBr , Na and $EtBr$ in liquid NH_3 ; Br in CCl_4 gives the dimethylethylstannyl bromide, b. 175–80°, which gives an unstable NH_3 complex, converted into the Na salt and treated with NH_4Br , there results dimethylethylstannane, b. 90°, which is oxidized by the air to the hydroxide, very hygroscopic needles, also obtained from the bromide and 30% NaOH.

C. J. WEST

Improvements in the method for the preparation of mercury dialkyls from organo-magnesium halides. HENRY GILMAN AND ROBERT E. BROWN. Iowa State College, Ames. *J. Am. Chem. Soc.* 51, 928–30(1929).—Improvements in the prepn. of HgX_2 by the method of Marvel and Gould (*C. A.* 16, 1561) consist in the use of a Soxhlet extractor for the $HgCl_2$, thus avoiding the fine powdering, in extending the time of heating from 10–12 to 20–24 hrs. and in the use of a larger vol. of Et_2O . $HgEt_2$ was obtained in 86–89% and $HgBu_2$ in 66% yields.

C. J. WEST

Organic mercuric hydroxides and their salts. K. H. SLOTTA AND K. R. JACOBI Univ. Breslau. *J. prakt. Chem.* 120, 249–300(1929).— $RHgBr$ may be obtained in good yield by reacting $RMgBr$ with $HgBr_2$; from this the Cl and I derivs. were obtained by reacting with KOH in $EtOH-H_2O$ and then with HCl or HI. In this way the following new compds. were prepd. Methylmercuric bromide, m. 172° (94% yield); ethylmercuric iodide, m. 186°; butylmercuric chloride, m. 130°; amylmercuric chloride, m. 110°; iodide, m. 110°; hexylmercuric chloride, m. 125°; iodide, m. 110°; heptylmercuric chloride, m. 119.5°; iodide, m. 103°; cetylmercuric bromide, m. 101.5° (90% yield); chloride, m. 102°; iodide, m. 82°. The following soly. detns. are reported for $EtOH$ at 18° and 78°, $CHCl_3$ at 18° and H_2O at 18° and 100° (g. per 100 g. solvent; the values for H_2O are to be multiplied by 10^{-4}): $MeHgBr$, 3.16, 12.7, 2.6, 0.72, 1.25; $MeHgCl$ (m. 167°), 4.2, 15.8, 3.7, 1.4, 10.0; $MeHgI$ (m. 152°), 1.27, 8.3, 1.9, 2.0, 3.3; $EtHgBr$ (m. 198°), 0.7, 2.1, 1.55, 0.6, 1.0; $EtHgCl$ (m. 192°), 0.75, 3.5, 2.6, 1.4, 2.5; $EtHgI$, 0.5, 0.6, 0.5, 0.4, 0.6; $PrHgBr$ (m. 140°), 1.58, 8.3, 7.4, 0.7, 1.1; $PrHgCl$ (m. 147°), 2.3, 10.5, 11.2, 2.0, 3.3; $PrHgI$ (m. 113°), 2.2, 7.0, 16.8, 0.5, 0.7; $BuHgBr$ (m. 136°), 1.05, 5.1, 4.2, 0.3, 0.5; $BuHgCl$, 1.5, 9.0, 5.6, 1.4, 3.3; $BuHgI$ (m. 117°), 1.5, 3.2, 9.6, 0.2, 0.4; $AmHgBr$ (m. 127°), 1.27, 7.5, 7.5, 0.4, 0.6; $AmHgCl$, 1.65, 11.5, 11.2, 0.8, 1.4; $AmHgI$, 1.65, 6.35, 22.2, 0.2, 0.4; $C_6H_{13}HgBr$ (m. 127.5°), 0.9, 6.04, 3.7, 0.2, 0.3; $C_6H_{13}HgCl$, 0.89, 5.1, 4.2, 0.7, 1.2; $C_6H_{13}HgI$, 1.3, 4.3, 16.8, 0.1, 0.2; $C_7H_{15}HgBr$ (m. 118.5°), 0.94, 10.5, 4.8, 0.2, 0.4; $C_7H_{15}HgCl$, 1.0, 10.5, 5.6, 0.4, 0.6; $C_7H_{15}HgI$, 1.4, 7.9, 22.2, 0.1, 0.3; $C_8H_{17}HgBr$, $EtOH$, 18°, 1.9; $CHCl_3$, 18°, 0.9; $C_8H_{17}HgCl$, 2.5, 0.74; $C_8H_{17}HgI$, 1.4, 2.5. $MeHgOH$, m. 137°, is obtained in 68% yield by treating 30 g. $MeHgBr$, moistened with 30 g. $MeOH$, with 100 cc. 40% $MeOH-KOH$, heating 0.5 hr., filtering while warm, treating with 20 cc. H_2O and concg. at 60° and 17 mm. and extg. the residue with 40 cc. C_6H_5N at 80°; soly. in H_2O at 18°, 2.5; at 100°, 25. Using the same general method the following homologs were prepd.: *Et*, m. 37° (54.5% yield), soly. 2.5 and 5.0; *Pr*, m. 78° (73% yield), soly. 1.4 and 3.3; *Bu*, m. 68° (55% yield), soly. 2.2 and 4.0; *Am*, m. 50° (54% yield), soly. 2.0 and 3.3; *hexyl*, m. 54.5° (45% yield), soly. 0.4 and 2.0; *heptyl*, m. 54° (57.5% yield), soly. 0.1 and 0.7; *cetyl*, m. 78° (46.3% yield); *α-naphthyl*, m. 228°. Values are given for the mol. cond. of

these bases in H_2O and $MeOH$ at 25° . Neutralization of the base with HCN in $MeOH$ and removal of the $MeOH$ and H_2O in *vacuo* over $CaCl_2$ gave the following *mercuric cyanides*.—*Me*, m. 93° ; *Et*, m. 77° ; *Pr*, m. 28° ; *Bu*, m. 42° ; *Am*, m. 39° ; *hexyl*, m. 38° ; *heptyl*, m. 53° . The following *mercuric acetates* were similarly prepd.: *Me*, m. 101° (Otto, *Ann.* 154, 198(1870) gives $142-3^\circ$); *Et*, m. 54° (Otto gives 178°); *Pr*, m. 56° ; *Am*, m. 52° ; *hexyl*, m. 50° ; *heptyl*, m. 54° . *Mercuric nitrates*.—*Me*, sinters 100° , turns green at 135° and decomps. 168° ; *Et*, m. 56° ; *Pr*, m. 75° ; *Bu*, pale yellow, m. 75° ; *Am*, yellow, m. 78° ; *hexyl*, pale yellow, m. 75° ; *heptyl*, m. 66° . *Mercuric sulfates*.—*Me*, decomps. 255° ; *Et*, decomps. 199° ; *Pr*, decomps. 196° ; *Bu*, m. 183° (decompn.); *Am*, decomps. 188° ; *hexyl*, m. 173° ; *heptyl*, m. 180° (decompn.). An attempt to prep. isomeric cyanides failed.

C. J. WEST

Heintz's aldol and its preparation. F. ADAMANIS. *Roczniki Chem.* 8, 349-57(1928). Heintz's aldol is prepd. by shaking acetone with $NaOH$ for 30 hrs., and is converted by the action of $MeMgBr$ into β,δ -dimethylpentane- β,δ -diol, which on dehydration yields β,δ -dimethyl- Δ^2 -penten- δ -ol.

B. C. A.

Higher aldehydes. SCHIMMEL & CO. *Ber. Schimmel* 1927, 131.—The aldehydes known in commerce as aldehydes C_{14} , C_{16} , C_{18} and C_{20} belong, in their chem. nature, to lactones and esters, and they do not correspond in C content with their names.

B. C. A.

Synthesis of iodoformal. JOSÉ UTHOFF AND GABRIEL F. MORAGAS. *Quim. Ind.* 5, 283-7(1928).—(a) The method of Schmidt (*Pharm. Chem.*, p. 354) for hexamethylenetetramine was thrice tested. U. and M. conclude that the formal and NH_3 can be mixed at once. If the temp. of evapn. be low, the yield may be quant. Heat in drying produces color, which can be removed by Et_2O . (b) The elec. method for CHI_3 gives the best yield, but, based on Schmidt's instructions, U. and M. have drawn up recommendations for CHI_3 . If $Me_2CO + 12I + H_2O = 2CHI_3 + 6HI$ represents the reaction then U. and M. claim their process gives an improved yield. (c) U. and M. obtain 96.8% yield Etl by following Schmidt's directions. (d) They obtain 100% yield hexamethylenetetramine- Etl , "Iodalin," by heating theoretical amounts of tetramine and Etl in a sealed glass tube for 20 hrs. at 40° . The reaction is addn.

The product is recrystd. from boiling alc. (e) U. and M. obtained 76% of iodoformal ($CH_3N_4EtI CHI_3$) by dissolving crude (d) in boiling abs. $EtOH$, and by dissolving a theoretical portion of crude CHI_3 in $CHCl_3$ and mixing hot. The yellow needles are dried in an air oven at 40° . U. and M. expect over 85-90% with the purified products.

S. L. B. ETHERTON

Some formals and mixed carbonic esters. S. SABETAY AND P. SCHVING. Houbigant Lab. *Bull. soc. chim.* 43, 1341-5(1928).—A mixt. of 35 g. of trioxymethylene (I) and 115 g. of PhC_6H_4OH (II) was cooled in ice and satd. with HCl . After sepg. and drying the oil with P_2O_5 , it was heated below its b. p. in *vacuo* to remove excess I, giving upon distn. the *chloromethyl ether* (III) of II, b_{14} $119-21.5^\circ$, n_D^{20} 1.5227. The corresponding ethers of the following alcs. were prepd.: *benzyl*, b_{14} $102-2.5^\circ$, n_D^{20} 1.5270; *phenylpropyl*, b_{13} 130.5° , $n_D^{18.5}$ 1.5190. From *cyclohexanol*, was obtained the *methylal*, b_{14} $139-41^\circ$, n_D^{21} 1.4702, d_{21} 0.9741. A PhH suspension of $NaOMe$ with III gave *phenethylmethylmethylal*, b_{13} $102-3^\circ$, n_D^{19} 1.4951, d_{19} 1.002. Boiling III with Ac_2O and $AcONa$ gave *phenethylacetylmethylal*, $AcOCH_2OC_6H_4Ph$, b_{13} $136-7^\circ$, n_D^{20} 1.4950; in like manner the *phenethylmethylals* of the following were prepd.: *iso-Bu*, b_{14} $131-2^\circ$, n_D^{21} 1.4793, d_{21} 0.9504; *Ph*, b_{14} $181-2^\circ$, n_D^{18} 1.5501, d_{18} 1.074; *Et*, b_{14} $113-3.5^\circ$, n_D^{21} 1.4846, d_{21} 0.9757; *tolyl*, b_{14} 190° , n_D^{21} 1.5472, d_{21} 1.061; *1,3,4-xylyl*, b_{17} $203-4^\circ$, d_{21} 1.045; α -*naphthyl*, b_{12} $213-5^\circ$; *guaiacyl*, b_{13} 207° , n_D^{18} 1.5502; *linalyl*, b_{11} $108-0^\circ$, n_D^{18} 1.5120; *benzyl*, b_{14} $192-4^\circ$, n_D^{20} 1.5436, d_{20} 1.012; and in like manner, *phenylpropylphenylmethylal*, b_{14} 172° , n_D^{21} 1.5560, d_{21} 1.090; and *benzylmethylmethylal*, b_{13} $95-7^\circ$, n_D^{20} 1.4941, d_{20} 1.013, from the corresponding chloromethyl ethers. In the presence of C_6H_5N , $ClCO_2C_6H_4Ph$ and $PhOH$ in $CHCl_3$

gave *phenethylphenyl carbonate*, b_{14} 203°, m. 89°; similarly, ClCO_2Et and PhCHOHEt gave *Et α -phenylpropyl carbonate*, $\text{PhCHEtOCO}_2\text{Et}$, b_{14} 131-3°, n_D^{21} 1.4858. Heating a mixt. of $\text{PhC}_2\text{H}_4\text{Br}$ with PhOH and KOH in the presence of ground Cu at 160° gave *phenethyl Ph ether*, b_{14} 162-3°, n_D^{16} 1.5706, d_{16} 1.054.

A. S. CARTER

The dipole moment of a few aliphatic ketones. K. L. WOLF AND E. LEDERLE. *Physik. Z.* 29, 948-50(1928).—The dipole moments are detd. by the classical method for the following aliphatic ketones: Me_2CO , MeCOEt , MeCOPr , MeCOBu , $\text{MeCO-C}_6\text{H}_{11}$, $\text{MeCOC}_6\text{H}_{13}$, Et_2CO , pinacolin, Pr_2CO , $(\text{tert-Bu})_2\text{CO}$. The dipole moment for all, irrespective of the length of the chain = $2.75 (\pm 0.05) \cdot 10^{-18}$. In the CO mol. which has a momentum of $0.108 \cdot 10^{-18}$, 8 of the 10 electrons are in a closed shell, the 2 others being similar to the valence electrons of alk. earths. In the ketones, the momentum is raised because these 2 valence electrons are taken into the octets of the neighboring C atoms.

G. CALINGAERT

Preparation of pentadecic acid. S. LANDA. *Chem. Listy* 22, 361-2(1928). Good yields of pentadecic acid are obtained by the oxidation of cctene, by means of hot 1% KMnO_4 .

B. C. A

Production and origin of acetic acid and other organic volatile constituents of pyroigneous distillate. C. PADOVANI AND J. BURRAL. *École Royale Polytechnique de Milan. Chimie et industrie* 21, 20-31(1929).—The present status of our knowledge and the various theories suggested to account for the formation and origin of AcOH and other org. volatile compds. in the pyrogenation of vegetable matter are reviewed. Expts. were carried out on Lybian esparto: the material was treated in the cold with NaOH of increasing concn. (1-7.5%), with H_2O at 100°, 130° and 170°, and with 2.5% NaOH at atm. pressure and at 170°, the loss in wt. of the material and the AcOH in the ext. were detd., the OMe was detd. in the residue and the latter was pyrogenated and the AcOH yield detd. Dil. NaOH (2.5%) exts. in the cold practically as much AcOH as is obtained on pyrogenation, and the amt. is not appreciably increased on increasing the NaOH concn. to 7.5% though the loss in wt. of the esparto increases considerably. The max. easily-hydrolyzable AcOH can also be obtained by treating with H_2O under pressure (170°); but for a given % AcOH the total loss in wt. of the material is greater on treatment with H_2O under pressure than with NaOH in the cold. The extn. of AcOH is considerably increased on treating with NaOH under pressure, owing to decompn. of the cellulose. In the residues from which the max. AcOH had been extd. by NaOH in the cold or by H_2O under pressure, pyrogenation yielded a practically const. amt. of AcOH (approx. 1/4 of the extd. AcOH). These results can be explained by assuming that, in the direct pyrogenation, part of the preformed AcOH is not liberated or is destroyed, and that the preliminary NaOH treatment acts in some as yet unknown manner on the cellulose complex so that on subsequent pyrogenation it gives off AcOH . The attack of esparto by NaOH is considered to take place in 3 stages: (1) Sapon. of the preformed Ac groups in the non-cellulose constituents, the lignin being degraded, but not completely solubilized; (2) after the Ac groups have been completely sapond., the lignin gradually passes into soln., but the cellulose remains unacted upon; (3) the cellulose is progressively attacked. Hydrolysis with 2.5% H_2SO_4 according to Schorger (*C. A.* 11, 2218) exts. considerably more AcOH than cold alkali, presumably owing to attack of the cellulose.

A. P.-C

The process of hydrogenation of highly unsaturated methyl esters by means of platinum catalysts. YOSHIYUKI TOYAMA AND TOMOTARO TSUCHIYA. Tokyo Inst. Ind. Research. *Bull. Tokyo Inst. Ind. Research* [5], 23, 1-13(1928).—T. and T. previously recognized as the most remarkable phenomenon observed in the hydrogenation by means of a Ni catalyst, that no appreciable quantity of solid acid is formed until the highly unsatd. acid capable of forming an Et_2O -insol. Br_2 addn. compd. is almost eliminated, and that when the latter is nearly eliminated, the quantity of the solid acid rapidly increases. But in the case of the Pt catalysts (the expt. being carried out at ordinary temp. and pressure, and with EtOH as solvent) the solid acid gradually increases from the beginning of the hydrogenation, so that at the stage where the highly unsatd. acid capable of forming an Et_2O -insol. Br_2 addn. compd. is almost eliminated, an appreciable quantity of a solid acid is already present. Comparing, at a stage where the highly unsatd. acid still remains, the samples which have been reduced to the same I no., it is found that the reduction product obtained by means of the Pt catalyst contains a larger quantity of a solid acid as well as the highly unsatd. acid than in the case of the product obtained by means of the Ni catalyst. Thus, in the reaction (A) of eliminating the unsatd. acid and (B) of forming a solid acid, (A) and (B) proceed simultaneously with the Pt catalyst, while in the case of the Ni catalyst

(A) proceeds almost exclusively before (B) begins. The expt. was conducted by using the Me ester of the highly unsatd. acid obtained from sardine. K. SOMEYA

Polymerization of a highly unsaturated acid. YOSHIYUKI TOYAMA AND TOMOTARO TSUCHIYA. Tokyo Inst. Ind. Research. *Bull. Tokyo Inst. Ind. Research* [5], 23, 15 28(1928).—T. and T. heated the highly unsatd. acid obtained from sardine at 240°, 280° and 320° in a CO₂ current and measured various properties of the resulting product, comparing them with those of the original acid. Original sample: d_{40}^{20} 0.9289, n_D^{20} 1.4965, sp. viscosity (20°) 3.8, neutralization value 177, sapon. value 178, I no. 351, unsaponifiable matter 1.4%. It forms a Br₂ addn. compd. insol. in Et₂O (the bromine addn. compd. was made with the fatty acid obtained by removing the unsaponifiable matter). The change of these properties with heating is as follows: (1) the d., n and sp. viscosity increases and the I no. decreases, the increase of the d. and n being roughly proportional to the decrease of the I no., and the sp. viscosity increasing rapidly with the decrease of the I no.; (2) the neutralization and the sapon. values decrease, a difference of the 2 values also resulting. The unsaponifiable matter increases on heating. E. g., the sample heated at 320° for 1 hr. has the neutralization value 121, sapon. value 149, the unsaponifiable matter being 8.5%; (3) the yield of Et₂O-insol. Br₂ addn. compd. decreases, becoming zero for the sample having the I no. 198. The Br content of the Et₂O-insol. Br₂ addn. compd. obtained from various polymerization products is 69.89% when it is smallest; (4) the mol. wt. increases, the highest being nearly twice that of the original. The relation between the mol. wt. and the yield of Et₂O-insol. Br₂ addn. compd. of the polymerization product shows that at the beginning of the polymerization process an intramol. change (probably ring formation) chiefly takes place. The effect of the temp. on the change of the above various properties is profound, the degree of change occurring on heating for 10 min. at 320° being much greater than that occurring on heating for 8 hrs. at 240°. Heating causes a slight decompn. of the original sample. E. g., the sample heated at 320° for 3 hrs. shows a decrease of 11% of its wt. The viscous polymerization product treated with petroleum ether yields a resinous solid, m. 69–70°. On heating for 2 hrs. at 320° the whole mass becomes resinous. K. SOMEYA

Polymerization of the methyl ester of a highly unsaturated acid. YOSHIYUKI TOYAMA AND TOMOTARO TSUCHIYA. Tokyo Inst. Ind. Research. *Bull. Tokyo Inst. Ind. Research* [5], 23, 29 42(1928).—The Me ester of a highly unsatd. acid obtained from sardine was heated at 200°, 240°, 280°, 320° in a CO₂ current and comparison was made of the properties of the resulting polymerization product with those of the original sample. The original sample: d_{40}^{20} 0.9155, n_D^{20} 1.4880, sp. viscosity (20°) 3.85, acid no. 16, sapon. no. 170, I no. 338, unsaponifiable matter 1.3%. The changes of these properties on heating are as follows: (1) The d., n and sp. viscosity increase and the I no. decreases, the increase of d. and n being roughly proportional to the decrease of the I no., while the increase of the sp. viscosity becomes more rapid as the I no. decreases. When the I no. falls to 170, the increase of the sp. viscosity becomes large even with a slight decrease in the I no. (2) The acid no. slightly decreases when there is a considerable lowering of the I no. E. g., for the sample subjected to heating at 320° for 2 hrs. the I no. is 138, acid no. 3.0, sapon. no. 158, unsaponifiable matter 2.9%. (3) The mol. wt. increases, the highest being nearly twice the original. Next, the polymerized acid was sep'd. from the heated product and its properties were compared with those of the original; (1) with the lowering of the I no. of the polymerized acid, the neutralization value and the sapon. value slightly decrease, the sapon. value being greater than the neutralization value with the product whose I no. is considerably lowered, (2) with the lowering of the I no. of the polymerized acid the quantity of the Br₂ addn. compd. insol. in Et₂O decreases, no Br₂ addn. compd. being formed with the polymerized acid whose I no. has been lowered down to 210. The lowest Br content of the addn. compd. is 66.65%. The relation between the mol. wt. of the polymerization product (Me ester) and the Br₂ addn. compd. shows that at the 1st stage of polymerization an intramol. change (probably a ring formation) takes place chiefly rather than the condensation between mols. The effect of the temp. upon the above various properties is very profound, the degree of change being much more remarkable in the sample heated to 320° for 10 mins. than in the one heated for 8 hrs. at 240°. Heating causes a slight decompn. of the original material. E. g., the sample heated for 2 hrs. at 320° shows a decrease of about 6% in wt. The viscous polymerization product, was sapon'd., the acid produced being treated with petroleum ether, whereby a resinous solid, m. 69–70°, insol. in petroleum ether, was obtained. K. SOMEYA

Tetrabromide of eleostearic acid. O. MERZ. *Farben-Ztg.* 33, 2423–4(1928).—

A review of published work on the bromination of the eleostearic acids. Expts. on the m. p. of mixts. of the tetrabromides of α - and β -eleostearic acids support the view of Rollett (*C. A.* 5, 1741) that isomerization from the α - to the β -form occurs on bromination, the β -form remaining unaffected. B. C. A.

Reaction of chloroacetic acids with zinc. HOWARD W. DOUGHTY AND DONALD A. LACOSS. Amherst College. *J. Am. Chem. Soc.* 51, 852-5(1929).—When $\text{Cl}_3\text{CHCO}_2\text{H}$ reacts with Zn in H_2O , a neutral soln. of ZnCl_2 and $(\text{Cl}_2\text{CHCO}_2)_2\text{Zn}$ is obtained there is no evolution of H; the reaction is strongly exothermic. With $\text{Cl}_2\text{CHCO}_2\text{H}$ the corresponding reaction with Zn is much less exothermic, much slower and H is evolved to approx. 10% of the amt. required by the equation $2\text{HX} + \text{Zn} = \text{H}_2 + \text{ZnX}_2$. With $\text{ClCH}_2\text{CO}_2\text{H}$ the reaction is very slow and is to quite a large extent in accordance with the reaction just stated. The reaction is similar to that in the case of $\text{Cl}_3\text{CCO}_2\text{H}$ and Cu and an explanation of the mechanism is suggested. C. J. W.

Molecular refraction and non-polar bonds. R. SAMUEL. *Naturwissenschaften* 17 13-4(1929); cf. *C. A.* 22, 3575.—If a pos. or neg. character is assigned to several org groups like Me and Et in mols., depending on their location in the mol., and if $s + p +$ or $-$ group refractions are used in the computation of the mol. refraction for these mols., it is found that the customary anomalies of the summation of refractions disappear. With only one at. refraction value for N (either in primary, secondary or tertiary amines), no exaltations or depressions for double bonds are necessary to give the correct total value, which is in even better agreement with the exptl. one than usual. The difference in function of the partners of a nonpolar bond is thus found to be essential. An example of the polarization assumed is $\text{Me}^{(-)} - \text{C}^{(4+)} = \text{O}^{(2-)} - \text{Me}^{(+)}$ for MeOAc

B. J. C. VAN DER HOEVEN

The diaminobutanes. ERICH STRACK AND HELLMUTH FANSELOW. Univ. Greifswald. *Z. physiol. Chem.* 180, 153-60(1929).—The 6 isomeric diaminobutanes described in the literature are not sufficiently well characterized for purposes of identification. One of these isomers is of biol. importance as a decompn. product of spermin. In prepg. these bases several of the methods previously described were found unsatisfactory and new and improved methods were therefore devised. The $m\text{-O}_2\text{NC}_6\text{H}_4\text{CO}$ derivs. are especially useful for the isolation and identification of the bases. They were prepd. by shaking the soln. in 5% NaOH with $m\text{-O}_2\text{NC}_6\text{H}_4\text{COCl}$, washing the ppt. with cold EtOH, and recrystg. by addn. of H_2O or EtOH to the pyridine soln., or in the case of the more sol. isomers by recrystn. from hot EtOH. 1,4-Di[m -nitrobenzoylamino]butane ($m\text{-O}_2\text{NC}_6\text{H}_4\text{CO}$ deriv. of putrescine), m. 246° . 2,3-Di[m -nitrobenzoylamino]butane, prepd. by reduction of diacetyl dioxime and acylation, yielded 2 fractions, the 1st of which was sol. in MeOH and m. 238° ; the 2nd, which m. 320° , was insol. in MeOH but sol. in pyridine and pptd. cryst. by addn. of H_2O . 1,2-Di[m -nitrobenzoylamino]butane, m. 197° , was prepd. from $\text{MeCH}_2\text{CHBrCH}_2\text{Br}$ and NH_3 in MeOH, also in better yield by treatment of $\text{MeCH}_2\text{CH}(\text{OH})\text{CN}$ with alc. NH_3 and reduction of the $\text{MeCH}_2\text{CH}(\text{NH}_2)\text{CN}$ thus formed with Na, followed by acylation. 1,3-Di[m -nitrobenzoylamino]butane, m. 199° , was obtained by reduction of 4-methyluracil in EtOH with Na, and acylation. 1,3-Di[m -nitrobenzoylamino]-2-methylpropane, m. 182° , by dehydration of $\text{MeCH}(\text{CONH}_2)_2$ with P_2O_5 to $\text{MeCH}(\text{CN})_2$ and reduction of the nitrile with Na and EtOH, followed by acylation. 1,2-Di[m -nitrobenzoylamino]-2-methylpropane, prepd. by treatment of $\text{Me}_2\text{C}(\text{OH})\text{CN}$ with alc. NH_3 and reduction of the resulting $\text{Me}_2\text{C}(\text{NH}_2)\text{CN}$ in EtOH with Na, and acylation, yielded 2 isomers, m. 145° and 174° , resp. Boiling with EtOH converts the 1st into the 2nd, but the rearrangement could not be reversed. A. W. DEX.

Basis for the physiological activity of -onium compounds. VIII. Phosphoric acid ester derivatives of choline. R. R. RENSHAW AND C. Y. HOPKINS. New York Univ. *J. Am. Chem. Soc.* 51, 953-4(1929); cf. *C. A.* 20, 3688.— $\text{HOCH}_2\text{CH}_2\text{Cl}$ and POCl_3 in CCl_4 , heated 3 hrs. on the H_2O bath, give 46-7% of β -chloroethylphosphoryl dichloride, b. $108-10^\circ$; this condenses readily with Me_3N to give a very hygroscopic product; MeOH in CCl_4 , refluxed until HCl evolution ceases, gives 25% of di-Me β -chloroethylphosphate, b. $95-6^\circ$; Me_3N in PhMe gives dimethylphosphatetriethylmethylammonium chloride, very hygroscopic, m. $136.5-7^\circ$ (cor.); this choline deriv. has little muscarine action but a powerful stimulating nicotine action. C. J. W.

Cyclic acetals. J. D. VAN ROON. Weesp, Lab. of C. J. van Houten and Son. *Rec. trav. chim.* 48, 178-190(1929).—In previous investigations on acetaldehyde, glycerols (Harnitzky and Menshutkin, *Ann.* 136, 126(1865); Nef, *Ann.* 336, 216(1904)) these compds. were discussed as if only 1 cyclic acetal is produced, yet the

α,β - (I) and the α,α' -compd. (II) are possible, both capable of existing in *cis*- and *trans*-modifications. Later, Hill and Hibbert (C. A. 18, 1987) assuming that the reaction product formed according to Nieuwland's method (C. A. 16, 235; 17, 2413) was a single substance, came to the conclusion that only a 6-ring is produced. van R. prepd. acetaldehyde-glycerol, b_{760} 183–96°, by Hibbert's method at 45° in 60% yield, but could not sep. the components quant. even by repeated fractional distn., both fractions thus obtained and b_{760} 183.5–4° and 194–4.5°, contg. an appreciable amount of each other (most probably the use of a Widmer fractionating column would be successful in this case; (ABSTRACTOR)). On benzylation according to Fischer's method (C. A. 15, 684) the lower boiling fraction furnished a benzyolated product which was mostly, but not entirely, solid, but from which, by crystn. from ether, pure α,α' -acetaldehyde-glycerol β -benzoate (III), m. 84.8°, b_{20} 183° could be obtained. The higher boiling component, however, gave an oily α,β -acetaldehyde-glycerol α' -benzoate (IV), b_{20} 173°, d_4^{25} 1.1663, n_D^{25} 1.5100. On hydrolysis with aq. KOH and continuous extrn. with ether, both acetaldehyde-glycerols were prepd. from the benzoates, I, b_{760} 187°, and II, b_{760} 176°. With PhNCO and a splinter of Na I and II were converted into α,α' -acetaldehyde-glycerol- β -phenylurethan, m. 134°, and α,β -acetaldehyde-glycerol- α' -phenylurethan, m. 129°. The constitution of the benzoates could not be elucidated by splitting off the AcH group with HCl in acetone in both cases glycerol α -monobenzoate being formed by migration of the acyl group in one case. Their constitution was therefore proved by independent syntheses: α -benzoylglycerol (12 g.) was acetalized with 92% yield by means of paraldehyde (80 g.) and HCl (1%) during an hr. at room temp. product being obtained which was identical with the liquid benzoate mentioned above (IV), and showing b_{20} 173°, d_4^{25} 1.1660, n_D^{25} 1.5093. A migration of the Bz group is not probable in this case since Fischer was able to acetalize α -benzoylglycerol with acetone in this way without migration of the Bz group. The solid acetal benzoate (III) could be synthesized from α,α' -di(triphenylmethyl)glycerol, prepd. according to Helferich's method (C. A. 17, 2574; 22, 59), on dissolving this compd. (15 g.) at 0° in 5 cc. paraldehyde contg. the theoretical quantity of HBr for the removal of both the Ph₃C groups and after standing for 24 hrs. at room temp., the free acid was neutralized with K₂CO₃. The acet- and paraldehyde were removed by distn. in a vacuum, sublimation of the residue gave 2.9 g. pure III, m. 85°; yield 85%. The acetaldehyde glycerols are very sensitive to traces of HCl; with mixts. contg. HCl in the ratio 1:20,000 occurs, a rise of the d. which, in most cases, has already reached a max. within an hr. Most probably in equil. occurs between the isomerides but the high d. shows that other changes must occur simultaneously and van R. thinks it probable that compds. from 2 mols. of glycerol and 1 mol. of AcH are also formed in this process. In order to investigate the equil. between I and II an arbitrary mixt. was treated with 1% dry HCl and kept at a definite temp. for some time, after which it was benzyolated with BzCl and quinoline. The mixt. of the benzoates III and IV was detd. off in a vacuum in order to get rid of the higher condensation products and then subjected to thermal analysis, the following setting points found with various t_c of III being detd.: 100, 84.82°; 90.18, 84.26°; 97.74, 83.57°; 96.03, 82.76°; 93.81, 81.76°; 90.92, 80.32°; 89.00, 79.52°; 85.02, 77.63°; 80.28, 75.01°; 75.22, 72.50°; 69.70, 69.99°; 66.62, 68.78°. Thus, at 179° no solid ester was obtained; at 135° only a trace; at 117°, 15.5%; at 100°, 16.3%; at 61°, 25.4%; at 43°, 32.5%; at 18°, 38.4% and at 0°, 44% of the solid benzoate, and it appears that at all these temps. the α,α' -acetaldehyde-glycerol is present to a smaller extent than the corresponding 5-ring compd., the quantity of the latter increasing rapidly with rising temp. and the best yield of the 6-ring being obtained at low temp. The case of formalglycerol is simpler than the one discussed above, since *cis*- and *trans*-isomerism is excluded. Moreover, Schulz and Tollens (Ann. 289, 29(1896)) had already demonstrated that in the prepn. of this compd. 2 isomers are formed, one giving a liquid benzoate and the 2nd giving a solid benzoate, m. 71°. van R. obtained a 50% yield of formalglycerol, b_{760} 193–4°, from glycerol and

ether liquor, until the phys. consts. did not change any more, α,β -formaldehyde- α' -benzoylglycerol (VI) was obtained as an oil, b_{20} 173°, d_4^{25} 1.2011, n_D^{25} 1.5194. On alk. hydrolysis V yielded α,α' -formaldehyde-glycerol (VII), b_{760} 193.8°, b_{20} 94°, d_4^{25} 1.2200, n_D^{25} 1.4527, and VI gave α,β -formaldehyde-glycerol (VIII), b_{760} 192.5°, b_{20} 93°, d_4^{25} 1.2008, n_D^{25} 1.4469. From VII α,α' -formaldehyde-glycerol β -phenylurethan, m. 133°,

and from VIII α,β -formaldehyde-glycerol α' -phenylurethan, m. 72° , were prepd. in the way described above for the corresponding AcH derivs. The interaction of α -benzoylglycerol, HCHO and HCl at 100° gave VI, but a better yield and a purer product are obtained starting from acetoneglycerol- α -benzoate, thus showing that VI and VIII possess a 5-ring structure. Since there are no other possibilities, V and VII must have a 6-ring structure. Although the formalglycerols are much more stable compds. than the acetaldehyde-glycerols, they are affected by acids at low temp., not only interconversion of the isomers occurring, but also formation of by-products, which are formed to a much greater extent than in the case of the acetaldehyde-glycerols (up to 40%).

C. F. VAN DUIN

Synthetic glycerides. I. Preparation and melting points of glycerides of known constitution. H. P. AVERILL, J. N. ROCHE AND C. G. KING. Univ. of Pittsburgh *J. Am. Chem. Soc.* **51**, 866-72(1929).—After consideration of various methods, Fischer's (*C. A.* **21**, 687) is chosen for the prepn. of pure glycerides of known constitution. In the prepn. of α -monoglycerides acetoneglycerol and quinoline (or C_8H_5N) were treated with the acid chloride, the base removed with 0.5 N H_2SO_4 and the acetone complex hydrolyzed by HCl or H_2SO_4 (full details given for α -monomyristin); the following were prepd. in this manner: α -monoacetin; α -monocaprin, m. 51.4° ; α -monolaurin, m. 63.0° ; α -monomyristin, m. 67.3° ; α -monopalmitin, m. 77.0° ; α -monostearin, m. 81.0° . References are given to other m. ps. recorded in the literature for these and other compds. mentioned below. α,α -Diglycerides were prepd. by reacting α iodo-hydrin and the acid chloride with quinoline and removing the I by refluxing with $AgNO_3$ in EtOH and H_2O for 1 hr. (full details are given for α,α -dilaurin); the following were prepd.: α,α -dilaurin, m. 56.6° ; α,α -distearin, m. 79.1° ; α,α -dipalmitin, m. 69.5° ; α,α -dimyristin, m. $63.8-64.4^\circ$. In the prepn. of triglycerides the monoglyceride is treated with 2 mols. of the acid chloride and quinoline or the diglyceride is treated with 1 mol. acid chloride; the following were prepd.: β -stearo- α,α -dilaurin, m. 45.6° ; α -stearo- α,β -dilaurin, m. 50.9° ; β -lauro- α,α -dimyristin, m. $49.2-49.5^\circ$; α -lauro- α,β -dimyristin, m. 48.5° ; β -palmito- α,α -dimyristin, m. $59.8-60^\circ$; α -palmito- α,β -dimyristin, m. 53.0° ; β -stearo- α,α -dipalmitin, m. 64.8° ; α -stearo- α,β -dipalmitin, m. 62.6° ; β -aceto- α,α -dipalmitin, m. 54.0° ; α -aceto- α,β -dipalmitin, m. 51.2° ; β -capro- α,α -dipalmitin, m. 66° ; α -capro- α,β -dipalmitin, m. 60.0° ; β -lauro- α,α -dipalmitin, m. $63.5-4^\circ$; α -lauro- α,β -dipalmitin, m. 54.5° ; β -myristo- α,α -dipalmitin, m. $58.5-9^\circ$; α -myristo- α,β -dipalmitin, m. 55.5° ; β -aceto- α,α -distearin, m. 62.7° ; α -aceto- α,β -distearin, m. 56.6° ; α -lauro- α,β -distearin, m. 50.9° . α -Iodo- α,β -dilaurin, m. 25.5° . The sym. isomer in each of 9 sets of isomeric triglycerides had a higher m. p. than that of the unsym. isomer.

C. J. WEST

The configurational relationship of 3-hydroxybutyric and 3-chlorobutyric acids. With a further note on the configurational relationship of 3-hydroxybutyric acid and methylpropylcarbinol. P. A. LEVENE AND H. L. HALLER. Rockefeller Inst., N. Y. *J. Biol. Chem.* **81**, 425-33(1929); cf. *C. A.* **23**, 1388.—The configurational relationship of I and II was confirmed by the following set of reactions:

The following compds. were prepd. and described: Δ^1 -4-pentenol-(4), α -naphthylurethan of *l*- Δ^1 -4-pentenol, *d*- Δ^1 -4-chloropentene, *d*-3-chlorobutyric acid, *l*-2-pentanol, its α -naphthylurethan and *l*-3-hydroxybutyric acid.

A. G.

Nitrogen trichloride and unsaturated acids. GEORGE H. COLEMAN AND GEORGE M. MULLINS. Univ. of Iowa. *J. Am. Chem. Soc.* **51**, 937-40(1929); cf. *C. A.* **22**, 4459.— CCl_4 reacts with $MeCH:CHCO_2H$ in CCl_4 to form, among other products, α -chloro- β -dichloroaminobutyric acid, which is changed by HCl to β -amino α -chlorobutyric acid, m. $161-1.5^\circ$, isolated as the HCl salt; *Bs deriv.*, m. $174-4.5^\circ$. The structure of the acid was established by reduction to the corresponding NH_2 acid. Similarly

$\text{PhCH:CHCO}_2\text{H}$ and NCl_3 give β -amino- α -chloro- β -phenylpropionic acid, m. 199–200°; HCl salt, m. 228–30°; *Bz* deriv., m. 194–5°. C. J. WEST

Preparation of symmetrical methylisopropylhydrazine and methylisopropylidimide. HERMAN C. RAMSPERGER. Stanford Univ. *J. Am. Chem. Soc.* 51, 918–21 (1929).— BzNHNbZCHMe_2 , Me_2SO_4 and NaOH give 70% of BzMeNnbZCHMe_2 , m. 76.25–6.75°; hydrolysis with 5 parts concd. HCl on the H_2O bath gives 50% of methylisopropylhydrazine, isolated from the acid soln. by adding concd. NaOH in a N atm. and drying with Al-Hg , b_76 100.2° \pm 0.5°, d. 0.7959 \pm 0.0005, heat of vaporization 9150 cal. per mol. Oxidation with 30% H_2O_2 at 0° in a N atm. gives 25% of methylisopropylidimide, b. 46.0° \pm 0.5°, heat of vaporization 7350 cal. per mol. Preliminary measurements on its decompn. show that it decomp. in a homogeneous, unimol. manner, giving about 2 mols. for each mol. of azo compd. It decomp. at about the same rate at 300° as the di-Me deriv. does at 320° and the diiso-Pr deriv. at 280°. It deviates from the unimol. rate const. only at pressures below several mm. C. J. WEST

The dissociation constants of certain amino acids. PAUL L. KIRK AND CARL I. A. SCHMIDT. Univ. of Calif. *J. Biol. Chem.* 81, 237–48 (1929).—Titration curves of serine, norleucine, isoleucine, valine, hydroxyproline, glutamic acid and β -hydroxyglutamic acid are given and their dissocn. consts. detd. ARTHUR GROLLMAN

The dissociation constants of ornithine. WERNER SCHMIDT, PAUL L. KIRK AND CARL I. A. SCHMIDT. Univ. Calif. *J. Biol. Chem.* 81, 249–50 (1929).—Titration curves of ornithine are given and its dissocn. consts. calcd. ARTHUR GROLLMAN

Residual affinity and coordination. XXXI. Molybdenyl bis- β -diketones. GILBERT T. MORGAN AND REGINALD A. S. CASTELL. Univ. of Birmingham, England. *J. Chem. Soc.* 1928, 3252–6; cf. *C. A.* 22, 1294.—M. and C. have found that molybdous acetylacetone, $\text{Mo}(\text{C}_5\text{H}_7\text{O}_2)_2$, described by Gach (*Monatsh.* 21, 112 (1900)) is identical with molybdenyl bisacetylacetone, $\text{MoO}_2(\text{C}_5\text{H}_7\text{O}_2)_2$ (I), described by Rosenheim and Berthelm (*Z. anorg. Chem.* 34, 439 (1903)). M. and C. have prepd. I as follows: by leaving MoO_3 (II) and CH_3Ac (III) in a closed vessel for 4 days; by heating II and III in EtOH in a stream of CO_2 ; by heating $\text{MoO}_3 \cdot 2\text{H}_2\text{O}$ with III in EtOH . The product in every case was I. I m. 175° and decomp. above 230°. Gach's results were probably due to the presence of a small quantity of Mo_2O_3 . The following molybdenyl compds. were prepd.: bispropionylacetone, recrystd. from EtOH , was brown and m. 185°, recrystd. from CHCl_3 was green and m. 130°; bisdiisopropylmethane, brown, m. 78°, bis-3-ethylacetylacetone, brown; bisbenzoylacetone, brown, m. 98°; bisdibenzoylmethane, brown, m. 112°. When $\text{MoOCl}_4 \cdot 4\text{H}_2\text{O}$ was heated with III in EtOH for several hrs., the product was molybdenyl acetylacetone, $\text{MoO}(\text{C}_5\text{H}_7\text{O}_2) \cdot 2.5\text{H}_2\text{O}$ (IV). IV decomp. at about 150°. Heated in air at 120° IV gave a green residue which decompd. at 150°. Analyses of this residue indicated a deriv. of quinquivalent Mo. L. K.

Properties and chemical constitution of glucic acid. E. K. NELSON AND C. A. BROWN. U. S. Dept. Agr. *J. Am. Chem. Soc.* 51, 830–6 (1929).—The unstable Ca salt of an acid, originally described by Winter under the name of glucic acid (*Z. Ver. Rubenzucker Ind.* 44, 1049 (1894)), was prepd. by the action of $\text{Ca}(\text{OH})_2$ upon dextrose in H_2O at 67° in the absence of air. The pptd. Ca compd. absorbed O rapidly from the air with decompn. and evolution of heat. The Ca salt, after decompn. with H_2SO_4 and extrn. with Et_2O , yielded a small amt. of cryst. unsatd. acid, corresponding to the formula $\text{C}_6\text{H}_8\text{O}_6$, which, from its strong reducing power, I absorption and other properties is in all probability the enolic form of $\text{HO}_2\text{CCH}_2\text{CHO}$. The cryst. acid can be partially sublimed without decompn. but undergoes upon heating a considerable degree of polymerization. It yields HCO_2H and $(\text{CO}_2\text{H})_2$ upon oxidation and is exceedingly unstable in the presence of org. impurities. C. J. WEST

Hydrogen peroxide as an oxidizing agent in acid solution. IX. The oxidation of keto acids. W. B. HATCHER AND A. C. HILL. McGill Univ., Montreal. *Trans. Roy. Soc. Can.* [3], 22, III, 211–20 (1928); cf. *C. A.* 22, 1136.—1. Pyruvic acid. Purified AcCO_2H was prepd. and exptl. analyses indicated that oxidation by peroxide and acid KMnO_4 were the only reliable methods for estg. this acid. Further expts. with peroxide showed that HCl retards the oxidation, that AcCO_2Na is more rapidly oxidized than the acid and the latter was about 12 times as reactive toward H_2O_2 as glyoxylic acid. Increasing the concn. of H_2O_2 increased the rate of oxidation of the acid. The mechanism of the oxidation implies the formation of a complex $\text{AcCO}_2\text{H} \cdot \text{H}_2\text{O}_2$ which breaks down rapidly to AcOH and CO_2 . 2. Mesoxalic acid. Aq. solns. of the acid were prepd. from the purified Ba salt and H_2SO_4 . The rate of oxidation by acid (H_2SO_4) KMnO_4 increased as the concn. of mineral acid was increased, but not so rapidly as with AcCO_2H . Oxidation of mesoxalic acid by H_2O_2

was found to be retarded by mineral acids, to increase with the concn. of H_2O_2 and with rise in temp. The Na salt resembled in its reactions those of formic and oxalic acids. Mesoxalic acid is about 0.2 as reactive toward H_2O_2 as is AcCO_2H . Calcg. the reaction as monomol. the value of K for the reaction H_2O_2 -mesoxalic acid is 9.5×10^4 .

Supposed α,β,β -trimethylglutaric acid of Noyes and Skinner. FRANCIS EARL RAY. Grinnell College. *J. Am. Chem. Soc.* 51, 930-2(1929); cf. *C. A.* 22, 945; Noyes and Skinner, *C. A.* 12, 478.—The explanation given by N. and S. for the formation of the unsatd. acid obtained by the decompn. of isoaminocamphononic acid with HNO_2 is shown to be based on an erroneous interpretation of the anal. data. No member of the trimethylglutaric acid series is formed on oxidation of this unsatd. acid. The decompn. of α,β,β -trimethyl- α -carboxyglutaric acid proceeds normally, giving α,β,β -trimethylglutaric acid whether decompn. is effected by heat alone or by heating the ester with HCl in a sealed tube at 200° .

The dehydrogenation of malic acid. AMANDUS HAHN AND W. HAARMANN. Inst. München. *Z. Biol.* 88, 91-2(1928); cf. *C. A.* 22, 3420.—After a mixt. of muscle, oxalacetic acid, semicarbazide and methylene blue was boiled to remove protein, it was filtered and the filtrate evapd. to dryness on a water bath. The semicarbazone contained in the residue was freed by digesting the latter with 50% H_2SO_4 at 50° for 0.5 hr. The resulting soln. was treated with anhyd. Na_2SO_4 , and the fine powder obtained was extd. with ether for 3 hrs. The ext. was evap. *in vacuo* at 25° and the residue in H_2O treated in the cold with $\text{PhNHNH}_2\cdot\text{HCl}$. Crystals of pyroracemic acid phenylhydrazone sepd. after a short time. In the presence of malic acid much more of this phenylhydrazone is obtained than without it. In the 3 instances given 95 mg., 95 mg. and 141 mg. were obtained as compared with 17, 28 and 30 mg.

Aconitic acids. I. Stereochemistry of the aconitic acids. R. MALACHOWSKI AND M. MASLOWSKI. Tech. Hochschule Warschau. *Ber.* 61B, 2521-5(1928). The work of M. and M. confirms the view of Feist that the isomerism of the aconitic acids is geometrical; the ordinary acid, m. $194-5^\circ$, is the more stable *trans* form (I), and the hitherto unknown *cis*-form (II) has now been prepd. by hydrolysis of the first known anhydride, the so-called "anhydro acid" (III). II m. 125° and is readily transformed into I either by fusion or by moderate heating in H_2O . It adds Br much more easily than I and its salts differ from those of I. With dehydrating agents it gives III exclusively; the isomeric "hydroxyanhydro acid" (IV), which is readily detected by its FeCl_3 reaction, is not formed even transitorily. This, together with the method of formation of II, shows conclusively that III is the true anhydride of II. As regards Thorpe's "labile" acid, m. 173° , M. and M. believe that it should be stricken from the literature as a chem. individual. Numerous attempts to repeat the work of Bland and Thorpe on the hydrolysis of IV always gave a somewhat impure and, therefore, low melting I; moreover, the alleged "labile" acid differs surprisingly little from I in its properties as described by B. and T. IV, which can be obtained only from I and regenerates I on hydration, must be the true anhydride of I. Aconitic acid is, therefore, not sym. and that substitution of a Me group in either the α - or β -position gives the same methylaconitic acid is readily explained by the assumption of a secondary rearrangement, under the conditions of the expt., of the less stable form. III seps from C_6H_6 with 0.5 mol. solvent which it loses in dry air and then m. 78.85° (cor.) **Dibromide of II** (not obtained pure; found, 46.23% Br), m. $117-20^\circ$. **Na salt of II**, glassy film, slowly drying to a white powder; **Ba salt**, flocculent ppt. still contg. 2 H_2O after drying at 105° ; **Cu salt**, changes at 70° in soln. into the blue-green salt of I. **II. Constitution and method of formation of the aconitic anhydrides.** R. MALACHOWSKI, M. GIEDROYC AND Z. JERZMANOWSKA. *Ibid* 2525-38.—Pfeiffer and Bottler have shown that maleic anhydride and its derivs. form deeply colored, quinhydrone-like addn. products with many aromatic compds., and as the authors found that the *cis*-aconitic anhydride (III) at once gives with PhNMe_2 a deep red, with hydroquinone in Et_2O a yellow color similar in appearance and intensity to the colors produced by citraconic anhydride, they conclude that of the 2 possible formulas (V and VI) for III, V is the correct one, as had already been assumed by Easterfield and Sell. The choice between formulas VII and VIII for the *trans*-compd. (IV) is more difficult. There are theoretically possible 6 isomeric mono-Me aconitatu., all 6 of which have been prepd. The α -*cis*-ester (IX) was obtained by methylating III with CH_3N , to the anhydro ester (X) and hydrolyzing the latter; the resulting IX readily regenerates X. Addn. of MeOH to III gave an ester mixt. sepd. by means of Et_2O into an ester (XI) and a smaller quantity of an isomer (XII) less sol. in Et_2O . With Ac_2O , XI gave no product which

the calcd. quantity of diazotized PhNH_2 , yellow, m. $172-2.5^\circ$, gives no color with FeCl_3 . *Me 6-hydroxy- α -pyrone-4-carboxylate* (XVI), m. $90-1^\circ$, forms a greenish yellow soln. in H_2O , gives an emerald-green color with FeCl_3 and a red-orange lignin reaction, at once forms XVII with diazotized PhNH_2 . *Me 6-methoxy- α -pyrone-4-carboxylate* (XIX) (yield, 60%), m. $77-8^\circ$. XX (4.7 g. from 3 g. IV), flocks (still impure; found 18.82, 0.83, 60.04% C, H, Br, resp.) from C_6H_6 , m. 122° , gives in H_2O with IV an intense red color; the Br cannot be removed even in part with Cu bronze or Ag.

C. A. R.

The formation of cyanogen by oxidation of hydrocyanic acid. B. RICCA AND F. PIRONE. *Ann. chim. applicata* 18, 550-5(1928).—The oxidation of HCN in acid ($\text{N H}_2\text{SO}_4$) soln., yielded some $(\text{CN})_2$ with many oxidants: $2\text{HCN} \xrightarrow{\text{O}_2} \text{H}_2\text{O} + (\text{CN})_2$. With HCN, KCN, $\text{K}_4\text{Fe(CN)}_6$ and $\text{K}_3\text{Fe(CN)}_6$ as the source of cyanide, various oxidizing agents were added and the extent of the oxidation reaction was measured by detg. the ratio of $\text{HCN}/(\text{CN})_2$ in the product.

Ratios of $\text{HCN}/(\text{CN})_2$ using

Oxidant	HCN	KCN	$\text{K}_4\text{Fe(CN)}_6$	$\text{K}_3\text{Fe(CN)}_6$
$\text{Na}_2\text{S}_2\text{O}_8$	9.39	1.95	0.65	0.13
H_2O_2	—	7.17	0.97	0.96
KMnO_4	(no $(\text{CN})_2$ formed)	10.57	5.06	0.19
$\text{K}_2\text{Cr}_2\text{O}_7$	180.8	20.70	8.82	(trace $(\text{CN})_2$ formed)
MnO_2	13.14	13.34	1.75	1.49
PbO_2	5.59	0.78	0.90	0.73
SnO_2	8.10	8.00	5.75	2.66

Temp. and the concn. of the reagents are very important in detg. the equil. conditions, i. e., increasing concn. of H_2SO_4 favors formation of $(\text{CN})_2$ as when PbO_2 acts on $\text{K}_4\text{Fe(CN)}_6$ (with 1:1 H_2SO_4) the ratio $\text{HCN}-(\text{CN})_2 = 0.16$ compared with 0.73 above.

A. W. CONTIERI

Synthetic carbamide from ammonia and carbon dioxide. G. A. YAKOVKIN. *J. Applied Chem. (Russia)* 1, 70-7(1928).—Urea was obtained from liquid NH_3 satd. with CO_2 under pressure without supercooling, followed by heating to $160-170^\circ$ (to convert the carbamate into carbamide) and increase of pressure up to 75-80 atm. A yield of 40% was obtained under the above conditions; various catalysts did not affect the result. The autoclave had to be made of Krupp's V4A steel to decrease the corrosion effect.

G. FABIAN

The reaction of carbon disulfide with some diamines and guanidines. FRICH STRACK. *Univ. Greifswald. Z. physiol. Chem.* 180, 198-211(1929).—Aliphatic diamines add CS_2 to 1 NH_2 group to form dithiocarbamic acids of the type $\text{H}_2\text{N}(\text{CH}_2)_x\text{NHCS}_2\text{H}$. These acids form an inner salt between the CS_2H and the remaining NH_2 group, analogous to the salts of the dithiocarbamic acids of monoamines with a 2nd mol. of the amine. When heated there is a tendency to ring closure by loss of H_2S , provided the resulting ring does not contain more than 7 members. The diguanides, which are analogous to the diamines, form only trithiocarbonates of the base. δ -Aminobutyl-N-dithiocarbamic acid, m. 173° (evolution of H_2S), was obtained by warming putrescine in EtOH with CS_2 and recrystg. the ppt. from hot H_2C . Heated 10 hrs. in alc. suspension at 100° it yielded tetramethylenethiourea, m. 177° , and H_2S . ϵ -Amino-*amyl-N-dithiocarbamic acid* was obtained in the same manner from cadaverine and CS_2 but could not be crystd. It formed a cryst. Ba salt which was not analyzed. The

diguanides were prepd. by adding the free diamine to $\text{H}_2\text{NC}(\text{:NH})\text{SEt.HBr}$ in alc., allowing the mixt. to stand 5 days, then acidifying with HBr and evapg. *in vacuo*. The products are best isolated through the sulfates by treatment of the HBr salts with Ag_2SO_4 , removing the Ag from the filtrate by H_2S and evapg. to crystn. To prep. the free bases the sulfates are treated with $\text{Ba}(\text{OH})_2$. 1-Guanido-3-aminopropane-2HBr, m. 116° ; sulfate, m. 265° ; free base is a hygroscopic sirup. 1,3-Diguanidopropane-2HBr, m. 218° ; sulfate, sinters 260° and m. 270° ; free base, m. 135° . 1,4-Diguanidobutane-2HBr, sinters 205° and m. 212° ; sulfate, m. 297° ; free base, m. 190° , is hygroscopic. 1-Guanido-5-aminopentane-2HBr, m. 105° ; sulfate, m. 284° ; free base did not cryst. 1,5-Diguanidopentane-2HBr, sinters 212° and m. 217° ; sulfate, m. 317° ; free base, m. 173° (foaming). By heating the free bases with CS_2 2 hrs. at 100° , their trithiocarbonates, all yellow or orange cryst. products, are obtained. Guanidine H_2CS_3 salt, sinters 125° and m. $133-5^\circ$. It is decompd. by dil. acids, including CO_2 , with liberation of 1 mol. H_2S . $\text{Pb}(\text{OAc})_2$ gives a red ppt. of PbCS_3 . 1,3-Diguanidopropane H_2CS_3 salt, m. 95° (decompn.); 1,4-diguanidobutane H_2CS_3 salt, m. 193° (decompn.); 1,5-diguanidopentane H_2CS_3 salt, m. 190° (decompn.). The monoguanides under the same treatment yield inner salts of dithiocarbamic acids; δ -guanidobutyl *N*-dithiocarbamic acid sinters 200° and m. 210° (foaming); ϵ -guanidoamyl-*N*-dithiocarbamic acid, m. 201° . These are sol. in dil. acid and alkali and pptd. cryst. from acid soln. by NH_4OH . A. W. DOX

Glucosides. I. Formation of glucosides from 3,4,6-triacetylglucose 1,2-anhydride. WILFRED J. HICKINBOTTOM. Birmingham Univ. *J. Chem. Soc.* 1928, 3110-7; cf. Brigl, *C. A.* 17, 1432. —Dry NH_3 was passed through 3,4,6-triacetylglucosyl chloride suspended in 8-10 parts of PhH for 3 hrs. After 15 hrs. the NH_4Cl was filtered off and the soln. freed of NH_3 *in vacuo* over H_2SO_4 ; PhH was partially evapd. and 3,4,6-triacetylglucose 1,2-anhydride (I), m. $57-8^\circ$, was pptd. by petroleum ether. I was treated with alcs. to form the following 3,4,6-triacetyl- β -alkylglucosides: Me, m. $95-7^\circ$, $[\alpha]_D^{20} 19^\circ$; Et (II), m. 121° , $[\alpha]_D^{20} 14.4^\circ$ in EtOH; *iso-Pr*, —; benzyl, —; *n*-butyl, m. 144° , $[\alpha]_D^{20} -10.6^\circ$ in PhH; Ph, —. Acetylation of these in $\text{C}_6\text{H}_5\text{N}$ with Ac_2O gave the corresponding 2,3,4,6-tetraacetyl- β -alkylglucosides: Me, m. $101-3^\circ$; Et, m. $105-6^\circ$; *iso-Pr*, m. $134-5^\circ$, $[\alpha]_D^{20} -23.4^\circ$ in EtOH; benzyl, m. $98-9^\circ$, $[\alpha]_D^{20} -44^\circ$ in EtOH; Ph, m. 112° , $[\alpha]_D^{20} 162^\circ$ in EtOH. II (0.76 g.) was dissolved in 18 g. of MeI and heated for 30 hrs. under a reflux with addn. of AgO; 10 g. of MeI was added and the heating continued for 10 hrs. Dilsn. with Et_2O , filtration and evapn. *in vacuo* gave a sirup which crystd. from alc. and proved to be the 2-Me deriv. of II. When treated with alc. NH_3 , this gave 2-methyl- β -ethylglucoside which was hydrolyzed with 0.7 *N* HCl to yield α - and β -2-methyl glucose (phenylhydrazone, m. $175-6^\circ$). Similar treatment with NH_3 gave β -benzyl glucoside, m. 119° , $[\alpha]_D^{20} -49^\circ$; β -menthylglucoside; and α -Ph glucoside hydrate, m. $155-60^\circ$, $[\alpha]_D^{20} 157^\circ$ in EtOH. A. S. CARTER

Determination of the structure of carbohydrates. WALTER N. HAWORTH. Birmingham Univ. *Bull. soc. chim.* 45, 1-21 (1929). —A lecture, Feb. 28, 1928, before the Strasbourg-Mulhouse section of La Société chimique de France. See *C. A.* 22, 2742. A. S. CARTER

Structure of normal monosaccharides. V. Lyxose. EDMUND L. HIRST AND JAMES A. B. SMITH. Birmingham Univ. *J. Chem. Soc.* 1928, 3147-54; cf. *C. A.* 22, 330, 3142 — α -Me lyxoside (7.2 g.) in 20 cc. of MeI was treated with 35 g. Ag_2O , giving 8.7 g. of trimethylmethyllyxoside (I), $b_{0.05} 70^\circ$, $n_D^{14} 1.4460$, $[\alpha]_D^{20} 10^\circ$ in H_2O , 37.3° in EtOH, largely the α -form. Heating 4 g. of I with 120 cc. of 6% HCl, neutralizing with BaCO_3 and extg. with CHCl_3 , gave 85% of trimethyllyxose (II), $b_{0.05} 90^\circ$, m. 79° , $n_D^{14} 1.4629$, $[\alpha]_D^{20} -22^\circ$ in H_2O . Ten g. of lyxose in H_2O was treated with 76 cc. of Me_2SO_4 and 140 cc. of 50% NaOH. The product was methylated with MeI, giving 10.6 g. of I, $[\alpha]_D^{20} -6^\circ$, hence contg. an excess of the β -form. Nine g. of II in 60 cc. of H_2O was treated with 8-10 cc. of Br at 35° , neutralized with Ag_2O ; the Ag pptd. as AgCl and the H_2O evapd. under reduced pressure. After heating at 100° (12 mm.), distn. gave 8 g. of trimethyl- δ -lyxonolactone (III), $b_{0.05} 105^\circ$, $n_D^{18} 1.4620$, $[\alpha]_D^{19} 35.5^\circ$ (initial), -9.3° (equil.); with PhNHNH_2 it gave 2,3,4-trimethyllyxononic phenylhydrazide, m. $180-1^\circ$. III was oxidized with HNO_3 (d. 1.42) at 90° ; HNO_3 was removed by distn. and the residue was boiled with 3% HCl in MeOH. Neutralizing with Ag_2O and distg. gave 76% of Me trimethoxyglutarate (IV), $b_{0.1} 100^\circ$, $n_D^{21} 1.4353$, $[\alpha]_D^{20} -39^\circ$ in MeOH, -31° in H_2O , which gave with NH_3 in MeOH trimethoxyglutaramide, m. 230° (decompn.), $[\alpha]_D^{20} -49^\circ$ in H_2O . MeNH_2 instead of NH_3 gave the meth. lamide, m. $171-2^\circ$. By similar oxidation, 1.6 g. of I gave 1.7 g. of IV. These products of

oxidation are evidence in support of the pyranose structure for α -Me lyxoside, for this method of oxidation has never been known to cause MeO migration. A. S. C.

The relationship of some complex natural products to the simple and amino acids. ROBERT ROBINSON. *Proc. Univ. Durham Phil. Soc.* 8, Part 1, 14-59(1927-1928).—While many natural products undoubtedly arise from formaldehyde units, it is probable that other unit structures are employed, and the application of the isoprene unit is now so well established that a new terpene structure will not meet with approval unless it can be derived by a fusion of isoprene mols. Animal and plant products can be classified according to the length and state of oxidation (which will be represented by S. O.) of the C chains. The hexose C_6 group is prevalent and often associates with a triose C_3 group which probably arises from glycerol. The S. O. is the no. of OH groups present in the satd. open-chain formula of the substance, the satn. and ring fission being brought by H_2O addn. Thus the S. O. of the $C:O$ group, the CO_2H group and C_6H_5 are 2, 3 and 4, resp., while the S. O. of a simple carbohydrate is $n + 1$, where n is the no. of C atoms in the mol. The conversion of dextrose (I) into kojic acid (II) by the action of various species of *Aspergillus* involves an increase in the S. O. from 7 to 8

As for the structures of chlorophyll and hemin, the substance III can be regarded as the progenitor, from which etioporphyrin and chlorophyll are derived by the loss of 4 and 2 mols. CO_2 , resp. By abstracting NH_3 from III, structure IV is obtained, which, by the addn. of 2 H_2O , leads to structure V, consisting of 4 chains of 9 C atoms each, whose S. O. is 9. This suggests that chlorophyll is derived from 4 mols. NH_3 , 4 mols. hexose, 4 mols. triose and 1 mol. MgO .

The natural products provide many cases of the assocn. of hexose and triose units, cinnamic acid, caffeic acid, coumarin, tyrosine and eugenol being examples of the C_6-C_3 models. This assocn. is probably the result of an aldol polymerization. In this polymerization, the S. O. of the mol. to which addn. occurs is reduced by 1 unit, while the S. O. of the addendum remains unchanged. In the formation of the C_6-C_3 model, the triose mol. attaches itself to the hexose and the S. O. of the hexose portion is reduced to 6. The following formula indicates the process of polymerization:

As a rule the triose fragment is present as a normal chain, but in a few compds., *e. g.*, tropic acid, $\text{PhCH(CO}_2\text{H)CH}_2\text{OH}$ (VI), the triose fragment occurs as a branched chain in the $\text{C}_6\text{—C}_3$ complex.

The flavones, the flavonols, the anthocyanins, also butein, phloretin and catechol are based on the $\text{C}_6\text{—C}_3\text{—C}_6$ model. As the hexose portion of the $\text{C}_6\text{—C}_3$ complex is incapable of further addn., it is probable that the $\text{C}_6\text{—C}_3\text{—C}_6$ model is derived by the addn. of another hexose mol. to the triose end of the $\text{C}_6\text{—C}_3$ model, in which case the S. O. of the triose portion will be reduced to 3. Such types are very common in nature and the groups occur in various S. O., the non-aromatic C_3 group exhibiting the greatest variation in this respect. Thus it is normal in butein, 2,4-(HO) $_2\text{C}_6\text{H}_3\text{COCH:CHC}_6\text{H}_3\text{(OH)(3,4)}$ (VII), oxidized in the flavones, flavonols and anthocyanidins of the general formulas VIII, IX and X and reduced in catechol (XI).

Prunetol (XII) and iridin contain a branched triose chain in their $\text{C}_6\text{—C}_3\text{—C}_3$ structure. In a similar manner the alkaloids appear to be derived from the amino acids of the C_6 and $\text{C}_6\text{—C}_3$ models. The occurrence of simple tetrahydroisoquinoline alkaloids such as anhalanine (XIII), alongside the corresponding phenylethylamine deriv. mezealme, 3,4,5-(MeO) $_3\text{C}_6\text{H}_2\text{CH}_2\text{CH}_2\text{NH}_2$ (XIV), suggests that the former arises from the action of HCHO on the latter and this process has been performed experimentally. The phenylethylamine derivs. and the more complex alkaloids probably arise from amino acid of the $\text{C}_6\text{—C}_3$ type and the norlaudanosine structure (XV) can be derived as follows:

The structure of papaverine, laudanosine, narcotine, hydrastine, berberine and the phenanthrene alkaloids can be derived from XV, while a polymerization of the 2 aromatic nuclei *a* and *b* will lead to structure XVI which has recently been proposed for morphine. Other alkaloids can be derived from the amino acids ornithine, $\text{H}_2\text{N(CH}_2\text{)}_3\text{CH(NH}_2\text{)CO}_2\text{H}$ (XVII), and lysine, $\text{H}_2\text{N(CH}_2\text{)}_4\text{CH(NH}_2\text{)CO}_2\text{H}$ (XVIII), and the formation of tropinone (XIX), hygrine (XX) and pelletierine (XXI) by the scheme suggested below has been partially imitated in the laboratory

(XVI)

(XIX)

The ornithine skeleton is also present in histidine, the lysine skeleton occurs in quinine, while nicotine contains both lysine and ornithine skeletons. Harmaline (XXIII) and physostigmine (XXIV) can both be derived from the amino acid tryptophan (XXII). The foregoing principles are a very valuable aid for diagnosing structures to be confirmed finally by synthesis.

ALBERT L. HENNE

The carbonyl number of some humic acids. H. LEOPOLD. *Brennstoff-Chem.* 9, 215-7(1928).—Carbonyl O₂ is detd. in 3 different samples of humic acids: (1) Merck's acid, (2) acid prepd. from starch and (3) Eller's acid, prepd. from hydroquinone. Two methods are used; one was based (Strache) on treatment with PhNHNH₂·HCl, forming a hydrazone with the CO groups, decompn. of excess PhNHNH₂ with Fehling's soln. and detg. N₂ evolved. In another method (Hoepner) NH₂OH·HCl was allowed to act on the CO groups liberating HCl which could be titrated. The first method gave 1.27, 2.31 and 2.16% carbonyl O₂ resp. for the above acids; the second method gave 0.22, 0.40 and 0.35%. Such lack of agreement of methods is often observed when they are applied to the more complex org. compds. Probably all the CO groups were not attacked in the latter method.

J. D. DAVIS

Oxidation of methylpentonic acids by nitrous acid, and the reduction products of 5-ketorhamnolactone. E. VOTOČEK AND L. BENEŠ. *Prague Polytech. Bull. soc. chim.* 43, 1328-41(1928).—Finely powd. *ramnolactone* (I) (20 g.) was oxidized by adding it to 9.4 g. of N₂O₃ dissolved in 18 g. of cold H₂O; crystn. from this soln. and washing with EtOH and H₂O gave 61-71% of 5-keto-*l*-ramnolactone (II), m. 196°, [α]_D -24.7°, identical with Kiliani's (*C. A.* 17, 985). Mixing equiv. amts. of a 1:20 soln. of *p*-O₂NC₆H₄NHNH₂·HCl and II gave a yellow cryst. *p*-nitrophenylhydrazone of II, m. 176°. II was dissolved in 0.2 N NaOH, cooled and satd. with CO₂, at the same time adding 3% Na-Hg until reduced as indicated by a test with Fehling's soln. After acidifying with H₂SO₄ and concg. to a sirup, the soln. was extd. with EtOH which was then concd. *in vacuo* at 30-5° to give 4 fractions of crystals. Following the work of K., the fraction with the highest sp. rotation was reduced to the corresponding methylpentose, which proved to be *l*-ramnose and not *gulomethylse* as believed by K. Studying these fractions by repeated crystn. from 85% EtOH and Me₂CO, they were resolved into the following: (A) m. 186-9°, [α]_D -66.2°, 1.7 g.; (B) m. 144°, [α]_D -48.4°, 6 g.; (C) m. 156°, [α]_D -56.0°, 4.6 g.; (D) m. 138°, [α]_D -48.4°, 2.5 g. These were converted into phenylhydrazides. B was crystd. from EtOH giving

hydrazide of I, m. 195°, insol., and a sol. product which was combined with A, C and D and again sepd. from any remaining I. This was boiled with Ba(OH)₂ for 10 hrs., PhNHNH₂ was removed in Et₂O and the Ba pptd. with dil. H₂SO₄, giving upon evapn. and crystn. from 95% EtOH, a lactone, m. 153°, whose initial $[\alpha]_D$ -58.3° became -38.3° upon standing. Reduction of this with Na-Hg gave *d*-gulomethylose, $[\alpha]_D$ -17.1°; phenylosazone, m. 140-2°, $[\alpha]_D$ -0.23°.

A. S. CARTER

The "normal" structure of aldoses and ketoses. H. KILIANI. *Z. angew. Chem.* 42, 16-7(1929).—The results of oxidation of dextrose or levulose with Br or the addn. of HCN (cf. *Ann.* 205, 180(1880)) and subsequent reduction with HI of both reaction products shows that it is immaterial whether the lactone linking is on carbon atom 4, 5

or 6 in the formulas: $\overset{6}{\text{CH}_2(\text{OH})}\overset{5}{\text{CH}(\text{OH})}\overset{4}{\text{CH}}.\text{CH}(\text{OH}).\text{CH}(\text{OH}).\text{CHOH}$ and $\overset{6}{\text{CH}_2(\text{OH})}\overset{5}{\text{CH}}.\overset{4}{\text{CH}(\text{OH})}.\text{CH}(\text{OH}).\text{C}(\text{OH})\text{CH}_2\text{OH}$; in view of the generally accepted

lactone formulas it is now necessary to speak of the aldehyde C or ketone C rather than the aldehyde O or ketone O. The cyanohydrin formation is accelerated by the addn. of small amts. of NH₃ (cf. *Ber.* 21, 916(1888); *C. A.* 7, 476); this does not result

in the formation of an addn. compd. of the type RCH(OH)NH₂ since none of the addn. compds. of monoses and HCN contain the group :CHNH₂; it is believed that an NH₃ alcoholate is formed on the aldehyde C (I) or on the lactone C (II) which accelerates the HCN addn.; I is given preference.

N. A. LANGE

Hexosemonophosphate (Robison). P. A. LEVENE AND ALBERT L. RAYMOND. Rockefeller Inst., N. Y. *J. Biol. Chem.* 81, 279-83(1929).—"On the basis of the rate of hydrolysis of the Me glucoside of the Robison monophosphate it is concluded that the substance has the γ -lactal structure." Since it is also an aldose deriv., the H₃PO₄ radical must be attached to C atom 5.

ARTHUR GROLLMAN

Lignosulfonic acid obtained from spruce wood by the action of sulfurous acid in the presence of ammonia. CHARLES DORÉ and EUSTACE C. BARTON-WRIGHT. *J. Soc. Chem. Ind.* 48, 9-12T(1929); cf. *C. A.* 19, 2742. —A lignosulfonic acid (I), C₁₀H₄O₉, 2H₂SO₄, is obtained in the form of its NH₄ salt by the action of H₂SO₄ on spruce wood in the presence of 0.1-0.5% NH₃ on the liquor present. I was purified by dialysis, conversion to the β -C₁₀H₇NH₂ deriv., and subsequent resolution of this deriv. with pyridine. Analysis of I, and its reactions with BzCl and PhNHNH₂, showed it to contain the following groupings: C₁₀H₁₂O₂(SO₃H)₂(CHOH)(OH)₂(CO)(OMe)₂. Oxidation of I with 5% HNO₃ gives a nitro compd. (II), C₁₀H₁₀O₁₀N₂, contg. 2 CO and 2 NO₂ groups. Reduction of II with Mg replaces the NO₂ groups with CO groups.

FREDERICK C. HAHN

Highly polymerized compounds. XI. H. STAUDINGER AND R. SIGNER. Univ. Freiburg, B. *Helv. Chim. Acta* 11, 1047-51(1928).—The structure proposed by Ott (cf. *C. A.* 22, 1879), is correct for low mol. formaldehyde-diacetates, but it is not admissible that the highly polymerized insol. polyhydroxymethylenes be built of (CH₂O)₄ units, since such a unit should boil at about 100-50°. Moreover, x-ray investigations by Mie and Hengstenberg (cf. following abstr.), show that the mols. of such compds. are long fibers, whose elements are bonded together by ordinary valences. If the elementary cell of the lattice is (CH₂O)₄, the elementary mols. are longer than the elementary cells: the av. mol. wt. is about (CH₂O)₁₀₀, and the shorter mol. is not smaller than (CH₂O)₂₀.

ALBERT L. HENNE

Röntgenometric investigation of highly polymerized organic substances. G. MIE AND J. HENGSTENBERG. Univ. Freiburg, B. *Helv. Chim. Acta* 11, 1052(1928); cf. preceding abstr.—Criticism of the results published by E. Ott (cf. *C. A.* 22, 1879); the criticism is based on previously published work (Staudinger, *et al.*, *C. A.* 21, 2794 and II, *C. A.* 22, 728). The discussion refers chiefly to the appearance of a face 001 which the present authors believe to be an illusion. Highly polymerized hydroxy-

methylenes should be long fiber-like mols., possibly wound on helixes. The elementary unit is larger than $(CH_2O)_n$. ALBERT L. HENNE

Acetylation of beech wood. OTTO HORN. Kaiser Wilhelm-Inst. f. Kohlen-Forschung, Mülheim-Ruhr. *Ber.* 61B, 2542-5(1928).—When under the conditions employed by Fuchs in the acetylation of pine wood (*C. A.* 22, 2744) red beech wood sawdust is slowly added to Ac_2O and 0.25% H_2SO_4 there can be obtained without difficulty almost 150% of an acetylated wood retaining the wood structure unchanged and, except for a lighter color, identical in appearance with the original wood but which gives no color reactions with the usual reagents for detecting lignin. No appreciable quantity of any substance or substances can be removed from the product by simple extrn. with org. solvents. By a single acetylation of wood with an av. Ac content of 5.1% can be obtained an acetylwood with 42.2% Ac. The lignin content of the original wood is 25.6%, of the acetylwood 15.9%. The so-called hemicelluloses are probably in great part removed in the acetylation. The MeO content is not changed (6% in the original, 4% (instead of the expected 4.1%) in the acetylated wood). The original wood contained 67.4% cellulose as detd. by the Cross and Bevan method. In attempting to make the same detn. on the acetylwood there was obtained after 4 alternate treatments with Cl and Na_2SO_3 and 1 short bleaching with $KMnO_4$ 76% of a snow-white prepn. still having an almost unchanged wood structure. The same prepn. was obtained by the Schmidt ClO_2 method. The suspicion that only the lignin acetate is removed while the cellulose acetate remains was confirmed by analysis of the prepn., the results corresponding to an almost pure triacetylcellulose with 42.75% Ac, in the usual cellulose solvents this acetate was appreciably sol. (about 60%) only in $CHCl_3$ and $AcOH$. Comparison of these results with those obtained with pine wood shows no difference between the 2 woods (cf. the contrary findings of Suida and Titsch, *C. A.* 22, 4807). C. A. R

Decahydroquinoline and its derivatives. V. Synthesis of *trans-o*-dimethylamino-propylcyclohexane. SHIN-ICHIRO FUJISE. *Bull. Inst. Phys. Chem. Research* 8, 27-33 (1929), *Abstracts* 2, 2; cf. *C. A.* 23, 144.—*o*-Propylcyclohexanone oxime is reduced and methylated, giving *trans-o*-dimethylaminopropylcyclohexane. Δ^1 -Propylcyclohexene is obtained by dehydration of *o*-propylcyclohexanol. Also in *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) 10, 83-9(1929). ALBERT L. HENNE

The use of iodine-iron for chlorine transfer. H. F. FIERZ-DAVID. Tech. Hochschule, Zürich. *Naturwissenschaften* 17, 13(1929).—I combined with Fe is a most powerful catalyzer for chlorination of org. compds. One % Fe in any form and 0.1% I induce rapid chlorination at low temp. of compds. that otherwise act slowly at high temp. $p-ClC_6H_4NO_2$, *o*- and $p-MeC_6H_4NO_2$, $PhNO_2$ and paraffin are chlorinated at 40° to 50° with considerable heat effect, necessitating external cooling. The products obtained are unusually pure; other combinations I-Ni, I-Co, I-Sb, I-Sn, I-P, I-Zn, etc., did not give favorable results. The I-Fe combination dissolves rapidly with deep brown color and no I escapes with the HCl evolved. The action is comparable to that of other modern mixed catalyzers. B. J. C. VAN DER HOEVEN

The existence of steric hindrance in the sense of Victor Meyer. S. C. J. OLIVIER. Chem. Dept. of the Agr. Univ., Wageningen. *Rec. trav. chim.* 48, 227-36(1929).—Previous investigations of O. (*C. A.* 20, 2485, 3161) have shown that the ratio of the velocities of the hydrolysis of the *o*- and *p*-halogenated benzyl chlorides is the same for the Cl, Br and I compds. and from this fact it had been concluded that in this reaction a purely mech. steric hindrance in the sense of Victor Meyer does not occur. The same conclusion was also drawn (*loc. cit.*) from the investigation of 2,4-, 3,5-, and 2,6- $Br_2C_6H_3CH_2Cl$, the effect of both substituents being about the product of the sep. influences. These investigations had been carried out with 50% aq. alc. as the solvent (which may lead to erroneous results, alcoholysis taking place simultaneously with the hydrolysis. ABTRACTOR) and have now been repeated with 50% aq. acetone, with the following results, showing that the conclusions, drawn previously, need not be changed. At 60° the monomol. reaction consts. are: $PhCH_2Cl$, 0.00046; *p*-Br compd., 0.000234; *o*-Br compd., 0.000129; *m*-Br compd., 0.000093; 2,4- Br_2 compd., 0.000095; 2,6- Br_2 compds., 0.000055; 3,5- Br_2 compd., 0.000032. The present paper, however, principally deals with the hydrolysis of the mono- and dibromobenzoyl chlorides in 50% aq. acetone at 0°, the following monomol. reaction consts. being obtained (cf. also *C. A.* 21, 3356): $BzCl$, 0.026; *o*-Br compd., 0.035; *m*-Br compd., 0.044; *p*-Br compd., 0.024; 2,6- Br_2 compd., 0.00029; 2,4- Br_2 compd., 0.057; 3,5- Br_2 compd., 0.35. The fact that one Br atom in the *o*-position accelerates while two Br atoms in this position retard the reaction considerably clearly proves that we are dealing here with a pronounced case of steric hindrance in the sense of Victor Meyer. The large difference

in this respect between 2,6-dibromobenzyl and -benzoyl chloride is explained by O. as follows: the hydrolysis of benzyl chlorides takes place the more easily, the more easily the Cl atom in the side chain passes into the ionic state, whereas the hydrolysis of the benzoyl chlorides proceeds the more quickly the more easily a mol. of water is added to the C:O group (cf. *C. A.* 21, 3356) and the latter reaction will be hindered far more by 2 substituents in the *o*-positions than the first mentioned one. 2,6-Dibromobenzoyl chloride, prepd. from 2,6-Br₂C₆H₃CO₂H (*C. A.* 19, 1259) in the usual way, m. 47–8°; 3,5-dibromobenzoyl chloride was obtained from 3,5-Br₂C₆H₃Me (cf. *C. A.* 20, 2485), 5 g. of which in 85 cc. boiling AcOH were oxidized with 12 g. CrO₃ to 3,5-Br₂C₆H₃CO₂H, m. 218.5–9.5°, which was converted into the chloride, m. 42.5–43°, by means of PCl₅. The prepn. of 2,4-Br₂C₆H₃CO₂H is to be published later; with PCl₅ 2,4-dibromobenzoyl chloride, m. 50–1°, was obtained. C. F. VAN DUIN

The replaceability of the methoxy group in 1-methyl-3-methoxy-4,6-dinitrobenzene. J. G. KERKHOF. Leiden, The University. *Rec. trav. chim.* 48, 251–3 (1929).—The nitration of benzene derivs. may be accompanied by a replacement of a hydrocarbon group by a nitro group; e. g., 2-nitro-*p*-cymene on nitration yields a mixt. of 2,6-dinitro-*p*-cymene and 2,4-dinitrotoluene (Alfthan, *C. A.* 14, 2490). According to Barbier (*C. A.* 22, 1339) the nitration of 3,2-Me(Me₃C)C₆H₃OMe (I) yields 3,2,4-Me(O₂N)₂C₆H₂OMe (II), m. 101°, along with 3,2,4,6-Me(Me₃C)(O₂N)₂C₆HOMe (III). De Capeller, however, has replaced the MeO group in II by NH₂ (*C. A.* 22, 2935) and obtained 3,4,6-H₂N(O₂N)₂C₆H₂Me, m. 193°; thus probably Barbier's formula I is incorrect and to be replaced by 3,6-Me(Me₃C)C₆H₃OMe (IV), so that the nitration products are 3,4,6-Me(O₂N)₂C₆H₂OMe (V) and 3,6,2,4-Me(Me₃C)(O₂N)₂C₆HOMe (VI). The following facts indicate that the correct formula has been assigned to V by de Capeller: *a*: on heating V with alc. NH₃ at 100°, K. obtained 1-methyl-3-amino-4,6-dinitrobenzene, m. 195°; *Ac deriv.*, m. 102°; *b*: the same expt. with MeNH₂ gave 1-methyl-3-methylamino-4,6-dinitrobenzene, m. 173° (cf. Braky and Gibson, *C. A.* 15, 1280); *c*: with N₂H₄ V yields 1-methyl-3-hydrazino-4,6-dinitrobenzene, m. 195° (cf. Giua, *C. A.* 14, 1532). This hydrazine gives a benzal compd., m. 225°, and an acetone deriv., m. 142° (cf. Giua, *C. A.* 18, 1479). C. F. VAN DUIN

Configuration of the tervalent nitrogen atom. FRÈREJACQUE. *Compt. rend.* 187, 894 G (1928).—Various amines have been condensed with camphor- α -sulfonyl chloride, m. 88°, (amide, m. 143°, [α]_D²⁰ + 94° in H₂O), and thus are obtained the camphorsulfonyl derivs. of PhNH₂, m. 124°, [α]_D²⁰ –42.5° in EtOH; *o*-toluidine, m. 117°, [α]_D²⁰ –49.5° in EtOH; *p*-toluidine, m. 197°, [α]_D²⁰ –52.5° in EtOH; ethylaniline, m. 89°, [α]_D²⁰ –68° in C₆H₆. In neutral solvents, these derivs. are strongly *l*-rotatory, while the SO₂H acid, its Me ester, amide and chloride are *d*-rotatory, but in alk. soln. the anilides are *d* rotatory: this is explained by a conversion of the camphor part of the mol. into an enolic form. The rotation of the anilides increases proportionally to the amt. of alc. EtOH added until an equimol. proportion has been added, and then remains const. All attempts to isolate enantiomorphous forms of these compds. of tervalent N were unsuccessful, the rotation remaining unchanged after fusion for several hrs., or after repptn. by acids from their soln. in dil. alkalies. ALBERT L. HENNE

Reaction between aromatic nitro compounds and organomagnesium halides. HENRY GILMAN AND ROY MCCrackEN. Iowa State College. *J. Am. Chem. Soc.* 51, 821 30R (1929).—The products obtained in the reaction between aryl NO₂ compds. and RMgX vary markedly with exptl. conditions. Under the conditions of the expts. described in the present paper, the following general reaction takes place: PhNO₂ + 4PhMgBr \rightarrow Ph₂NH + PhOH + Ph₃. With alkylmagnesium halides, tetrasubstituted hydrazines are among the reaction products. EtMgBr and PhNO₂, e. g., give PhEt-NNEtPh. The formation of alkylanilines in this reaction is due in part to the decompn. of such hydrazines. The original should be consulted for the details of the expts. reported. C. J. WEST

Some of the reactions of 3-hydroxy-6-aminotoluene and certain of its derivatives. MARSHALL T. BOGERT AND GEO. H. CONNITT. Columbia Univ. *J. Am. Chem. Soc.* 51, 900–15G (1929).—3,6-HO(H₂N)C₆H₃Me.HCl (I) darkens above 250° and decompn. 290°. With BzH and AcONa there results nearly quant. 3-hydroxy-6-benzalamino-toluene, m. 135.5° (all m. ps. cor.); fusion with S gave a resin from which no thiazole could be isolated. The *salicylal deriv.*, red, m. 92.5°, with EtOH of crystn., or 111–1.5° likewise did not yield a thiazole deriv. The 6-Ac deriv., m. 125°; the *chloroacetyl deriv.*, pale brown, m. 133–3.5° (15% yield). 3,6-HO(H₂N)C₆H₃Me (II). C₆H₅(CO)₂ and C₆H₅, refluxed 1 hr., give 33% of *phthal-p*-hydroxy-*o*-tolil, m. 204°. Refluxing II with glacial AcOH, AcONa and Ac₂O gives 75% of 3-acetoxy-6-acetylamino-toluene, m. 127.5–8°. The action of Ca(ClO)₂ upon II in glacial AcOH gives 25% of

2,4-dichlorotoluquinone-6-acetamide, yellow, m. 159-9.5°, oxidized by dil. CrO_3 to 2,4-dichlorotoluquinone and reduced by SO_2 in EtOH to **2,4-dichloro-3-hydroxy-6-acetylaminotoluene**, m. 212-2.5°. **3-Hydroxy-5-nitro-6-acetylaminotoluene**, greenish yellow, m. 188.5° (62% yield on hydrolysis of the acetate with K_2CO_3); *Ac deriv.*, pale tan, m. 190-90.5°, results in 93% yield with fuming HNO_3 and Ac_2O , together with some 2,4-di- NO_2 deriv. **3-Hydroxy-2,4-dinitro-6-aminotoluene**, analyzed as the *HCl salt*, pale yellow, decomp. 200°; the free base, m. 166.5-7.5°; *Ac deriv.*, orange-yellow, m. 231° (decompn.); *acetate*, yellowish green, m. 170-70.5°. **3-Ethoxy-6-aminotoluene**, pale yellow oil, b. 253-5° (83% yield); *HCl salt*, m. 212°; *benzal deriv.*, bright yellow oil, b. 212-7° (80% yield); *salicyl deriv.*, yellow, b. 237-8°, m. 48.5°; *Ac deriv.*, m. 118.5°; soly. in 100 parts H_2O at 25°, 0.28 part; this could not be oxidized by KMnO_4 nor converted into the corresponding aldehyde. **6-Chloroacetyl deriv.**, m. 140.5-1°. **3-Ethoxy-6-salicylaminotoluene**, m. 153.4-4°. **Oxal-p-ethoxy-o-toluidide**, m. 205° (72% yield). **Phthal-p-ethoxy-o-tolil**, m. 140.5° (75% yield). **Et 2-methyl-4-ethoxyphenylacetyl-glycinate**, b. 210-2.5° (60% yield); this could not be converted into an indoxyl deriv. **2,4-Dichloro-3-ethoxy-6-aminotoluene**, m. 83°; *HCl salt*, m. 244°; 6-Ac deriv., m. 162.5-3° (75% yield by the action of HOCl on 3,6-EtO(AcNH)- $\text{C}_6\text{H}_3\text{Me}$). **3-Ethoxy-4-nitro-6-aminotoluene**, dark red, m. 86-7°; *HCl salt*, decomp. 249°; *Ac deriv.*, yellow, m. 192.5-3°. **3-Ethoxy-5-nitro-6-aminotoluene**, orange-red, m. 101-1.5°; *HCl salt*, decomp. 240°; *Ac deriv.*, yellow, m. 160°. **3-Ethoxy-2,4-dinitro-6-aminotoluene**, yellow, m. 96-7°; *HCl salt*, pale yellow, decomp. 195-7°; *Ac deriv.*, pale yellow, m. 167-7.5°. **3-Ethoxy-4,5-dinitro-6-acetylaminotoluene**, pale yellow, m. 257-8°. **3-Ethoxy-4,6-diacetylaminotoluene**, m. 200-200.5°. **3-Ethoxy-3'-hydroxy-6,6'-azotoluene**, brown, m. 132.5° (60% yield); the 3,3'-di-EtO deriv., yellow, m. 149-9.5° (62% yield). **3-Hydroxyethoxy-6-acetylaminotoluene**, m. 117.75°; **3-acetoxyethoxy-6-diacetylaminotoluene**, m. 117°. C. J. WEST

Alkylaryllead compounds. Anti-knock studies. HENRY GILMAN, O. R. SWEENEY AND J. E. KIRBY. Iowa State Coll. *Iowa State Coll. J. Sci.* 3, 1-4 (1928).—Four butyltriphenylleads have been prepd. from the appropriate Grignard reagent and Ph_3PbBr . **Butyltriphenyllead (I)**, **isobutyltriphenyllead (II)** and **sec-butyltriphenyllead (III)** were prepd. by refluxing the appropriate mixts. for about 90 mins. and then hydrolyzing by means of iced NH_4Cl soln. After evapn. of the ether and recrystn. of the residue from EtOH, I was obtained as a white cryst. substance, m. sharply 47°, II, fine needles, m. sharply 68-8.5°, and III, m. 84°. The yields were: 66.5, 80.6 and 64.4%, resp. **Tertbutyltriphenyllead (IV)** was prepd. in the same way. At first the Ph_3PbBr was added to the Grignard reagent. The ether ext. gave a yellow solid, m. about 95°. After recrystn. from EtOH and C_6H_6 the m. p. was 150°. From the mother liquor by diln. with EtOH were obtained crystals which agreed in properties and analysis with **triphenyllead, Ph₃Pb**. Second, the Grignard reagent was added to an excess of the Ph_3PbBr . The insol. solid resulting from hydrolysis was extd. with hot EtOH and repeatedly recrystd. from EtOH. In this manner IV was obtained as white crystals, m. 150-0.55°. The yellow solid which resulted from the evapn. of the ether was unstable in hot EtOH. IV is the first reported organolead compd. having a tertiary radical attached directly to the Pb. F. E. BROWN

Organo-antimony compounds. III. SUDHIR CHANDRA NIVOGY. Univ. Coll. of Science, Calcutta. *J. Indian Chem. Soc.* 5, 753-7 (1928); cf. C. A. 22, 4112. This work was undertaken to det. the constitution of Brahmachari's "urcastibamine" (I). A mixt. of 4- $\text{H}_2\text{NC}_6\text{H}_4\text{SbO}_3\text{H}_2$ (II) and urea in H_2O was heated on a water bath 3-4 hrs. and left to stand overnight. The solids present were removed by filtration, and from the soln. was obtained $\text{H}_2\text{NCONHC}_6\text{H}_4\text{SbO}_3\text{HNH}_2$ (III), which is the carbamino deriv. of the NH_4 salt of II. III was also obtained by the action of the Na salt of II with KOCN in H_2O contg. a small quantity of AcOH . III is identical in chem. and physiol. properties with I. The Na and K salts corresponding to III were also prepd., and unlike III were found to have no marked action on the kala-azar parasites. LOUISE KELLEY

Action of bases on certain mercurated anilines. FRANK C. WHITMORE, E. R. HANSON AND F. L. CARNAHAN. Northwestern Univ. *J. Am. Chem. Soc.* 51, 894-900 (1929).—*p*- $\text{AcOHgC}_6\text{H}_4\text{NH}_2$ (5 g.) and 2 g. NaBr in 1500 cc. H_2O , refluxed 3 hrs., give 1.8 g. *p*-bromomercurianiline, m. 181°; the *p*-I deriv., m. 165°. Refluxing 1 mol. *p*- $\text{AcOHgC}_6\text{H}_4\text{NH}_2$, 32 mols. KOH , 100 mols. EtOH and 100 mols. H_2O 30 min. gives a yellow ppt., which is not the Hg bis-compd.; its true formula is unknown. By mercurating the *N*-disubstituted anilines with $\text{Hg}(\text{OAc})_2$ in H_2O , EtOH and AcOH , the following *p*-acetoxymercurialkylanilines were prepd.: *di*-Me, m. 165°, 82% yield; *di*-Et, m. 105°, 51%; *di*-Pr, m. 99°, 90%; *di*-Bu, m. 89-90°, 91%; *MeEt*, m. 92-3°.

85%; *benzylethyl*, m. 92–4°, 72%. Refluxing these compds. with CaCl_2 and NaBr in EtOH or treating with NaI in cold Me_2CO , gives the following derivs.: *Cl compds.*: *di-Pr*, m. 170–2°; *di-Bu*, m. 162–3°; *MeEt*, m. 162–6°; *benzylethyl*, m. 150–1°; *Br compds.*: *di-Et*, m. 158°; *di-Pr*, m. 165–7°; *di-Bu*, m. 164–5°; *MeEt*, m. 154–5°; *benzylethyl*, m. 155°. *I compds.*: *di-Et*, m. 120–1°; *di-Pr*, m. 159°; *di-Bu*, m. 151°; *MeEt*, m. 137–8°; *benzylethyl*, m. 132–4°. *Hg-bis compds.*, $(\text{R}_2\text{NC}_6\text{H}_4)_2\text{Hg}$, were prepd. from the *Ac* derivs. by the action of alc., KOH , NaI (excess) in cold Me_2CO and $\text{Na}_2\text{S}_2\text{O}_3$ in cold concd. aq. soln. The following m. ps. are recorded: *di-Me*, 168–9°; *di-Et*, 160–1°; *di-Pr*, 86°; *di-Bu*, 80–1°; *MeEt*, 133–5°; *benzylethyl*, 125–6°. In the reaction the HgO is partly converted to Hg_2O or Hg and partly to the very slightly sol. ethane hexamer carbide.

C. J. WEST

The relationship between constitution and taste among some derivatives of urea. H. THATE. Leiden, The University. *Rec. trav. chim.* 48, 116–20(1929).—Several asymm. ureas have a sweet taste, e. g., dulcin (cf. Thomson, *Z. angew. Chem.* 37, 810 (1924)), α -dimethylurea (*Rec. trav. chim.* 2, 121(1883); 3, 223(1884)), etc. Further it has already been shown that the introduction of a *Me* group intensifies the sweetness of the taste, α -methyl- α -phenylurea being sweeter than dulcin (Bergmann, Camacho and Dreyer, *C. A.* 17, 996). In order to investigate the latter subject more fully, T. has prepd. phenylurea, α -methyl- α -phenylurea, 4-methylphenylurea and α -methyl- α -4-methylphenylurea and it was found that generally the introduction of a *Me* group intensifies the sweetness of the taste. While phenylurea itself is not sweet, but bitter, PhNMeCONH_2 is sweet, $p\text{-MeC}_6\text{H}_4\text{NHCONH}_2$ is quite sweet and $p\text{-MeC}_6\text{H}_4\text{NMeCONH}_2$ is very sweet. α -Methyl- α -phenylurea, prepd. from PhNHMe.HCl and KCNO (cf. *Ber.* 17, 2095(1884)), m. 82°, a small amount of α -methyl- α -phenylbiuret, m. 156°, being formed at the same time. 4-Methylphenylurea, obtained in a similar way from $p\text{-MeC}_6\text{H}_4\text{NH}_2\text{.HCl}$ and KCNO , m. 176°, while the interaction of $\text{MeC}_6\text{H}_4\text{NHMe.HCl}$ and KCNO gave α -methyl- α -4-methylphenylurea, m. 103°, together with some α -methyl- α -4-methylphenylbiuret, m. 167°. The $p\text{-MeC}_6\text{H}_4\text{NHMe}$, b. 208–11°, required for this investigation, was obtained by first prep. the *Na* deriv. of $p\text{-MeC}_6\text{H}_4\text{NHAc}$ from the components in boiling xylene, followed by treatment with MeI and sapon; yield 10 g. from 25 g. of $\text{MeC}_6\text{H}_4\text{NHAc}$, 7 g. of *Na* and 28 g. of MeI (cf. *Ber.* 10, 327(1877); 21, 1103(1888)). In agreement with Schiff's observations upon aromatic derivs. of biuret (*Ann.* 299, 253(1897); *C. A.* 1, 1700), neither α -methyl- α -phenylbiuret, nor α -methyl- α -4-methylphenylbiuret give the biuret reaction.

C. F. VAN DUIN

Synthetic preparation of dulcin (*p*-phenetylurea). JOSÉ UHTHOFF AND GABRIEL MORAGAS. *Quim. Ind.* 5, 207–10(1928).— EtBr is made either from Br_2 and EtOH or from EtOSO_3H and NaBr by the usual method. Anhyd. $\text{K}_4\text{Fe(CN)}_6$ is heated with K_2CO_3 and Ph_2O_4 is then added. The mixt. is fused, cooled, broken up, dissolved in water and filtered. The KOCN soln. is heated with Am_2SO_4 , the K_2SO_4 removed, the liquid evaporated and the residue extd. with abs. EtOH and the urea crystd. Yield 44%. Urea nitrate is obtained preferably with pure concd. HNO_3 and is preserved well dried, as it is deliquescent. Phenetidine is acetylated with glacial AcOH , the *Ac* deriv. is purified from boiling H_2O contg. NaOH , NaHSO_3 and Zn dust. The whitest phenacetin is obtained from boiling PhMe ; yield 86–93%, depending upon the purity of the AcOH . U. and M. consider the use of Ac_2O to be advantageous. Fresh and anhyd. phenetidine is boiled with a soln. of urea nitrate (following D. R. P. 76,596) and dulcin ppts. The impure product is heated with NaOH , NaHSO_3 and Zn dust and let crystallize. The product, if colored, is recrystd. from boiling water. Yield 76%.

S. L. B. ETHERTON

2,5-Dichlorophenetidine. G. BARGELLINI AND L. MONTI. *Atti accad. Lincei* 8, 590–4(1928).—Having established the constitution of 3,5- and 2,6-dichlorophenetidine (cf. *C. A.* 23, 1629) the constitution of the di-*Cl* deriv. first prepd. by Reverdin and During (*Ber.* 32, 154(1899)) was detd. by transforming it first to the phenol, then to the known 2,5-dichloroquinone, therefore establishing the constitution of the R. and D. compd as $2,5,4\text{-Cl}_2(\text{EtO})\text{C}_6\text{H}_3\text{NH}_2$.

A. W. CONTIERI

Ring disruption of dihydroxymethylene ethers by means of the Grignard reagent. KINZO KAFUKU, NOBUTOSHI ISHIKAWA AND RYO KATO. Research Inst. Government of Formosa. *Bull. Ind. Research Government of Formosa* 24, 1–24(1928).—The writers have previously obtained monoethers of the bivalent phenols by the action of Grignard reagents upon *safrole* and *isosafrole* and established their constitution. They also mentioned that the same reagent acts similarly with dihydroxymethylene ethers, such as piperonal, apiole, isoapiole, myristin and isomyristin. Constitution of *safrole* and *isosafrologeneol*: The authors previously showed that *safrole* is either $3,4\text{-CH}_2\text{O}$ -

$C_6H_5CH:CHMe$ (I) or 4,3-HO(EtO) $C_6H_3CH:CHMe$ (II) and hence they tried to decide between these by synthesizing *isoeugenol Et ether*, 3,4-MeO(EtO) $C_6H_3CH:CHMe$ (V) and *isobutenylphenol Et ether* and comparing them. *Isosafroegenol Me ether* (III), m. 62–63.5°; V, m. 59–60°; 4,3-MeO(EtO) $C_6H_3CH:CNHMe$ (VI), m. 50°; all are different from each other. After repeated crystn. V m. 62–63°. If *eugenol Et ether* is isomerized, it m. 62–63°, and since the phys. const. of *safroegenol Me ether* and of *eugenol Et ether* coincide with each other it was established that *safroegenol* and *isosafroegenol* belong to the type I. Expt. *Eugenol Et ether*, obtained by fractionation under reduced pressure of the oil obtained from cloves and ethylation with KOH and EtI, b_4 132.5°, d_4^{19} 1.0948, n_D^{18} 1.53300. *Safroegenol Me ether*, from *safroegenol* methylated by MeI and KOH, b_5 136–9°, d_4^{20} 1.0943, n_D^{20} 1.5324. *Safroegenol phenylurethan*, m. 57.5–59°. *Isosafroegenol phenylurethan*, m. 121–3°. *Safroegenol dibromide*, m. 52°. *Hydrosafroegenol*, obtained by a similar reaction of the Grignard reagent upon *hydrosafrole*, decomps., b_3 114.3–5.4°, n_D^{19} 1.5172, d_4^{25} 1.0095, crystals on standing, m. 41.2–2.5°, and is identical with the compd. obtained by hydrogenating *safroegenol* with Pt black and H_2 or *isosafroegenol* with Na and EtOH. *Phenylurethan*, m. 79–81°. *Ac deriv.*, b_{11} 153–4°, d_4^{18} 1.0174, n_D^{19} 1.4980. Formation of 1-vinyl-3-hydroxy-4-ethoxybenzene from *piperonal*. The Grignard reagent is made to act upon the aldehyde group of *piperonal*, the reaction being carried out at a higher temp. to obtain 1-vinyl-3-hydroxy-4-ethoxybenzene. *Vinylcatechol methylene ether*, b_{15} 109–11°. 1-Vinyl-3-hydroxy-4-ethoxybenzene, m. 64°. *Brominated compd.*, m. 69–71°. *Phenylurethan*, m. 96°; when this is oxidized by O_3 at 0–5° in $CHCl_3$, *safrovanillin*, m. 124–5°, is obtained. Formation of *apiolol* and *isoapiolol* from *apiole* and *isoapiole*. *Apiolol*, made similarly from *apiole*, b_7 105–7.5°, d_4^{17} 1.1067, n_D^{17} 1.5264; *Ac deriv.*, m. 42–3°; *Bz deriv.*, m. 86.7° *Me ether*, obtained by heating in MeOH with MeI and KOH at 140–60° in a sealed tube for 4 hrs., b_{11} 168–70°, d_4^{22} 1.653, n_D^{23} 1.5227. When this is oxidized by $KMnO_4$, there is obtained an acid, b_7 230–2°, d_4^{22} 1.2020, n_D^{23} 1.5287. *Isoapiolol*, obtained similarly from *isoapiole* which is made by isomerizing *apiole*, b_7 175°, d_4^{17} 1.1428, n_D^{17} 1.5506; *Ac deriv.*, m. 73–4°; *Bz deriv.*, m. 98–9°; *Me ether*, b_{32} 180–2°, d_4^{18} 1.0759, n_D^{18} 1.5300. Formation of *myristinol* and *isomyristinol* from *myristin* and *isomyristin*. *Myristinol*, b_8 153–6°, d_4^{33} 1.0818, n_D^{32} 1.5287; *Ac deriv.*, b_8 175, d_4^{25} 1.0667, n_D^{25} 1.5126; *Bz deriv.*, m. 57.8°; *Me ether*, b_3 120–2°, d_4^{25} 1.0030, n_D^{25} 1.5202. When oxidized with $KMnO_4$ an acid, m. 91°, is obtained. *Isomyristinol*, m. 34–5°, is made similarly from *isomyristin*, or by isomerizing *myristinol*.

K. SOMEYA

Reactivity of some carbinols. With a note on the Walden Inversion. P. A. LEVENE AND ALEXANDRE ROTHEN. Rockefeller Inst., N. Y. *J. Biol. Chem.* 81, 359–68(1929).—The reaction times of a no. of primary, secondary and aromatic carbinols with HBr at 79.7° were detd. The relation of reactivity to Walden inversion is discussed.

ARTHUR GROLLMAN

Trichloro- and tetrabromonitrobenzaldehydes, hexachloro- and octabromindigo. C. VAN DE BUNT. Leiden, The University. *Rec. trav. chim.* 48, 121–46(1929).—Continuing the investigations of van der Lee (*C. A.* 20, 912; 21, 399) the author has prepd. halogeno- ω ,2-dinitrostyrenes with the intention of reducing them to the corresponding halogenoindoles (cf. van der Lee, *C. A.* 20, 912; Nenitzescu, *C. A.* 19, 2666), but the reduction gave unsatisfactory results and, therefore, the investigation was continued further in the direction of synthesizing the halogenoindigos (cf. Jansz, *C. A.* 15, 3817). 3,4,5-Tribromocinnamic acid (I), m. 215–6° is obtained by boiling during 7 hrs. 30 g.; 3,4,5-Br $_3$ C $_6$ H $_2$ CHO (cf. *C. A.* 15, 3817), 30 g. freshly fused AcONa and 225 cc. Ac $_2$ O, yield 53%. 2-Nitro-3,4,5-tribromocinnamic acid (II), prepd. from 3,4,5,2-Br $_4$ (O $_2$ N)C $_6$ HCHO (*C. A.* 15, 3817), m. 264–5°; yield 68%. ω ,2-Dinitro-3,4,5-tribromostyrene (III), obtained from both these compds. on dissolving the cinnamic acid g.) in 15 cc. ice cold abs. HNO $_3$ and heating slowly to 55°, yellow, m. 228–30°. Reduction of III by means of Fe powder in alc. AcOH at 85–90° did not give a halogenoindole. The nitration of 3,4,5-Br $_3$ C $_6$ H $_2$ CHO with abs. HNO $_3$ as well as with a mixt. of HNO $_3$ and H $_2$ SO $_4$ at low temp. gives the mononitro compd., but at 100° nitration and oxidation occur simultaneously with the formation of 2,6-dinitro-3,4,5-tribromobenzoic acid (IV), m. 245–8°. On recrystn. from alc. IV splits off CO $_2$ with the formation of 2,6-dinitro-3,4,5-tribromobenzene, m. 150–1°. For the prepn. as follows: Cl $_3$ C $_6$ H $_2$ CHO, 4-amino-3,5-dichlorobenzaldehyde (V) had to be prepd. as follows: 15 g. of *p*-ClH $_2$ NC $_6$ H $_4$ CHO was dissolved in a mixt. of 250 cc. water and 750 cc. AcOH; after filtering this soln. was chlorinated in 200 cc. portions with the Cl obtained

from concd. HCl and 2.5 g. KMnO_4 . Then a small amt. of NaHSO_3 was added and the soln. poured into 750 cc. of water, a yellow ppt. being formed, from which V, which is very volatile with steam, could be obtained by refluxing with a large amount of water. In this way was obtained 7 g. of V, m. 144° . The chlorination may also be carried out in aq. alc., but with poorer results. Further chlorination of V yields $2,4,6\text{-Cl}_3\text{C}_6\text{H}_2\text{NH}_2$, thus showing that in V the Cl atoms occupy the positions 3 and 5. By means of the Sandmeyer reaction V was converted into 3,4,5-trichlorobenzaldehyde (VI), m. $90\text{--}1^\circ$, which, on oxidation with an alk. KMnO_4 gave 3,4,5-trichlorobenzoic acid, m. $210\text{--}0.5^\circ$. The nitration of VI (3 g.) with abs. HNO_3 , first at 0° , and then during 3 mins. at 50° , gives 2-nitro-3,4,5-trichlorobenzaldehyde, m. $118.5\text{--}9^\circ$ (VII), which again, on oxidation with KMnO_4 , gave 2-nitro-3,4,5-trichlorobenzoic acid (VIII), m. $181\text{--}1.5^\circ$. Nitration of VII with a mixt. of HNO_3 and H_2SO_4 acids at higher temp. gave 2,6-dinitro-3,4,5-trichlorobenzoic acid (IX), m. $219\text{--}21.5^\circ$, which, on boiling in alc., splits off CO_2 with the formation of 2,6-dinitro-3,4,5-trichlorobenzene, m. 94° . On further nitration of VIII with $\text{HNO}_3\text{--H}_2\text{SO}_4$, again IX was obtained. By means of the usual methods the following compds. were prepd.: 4-Amino-3,5-dichlorobenzaldehyde phenylhydrazone, m. $156\text{--}7^\circ$; 3,4,5-trichlorobenzaldehyde phenylhydrazone, m. 147° ; 2-nitro-3,4,5-trichlorobenzaldehyde phenylhydrazone, m. 229° . This compd. was obtained in 2 modifications, a red one, m. 229° , and a yellow one, which is easily obtained on recrystg the red modification from benzene. The yellow modification also m. 229° , having passed before melting into the red modification. 4-Amino-3,5-dichlorobenzaldehyde p-nitrophenylhydrazone, m. $288\text{--}9^\circ$; 3,4,5-trichlorobenzaldehyde p-nitrophenylhydrazone, m. 342° ; 2-nitro-3,4,5-trichlorobenzaldehyde p-nitrophenylhydrazone, m. $293\text{--}4^\circ$; 4-amino-3,5-dichlorobenzaldehyde semicarbazone, m. $248\text{--}50^\circ$; 3,4,5-trichlorobenzaldehyde semicarbazone, m. $252\text{--}4^\circ$; at the m. p. both these semicarbazones pass into the corresponding azines, m. $281\text{--}2^\circ$ and $284\text{--}5^\circ$, resp. 2-Nitro-3,4,5-trichlorobenzaldehyde semicarbazone, m. $278\text{--}9^\circ$; 4-amino-3,5-dichlorobenzaldehyde semioxamazone, m. $269\text{--}70^\circ$; 3,4,5-trichlorobenzaldehyde semioxamazone, m. $297\text{--}8^\circ$; 2-nitro-3,4,5-trichlorobenzaldehyde semioxamazone, m. $303\text{--}4^\circ$; 4,4'-diamino-3,3',5,5'-tetrachlorobenzaldehyde azine, m. $285\text{--}6^\circ$; 3,3',4,4',5,5'-hexachlorobenzaldehyde azine, m. $289\text{--}9.5^\circ$; 2,2'-dinitro-3,3',4,4',5,5'-hexachlorobenzaldehyde azine, m. $287\text{--}8^\circ$. 2,3,4,5-Tetrabromobenzaldehyde was prepd. in the following way: o-toluidine \rightarrow 4-nitro-2-aminotoluene \rightarrow 4-nitro-2-bromotoluene (*Chem. Weekblad* 6, 906(1909)) \rightarrow 2,4-Br $(\text{H}_2\text{N})\text{C}_6\text{H}_3\text{CHO}$ (*Chem. Weekblad* 6, 907(1909)) \rightarrow 2,3,5,4-Br $(\text{H}_2\text{N})\text{C}_6\text{HCHO}$ (C. A. 7, 769) \rightarrow 2,3,4,5-Br $(\text{H}_2\text{N})\text{C}_6\text{HCHO}$ (X). On nitration of X with abs. HNO_3 at $50\text{--}60^\circ$, 2-nitro-3,4,5,6-tetrabromobenzaldehyde (XI), m. $225\text{--}7^\circ$, was produced. On oxidation with boiling dil KMnO_4 , X passes into 2,3,4,5-tetrabromobenzoic acid, m. 234° , which on nitration yields 2-nitro-3,4,5,6-tetrabromobenzoic acid, m. $238\text{--}40^\circ$, which does not split off CO_2 on boiling in alc. 2-Nitro-4,6-dichloro-3,5-dibromobenzaldehyde (XII) was prepd. as follows: 4-nitro-2-chlorotoluene \rightarrow 2,4-Cl $(\text{H}_2\text{N})\text{C}_6\text{H}_3\text{CHO}$ (*Chem. Weekblad* 6, 903(1909)) \rightarrow 2,3,5,4-ClBr $(\text{H}_2\text{N})\text{C}_6\text{HCHO}$ (C. A. 7, 769), this compound was converted by the Sandmeyer reaction into 2,4-dichloro-3,5-dibromobenzaldehyde, m. $110\text{--}1^\circ$. Nitration of the latter compd. with a large excess of HNO_3 and some H_2SO_4 at 50° during 15 mins., gives XII, m. $198\text{--}9^\circ$. From VII, XI and XII, 5,5',6,6',7,7'-hexachloroindigo, 4,4',5,5',6,6',7,7'-octabromoindigo and 4,4',6,6'-tetrachloro-5,5',7,7'-tetrabromoindigo were prepd. according to Baeyer and Drewsen's method (*Ber* 15, 2856(1882); 16, 2205(1883)) by means of acetone and dil. alkali. C. F. VAN D.

Dynamic isomerism. XXVIII. Absorption spectra of the ketonic and enolic forms of an α -diketone. THOMAS M. LOWRY, HENRI MOUREU and ALEXANDER H. MACCONKEY. Cambridge, Eng. *J. Chem. Soc.* 1928, 3167-79.—A continuation of work (C. A. 22, 3158) on the isomerides of benzoylcamphor. Other enol-keto isomers are studied, in particular benzylmethylglyoxal. This latter compd. (C. A. 22, 2548) could be isolated in pure enol and keto forms, both of which were relatively stable. In accordance with their previous results the authors found a band with an extinction of $\log \epsilon = 1.5$ at 4300 A. U. and a step out or indication of a band at 3000 A. U., for the keto isomeride, $\text{PhCH}_2\text{COCOMe}$. The enolic isomeride, PhCH:C(OH)COMe , gave a strong absorption band in the ultra-violet with an extinction of $\log \epsilon = 4.3$ at 3100 A. U. The results are contrary to those of Morton and Rosney (C. A. 20, 1788) who assumed that the keto and enol forms should have absorption bands at the same frequency.

WALLACE R. BRODE

Stability of isomers according to their absorption spectra. Intramolecular rearrangements in the 1-aryl-2-phenyl-2-ethyl-1-butanol series. (MME.) RAMART-LUCAS and ANAGNOSTOPOULOS. *Bull. soc. chim.* 43, 1345-61(1928).—See C. A. 22, 3154, and R. and Salmon-Legagneur, C. A. 22, 4521.

A. S. CARTER

The elimination of amino groups from tertiary amino alcohols. V. Semipinalin-deamination and Walden inversion. ALEX. MCKENZIE AND ARTHUR K. MILLS. St. Andrews Univ. *Ber.* 62B, 284-8(1929); cf. *C. A.* 21, 1977.—*d*-2-Phenyl-2-amino-1,1-dibenzyl-1-ethanol was prepd. by the action of *l*-ClH.H₂NCHPhCO₂Et (I) on PhCH₂MgCl. It is slightly sol. in EtOH, m. 144-5°, and gives a yellow color with concd. H₂SO₄. By the action of HNO₂ this compd. was converted to *d*-α,γ-diphenyl-γ-benzylacetone and *d*-2-phenyl-2-hydroxy-1,1-dibenzyl-1-ethanol. The latter compds. were identical with those prepd. by Roger and McKenzie (*Ber.* 62, 272(1929)). *Conclusion:* No configurational change occurs either in the conversion of *d*-PhCH(NH₂).CO₂H to *l*-PhCH(OH)CO₂H or of *d*-PhCH(NH₂)C(CH₂Ph)₂OH to *d*-PhCH(OH)C(CHPh)₂OH. VI. The action of nitrous acid on the amino alcohols of *l*-phenylaminoacetic acid. ALEX. MCKENZIE AND MARY STEPHEN LESSLIE. *Ibid* 288-95.—By the application of the Grignard reaction, the following compds. were prepd.: *l*-Et₂C(OH)CH(OH)Ph, *l*-Et₂C(OH)CH(NH₂.HCl)Ph (I), *dl*-Me₂C(OH)CH(NH₂)Ph (II), *dl*-Pr₂C(OH)CH(NH₂.HCl)Ph (III), *d*-Pr₂C(OH)CH(OH)Ph and *l*-Pr₂C(OH)CH(NH₂)Ph (IV). Deamination of I, II, III and IV by HNO₂ gave only the corresponding *dl*-glycols. ARTHUR GROLLMAN

Bromination of *p*-aminobenzoic acid and its ethyl and butyl esters. A. LEULIER AND J. DINET. *J. pharm. chim.* 8, 57-61(1928).—The reaction $2\text{HBr} + \text{H}_2\text{O}_2 \rightarrow 2\text{Br} + 2\text{H}_2\text{O}$ permits substitution of Br or Br₂ in the mol. of *p*-H₂NC₆H₄CO₂H (I) and of Br in its Et and Bu esters. To prep. the compd. C₆H₄Br(NH₂)CO₂H (II), mix 0.8 g. I with 6 cc. H₂O₂ soln. and 2 cc. of 48% HBr. The mixt. clears, then II is pptd.; yield 60%; after recrystn. from EtOH, it m. 225°. To prep. the compd. C₆H₄Br₂(NH₂)CO₂H, mix 6.5 g. I with 3.5 cc. HBr (65° Bé.) and 50 cc. H₂O₂ soln.; after 1 hr. add another 3.5 cc. HBr, then crystn. begins. The yield is 57%. It m. 320° (330° (decompn.)), Koopal, *C. A.* 9, 2645; decompn. without melting 260-70°, Sudborough, *Ber.* 27, 513(1894)). To act with Br on the Et ester of I ("anesthesine," benzocaine) (III) and on the Bu ester of I ("scluroforme," butesine) (IV), use in each case 5 g. of III or IV, 30 cc. of H₂O₂, 3 cc. HBr (65° Bé.) for III and 2.5 cc. HBr (48%) for IV. Crystn. begins after 15 mins. Allow to stand for 24 hrs., collect the crystals and remove all HBr by washing. The yield of compd. C₆H₁₀O₂NBr, m. 92°, is 80%, that of the compd. C₁₁H₁₄O₂NBr, m. 63°, is 90%. The Br products of III and IV also exhibit anesthetic properties (cf. *C. A.* 14, 1157, 18, 2944), but are more easily sol. and show no increased toxicity. S. WALDBOTT

Synthesis of β-aryl-β-aminoethane-α,α-dicarboxylic acids. The mechanism of Knoevenagel's synthesis of cinnamic acid. V. M. RODIONOV. Technical Collg., Moscow. *J. Am. Chem. Soc.* 51, 847-52(1929).—On heating a mixt. of 22 g. piperonal, 70 cc. 11% EtOH-EtNH₂ and 18 g. CH₂(CO₂H)₂ until the EtOH is distd. off, there results 26% of β-piperonyl-β-ethylaminopropionic acid, m. 198-200°; nitrosamine, m. 136-8°. Similarly, Me₂NH gives 2-3% of the HCl salt of the β-dimethylamino deriv. When a mixt. of BzH, 6% EtOH-NH₃ and CH₂(CO₂H)₂ are mixed and allowed to stand in ice H₂O for 12 hrs., there results 76% of β-phenyl-β-aminoethane-α,α-dicarboxylic acid, m. 148°; on heating at 150° CO₂ and NH₃ are evolved and PhCH:CHCO₂H results, but on heating with HCl there results 40% of the acid and 50% of PhCH₂(NH₂)CH₂CO₂H. β-Phenyl-β-piperidylethane-α,α-dicarboxylic acid, m. 163-4° (decompn.) (91% yield); heating with HCl gives only PhCH:CHCO₂H. β-Piperonyl-β-piperidylethane-α,α-dicarboxylic acid, m. 150-2° (decompn.) (87% yield); in the case of the last 2 compds., only 1 CO₂H group reacts with NaOH. BzH, EtNH₂ and CH₂(CO₂H)₂ give β-phenyl-β-ethylaminoethane-α,α-dicarboxylic acid, m. 163-4° (decompn.) (68.8% yield); the corresponding β-piperonyl deriv., m. 155-7° (decompn.) (58% yield). The mechanism of the Knoevenagel reaction is discussed. C. J. WEST

Mechanism of formation of β-aryl-β-amino fatty acids by the condensation of aromatic aldehydes with malonic acid and its derivatives. V. M. RODIONOV AND E. A. POSTOVSKII. 2. State Univ., Moscow. *J. Am. Chem. Soc.* 51, 841-7(1929).—In order to confirm certain suppositions regarding the mechanism of the Knoevenagel reaction, the following compds. were prepd. *Di*-Et β-phenyl-β-amino-α-methylethane-α,α-dicarboxylate-HCl, m. 158°, results in 51.7% yield by heating 10 g. MeCH(CO₂Et)₂, 6 g. BzH and 15 cc. EtOH-NH₃ in a sealed tube 7 hrs. in the H₂O bath; using piperonal, there results 38.2% of the β-piperonyl deriv., m. 125-7°. BzH and EtCH(CO₂Et)₂ give 17% of *di*-Et β-phenyl-β-amino-α-ethylethane-α,α-dicarboxylate-HCl, m. 166°; β-piperonyl deriv., m. 157° (6% yield). Heating 5 g. MeCH(CO₂H)₂, 4.5 g. BzH and 15 cc. 10% EtOH-NH₃ in the H₂O bath until CO₂ evolution ceases gives 60.4% of β-phenyl-β-amino-α-benzylpropionic acid-HCl, m. 225°; β-piperonyl deriv., 77% yield. β-Phenyl-β-amino-α-ethylpropionic acid-HCl, m. 249° (23.7% yield); β-piperonyl deriv.,

m 215° (13.4% yield). $\text{PhCH}_2\text{CH}(\text{CO}_2\text{H})$, BzH and $\text{EtOH}\cdot\text{NH}_3$ give 34.6% of β -phenyl- β -amino- α -benzylpropionic acid-HCl, m. 222°; β -piperonyl deriv., m. 203–5° (20.3% yield). These results indicate that the first reaction is the condensation of RCHO and NH_3 to give $\text{RCH}(\text{OH})\text{NH}_3$, which then condenses with $\text{CH}_2(\text{CO}_2\text{H})_2$ to give $\text{RCH}(\text{NH}_3)\text{CH}(\text{CO}_2\text{H})_2$, and this then loses CO_2 to give $\text{RCH}(\text{NH}_3)\text{CH}_2\text{CO}_2\text{H}$.

C. J. WEST

Symmetrical diphenyltetra-*tert*-butylethynylethane. S. S. ROSSANDER AND C. S. MARVEL. Univ. of Illinois. *J. Am. Chem. Soc.* 51, 932–6 (1929).—Phenyldi-*tert*-butylethynylcarbinol (I), b_p 135–9°, m. 46–7°, results in 55–64% yields from the Grignard reagent with $\text{Me}_3\text{CC}:\text{CH}$ and PhCO_2Et . Boiling with concd. H_2SO_4 in AcOH converts I into the α,β -unsatd. ketone, $\text{C}_{19}\text{H}_{24}\text{O}$, m. 108–10°. I and PBr_3 in Et_2O at 0° give the bromide, m. 58–9° (60% yield), which, shaken with Ag for 24 hrs., gives 40–50% of sym-diphenyltetra-*tert*-butylethynylethane (II), m. 98–9°. II in PhBr , shaken in an O atm. for 6 hrs. at 100°, showed no absorption of O. When a soln. of II is heated, color develops and this color does not disappear when the soln. is cooled. II is changed by heat but apparently does not rearrange to a solid stable compd. as does hexa-*tert*-butylethynylethane. II reacts with 40% Na-Hg and with liquid Na-K alloy to give the alkali metal deriv. of phenyldi-*tert*-butylethynylmethyl, whose structure was established by converting it into phenyldi-*tert*-butylethynylacetic acid, m. 154–6°, which was also prepd. from the bromide and CO_2 . II does not react with 1% Na-Hg. The reaction of the bromide and Ag in the presence of O does not give II but only tarry products; the amt. of O absorbed is greater than would be needed for the formation of a peroxide.

C. J. WEST

Nitration of 4-halo-2-hydroxy- and 2-halo-4-hydroxybenzaldehydes. HERBERT H. HODGSON AND THOMAS A. JENKINSON. Tech. College, Huddersfield. *J. Chem. Soc.* 1928, 2272–80.—4,2-Cl(HO)C₆H₃CHO (I) (2 g.) in 5 cc. AcOH , treated at 18° with 0.5 cc. fuming HNO_3 and kept 8 hrs. at 60°, gives 0.3 g. 5- NO_2 deriv., pale yellow, m. 116°; phenylhydrazone, orange-yellow, m. 188° (decompn.); *p*-nitrophenylhydrazone, bright yellow, m. 294° (decompn.); semicarbazone, very pale yellow, decomp. above 300°. I (0.75 g.) in 8 cc. AcOH , added to 8 cc. 91% HNO_3 , warmed to 100° for 5 mins. and kept 15 mins., gives 1 g. 3,5-di- NO_2 deriv., pale golden yellow, m. 153°; phenylhydrazone, light brown, m. 219°; *p*-nitrophenylhydrazone, light brown, m. 286° (decompn.); semicarbazone, light yellow, m. 225° (decompn.). 2,4-Cl(HO)C₆H₃CHO yields a 5- NO_2 deriv., m. 125° (phenylhydrazone, dark purple, m. 166° (slight decompn.); *p*-nitrophenylhydrazone, deep orange, m. 266° (decompn.); semicarbazone, light orange, m. 266° (decompn.)), and a 3,5-di- NO_2 deriv., pale yellow, m. 93° (phenylhydrazone, brownish purple, m. 210° (decompn.); *p*-nitrophenylhydrazone, reddish brown, m. 267° (decompn.); semicarbazone, light brown, m. 192° (decompn.)). By means of the Reimer-Tiemann reaction, there were prepd. 4-chloro-3-bromo-2-hydroxybenzaldehyde (II), m. 124° (phenylhydrazone, m. 204°; *p*-nitrophenylhydrazone, orange, m. 298° (decompn.)) 3-chloro-2-bromo-4-hydroxybenzaldehyde (III), m. 177°, very slightly volatile with steam (*p*-nitrophenylhydrazone, dark crimson, m. 253° (decompn.)); 3,4-dibromo-2-hydroxybenzaldehyde (IV), m. 129° (*p*-nitrophenylhydrazone, orange, decomp. above 220°); 2,3-dibromo-4-hydroxybenzaldehyde (V), m. 192°, very slightly volatile with steam (*p*-nitrophenylhydrazone, vermilion-red, m. 254° (decompn.)). Nitration of II gives the 5- NO_2 deriv., yellow, m. 137° (phenylhydrazone, bright yellow, m. 229° (decompn.)). The same NO_2 deriv. was obtained by bromination of 4,5,2-Cl(O₂N)(HO)C₆H₃CHO. 4-Chloro-5-bromo-2-hydroxybenzaldehyde, m. 125° (phenylhydrazone, m. 200°; *p*-nitrophenylhydrazone, light brown, m. 280° (decompn.)); 3- NO_2 deriv., pale yellow, m. 116° (Na salt, bright red; phenylhydrazone, orange, m. 241°). Nitration of 2,3,4-ClBr(HO)C₆H₃CHO gives the 5- NO_2 deriv., golden yellow, m. 140° (phenylhydrazone, very deep purple, m. 205° (decompn.)). Nitration of 4,2-Br(HO)C₆H₃CHO gives the 5- NO_2 deriv., very pale yellow, m. 128° (phenylhydrazone, orange, m. 189°; *p*-nitrophenylhydrazone, yellow, m. 301° (decompn.); semicarbazone, pale yellow, decomp. above 210°); 3,5-di- NO_2 deriv., m. 143° (phenylhydrazone, orange, m. 209° (decompn.); *p*-nitrophenylhydrazone, orange, m. 250° (decompn.); semicarbazone, light yellow, m. 224° (decompn.)). 2,4-Br(HO)C₆H₃CHO gives a 5- NO_2 deriv., pale yellow, m. 131° (Ag salt, orange-red; Cu salt, bright green; phenylhydrazone, purple, m. 181° (decompn.); *p*-nitrophenylhydrazone, orange, m. 265° (decompn.); semicarbazone, light orange, m. 267° (decompn.)); 3,5-di- NO_2 deriv., pale yellow, m. 110° (phenylhydrazone, dark purple, m. 186° (decompn.); *p*-nitrophenylhydrazone, brown, m. 248° (decompn.); semicarbazone, orange, m. 188° (decompn.)). Nitration of V gives the 5- NO_2 deriv., m. 155° (phenylhydrazone, deep purple, m. 204° (decompn.)); the same product was obtained by brominating the NO_2 deriv. Likewise, IV gives a 5- NO_2 deriv., pale

yellow, m. 114°. 4,5-Dibromo-2-hydroxybenzaldehyde, m. 132° (Ag salt, yellow; *p*-nitrophenylhydrazone, deep orange-brown, m. 266° (decompn.)); 3-NO₂ deriv., pale yellow, m. 118° (Ag salt, deep orange; phenylhydrazone, orange, m. 236° (decompn.)). 4,2-I(HO)C₆H₃CHO yields a 5-NO₂ deriv., golden yellow, m. 118° (Ag salt, yellow; phenylhydrazone, old gold, m. 177° (decompn.)); *p*-nitrophenylhydrazone, bright yellow, m. 297° (decompn.); semicarbazone, pale yellow, decompn. 230–40°; 3-Br deriv., pale yellow, m. 145°; 3,5-di-NO₂ deriv., brown, m. 160° (Ag salt, light orange; phenylhydrazone, brown, m. 229° (decompn.)); *p*-nitrophenylhydrazone, brownish orange, m. 257° (decompn.); semicarbazone, light brownish yellow, decompn. on heating). 5-Bromo-4-iodo-2-hydroxybenzaldehyde, very pale yellow, m. 117° (Ag salt, yellow; Na salt, golden; phenylhydrazone, pale yellow, m. 151°; *p*-nitrophenylhydrazone, orange, m. 266° (decompn.)); 3-NO₂ deriv., golden yellow, m. 153° (Ag salt, orange; phenylhydrazone, deep orange, m. 245° (decompn.)). 2,4-I(HO)C₆H₃CHO yields a 5-NO₂ deriv., m. 162° (Ag salt, orange; phenylhydrazone, very dark purple, m. 204° (decompn.); *p*-nitrophenylhydrazone, reddish brown, m. 273°; semicarbazone, light brown, m. 211° (decompn.)); 3,5-di-NO₂ deriv., yellow, m. 162° (Ag salt, canary-yellow; Cu salt, bright green; phenylhydrazone, deep brownish purple, m. 197° (decompn.); *p*-nitrophenylhydrazone, dark red, m. 240° (decompn.); semicarbazone, orange, m. 205° (decompn.)). 3-Bromo-2-iodo-4-hydroxybenzaldehyde, pale yellow, m. 204°.

C. J. WEST

Constituents of lichens. II. Constitution of barbatic acid. A. S. PFAU. *Helv. Chim. Acta* 11, 864–76(1928); cf. Stenhouse and Groves, *Ann.* 203, 285(1880); Hesse, *J. prakt. Chem.* 68, 1–71(1903).—Steam-distn. of the alc. ext. from 35 kg. of the lichen *Evernia prunastri* L. Ach., gives 2.5 g. of rhizonic acid (now shown to be 3,6,2,4-Me₂(HO)(MeO)C₆HCO₂H, m. 233–5° [Me ester (I), m. 95°; Et ester (II), m. 82°], obtained also by the hydrolysis of barbatic acid (annexed formula), m. 191°, with Ba(OH)₂

soln. The prolonged action of hot alc. on barbatic acid affords II. Methylation of Me β -orcinolcarboxylate (cf. *C. A.* 21, 1289) yields I together with Me 2,4-dimethoxy-3,6-dimethylbenzoate, b₁₀ 161–3° (free acid, m. 104.5°). Treatment of a mixt. of β -orcinol and HCONHPh with POCl₃ in abs. ether and decompn. of the resulting product with NaOH gives 2,4-dihydroxy-3,6-dimethylbenzaldehyde, m. 163–4° [oxime, m. 224.5°; semicarbazone, m. 285° (decompn.)], methylated to 2-hydroxy-4-methoxy-3,6-dimethylbenzaldehyde (III), m. 136° (cf. Sonn, *C. A.* 11, 2673) (oxime, m. 188–9°). When rhizonic acid is heated with Cu powder at 200° β -orcinol mono-Me ether, b₁₀ 135–8°, m. 67.5–8° (lit. 118–21°), is obtained. The action of HCONHPh and POCl₃ on this ether is to give III. Treatment of the O-Ac deriv. of III with Zn and BrCH₂CO₂Et in presence of benzene and subsequent hydrolysis of the product with alc. KOH gives 5,8-dimethylumbelliferone Me ether, m. 128–9°, thus demonstrating that in III the HO and CHO groups are in the *o*-position (cf. Sonn, *loc. cit.*). The isorhizonic acid from the lichen *Ramalina dilacerata* Hoffm. (Nakao, *C. A.* 17, 3184), and the rhizonic acids from *Evernia prunastri* and *Usnea ceratina* (Hesse, *loc. cit.*) are identical. [With A. OFNER.] β -Orcinol mono-Me ether undergoes the Gattermann reaction using Zn(CN)₂, yielding a mixt. of 94% of III and 6% of 4-hydroxy-2-methoxy-3,6-dimethylbenzaldehyde, m. 150–0.5°, while orcinol mono-Me ether gives evernaldehyde (26%), m. 64°, and isoevernaldehyde (74%), m. 194–5° (lit. 188°).

B. C. A.

Dimethylhydroresorcinol as a reagent for aldehydes and the assimilation of carbon. D. VORLÄNDER. *Z. angew. Chem.* 42, 46–7(1929).—Dimethylhydroresorcinol, which is also known as methon (I), is a reagent for aldehydes (cf. *C. A.* 20, 1385) which does not react with ketones in aq. or alc. solns. This reagent has been employed recently by several investigators in biochemistry who have found it useful and have given it various names, viz., Erdmann's reagent, Neuberg and Reinfurth's dimedon reagent (cf. Rosenthaler, *Der Nachweis organischer Verbindungen*, 2 Aufl, 1923, page 118; *C. A.* 14, 3257). Some investigators in biol. chemistry take a known chem. reaction and finding that it likewise can be employed in their work proceed to describe it as something original, giving it a new name which reflects credit to themselves. An objection is made to this practice. G. Klein (cf. *C. A.* 20, 2519) and co-workers have used I in the study of C assimilation and have concluded that HCHO is present as an intermediate in CO₂ assimilation. This may be a false conclusion since the HCHO may have come from the oxidation of I, which is known to form HCHO under oxidizing conditions.

N. A. LANGE

Occurrence of d - β -pinene. B. N. RUTOVSKII AND I. V. VINOGRADOVA. Staatlichen Chemopharm. Forschungsinst., Moskau. *J. prakt. Chem.* 120, 41-8(1928).—Full details are given of the examn. of the ethereal oil from *Ferula Badra-Kema* (*F. galbaniflua*), from which were isolated 30% of d - β -pinene, 40% of dl - α - and β -pinene, 1.5% of d -limonene, about 3% of an undefined alc. and 1% of a ketone. C. J. W.

Action of aromatic sulfonyl chlorides on tertiary bases. A. WAHL. *Rev. gén. mat. color* 32, 176-7(1928); cf. *Ber.* 35, 2768-74(1902); *Compt. rend.* 140, 248-50(1905); *C. A.* 22, 4112.—Toluene-*o*-, *p*- and probably *m*-sulfonyl chlorides react with PhNMe_3 , giving crystal violet in small yield, $(\text{Me}_2\text{NC}_6\text{H}_4)_2\text{CH}$, and probably 4'-dimethylamino-4-methyldiphenyl sulfone. Me violet is not produced (cf. *Ber.* 12, 1275-6; Michler and Meyer, *Ber.* 12, 1791-3(1880)). Similarly, PhNEt_3 and Ph_2NMe yield violet and blue dyes, resp. B. C. A.

Some mercury derivatives of halogen compounds of resorcinolsulfonephthalein. FITZGERALD DUNNING AND LARKIN H. FARINHOLT. Hynson, Wescott and Dunning *J. Am. Chem. Soc.* 51, 804-8(1929).—Chlorination of resorcinolsulfonephthalein (I) with chloramine-T gives 65% of the *di-Cl deriv.* Condensation of tetrachloro-, tetrabromo- and tetraiodo-*o*-sulfobenzoic anhydrides with *m*- $\text{C}_6\text{H}_4(\text{OH})_2$ gives *resorcinoltetrachloro-*, *tetrabromo-* (both in poor yields) and *tetraiodosulfonephthalein* (80% yield). Using known methods of mercururation, the *mono-* and *dihydroxymercuri derivs.* of these compds., and also of I and its *di-Br* and *di-I* derivs. were prepd. These show 2 color changes corresponding to the formation of the *mono-* and then the *di-Na* salts; they cannot be used as indicators, however, as they exhibit to a marked degree the phenomenon of dichromatism. A method for the analysis of Hg in the presence of I is included. C. J. WEST

Action of phthalyl chloride on *p*-cresol methyl ether and *p*-thiocresol methyl ether. RICHARD WEISS AND WALTER KNAPP. Univ. Wien. *Monatsh.* 50, 392-8(1928); cf. *C. A.* 22, 3651.—*p*- $\text{MeC}_6\text{H}_4\text{OMe}$ (24 g.) and 20 g. *o*- $\text{C}_6\text{H}_4(\text{COCl})_2$ in 80 cc. CS_2 , treated with 25 g. AlCl_3 and heated 3 hrs. at 40-50°, give 60% of *p*-cresolphthalein *di-Me ether* (I), light yellow, m. 170°; cold concd. H_2SO_4 colors it bluish green and on standing causes decompn. Reduction of I with 3% Na-Hg in boiling EtOH gives nearly quant. *p*-cresolphthalin *di-Me ether*, m. 213-4°, which is oxidized by KMnO_4 in dil. KOH to *anisic acid phthalin*, m. 317-20° (decompn.) (90% yield). The latter on standing 12 hrs. with 25 parts of concd. H_2SO_4 gives 30% of 2,2'-dimethoxy-9-phenylanthrone-5,5'-dicarboxylic acid, m. 340° (decompn.); the intermediate anthranol could not be isolated. *p*- $\text{MeC}_6\text{H}_4\text{SMe}$, *o*- $\text{C}_6\text{H}_4(\text{COCl})_2$, AlCl_3 and CS_2 give 55% of 2',7'-dimethyl-1-thiofluoran, m. 228-30°; concd. H_2SO_4 gives a red soln. with a marked light brown fluorescence, which is stable at 120° but decomps. at 150°; reduction with 3% Na-Hg in boiling EtOH gives nearly quant. 2',7'-dimethyl-1-thiohydrofluoranic acid, m. 192-5°, which, when dehydrated with P_2O_5 in C_6H_6 , gives 20% of 2,7-dimethyl-coerithione, gray, m. 188-90° (decompn.); the concd. H_2SO_4 soln. is red, changing to emerald-green on heating. C. J. WEST

Action of *o*-tolylmagnesium bromide upon the dilactone of benzophenone-*o*-dicarboxylic acid. RICHARD WEISS AND SZASSA R. KRATZ. Univ. Wien. *Monatsh.* 50, 429-35(1928).—Benzophenone-2,2'-dicarboxylic lactone in cold C_6H_6 , treated with *o*- $\text{MeC}_6\text{H}_4\text{MgBr}$ in Et_2O , gives nearly quant. 2'-*o*-tolylbenzophenone-2-carboxylic acid (I), m. 188-92°; if the reaction is carried out in boiling C_6H_6 , 2-toluphenon-2'-phthalide (II), m. 170-4°, is obtained nearly quant. Reduction of I with HI and red P gives 2-methylbenzohydrol-2'-phthalide, m. 145-7°. Oxidation of I with KMnO_4 in dil. KOH gives 50% of *o*-phenylene-*di-o*-phthaloylic acid dilactone (III), m. 280-2°, also obtained by oxidizing II with CrO_3 in AcOH . III and $\text{NH}_2\text{OH} \cdot \text{H}_2\text{O}$ give *o*-phenylene-4',4''-dihydroxydiphthalazine, m. 350°. Heating III and AlCl_3 at 200° for 3 hrs. gives 30% of anthraquinone-1-*o*-phthaloylic acid, blue. Reduction of III with HI and red P gives *o*-phenylenediphthalide, m. 198-200°, reduced by EtOH and Na to *o*-phenylenedi-*o*, ω -toluylic acid, m. 235-7°. C. J. WEST

Electrochemical oxidation of α -methylnaphthalene. FR. FIEHTER AND SAMUEL HERSZBEIN. *Helv. Chim. Acta* 11, 1264-7(1928).—Electrolytic oxidation of α -methylnaphthalene (I) in *N* H_2SO_4 at 20°, with 0.018 amp./cm.², gives 10.5% 1,1'-dimethyl-4,4'-dinaphthyl (II), m. 147°, 36.6% of a resin, and 38.7% I, while 14.2% is lost in strong oxidation. II and Br in CCl_4 give a *di-Br deriv.*, m. 243°. Nitration of II gives a mixt. of dinitro derivs., decomp. 125-30°. FREDERICK C. HAHN

α -Chloronaphthalene. III. Sulfonation. P. FERRERO AND C. BOLLIGER. *Helv. Chim. Acta* 11, 1144-51(1928).—F. and B. have studied the effect of various conditions in the monosulfonation of α - $\text{C}_{10}\text{H}_7\text{Cl}$ (I). The 1,4- (II), 1,5- (III), and 1,6-chloronaphthalenesulfonic (IV) acids were prepd. in pure form according to Sandmeyer's

reaction from naphthionic, Laurent's and Cleve's acids, resp. The acid chlorides, sulfonamides, sulfonanilides of II and III, and the corresponding dichloronaphthalenes obtained by treating II or III with PCl_5 , were prepd. and m. ps. detd., resp., as follows—(II) 94–5°, 185°, 145–6°, 65–6°; (III) 95–6°, 226°, 138°, 105–7°. Soly. of Na, K, Ca, Ba, Pb salts, resp., in 100 cc. water at 18°—(II) 1.79, 0.73, 0.19, 0.08, 0.28 g.; (III) 4.37, 3.12, 0.98, 0.64, 0.29; Na, K, Ca, Ba salts, resp., at 98°—(II) 40, 40, 0.84, 0.46; (III) 45, 45, 5.39, 4.33. Using the foregoing information in the sepn. and identification of the products, I has been sulfonated with concd. H_2SO_4 at various temps. At 56°, 78°, 98°, 70, 57 and 31%, resp., of II were obtained. At 140–50° it was not possible to isolate an acid by crystn. At 160° was obtained a mixt. of isomers in which IV was identified. III was not isolated in any case. Sulfonation of I with ClSO_3H gives II.

FREDERICK C. HAHN

Halogen derivatives of 2-hydroxynaphthalene not substituted in the 1-position. CHARLES MARSCHALK. Kuhlmann, Villers-St. Paul. *Bull. soc. chim.* 43, 1361–7 (1928).—During 1 hr. 100 g. of Br in HOAc was added to 100 g. of 1-nitroso- β -naphthol (I) in 300 cc. of CHCl_3 (cold). After filtering, washing with CHCl_3 and drying, the ppt was dissolved in 48 g. of NaOH in 5 l. of H_2O and repptd. with HCl to eliminate HBr. With agitation, this was suspended in 1250 cc. of H_2O , 200 g. of $\text{Na}_2\text{S}_2\text{O}_4$ added and in 40 mins. filtration gave a paste of 1-amino-3-bromo- β -naphthol (II). II was dild. with 1250 cc. of H_2O and a soln. contg. 51.2 g. of NaNO_2 and 74 g. of CuSO_4 added. Agitation for 1 hr. and heating for 10 mins. at 50° gave a suspension of 3-bromonaphthalene 1,2-diazoöxide, pure samples of which were obtained by crystn. from hot H_2O . To the suspension was added 150 g. of SnCl_2 in NaOH soln. which was then heated to 75–80° until N_2 evolution ceased. The ppt. which formed upon cooling was dried and recrystd. from ligroin by evapn., giving 41.5 g. of 3-bromo- β -naphthol, m. 84–5°. Slow addn. of 50 g. of SO_2Cl_2 to 50 g. of I in 200 g. of $\text{C}_2\text{H}_2\text{Cl}_4$ which was then held at 15–20° for 12 hrs. gave 49 g. of 3-chloro-1-nitroso- β -naphthol, m. 168° after recrystn. from HOAc. In a manner similar to the above, this was converted into the 3-chloro-1-amino deriv. and 3-chloronaphthalene 1,2-diazoöxide which gave 15.3 g. of 3-chloro- β -naphthol, m. 90°, by treatment with SnCl_2 . The same procedure when applied to the 3,4-di-Cl deriv. of I gave 1-amino-3,4-dichloro- β -naphthol, 3,4-dichloronaphthalene 1,2-diazoöxide and 3,4-dichloro- β -naphthol.

A. S. CARTER

Preparation of perylene. CHARLES MARSCHALK. Kuhlmann, Villers-St. Paul. *Bull. soc. chim.* 43, 1388–1402 (1928).—See patents (C. A. 19, 1284, 3272; 20, 3170; 21, 3204, 22, 4539). Distg. 35 g. of 1,1'-di-2-naphthol (I), 50 g. of ZnCl_2 , 60 g. powd. Zn and 17 cc. of H_2O gave perylene (II), m. 265°, after washing with 1% NaOH and crystg. from PhMe. Evapn. of the PhMe liquor gave dinaphthalene oxide, m. 154° after crystn. from HOAc. Using FeCl_3 or AlCl_3 instead of ZnCl_2 also gave II. With agitation, 150 g. of I and 160 g. of POCl_3 were heated at 95–100° under CO_2 or N_2 while 105 g. of powd. Zn was slowly added. Increasing the temp. to 200° until the reaction was complete, then distg. (500–600°) gave II. Studying the course of this reaction the intermediate 1,1'-di[2-naphthyl]chlorophosphate, $\text{C}_{10}\text{H}_6\text{O} \cdot \text{PO}_2\text{ClC}_{10}\text{H}_6$, was prepd. which when distd. gave 12% of II; distd. with powd. Zn it gave 16% of II; with ZnCl_2 , 24% of II; with ZnCl_2 and powd. Zn together, 36% of II. Using PCl_5 instead of POCl_3 , the corresponding chlorophosphorous ester resulted.

A. S. C.

Alkaline fusion of anthracenemonosulfonic acids. P. FERRERO AND A. CONZETTI. *Helv. Chim. Acta* 11, 1152–9 (1928).—F. and C. have studied the effect of various conditions on the alk. fusion of α - and β -anthracenesulfonic acids. The optimum conditions for conducting the fusion in an autoclave with the α -deriv. were 1 part KOH, 2 water, 230°, 7 hrs., or 1 part NaOH, 2 water, 240°, 10 hrs.; β -deriv., 3 parts KOH, 3 water, 270°, 4 hrs., or 3 parts NaOH, 3 water, 290°, 4.5 hrs. (yields 95–8%). As with corresponding naphthalenesulfonic acids, the β -deriv. is more stable toward alkali.

FREDERICK C. HAHN

Munjistin. I. PRAFULLA CHANDRA MITTER AND ASOKE KUMAR SEN. Univ. Coll. of Sci., Calcutta. *J. Indian Chem. Soc.* 5, 631–8 (1928).—M. and S. believe munjistin to be 1,3-dihydroxy-2-carboxyanthraquinone, an oxidation product of rubiadin (1,3-dihydroxy-2-methylantraquinone) (C. A. 22, 587, 2562; cf. Adams, C. A. 21, 3053) and not 1,3-dihydroxy-4-carboxyanthraquinone, the only other possible isomer. Compds. prepd. were: from *o*-cresol (50 g.) and phthalic acid (50 g.) with AlCl_3 , after crystn. from glacial AcOH, 34 g. of 3-methyl-4-hydroxybenzoyl-*o*-benzoic acid (I) (m. 223°) and 5 g. of 2-methyl-1-hydroxybenzoyl-*o*-benzoic acid, m. 196°, were obtained. I in concd. H_2SO_4 gave 1-methyl-2-hydroxyanthraquinone, m. 111–2°; Ac deriv., m. 125°. I on treatment with KOH and Me_2SO , gave 3-methyl-4-methoxy-

benzoyl-*o*-benzoic acid (II), m. 176°, which on treatment with concd. H_2SO_4 at 155° for 30 mins. gave 3-hydroxy-2-methylantraquinone (III), m. 299° (Ac deriv. m. 176°), and 3-methoxy-2-methylantraquinone, m. 184°. III on heating with Zn and H gave β -methylanthrane, m. 201°. III on heating with 50% KOH gave 3-methylalizarin (IV), m. 245-6°; Ac deriv. m. 262°. IV on oxidation with MnO_2 in H_2SO_4 gave 3-methylpurpurin, m. 234°, Ac deriv., m. 287°.

WALLACE R. BRODE

Indoquinonanthrene (*trans*-bisang- or 1,2,5,6-diphthalylantraquinone). ROLAND SCHOLL AND H. KURT MEYER. Techn. Hochschule, Dresden. *Ber.* 61B, 2550-5 (1928).—Isoviolanthrone in boiling AcOH with CrO_3 gives about 6% of *trans*-bisang- or 1,2,5,6-diphthalylantraquinone (I) for which, because of its indanthrene-like linking, is suggested the name *indoquinonanthrene*. It is very easily converted into a vat dye, even in cold Na_2CO_3 , by $\text{Na}_2\text{S}_2\text{O}_4$. The red vat contains a *hexahydro deriv.* (II) pptd. by acids which, both in the alk. vat and in free form, is converted in the air (in the free form also by heating, as by adding it to boiling $\text{C}_6\text{H}_5\text{Cl}_3$) into a dark *quinhydrone* (III) quite stable in the air and insol. in aq. alkalies; its compn. corresponds to a compd. consisting of 1 mol. each of I and II. The possibility (which cannot be entirely excluded by the anal. results) that it is not a quinhydrone but a dihydro deriv. of I is rendered remote by the insoly. of III in aq. alkalies and its stability in the air. I is especially well adapted to synthetical purposes by reason of the two 1,4-diketo groups which it contains. Thus, with $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ in hot quinoline it gives at once a *hydro deriv.* (IV), quite stable in the air, of the *di-o-diazine* (V) into which IV is readily converted by all kinds of oxidizing agents. A similar condensation product has been obtained with MeNH_2 . I, light yellow, does not m. 345°, sublimes in CO_2 under 20 mm. at 380-400° (considerable decompn.) in orange-yellow needles, dissolves in about 150 parts boiling and 1500 parts cold PhNO_2 and about 10,000 parts boiling AcOH, easily in concd. H_2SO_4 with yellow color changing to red on long standing. II, light yellow ppt.; *O*-hexa-*p*-bromobenzoyl deriv. (85% from the $\text{NaOH-Na}_2\text{S}_2\text{O}_4$ vat of I with $\text{BrC}_6\text{H}_4\text{COCl}$ in Et_2O), yellow, relatively easily sol. in org. solvents with yellow color and strong green fluorescence, insol. in cold concd. H_2SO_4 , not saponified by boiling 10% NaOH but converted by hot alc. KOH into a blue substance. III, blue-black crystals, blue-green in transmitted light, sol. in hot PhNO_2 with green color rapidly changing to the yellow of I. IV, dark blue needles; the olive-brown soln. in concd. H_2SO_4 changes after some time (rapidly on heating) to red and on addn. of H_2O yields V, red-brown, sublimes in CO_2 under 20 mm. at 460-80° (for the most part with carbonization) in red needles, practically insol. in org. solvents; the yellowish red soln. in concd. H_2SO_4 shows red fluorescence in concd. H_2SO_4 ; it is at once converted into IV by alk. $\text{Na}_2\text{S}_2\text{O}_4$. (The microanalyses were made by MAX BOETIUS.)

Mercuration

F. L.

Hg salt

off CO_2 and gives annyaro-1-nyaroxymercurianintraquinone-2-carboxylic acid, yellow, decompn. on heating above 300°, whose constitution was established by the prepn. of $2\text{-C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ by heating with acid. Replacement of the Hg in I by heating with KI and I in H_2O at 70° gives $1,2\text{-C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_4\text{ICO}_2\text{H}$, while Br in NaBr gives 1-bromoanthraquinone-2-carboxylic acid, yellow, m. 267-8°. Heating I with NaOH soln. and then making acid with HCl gives the 1-chloromercuri deriv., light yellow. A new method is described for the prepn. of $2,3\text{-C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$ whose *Hg* salt, light yellow, on heating to 210-5° evolves CO_2 , giving anhydro-3-hydroxy-mercurianintraquinone-2-carboxylic acid, bright yellow. Treated as I, there results

3-iodoanthraquinone-2-carboxylic acid, bright yellow, m. 289–90°, and the *3-chloro-mercuri deriv.*, light yellow.

C. J. WEST

Benzanthrone from phenanthrene. J. S. TURSKI AND R. PRAGIEROWA. Warsaw Polytech. *Przemysl Chem.* 13, 33–5(1929).—About 58% of benzanthrone was obtained by the condensation of *phenanthraquinone* in 70 parts of 70% H_2SO_4 as the medium with 10 parts of anhyd. $FeSO_4$ maintaining the glycerol relation used in prepg. benzanthrone from anthraquinone. The reaction proceeds in 2 stages, one at 100°, and the other at 150–5°. For good yields the temp. should not be raised too rapidly to 150°. The product was pptd. with H_2O and recrystd. whereupon it showed color reactions identical with those of benzanthrone obtained from anthraquinone. Elementary analysis, b.-p. detns., and spectrum analyses further established its identity. Benzanthrone by condensation of phenanthrene with glycerol and acrolein in H_2SO_4 was obtained only in traces sufficient for identification.

A. C. ZACHLIN

Some derivatives of 3,4-phenanthrenequinone. LOUIS F. FIESER. Bryn Mawr College. *J. Am. Chem. Soc.* 51, 940–52(1929).—Details are given of the prepn. of, 4-amino-3-phenanthrol and its HCl salt; its oxidation is best accomplished by adding aq. ClO_2 to a suspension of the salt in glacial AcOH, giving 87% of 3,4-phenanthrenequinone (I), brilliant red, m. 133° (decompn.); I in concd. H_2SO_4 gives a Prussian-blue color, changing in a few min. to a clear, chrome-green. I is reduced by SO_2 or $NaHSO_3$ to morphol, while Zn, AcONa and Ac_2O give the di-Ac deriv. I dissolves in satd. $NaHSO_3$ and after time has been allowed for the rearrangement, 3,4-dihydroxyphenanthrene-1-sulfonic acid (II) is isolated as the NH_4 salt, dark red plates, very hygroscopic, or the *p-toluidine* salt, decomp. 182°. Heating the NH_4 salt of II and *p-MeC₆H₄NH₂* a short time gives 1-[*p-toluidino*]-3,4-phenanthrenequinone, dark red, decomp. 260°; reductive acetylation gives 1-[*p-toluidino*]-3,4-diacetoxyphenanthrene, m. 208°. Oxidation of II, which need not be isolated, with air, or better, H_2O_2 , in alk. soln. gives 3-hydroxy-1,4-phenanthrenequinone (III), orange-yellow, m. 230° (decompn.); the NH_4 salt of II and MeOH with concd. H_2SO_4 give the *Me ether*, light yellow, m. 170°, reductively acetylated to 3-methoxy-1,4-diacetoxyphenanthrene, m. 168.5. The Ag salt of III, dark red, with $CH_2:CHCH_2Br$ gives 1-allyloxy-3,4-phenanthrenequinone, brilliant orange, m. 161° (63%), and 2-allyl-3-hydroxy-1,4-phenanthrenequinone, orange, m. 155° (17%); with concd. H_2SO_4 there results 1-methyl-5,6-[1,2-naphtho]-3,4-quinone, brilliant red, m. 198–9°. Boiling III with dil. alkali for about 4 hrs. gives 82% of 2-aceto-1-naphthylglyoxylic acid (IV), m. 196° (evolution of CO_2); *Me ester*, m. 181°. Oxidation of IV in alk. soln. gives 1,2- $C_{10}H_6(CO_2H)_2$, while in acid solution there results 1,2-naphthindandione, m. 174–5°. IV and $PhNH_2$ give 2-aceto-1-naphthalaniline, yellow, m. 202°, whose concd. H_2SO_4 soln. has an intense green-yellow fluorescence.

C. J. WEST

γ -Pyrrolidino- and γ -pyrrolinopropyl benzoates. LESLIE H. ANDREWS AND S. M. McELVAIN. Univ. of Wisconsin. *J. Am. Chem. Soc.* 51, 887–92(1929).—Pyrrole, twice distd. over Na, is catalytically reduced (Pt oxide-Pt black), giving 63% of pyrrolidine (I). Details are also given of the reduction with Zn and 20% HCl, which gives 56% of pyrrolidine (II). Methylpyrroles and α -carbethoxypyrrole could not be similarly reduced. I (20 g.) and 28 g. $ClCH_2CH_2CH_2CO_2Ph$, heated on the steam bath for 15 hrs., give 14 g. γ -pyrrolidinopropyl benzoate HCl (III), m. 125–6°. Similarly, 10 g. II and 14 g. $ClCH_2CH_2CH_2CO_2Ph$ give 3.5 g. γ -pyrrolinopropyl benzoate-HCl (IV), m. 136–8°. III is a much more efficient anesthetic than γ -piperidinopropyl benzoate HCl. The presence of the double bond in IV greatly reduces its anesthetic activity.

C. J. WEST

A theory of color on the basis of molecular strain. VI. Effect of sulfur on color. AMARENDRA NATH DEY AND SIKHIBHUSAN DUTT. Allahabad Univ. *J. Indian Chem. Soc.* 5, 639–41 (1928); cf. *C. A.* 22, 3891.—Substitution of S for C in dyes obtained by the condensation of glutaric acid with phenols or anilines causes a deepening of the color. Ninety-five g. $ClCH_2CO_2H$ is added slowly to 145 g. Na_2CO_3 in a min. amt. of water. Forty-five g. NaOH is dissolved in 100 cc. H_2O , 50 cc. of which is satd. with H_2S and all of the NaOH soln. is added with stirring to the $ClCH_2CO_2H$ sol. After 3 hrs. 100 g. concd. H_2SO_4 is added and the hot soln. filtered. Thiodiglycolic acid seps. out on cooling and after recrystn. from H_2O , m. 129°. Resorcinol, phloroglucinol, phenol, *m*- $Et_2NC_6H_4OH$ and *m*- $C_6H_4(NH_2)_2$ were condensed with $S(CH_2CO_2H)_2$ to form the corresponding thiodiglycoleins.

WALLACE R. BRODS

Oxidation. II. Action of ferric chloride and hydrogen peroxide on symmetrical and unsymmetrical disubstituted thiocarbamides and synthesis of thiodiazoles. FARINIKANTA CHAKRABARTI AND SATISH CHANDRA DE. Dacca Univ. *J. Indian Chem. Soc.* 5, 661–4(1928); cf. *C. A.* 22, 4123.—By the action of H_2O_2 on sym. or unsym.

diarylthiocarbamides in warm or hot EtOH the following 1,3,4-thiodiazoles were prepd.: 2,5-di-phenylimido-3,4-diphenyl, m. 228–30°; 2,5-di-*p*-tolylimido-3,4-di-*p*-tolyl, m. 261°; 2,5-di-*o*-tolylimido-3,4-di-*o*-tolyl, m. 249°; 2,5-di-*m*-xylylimino-3,4-di-*m*-xylyl, m. 247°; 2,5-di- α -naphthylimino-3,4-di- α -naphthyl, m. 285°; 2,5-di- β -naphthylimino-3,4-di- β -naphthyl, m. 288°; 2,5-di[phenylmethylamino], m. 94°; 2,5-di[phenylethylamino], m. 107–9°; 2,5-di[diphenylamino], m. 155°. The action of FeCl₃ on diarylthiocarbamides did not result in the formation of thiodiazoles.

LOUISE KELLEY

Condensation of *o*-aminobenzaldehyde with 1-phenyl-3-methyl-5-pyrazolone and with 1-*o*-chlorophenyl-3-methyl-5-pyrazolone. A. MUSIEROWSKI, S. NIEMENTOWSKI AND Z. TOMASIK. *Roczniki Chem.* 8, 325–44(1928).—Fusion in equimol. quantities at 140° of *o*-H₂NC₆H₄CHO with 1-phenyl-3-methyl-5-pyrazolone produces the phenyl hydrazone of 2-hydroxy-3-quinolyl Me ketone, m. 236°, which when heated with BzH yields 2-hydroxy-3-quinolyl styryl ketone, m. 269°. Among the prod-

ucts of the original condensation (carried out at 265°) is 4-hydroxy-1-phenyl-3-methylquinpyrazole (I), m. 273° (HCl salt, m. 273°; methiodide, m. 273°), together with 2'-hydroxy-2,3'-diquinolyl, m. 313° [nitrate, m. 325°; sulfate, m. 299°; HCl salt, m. 256° (decompn.); methiodide, m. 295°]. Fusion at 150° with 1-*o*-chlorophenyl-3-methyl-5-pyrazolone yields the *o*-chlorophenylhydrazone of 2,4-dihydroxy-3,4-dihydro-3-quinolyl Me ketone, m. 280° (*O*-Ac deriv., m. 262°; *N*-Ac deriv., m. 236°; monobromide, m. 230°; dibromide, m. 236°; monobromide, m. 230°; dibromide, m. 208°), and 4-hydroxy-1-*o*-chlorophenyl-3-methylquinpyrazole, m. 281°.

B. C. A.

Remarks on the work of W. König: "A simplified process for obtaining substituted μ -methylbenzothiazoles and their transformation into new heterocyclopoly-methine dyestuffs." (Preliminary communication.) ROBERT SCHULOFF, RUDOLF POLLAK AND EUGEN RIESZ (with MARTIN HOPMAYER). *Bundeslehr- u. Versuchsanstalt f. chem. Industrie, Wien. Ber.* 61B, 2538–41(1928).—The authors report some of the results of an unfinished investigation covering in part the same field as König's work (*C. A.* 23, 389). The object of this investigation is the condensation not only of thiazolium but also of quinolinium and other cyclammonium compds. with different substituted aldehydes to det. the influence of substituents on the photodynamic effect and other properties, especially the dyestuff character, of the resulting products. Among the aldehydes already studied are PhCH:CHCHO, *o*- and *p*-MeOC₆H₄CHO, *o*-HOC₆H₄CHO and *m*-O₂NC₆H₄CHO. In this paper are given only the results touching directly on K.'s work. Of benzothiazoles with reactive Me groups were used 5-chloro-2-methyl- (I), 6-chloro-2,4-dimethyl- (II) and 6-ethoxy-2-methylbenzothiazole (III). I, described by K. as being new, had been prepd. by Gebauer-Fulnegg and Riesz (*C. A.* 21, 905) and the reductive acetylation of [4,2-Cl(O₂N)C₆H₄]₂S₂ employed by K. was recently described by Pollak, Riesz and Kahane (*C. A.* 22, 3658). For the present work I, II and III were prepd., with very satisfactory yields, from aromatic *o*-amino Zn mercaptides and AcCl or AcOH-P chlorides. In general, not only the alkyl halides but also the alkyl sulfates and toluenesulfonates of the thiazoles were used for the condensations. Diminishing the basicity of the thiazolium compds. by the introduction of acid substituents (*e. g.*, Cl) renders more difficult the condensation with aldehydes, especially if they also contain acid substituents (HO, MeO, etc.); on the other hand, strongly basic aldehydes, like *p*-Me₂NC₆H₄CHO, facilitate the condensation. I, m. 68° (as found before although given by mistake as 78° in the earlier paper); *di*-Me sulfate, m. 217°, gives with *p*-Me₂NC₆H₄CHO in MeOH and piperidine a blue-violet cryst. polymethine dye, m. 245°. III, m. 56°; ethiodide, m. 156°; amiodide, m. 232°. Polymethine dye from the ethiodide with anisaldehyde, faintly reddish yellow, m. 231°; with *o*-methoxybenzaldehyde, reddish yellow, m. 231–2°; with *p*-dimethylaminobenzaldehyde, red-violet, m. 257°; with cinnamaldehyde, reddish, m. 219–20°; with *m*-nitrobenzaldehyde, yellowish, m. 211°.

C. A. R.

The supposed *o*-(β , β -dimethylacroyl)phenol of S. Skraup. K. v. AUWERS AND W. MAUSS. *Marburg, Chem. Inst. Ber.* 61B, 2545–9(1928).—The sample of the compd. in question (I) supplied by Skraup (*cf. C. A.* 23, 96) was compared with *o*-[β , β -dimethylacroyl]-*p*-cresol (II). While II is vigorously attacked by KMnO₄, at once absorbs 1 mol. Br₂ in CS₂ without evolving a trace of HBr, gives with FeCl₃ a dirty green color and dissolves in NaOH with yellow color but at once begins to change into 2,2,6-trimethylchromanone, I is stable toward cold KMnO₄, adds no Br, gives no color with FeCl₃ and is neither sol. in nor acted upon by NaOH. These properties exclude the structure of an unsatd. ketone for I. Presumably a compd. of the structure ascribed by S. to I is formed as an intermediate product in his reaction (super-

heating of $\text{Me}_2\text{C}:\text{CHCO}_2\text{Ph}$) but at once rearranges. The investigations in v. A.'s lab indicate that such a compd. might rearrange into a coumaranone (III), chromanone (IV) or hydroxyhydrindone. I, from its properties, cannot be a hydroxyhydrindone. IV seemed the more probable formula and it became a question of proving the presence in I of a CH_2 next to the $\text{C}:\text{O}$ group. Chromanones in general condense with aldehydes but it was feared that the adjacent *gem*- Me_2 group would prevent such a condensation and as a matter of fact the homologous 2,2,3-trimethylchromanone (V) could not be made to condense with BzH . I was therefore treated in cold CS_2 with Br ; like V, it did not at first take up the Br but after some time there was a vigorous evolution of HBr and 2 mols. Br_2 were consumed; as the Br enters the hetero-ring exclusively, the presence of a CH_2 group is proved and the 2,2-dimethyl-4-chromanone structure (IV) of I is established. This is further confirmed by the formation of a normal monohydrazone with excess of hot $p\text{-O}_2\text{NC}_6\text{H}_4\text{NHNH}_2\cdot\text{HCl}$ and by the greenish yellow color of dil. and golden yellow color of more concd. solns. of I in concd. H_2SO_4 . The formation of $o\text{-HOC}_6\text{H}_4\text{COMe}$ from I with boiling alc. KOH is no proof of the structure assigned by S. to I, for 2,2,6-triphenylchromanone yields 5,2- $\text{Me}(\text{HO})\text{C}_6\text{H}_3\text{COMe}$ under the same conditions. Attempts to synthesize I failed because of the too great lability of the Br in the necessary $\text{Me}_2\text{CBrCH}_2\text{CO}_2\text{H}$ or its derivs., resulting in elimination of HBr instead of reaction in the desired direction. 2,2-Dimethyl-3,3-dibromo-4-chromanone, from I and 2 mols. Br_2 in CS_2 at room temp., m. $95\text{--}6^\circ$. *p*-Nitrophenyl-*hydr* of I, yellow-red, m. $193\text{--}4^\circ$. *Et* β -bromoisovalerate (45% from the acid) d to stand 6 hrs. in EtOH satd. cold with HBr , or 8 g. from the chloride (from 1 g. of the acid) in 2 mols. EtOH , b_{16} $78\text{--}80^\circ$.

C. A. R.

Hydroxy derivatives of thioxanthone dioxide. WM. B. PRICE AND SAMUEL SMILES. Kluwer's Coll., London. *J. Chem. Soc.* 1928, 3154-60.—Equiv. quantities of quinone and 2-sulfonobenzoic acid (I) with 100 cc. of H_2O per 2 g. of reagents gave 2,5-dihydroxy-2'-carboxydiphenyl sulfone (II), m. 235° (*di-Ac* deriv., m. 188°), which was treated with 5 mols. of Me_2SO_4 in 6 mols. of NaOH , giving almost 100% of 2,5-dimethoxy-2'-carboxymethoxydiphenyl sulfone (III), $\text{MeO}_2\text{CC}_6\text{H}_4\text{SO}_2\text{C}_6\text{H}_3(\text{OMe})_2$, m. 195° , which hydrolyzed to yield the free 2'-carboxy deriv., m. 223° . In a similar manner *p*-toluquinone gave the *Me* deriv. of II, m. 203° ; chloroquinone gave the *Cl* deriv., m. 210° ; and quinizarin in HOAc gave 2-carboxyphenyl-2'-quinizarin sulfone, m. 263° . These compds may also be prepd. by H_2O_2 oxidation of sulfides, but this sometimes fails (cf. A 23, 827), thus 2,4-dihydroxy-2'-carboxydiphenyl sulfide gave the sulfoxide, m. 204° . Heating II at 100° in H_2SO_4 gave 1,4-dihydroxythioxanthone dioxide (IV), $\text{C}_6\text{H}_4(\text{O} \text{ --- } \text{SO}_2 \text{ --- } \text{C}_6\text{H}_4 \text{ CO})$, m. 224° (*di-Ac* deriv., m. 174°); the other sulfones gave

the corresponding derivs.: *Me*, m. 175° ; *Cl*, m. 230° . A paste of IV was ground with 2 parts of $\text{Ph}(\text{OAc})_4$ and after 4 days gave thioxanthone dioxide 1,4-quinone, m. 185° . III by similar treatment gave the *di-MeO* deriv. of IV, m. 193° . Phenol was heated in H_2SO_4 with the dichloride of I, giving 2-hydroxythioxanthone (V) which was oxidized to the sulfone, m. 259° , by H_2O_2 in HOAc at 100° ; this was methylated to 2-methoxythioxanthone dioxide (VI), m. 204° . In the same manner, pyrocatechol gave the *di-HO* deriv., the sulfone (m. 203°) and the 2,3-*di-MeO* deriv. (m. 241°) corresponding to V and VI. From naphthoquinone and I, by an abnormal reaction, was prepd. 1,2-naphthoquinone-2'-carboxyphenyl sulfoxide, $\text{C}_{10}\text{H}_6\text{O}_2\cdot\text{SO}\cdot\text{C}_6\text{H}_4\text{CO}_2\text{H}$, m. 236° (phenylhydrazone, m. 251° ; quinoxaline deriv., m. $292\text{--}3^\circ$). An Ac_2O soln. of 1 g. of this naphthoquinone sulfoxide and 5 g. of NaOAc was boiled for 3 hrs., giving 3,4-naphthothioxanthone 1,2-quinone, $\text{S}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{C}_{10}\text{H}_4\text{O}_2$, m. $244\text{--}5^\circ$. This abnormal

condensation is unexplained.

A. S. CARTER

Bromination of pyridine. S. MARY ELIZABETH ENGLERT AND S. M. McELVAIN. Univ. of Wis. *J. Am. Chem. Soc.* 51, 863-6(1929).— $\text{C}_5\text{H}_5\text{N}\cdot\text{HBr}$ (160 g.) in 240 g. glacial AcOH at $60\text{--}5^\circ$, treated with 160 g. Br in 160 g. AcOH , gives 300-10 g. of perbromide, $\text{C}_5\text{H}_5\text{N}\cdot\text{HBr}\cdot\text{Br}_2$ (47% perbromide Br), orange-red, m. $132\text{--}4^\circ$. With 80 g. Br there results a perbromide with 39.7% perbromide Br , m. $101\text{--}3^\circ$ (av. yield, 205 g.). Heating the latter at $230\text{--}50^\circ$, there results about 36-38% 3- Br and 30-6% of the 3,5- Br_2 deriv. of $\text{C}_5\text{H}_5\text{N}$. Under similar conditions the higher perbromide yields 40% of the *di Br* deriv. but no 3- Br deriv.; if 1 mol. of this perbromide and 2 mols. $\text{C}_5\text{H}_5\text{N}$.

HBr are heated together there results 10% of the 3-Br and 30% of the 3,5-Br₂ derivs.
C. J. WEST

The quaternary pyridine bases. O. YU. MAGIDSON AND G. P. MEN'SHIKOV. *Trans. Sci. Chem.-Pharm. Inst. (Moscow)* 1926, No. 16, 7-22.—The authors prepd the methiodide, ethiodide, allyl iodide, benzyl chloride, propyl iodide and isoamyl iodide of pyridine, tested the elec. cond., dissocn. consts. and the physiol. effects on frog as apparent from an induced paralysis. The strongest effect was found in the benzyl chloride (25 times weaker than curare); the methiodide and amyl iodide were also strong in their paralyzing power (100 times weaker than curare). The least effective were the ethiodide and allyl iodide. The prepn. which show strong paralyzing effects show a low cond. and low dissocn. const.
J. S. JOFFE

Pentadecoyllutidine and pentadecoyllupetidine, a higher homolog of coniine. S. GOTTFRIED AND F. ULZER. *Wiss. Mitt. Oesterr. Heilmittelstelle* 1926, No. 1, 1-3, No. 2, 1-4; 1927, No. 3, 1-3, No. 4, 1-4.—A mixt. of monomeric and trimeric palmitaldehyde, b_s 170-2°, b₁₀₀ 240-1° (corr.), m. 57.5-8.5°, was obtained from Ba palmitate, formate, and carbonate; treatment with NH₂OH in 80% alc. yields palmitaldoxime, m. 87.5-8, and leaves the trimeric aldehyde, m. 72.5°. The monomeric aldehyde m. 33.5-4° (confirming Le Sueur's observation). The mixt., m. 58°, cannot be depolymerized by simple distn.; it was heated at 150°, 1-2 mg. of ZnCl₂ was added and the mixt was rapidly distd. in a vacuum. When heated with AcOEt and alc. NH₃, the monomeric aldehyde affords *Et 4-pentadecoyl-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate*, m. 50.5-1°. The crude product is treated with N₂O₃, followed by treatment with HCl and then NaOH, yielding *Et 4-pentadecoyl-2,6-dimethylpyridine-3,5-dicarboxylate*, b₁₀ 267-9° (*HCl salt*, m. 88-9°; *chloroplatinate*, m. 119-20.5°). The free acid m. 61° [*HCl salt*, m. 123-4° (decompn.); Pb, Ag and Cu salts]. Distn. of the HCl salt with soda-lime affords pentadecoyllutidine [*4-pentadecoyl-2,6-dimethylpyridine*], b₁₀ 240-2° (*HCl salt*, m. 78-9°; *chloroplatinate*, m. 107-8°; *picrate*, m. 71°), which with Na and alc. gives pentadecoyllupetidine [*4-pentadecoyl-2,6-dimethylpiperidine*], an oil [*HCl salt*, m. 126° (decompn.); *chloroplatinate*, m. 145.5-6.5°].
B. C. A

Local anesthetics derived from 2-(β-hydroxyethyl)piperidine. C. S. MARVEL AND R. S. SHELTON. Univ. of Illinois. *J. Am. Chem. Soc.* 51, 915-7 (1929).—With MeI, EtBr or PrBr, the following *N-alkyl derivs.* of 2-[β-hydroxyethyl]piperidine were prepd.: Me, b₂₅₋₄₀ 175-8°, d₄²⁰ 0.9840, n_D²⁰ 1.4872; Et, b₂₇₋₂₈ 136, d₄²⁰ 0.9739, n_D²⁰ 1.4885; Pr, b₂₇ 139-41°, d₄²⁰ 0.9657, n_D²⁰ 1.4905. With *p*-O₂NC₆H₄COCl, the corresponding *p-nitrobenzoate HCl salts* were prepd. in 55-60% yields: Me, m. 181-2°; Et, m. 198.9°, Pr, m. 124-6°. Catalytic reduction gives the corresponding *p-aminobenzoate HCl salts*: Me, could not be crystd.; Et, m. 238.6-9°; Pr, m. 175-6°. With 1% solns of the 2 HCl salts, the following pharmacol. data were obtained: Av. onset, min., 3 and 2.25-2.5; av. duration of anesthesia, min., 15-20, 35-40; M. F. D., mg per kg. of body wt., not detd., 14-15.
C. J. WEST

Piperidine derivatives. VII. 1-Alkyl-4-piperidyl benzoates and *p*-aminobenzoates. N. W. BOLDYARD AND S. M. McELVAIN. Univ. of Wisconsin. *J. Am. Chem. Soc.* 51, 922-8 (1929); cf. C. A. 20, 3010; 23, 601.—1-Alkyl-3-carbethoxy-4-piperidone HCl salts were heated with 20% HCl, which causes hydrolysis and decarboxylation, giving the following *1-alkyl-4-piperidone HCl salts*: Me, m. 94-5° (all m. ps. cor.), 84% yield; Et, m. 105-6°, 70%; Pr, m. 117-8°, 70%; Bu, m. 178-80°, 70%; *iso-Am*, m. 183-5°, 70%; *phenylethyl*, m. 182-4°, 92%. These compds. were then catalytically reduced and heated with BzCl, giving the following *1-alkyl-4-piperidyl benzoate HCl salts*: Me, m. 219-20°, 64% yield; Et, m. 204-5°, 74%; Pr, m. 210-1°, 83%; Bu, m. 223-4°, 73%; *iso-Am*, m. 199-200°, 50%; *phenylethyl*, m. 236-8°, 82%. The corresponding *p-nitrobenzoates* were also prepd.: Me, m. 197-9°, 40%; Et, m. 204-6°, 53%; Pr, m. 219-20°, 48%; Bu, m. 242-3°, 48%; *iso-Am*, m. 243-5°, 52%; *phenylethyl*, m. 242-4°, 55%. Catalytic reduction of these gives the corresponding *p-aminobenzoates*: Me, m. 231-3°, 73%; Et, m. 183-4°, 83%; Pr, m. 201-3°, 94%; Bu, m. 234-6°, 82%; *iso-Am*, m. 233-5°, 94%; *phenylethyl*, m. 238-40°, 88%. Complete pharmacol. data are given for the 2 series of compds. These members of these series are local anesthetics and show the same relationship between the size of the alkyl group and pharmacol. action of the compd. as was found to exist in the 1-alkyl-3-carbethoxy-4-piperidyl benzoates and *p*-aminobenzoates. *Phenylethyl-4 piperidyl benzoate* is a very potent local anesthetic, possessing about 7 times the anesthetic power of cocaine and considerably less toxicity. The relationship between physiol. action and certain types of structure is discussed.
C. J. WEST

The catechol problem. M. NIERENSTEIN. *Chem. Age (London)* 19, 291 (1928).—

A criticism of Mason's article (cf. *C. A.* 23, 1403). The constitution of cyanidin is regarded as being *sub judice*. B. C. A.

The catechol problem. R. ROBINSON. *Chem. Age* (London) 19, 337(1928).—A reply to Nierenstein (preceding abstr.). In view of the 2 recorded syntheses (Willstätter; Robinson) of cyanidin, the constitution of the latter substance is satisfactorily established. B. C. A.

Carbocyanine dyes with substituents attached to the three-carbon chain. FRANCES MARY HAMER. *J. Chem. Soc.* 1928, 3160-3.—An unsuccessful attempt was made to prep. a carbocyanine dye possessing the chain ($:\text{CH}:\text{CMe}:\text{CH}:$), by the interaction of quaternary salts contg. active Me groups with $\text{MeC}(\text{OEt})_3$. This reaction did work, however, in the prepn. of thiocarbocyanines. By condensing 1-methylbenzothiazole alkyl halides with $\text{MeC}(\text{OEt})_3$ in the presence of pyridine 3 new dyes were obtained, all of them being powerful photographic sensitizers. 8-Methyl-2,2'-diethylthiocarbocyanine iodide, m. 290° (decomps. 280°), has a strong absorption band at 5400 A. U. and a weaker band at 5100 A. U. 2,2,8-Trimethylthiocarbocyanine iodide, m. 298° (decompn.), has the principal absorption max. at 5400 A. U. in alc. 8-Methyl-2,2-diallylthiocarbocyanine bromide, m. 260° (decompn.), has an absorption band at 5450 A. U. (cf. *C. A.* 22, 784). WALLACE R. BRODE

The preparation of 5- and 8-aminoquinolines. R. P. DIKSHOORN. Leiden Univ. *Rec. trav. chim.* 48, 147-54(1929).—When quinoline is nitrated with a mixt. of HNO_3 and fuming H_2SO_4 at a low temp. the main product is a mixt. of 5- and 8-nitroquinolines which can be sepd. into its components quite easily, since the nitrate of 5-nitroquinoline is only slightly sol. in dil. HNO_3 , while the nitrate of the 8-nitro deriv. is readily sol. (cf. *J. Chem. Soc.* 61, 783(1892)). The reduction of these nitro compds. has been carried out by several investigators with various reducing agents, but as the results are not in agreement with one another, the subject was investigated anew and it was found that in every case the presence of HCl is to be avoided. On carrying out the reduction with SnCl_2 and HCl according to Meigen (*C. A.* 2, 2558), satisfactory results were obtained with 5-nitroquinoline, the m. p. of 5-aminoquinoline being found at $105-6^\circ$, instead of 110° , as given in the literature. With 8-nitroquinoline, however, was obtained a mixt. of two chloroaminoquinolines, namely, 5-chloro-8-aminoquinoline, m. $70-2^\circ$, and an isomer, m. 85° , to which D. has given the formula of 3-chloro-8-aminoquinoline, since the m. p. does not agree with the m. ps. of 5-, 6- or 7-chloro-8-aminoquinolines given in the literature. With 8-nitroquinoline the reduction thus proceeds in the same way as with various benzene derivs., the chloro-amino compds. being formed from the chloroamines, which are formed as an intermediate product by the interaction of the hydroxyamino compd., formed in the 1st step of the reduction, and the HCl (cf. *Rec. trav. chim.* 25, 365(1906)). Both the chloroaminoquinolines, mentioned above, could be sepd. by means of a distn. with steam. From both 5- and 8-nitroquinoline the amino compd. could be obtained by reduction of 20 g. of the nitro compd. in 200 cc. warm 50% AcOH with 16 g. of Fe powder, the aminoquinolines being obtained with yields of 58% and 75%, resp., and the 8-amino quinoline showing the m. p. 65° . C. F. VAN DUIN

Derivatives of 5-aminoquinoline. R. P. DIKSHOORN. Leiden Univ. *Rec. trav. chim.* 48, 237-46(1929); cf. preceding abstr.—According to the investigations of Kniphorst (*C. A.* 20, 586) and Lorang (*C. A.* 22, 230) α -aryl- β -ethylureas are readily nitrated. The PhNHCONH^t easily affords 2,4-(O_2N) $_2$ $\text{C}_6\text{H}_3\text{NHCON}(\text{NO}_2)\text{Et}$ which is easily decompd. by water, giving 2,4-(O_2N) $_2$ $\text{C}_6\text{H}_3\text{NH}_2$, CO_2 and EtNHNO_2 . In the present paper the prepn. and nitration of several *N*-substituted derivs. of 5-aminoquinoline are described. 1. α -5-Quinolyl- β -ethylurea (I), prepd. on heating 5-aminoquinoline (7 g.), EtNCO (5 cc.) and 200 cc. ether in a sealed flask at 100° during 6 hrs. (yield 7 g.), m. $219-20^\circ$; soon after the substance has melted it solidifies, sublimes 260° and m. again at 306° , probably *sym*-di-5-quinolylurea being formed together with diethylurea. 2. *Me* quinolyl-5-carbamate (II), formed on dissolving 5 g. 5-aminoquinoline in 30 cc. AcOH , adding 5 cc. ClCO_2Me in 10 cc. AcOH and 2.5 g. EtONa in small quantities at a time, m. 134° ; yield 3 g. In an analogous way the *Et* ester (III), m. 137° , was prepd. while 5-quinolylurea (IV) was obtained on adding 1 g. KCNO in 10 cc. water to 1 g. 5-aminoquinoline in 25 cc. 20% aq. AcOH . On heating IV underwent a change at 224° , decompd. apparently and then m. again 280° . In this prepn. a small quantity of a biuret deriv., $\text{C}_6\text{H}_3\text{NNHCONHCONH}_2$, m. 305° , is formed simultaneously. On nitration with abs. HNO_3 I yields α -8-nitro-5-quinolyl- β -ethylnitrourea (V), m. 173° (violent decompn.); the position of the nitro group in the quinoline nucleus was not proved, however. On heating V with water or alc. NH_3 at 100° in a sealed tube, 8-nitro-5-aminoquinoline (VI), m. 280° , was obtained, again the position of the nitro group

being uncertain. Nitration of I with $\text{HNO}_3\text{-H}_2\text{SO}_4$ gives 6,8-dinitro-5-aminoquinoline (VII), m. 273-7°, when the reaction mixt. is poured out on ice, the α -dinitro-5-quinolyl- β -nitroethylurea, which is first formed, being unstable in the presence of water. In VII the position of neither of the nitro groups has been proved. Nitration of II with abs. HNO_3 gives a mixt. of *Me mono-* and *dinitroquinoline-5-carbamates*, m. 180° and 195°, resp.; without proof the positions 8 and 6, 8, resp., are assigned to the nitro groups in these compds. On hydrolysis at 105° with concd. H_2SO_4 these compds. yield VI and VII, described above. The nitration of III with abs. HNO_3 gave an *Et nitroquinolyl-5-carbamate*, m. 156°, which, on hydrolysis with concd. H_2SO_4 , affords VI. With $\text{HNO}_3\text{-H}_2\text{SO}_4$ III gives an *Et dinitroquinolyl-5-carbamate*, m. 180-3°, which is converted into VII by concd. H_2SO_4 at 105°. IV could not be nitrated; even on careful nitration with well-cooled abs. HNO_3 it decomps. C. F. VAN DUIN.

Synthesis of certain acridine compounds. KONOMU MATSUMURA. Kitasato Inst. *J. Am. Chem. Soc.* 51, 816-20(1929); cf. *C. A.* 21, 1461.—Details are given for the prepn. of [2,4-(O_2N) $_2\text{C}_6\text{H}_3$] $_2\text{CH}_2$, m. 173°, of [2,4-(O_2N) $_2\text{C}_6\text{H}_3$] $_2\text{CO}$, m. 232°, and of 3,6-diaminoacridone, does not m. 320°; 12 g. of the latter, 50 cc. H_2O and 40 g. concd. H_2SO_4 , heated 6 hrs. at 195°, give 85% of 3,6-dihydroxyacridone, does not m. 320°; the concd. H_2SO_4 soln. has a pure blue fluorescence; *di-Me ether*, does not m. 320° (77% yield); with PCl_5 in PhMe 5.1 g. of the latter yields 5 g. of the 9-*Cl deriv.*, light yellow, m. 184°, which gives an intense green fluorescence in concd. H_2SO_4 . Heating with satd. alc. NH_3 and $\text{Cu}(\text{OAc})_2$ at 140° for 8 hrs. transforms this into the 9- NH_2 deriv., deep yellow, m. 268°; the concd. H_2SO_4 soln. has a green fluorescence, becoming violet-blue on diln.; the EtOH soln. shows a green fluorescence, changing to pure blue on diln. with EtOH ; *HCl salt*, light yellow, m. 315° (decompn.); *picrate*, yellow, m. 285° (decompn.); *Ac deriv.*, light yellow, m. 277-8°. The *methiodide* of the *Ac deriv.*, yellow, m. 310° (decompn.); the *Me p-toluenesulfonate* is light yellow and m. 280°; with HCl this gives the *methochloride*, yellow, m. 315°, which has a deep blue fluorescence in H_2O , violet-blue in hot EtOH and weak green in concd. H_2SO_4 . The slight soly. of the methiodide makes it unsuitable for physiol. study. C. J. W.

1,3,4-Oxidazines. III. J. VAN ALPHEN. Leiden Univ. *Rec. trav. chim.* 48, 163-72(1929); cf. *C. A.* 22, 2566; 23, 145.—In this investigation compds. derived from Δ^2 -4-phenyl-5-keto-1,3,4-oxidiazine, $\text{O.CH:N.NPh.CO.CH}_2$ (I), are described

together with their hydrolysis by means of 10% boiling H_2SO_4 . *dl- α -[α -Bromopropionyl]- β -acetylphenylhydrazine* was prepd. from MeCHBrCOBr (23 g.) and PhNH.NHAc (16 g.) in benzene (40 cc.), as a sirup, which could not be induced to crystallize; on heating in acetone with anhyd. K_2CO_3 , *dl- Δ^2 -2,6-dimethyl-4-phenyl-5-keto-1,3,4-oxidiazine* (II) was obtained as a pale yellow liquid, b_{15} 165-70°, n_D^{15} 1.5583. On boiling for an hr. with the 20 parts of 10% aq. alc. H_2SO_4 , II is completely hydrolyzed with the formation of PhNHNH_2 . Again, from EtCHBrCOBr and PhNHNHAc *dl- α -[α -bromobutyryl]- β -acetylphenylhydrazine* was obtained as a non-crystallizable liquid, which was converted in the way described above for I into *dl- Δ^2 -2-methyl-6-ethyl-4-phenyl-5-keto-1,3,4-oxidiazine* (III), b_{15} 146-8°; n_D^{15} 1.5512. Under the same conditions mentioned above for II, III also is completely hydrolyzed. Starting with $\text{Me}_2\text{CBrCOBr}$, *Δ^2 -2,6,6-trimethyl-4-phenyl-5-keto-1,3,4-oxidiazine* (IV) was obtained, b_{15} 150-3° (slight decompn.), n_D^{15} 1.5423. Under the conditions which provoke complete hydrolysis for II and III, IV is only hydrolyzed to a small extent. On refluxing PhNHNHAc (7.5 g.) and $\text{Ph}_2\text{CClCOCl}$ in 100 cc. benzene during 12 hrs., *Δ^2 -2-methyl-4,6,6-triphenyl-5-keto-1,3,4-oxidiazine* (V), m. 156°, is produced at once, the hydrazine deriv. which is formed as an intermediate product being converted spontaneously into the oxidiazine, which is not surprising in view of the great reactivity of the Cl atom in $\text{Ph}_2\text{CClCO}_2\text{H}$. Under the conditions, mentioned above for II, III and IV, V is not hydrolyzed at all, but completely recovered unchanged. PhCHClCOCl and PhNHNHPh in benzene gave *dl- α -[α -phenylchloroacetyl]- β -benzoylphenylhydrazine*, m. 136°, which, on heating in acetone with K_2CO_3 , yields *dl- Δ^2 -2,4,6-triphenyl-5-keto-1,3,4-oxidiazine* (VI), m. 141°, which is not hydrolyzed by boiling 10% H_2SO_4 , but on boiling with alc. NaOH dissolves with conversion into the enolic form. In accordance with this fact, *Δ^2 -2,4,6-tetra-phenyl-5-keto-1,3,4-oxidiazine* (VII) does not dissolve in alc. NaOH , the formation of an enolic form being impossible in this case. VII, prepd. from $\text{Ph}_2\text{CClCOCl}$ and PhNH.NHPh in the usual way, m. 151°, with 10% aq. alc. H_2SO_4 hydrolysis does not take place. From $\text{PhCH}_2\text{CH}_2\text{CONHNHPh}$ (*Ber.* 36, 1101(1903)) and ClCH_2COCl was prepd. a sirupy hydrazine which, on heating with K_2CO_3 in acetone, was converted into *Δ^2 -2-[β -phenylethyl]-4-phenyl-5-keto-1,3,4-oxidiazine* (VIII), m. 79°, which is hydrolyzed

completely with 10% H_2SO_4 , with the formation of $\text{PhCH}_2\text{CH}_2\text{CONHNHPh}$. Starting with the $\text{PhCH}:\text{CHCONHNHPh}$, is formed Δ^1 -2-[β -phenylvinyl]-4-phenyl-5-keto-1,3,4-oxdiazine (IX), pale yellow, m. 128° , which is not hydrolyzed by hot aq. alc. 10% H_2SO_4 . These results and those recorded previously (C. A. 23, 145) show that the hydrolysis of the oxidiazines is not hindered by a Me group, an iso-Pr group, two Me groups or one Me and one Et group. On the other hand, three Me groups inhibit ring opening to a marked extent, while one Ph group inhibits it altogether. This is not simply a consequence of the size of the group, since the PhCH_2CH_2 group does not inhibit ring opening; the unsatd. character of the Ph group must play an important role, since the $\text{PhCH}:\text{CH}$ group inhibits ring opening completely. Although these results are in agreement with Hjelt's rule on the introduction of hydrocarbon radicals on the stability of lactone rings, the nature of the group plays a more important role in the case of the oxidiazines.

C. F. VAN DUIN

Pyrimidines. CIV. Isouracil and its derivatives. Preliminary study of the methods of synthesis. TREAT B. JOHNSON AND W. T. CALDWELL. Yale Univ. *J. Am. Chem. Soc.* 51, 873-80(1929); cf. C. A. 20, 206.—While the ultimate object of this work is the structure of orotic acid, which may be isouracilcarboxylic acid, the present paper is confined to the study of 2 different methods for synthesizing CO_2H derivs. of isouracil; neither have led to practical results. $\text{CS}(\text{NH}_2)_2$ and $\text{EtOCH}_2\text{COCH}(\text{OEt})\text{CO}_2\text{Et}$ are condensed by EtONa to 2-thio-4-ethoxymethyl-5-ethoxy-6-ketopyrimidine, m. 178° , sol. in about 100 parts boiling H_2O ; heating with $\text{ClCH}_2\text{CO}_2\text{H}$ gives 82% of the corresponding 2-keto deriv., m. 168° ; heating with concd. HCl at $120-40^\circ$ for 2 hrs. removes the EtO groups, giving 93% of 2-keto-4-hydroxymethyl-5-hydroxy-6-ketopyrimidine, yellow, does not m. 320° . With $\text{H}_2\text{NC}(\text{SEt})\text{NH}$ there results 2-ethylmercapto-4-ethoxymethyl-5-ethoxy-6-ketopyrimidine, m. 123° ; with PCl_5 there is formed the 6-Cl deriv., light yellow oil, $b_{10} 165-6^\circ$, which is reduced by Zn in $\text{EtOH-H}_2\text{O}$ to 2-ethylmercapto-4-ethoxymethyl-5-ethoxypyrimidine, m. 167° ; hydrolysis with HCl causes the evolution of EtSH , but the amt. of material did not permit the continuation of the work. $\text{EtO}_2\text{CCOCH}(\text{OEt})\text{CO}_2\text{Et}$ and $\text{H}_2\text{NC}(\text{SEt})\text{NH}$ condense to give a small amt. of 2-ethylmercapto-4-carbethoxy-5-ethoxy-6-ketopyrimidine, m. 82.3° ; the 2-keto deriv. m. 230° , and 2-keto-4-carboxy-5-ethoxy-6-ketopyrimidine m. 260° , heating the latter at 110° with concd. HCl gives isobarbituric acid.

C. J. WEST

The dehydrogenation of yohimbine (preliminary communication). F. MENDLIK AND J. P. WITBAUT. Univ. Amsterdam. *Rec. trav. chim.* 48, 191-2(1929).—Up to the present time expts. to dehydrogenate yohimbine have not been undertaken; M and W. have now carried out this expt. according to the method of Diels (C. A. 22, 132) by means of Se. A mixt. of 20 g. yohimbine and 15 g. pulverized Se was heated during 3 hrs. at $300-10^\circ$; after cooling in a CO_2 atm., the reaction mixt. was pulverized mixed with the same vol. of sand and extd. for 2 hrs. with boiling benzene. A white substance, $\text{C}_{18}\text{H}_{18}\text{N}_2$, m. $212-3^\circ$, dissolves in the benzene and crystallizes on cooling (4.5 g.), it sublimes without decompn., dissolves in dil. acids with a blue fluorescence and shows several alkaloid reactions, e. g., gives a ppt. with picric acid, I-KI and Nessler's reagent. Extn. of the residue of the benzene extn. with alc. gives a yellow substance, m. 326° , which, however, still contains a small quantity of Se and could not be obtained in an analytically pure condition.

C. F. VAN DUIN

Polarized light and cocaine decomposition. H. T. DAILEY AND H. C. BENEDICT. Northwestern Univ. Dental School. *J. Am. Chem. Soc.* 51, 808-16(1929).—A study of the relative effect of polarized and non-polarized light on the decompn. of cocaine has been made, in which several concns. of cocaine-HCl were used; 2 methods of obtaining a polarized radiation were used; the times of irradiation ranged from 1 to 12 hrs.; the effect was tested on goldfish and *Lupinus albus*. The conclusion is drawn that polarized radiations have no selective action in the decompn. of cocaine-HCl. Cocaine is slowly decompd. by light. Obvious sources of error which have been eliminated, as far as possible, are the variability of individual goldfish, the tolerance that goldfish develop to cocaine and the effect of traces of impurity in the H_2O .

C. J. WEST

The anhydride of abietic acid. W. NAGEL. Res. Lab. Siemens Corp. *Chem. Umschau Fette, Oele, Wachse Harze* 36, 33-4(1929).—When rosin is acetylated it becomes anhyd and Fonrobert and Pallaut (*Farben. Ztg.* 31, 1849(1926)) have isolated the anhydride. Dupont's assertion (*Chem. et Ind.* 1927, 1691; cf. C. A. 22, 423) that the anhydride is simply the hydrated acid less H_2O of crystn. was disproved by a reexamn. which characterized the product as an anhydride by its acid no. at 0° , m. $148-50^\circ$, and its correct value of the sapon. no. Details of the methods are given. For prep.

abietic anhydride in the wet way, the rosin was first ground with malonic ester and crystd. several times; recrystn. was finally made with low mol. solvents like acetone.

P. ESCHER

Constitution of carthamin. CHIKA KURODA. Inst. Phys. Chem. Research, Tokyo. *Proc. Imp. Acad. (Japan)* 5, 32-3(1929).—Crude carthamin paste (from safflower), treated with cold dil. HCl and dried, gives *isocarthamin*, yellow, crystg. with $2H_2O$, m. 228° , which is very unstable and passes into a red amorphous product when exposed to the air; C_6H_5N gives red carthamin, $C_{21}H_{22}O_{11}$, which, dried at 100° , loses $1H_2O$. Heating with dil. mineral acids gives glucose.

C. J. WEST

Rate of hydrolysis of casein in acid solutions as measured by the formation of amino nitrogen. E. S. NASSET AND DAVID M. GREENBERG. Univ. of California. *J. Am. Chem. Soc.* 51, 836-41(1929).—The rate of hydrolysis of casein by acids as measured by the increase in NH_2 N conforms to the equation for a 2nd order reaction. As was previously found for other proteins, the catalytic effect of acids on casein hydrolysis is proportional to the H-ion activity of the acids. The change of rate of hydrolysis with temp. is expressed by the relation $\log Ka = 0.0307 T - 5.61$.

C. J. WEST

The molecule binding power of bile acids and sterols. I. Desoxycholic acid and apocholic acid. HEINRICH RHEINBOLDT WITH ELSE FLUME AND OTTO KÖNIG. Univ. Bonn. *Z. physiol. Chem.* 180, 180-6(1929).—Thawing p. and m. p. curves were plotted for the following binary mixts.: palmitic acid and desoxycholic acid, stearic acid and desoxycholic acid, cetyl alc. and desoxycholic acid, palmitic acid and apocholic acid, stearic acid and apocholic acid, cetyl alc. and apocholic acid. Cryst. compds. were prepd. from cetyl alc. and desoxycholic acid, and from cetyl alc. and apocholic acid. Detns. of the neutralization equiv. showed both compds. to consist of 1 part of alc. to 8 parts of acid.

A. W. DOX

Oxime rearrangements in the group of bile acids. M. SCHENCK. *Z. anorg. Chem.* 42, 61-5(1929).—Oximes of satd. cyclic ketones can be converted to isoximes or lactams by a Beckmann-Wallach rearrangement and these can then be hydrolyzed to the corresponding amino acids (cf. Wallach, *Ann.* 312, 171(1900)). Similar rearrangements and hydrolyses can be carried out with ketoxime acids in the group of bile acids. Desoxybiliaric acid (cf. C. A. 14, 1811) and NH_2OH form an oxime which on warming with concd. H_2SO_4 is converted to the isoxime I; when I is boiled with 20% HCl it is converted to the amino acid II.

In a similar manner isodesoxybiliaric acid can be rearranged to the isoxime and the amino acid obtained from this by hydrolysis can be converted to the lactam. A comprehensive review and discussion of these reactions, the exptl. data of which have been published previously, is given (cf. C. A. 21, 1991, 2477, 3903).

N. A. LANGE

The higher carbon ring compounds. L. RUZICKA. *Chem. Weekblad* 25, 614-7 (1928).—Civetone, obtained from civet, was one of the first compds. found to have 17 C atoms in ring formation. Mol. refraction as well as reduction to the dihydro product yields a di- CO_2H acid which is identical with pentadecane-1,15-dicarboxylic acid. Dihydrocivetone is cycloheptadecanone. Belonging to the same class are musk and muscone ($C_{15}H_{26}O$). Muscone is 3-methylcyclopentadecan-1-one. Some of the higher ketonic substances can be prepd. by heating the Ca salts of the polymethylene dicarboxylic acids. Cyclic ketones contg. from 9-29 C atoms are thus made known. These ketones up to 19 C atoms have a characteristic odor. Kerchbaum attributes this to lactones of ω -HO acids. The stability of these ketonic compds. is remarkable and does not appear to be in agreement with the Baeyer strain theory. Information

on this has appeared along 4 lines: (1) the mol. vol. of a CH_2 group has the same value as in straight chain compds.; (2) similar "spacings" between CH_2 groups are found in aliphatic compds.; (3) the same is also brought out with Röntgen rays; (4) it has been found that from 13 C atoms up, these substances form monomol. layers on water.

Separation of components of oily mixtures produced by the catalytic hydrogenation of carbon oxides. MARTIN LUTHER and HERMANN JOCHHEIM (to I. G. Farbenind. A. G.) U. S. 1,704,751, March 12. Alcs. may be readily isolated from the mixts. by converting them into aldehydes by dehydrogenation, sepg. the aldehydes by distn. or combination with bisulfite and thereafter reconverting them into alcs. Or the alcs. may be oxidized to acids and sepn. of the acids effected. Alternatively, the material may be treated with partially or wholly dehydrated hydrate-forming salts such as MgCl_2 , $\text{Ca}(\text{NO}_3)_2$ or CaCl_2 whereby, on cooling, preferably with addn. of a pptg. agent such as benzene, mol. compds. sep. which are subsequently decomposed by addn. of water. Products are thus obtained which are of lighter color, lower b. p. and more agreeable odor than the original material. Inorg. acids may be used for recovery of ketones in the oily mixts. under treatment, suitably by washing on the counter-current plan. Several examples with details of procedure are given.

Hydrogenating aromatic bases. I. G. FARBENIND. A.-G. Brit. 295,033, Aug. 6, 1927. Catalytic hydrogenation of aromatic bases is facilitated by use of an alkali or alk. earth, e. g., Na_2CO_3 may be added to assist in the hydrogenation of ethylaniline in the presence of Ni oxide to produce hexahydroethylaniline, or CaO and Co oxide may be used together in hydrogenation of *o*-toluidine.

Arsenating organic compounds. EMIL SCHELLER (to Deutsche Gold & Silber Scheideanstalt, vorm. Roessler). U. S. 1,704,106, March 5. In forming products such as α -hydroxy- β -pyridinearsonic acid, a diazo compd. such as that of α -hydroxy- β -pyridine in HOAc is caused to react with AsCl_3 or other suitable halogen compd. of As and the reaction product is decomposed and the product purified (suitably by heating, use of Na hydrosulfite, H_2O_2 and subsequent reprecipn. Cu compds. are used as catalysts. Cf. C. A. 23, 1136.

Organic copper compounds. I. G. FARBENIND. A.-G. Fr. 645,219, Dec. 6, 1927. Complex azo compds. of Cu are prepd. by coupling diazo, diazoazo, and tetraazo compds., resp., in which in the *o*-position with respect to one or more azo or diazo groups are carboxy, hydroxy or carbonyl groups, with any coupling components in the presence of complex compds. of Cu contg. N and sol. in water. In examples, diazotized 2-amino-naphthalene-3-carboxylic acid is added to an aq. soln. of 5,5'-dihydroxy-2,2'-dinaphthyl-

urea-7,7'-disulfonic acid, Na_2CO_3 and an aq. soln. of $[\text{Cu}(\text{NH}_3)_4]\text{SO}_4$, whereon coupling and formation of the Cu compd. takes place. Other complex compds. are obtained if $[\text{Cu}(\text{NMe}_2)_4]\text{SO}_4$ or $[\text{CuPy}_4]\text{SO}_4$ are used. 2-Aminobenzoic acid is diazotized and coupled with 5,5'-dihydroxy-2,2'-dinaphthylamino-7,7'-disulfonic acid in the presence of Na_2CO_3 and $[\text{Cu en}_2(\text{H}_2\text{O})_2]\text{SO}_4$ or di-aquo-di-en-cuprisulfate of glycolol cupri-diamine, in which "en" represents ethylenediamine. Other examples are given.

Benzanthrone derivatives. I. G. FARBENIND. A.-G. (Julius Müller, inventor). Ger. 471,021, Nov. 29, 1925. It is found that the usual methods of prepg. benzanthrone from anthraquinone, when applied to 2,6-dihaloanthraquinones, yield 2,6-dihaloanthrones free from isomers. The prepn. of 2,6-dichlorobenzanthrone, m. 236° , is described in an example and 2,6-dibromobenzanthrone, m. 221° , is also mentioned.

Esters. W. CLAASEN. Brit. 294,947, Feb. 2, 1927. See Fr. 32,991 (C. A. 23, 846).

Vinyl ester. FREDERICK W. SKIRROW (to The Canadian Electro Products Co., Ltd.). Can. 287,496, Feb. 26, 1929. Inactive vinyl esters of unsatd. alcs. and hypothetical alcs. made by interaction of an acetylene and a carboxylic acid, are rendered active and capable of polymerization and of reaction with aldehydes and acetals by treating the vinyl esters with oxygen in presence of natural or artificial light.

Vinyl ester. FREDERICK W. SKIRROW AND GEORGE O. MORRISON (to The Canadian Electro Products Co., Ltd.). Can. 287,494, Feb. 26, 1929. Vinyl esters are made from the corresponding carboxylic acids by passing acetylene into said acids in presence of a Hg orthophosphate formed *in situ* by interaction of H_3PO_4 on a Hg oxide dissolved in the carboxylic acid.

Alkamine esters of *o*-aminobenzoic acids. OTTO EISLER (to Winthrop Chemical Co.). U. S. 1,704,660, March 5. Compds. of greater power than cocaine in producing local anesthesia are formed by esterifying *o*-*N*-alkyl- or *o*-*N*-alkoxyalkylaminobenzoic acid with an amino alc. or by treating an alkamine ester of *o*-aminobenzoic acid with alkylating or alkoxyalkylating agents. In an example which is given, the mono-hydrochloride of methoxyethylanthranilic acid piperidinoethyl ester is first obtained as an oil but soon solidifies and when recrystd. from AcOEt forms a colorless cryst. powder, m. 118° .

Diazo compounds. KALLE & Co., A.-G. Brit. 294,248, July 21, 1927. Solid stable compds. are obtained by treating soln. of diazo compds. with a salt of Cd such as CdCl_2 . Examples are given.

Oxidizing aldehydes to monocarboxylic acids. ARTHUR STOLL and WALTER KUSMAUL (to Chemische Fabrik vorm. Sandoz). U. S. 1,703,755, Feb. 26. See Brit. 293,322 (C. A. 23, 1650).

Alkylphenols. SCHERING-KAHLBAUM A.-G. Brit. 294,238, July 21, 1927. Alkylphenols are produced by heating an alkyl ether of a phenol under pressure and preferably in the presence of a catalyst such as silica gel or fullers earth and with stirring or agitation. Polyalkylphenols may be formed as by-products. Examples are given of the transformation of phenol Et ether into ethylphenol together with some diethylphenols of phenol cyclohexyl ether into cyclohexylphenol and of the isopropyl ether of *m*-cresol into a mixt. of thymol and 3-methyl-4-isopropylphenol.

Aminophenol ethers. JOSEPH TCHERNIAC. Fr. 644,989, Dec. 1, 1927. *o*-Aminophenol ethers are prepd. by heating in an alk. soln. the product of reaction of an alkoxyarylcarboxylic acid amide and a hypochlorite. In an example, methylsalicylamide is stirred up with a soln. of NaOCl and NaOH . The mixt. is kept at about 20° for several hrs. and then heated to boiling. Steam distn. gives 80% practically pure anisidine.

Aromatic hydroxyaldehydes. I. G. FARBENIND. A.-G. Brit. 294,889, July 30, 1927. Hydroxyarylamines are boiled with dil. alkali in the presence of isatin or a suitable deriv. By introducing air or other gaseous oxidizing agent the quantity of isatin or the like required may be reduced below the usual requirement of 2 mol. proportions. By boiling *o*-hydroxybenzylamine and vanillylamine-HCl with K isatin-5-sulfonate in alk. soln., salicylaldehyde and vanillin are formed. Another example is given of the production of vanillin and 5-aldehyde-1,2,3-*o*-cresotinic acid from vanillylamine and 5-(ω -aminomethyl)-1,2,3-*o*-cresotinic acid by oxidation with air and use of K isatin-5-sulfonate as catalyst.

Cyclohexyl compounds. ROGER ADAMS (to Abbott Laboratories). U. S. 1,703,186, Feb. 26. Various compds. which are *bactericidal against acid-fast bacteria* such as *B. leprae* and *B. tuberculosis* have the general formula $\text{C}_6\text{H}_{11}(\text{CH}_2)_y\text{CHRCOOZ}$ in which y may be zero or more, R represents an alkyl or alkylene group, and Z represents H, a metal, or an alkyl group. Acids of this type are made by condensation of a

haloalkylcyclohexane with a properly substituted malonic ester or by condensation of an ω -cyclohexylmalonic ester with an alkyl halide followed by sapon. and elimination of CO_2 . Examples are given. Cf. *C. A.* 22, 227, 2147; 23, 848.

Tetrazoles. C. H. BOHRINGER SOHN. Fr. 645,265, Nov. 5, 1927. Tetrazoles are prepd. by the action of azides or free hydrazoic acid on esters of oximes, particularly the sulfonic esters, or the Beckmann transformation products of these esters, or the components necessary for ester formation may be used. The esters may be treated in the presence of HN_3 with substances such as thionyl chloride, POCl_3 or PCl_5 which effect the transformation. Tetrazoles are also produced by the action of HN_3 or azides on amido or imido chlorides. In examples (1) 1,5-dimethyl-1,2,3,4-tetrazole is prepd. from the benzene sulfonic ester of acetoxime and Na azide; (2) $\alpha\beta$ -cyclopentamethylenetetrazole from cyclohexanone, PhSO_3H and NaN_3 , some 2-leucine lactam is produced at the same time; (3) 1-phenyl-5-amino-1,2,3,4-tetrazole by esterifying benzoylamidoxime with PhSO_2Cl in NaOH soln. and boiling the ester with NaN_3 ; (4) 1,5 diphenyltetrazole by treating a mixt. of benzophenoneoxime and HN_3 in CHCl_3 with thionyl chloride; (5) tetrazole from ϵ -leucine lactam in CHCl_3 with POCl_3 and NaN_3 ; (6) $\alpha\beta$ -cyclopentamethylenetetrazole by esterifying ϵ -leucine lactam with PhSO_2Cl and treating with NaN_3 .

Quaternary ammonium compounds. SOC. ANON. POUR L'IND. CHIM. A BAË. Brit. 294,582, July 26, 1927. Quaternary ammonium compds. are prepd. by reaction of an alkylating or aralkylating agent upon monoacylated or unsymmetrically diacylated diamines such as those described in Brit. 219,304 (*C. A.* 19, 523). Examples are given of the treatment of oleyldiethylethylenediamine with MeI , oleyldiethylethylenediamine with Me_2SO_4 and water and stearyldiethylethylenediamine, in melted condition, with Me_2SO_4 .

Sulfurized compounds. I. G. FARBENIND., A.-G. Fr. 645,820, Dec. 16, 1927. See Can. 284,056 (*C. A.* 23, 608).

Sulfuro-anhydride derivatives of tertiary organic bases. E. G. BECKETT, J. E. G. HARRIS, B. WYLAM, J. THOMAS AND SCOTTISH DYES, LTD. Brit. 294,507, Feb. 25, 1927. Bases such as pyridine or dimethylaniline are caused to react with SO_3 or with a substance capable of forming a sulfuro-anhydride deriv. with the base, in the form of vapors, gases, mists or sprays. An equimol. proportion of SO_3 is suitable but if chlorosulfonic acid or an alkyl ester is used approx. 2 mol. proportions of the base are used and the product in such case is a mixt. of the sulfuro-anhydride and hydrochloride or alkyl chloride of the base. The product is obtained in the form of a fine powder or snow and may be used in the prepn. of esters of vat dyes and for sulfonation of various hydrocarbons. Various details and modifications are described.

Alkali metal xanthates. WILHELM HIRSCHKIND (to Great Western Electro Chemical Co.). U. S. 1,704,249, March 5. Caustic alkali, alc. and CS_2 are caused to react at a temp. below 35° (suitably about 20°). The CS_2 is added last. Cf. *C. A.* 23, 1481.

Ammonium benzoate. JOSEPH A. SPINA (to Hooker Electrochemical Co.). U. S. 1,704,636, March 5. Reaction between NH_3 and benzoic acid is effected while both are in substantially anhydrous condition, *e. g.*, by contact of NH_3 with vaporized benzoic acid.

Formates. I. G. FARBENIND. A.-G. Brit. 294,396, Sept. 19, 1927. See U. S. 1,698,573 (*C. A.* 23, 1138).

Vinyl acetate. GEORGE O. MORRISON (to The Canadian Electro Products Co., Ltd.). Can. 287,495, Feb. 26, 1929. In a continuous process, an oxide of mercury is dissolved in AcOH ; the soln. is treated with H_3PO_4 ; C_2H_2 is passed into the liquor until the reaction slackens, through exhaustion of the catalyst; H_3PO_4 is made to react on a fresh AcOH soln. of Hg oxide; C_2H_2 is passed into the fresh acid and phosphate until vinyl acetate formation commences; and the fresh catalyst is substituted for that which has been exhausted.

Acetic acid. HENRY DREYFUS. U. S. 1,704,965, March 12. A mixt. comprising CH_4 and CO_2 is passed under pressure in contact with heated catalytic material such as carbonates of Ni or Fe at a temp. between about 120° and 300° . Cf. *C. A.* 23, 1141.

Concentrating acetic acid. HERMANN SUIDA. U. S. 1,703,020, Feb. 19. Extn. of HOAc from a dil. soln. in vaporized state is effected with a mixt. of an extn. medium such as tar cresol having a high b. p. as compared to HOAc together with a solvent (such as C_2HCl_3) for the extn. medium. An arrangement of app. is described. Cf. *C. A.* 23, 608.

Concentrating acetic acid. I. G. FARBENIND. A.-G. Brit. 294,636, July 29, 1927. In a process of effecting concn. of HOAc by adding an alkyl acetate and distg., as described in Brit. 284,688 (*C. A.* 22, 4539), the alkyl acetate, such as EtOAc is used

in mixt. with a hydrocarbon or Cl deriv. of a hydrocarbon such as C_6H_6 or ethylene chloride. Cf. C. A. 22, 3669.

Acetic acid from acetylene. J. KARPATY and M. G. HÜBSCH. Brit. 294,226, July 21, 1927. In a reaction vessel there is placed 98% HOAc contg. $HgSO_4$ and 0.1% of cellulose which has been activated by heating in a current of N. The app. is evacuated and C_2H_2 and O are then supplied alternately and the liquid is circulated in the app. (various details of which are described). An alk. wash-liquor serves to absorb CO_2 and any entrained acetic acid and aldehyde. The activated cellulose may be prepd. from sawdust or shavings heated in N at 200° to produce only a slight superficial carbonization. Colloidal substances in HOAc soln., such as collodion and cellulose acetate, and colloidal PbO_2 , V_2O_5 and the like which are stable in HOAc in the presence of Hg salts also may be used, and the reaction may be promoted by adding 0.1–0.2% H_2SO_4 to the HOAc.

Acetaldehyde from acetylene. J. KARPATY and M. G. HÜBSCH. Brit. 294,227, July 21, 1927. In the oxidation of C_2H_2 , the latter and the acid absorption medium (comprising H_2SO_4 or HOAc or both) are separately maintained in circulation systems (of an app. which is described) having in common a reaction chamber in which the absorption medium falls in coherent thin streams. $HgSO_4$ may be used as a catalyst and various details are described. A temp. of 70° is suitable and the acetaldehyde formed may be of such strength that it can be sepd. from soln. by salting out.

Acetaldehyde or acetic acid. I. G. FARBENIND. A.-G. Fr. 645,967, Dec. 1, 1927. AcH or AcOH is prepd. by passing C_2H_2 over contact substance, such as salts of Hg, Ag, Sn or Cu preferably contg. V in the acid radical, in the presence of H and an oxidizing gas or substance liberating O. In examples, a gaseous mixt. contg. much AcH is obtained by passing H, N, C_2H_2 and O at 110° over mercuric phosphate. A gas contg. 30–35% AcOH is obtained by passing H, C_2H_2 , and O at 250° over Ag vanadate. Sn vanadate is also used.

Metaldehyde. ELEKTRIZITÄTSWERKE IONZA and CHEM. FAB. A.-G. Ger 470,851, June 24, 1924. See Brit. 235,867 (C. A. 20, 917).

Methanol. COMMERCIAL SOLVENTS CORPORATION. Fr. 644,525, June 20, 1927. A catalyst composed of one or more difficultly reducible oxides and a metal halide is used in the production of CH_3OH from H and CO. In examples a mixt. of (1) Cr_2O_3 and $ZnCl_2$ or $MgCl_2$; (2) Cr_2O_3 , ZnO or MgO and $ZnCl_2$; (3) WO_3 , ZnO and $ZnBr_2$, and (4) oxide of U and $ZnCl_2$ are used.

Ethylene from acetylene and hydrogen. I. G. FARBENIND. A.-G. Brit. 291,787, Aug. 27, 1927. C_2H_2 and H in a finely distributed condition and at an elevated temp. are passed through an inert liquid such as a hydrocarbon, contg. a catalyst in suspension. An example is given of the use of decahydronaphthalene carrying in suspension Pd deposited on kieselguhr at a temp. of 150 – 60° . Another example refers to Ni as a catalyst.

Hydrogen peroxide. P. ASKENASY. Brit. 294,265, July 21, 1927. See Fr 638,090 (C. A. 23, 245).

Menthol. KARL SCHÖLLKOPF (to Rheinische Kampfer-Fabrik, G.m.b.H.). U. S. 1,704,630, March 5. In the manuf. of inactive menthol, thymol is heated with H under pressure in the presence of hydrogenation catalysts, inactive menthol is sepd. from the mixt. of liquid menthols, and the latter is converted by dehydrogenation into a mixt. contg. menthones and this mixt. is heated with H under pressure in the presence of hydrogenation catalysts. Cf. C. A. 23, 611.

Pinacol. HENRY BERLIN (to International Patents Development Co.). U. S. 1,703,220, Feb. 26. Acetone or a homolog is caused to react in the presence of Al and a Hg salt such as $HgCl_2$ sol. in the ketone and decomposable by the Al while CCl_4 is introduced intermittently in such manner as to avoid violence of the reaction; the soln. of pinacol is sepd. after decomposing the reaction product.

1-Methyl-5-chlorobenzene-2-carboxamino-3-thioglycolic acid. ERWIN HOFFA, JENS MÜLLER and FRITZ MÜLLER (to Grasselli Dyestuff Corp.). U. S. 1,703,145, Feb. 26. 1-Methyl-5-chloro-2-cyanobenzene-3-thioglycolic acid is treated with H_2SO_4 until the corresponding 2-carboxamino compd. is formed and the reaction is then stopped by diln.

1-Propenyl-3-ethoxy-4-hydroxybenzene. FRIEDRICH BOEDECKER. U. S. 1,704,494, March 5. *i*-Chavibetol is ethylated, the resulting 3-ethyl 4-methyl ether is subjected to the action of an alk. medium such as aq. NaOH soln. and the resulting 1-propenyl-3-ethoxy-4-hydroxybenzene is sepd. from the 4-methoxy compd. by recrystn.

Sulfo salt of 3,3'-dichlorodiphenylmethane-4,4'-di(trimethylammonium hy-

dioxide). GEORG. KALISCHER and KARL KELLER (to Grasselli Dyestuff Corp.). U. S. 1,703,150, Feb. 26. This compd. may be obtained by the action of Me_2SO_4 upon 3,3'-dichloro-4,4'-bis(dimethylamino)diphenylmethane and is a cryst. compd. easily sol in water and m. at about 218° with evolution of gas.

Lactone of tetradecane-14-hydroxy-1-carboxylic acid. SOC. ANON. M. NAEF ET CIE. Brit. 294,602, July 27, 1927. This compd. is made by heating cyclopentadecanone with persulfuric acid. On acidification it yields the acid and the latter, by oxidation with chromic acid, gives tridecane-1,13-dicarboxylic acid.

Styrene. IVAN OSTROMISLENSKII (to Naugatuck Chemical Co.). U. S. 1,703,950, March 5. In obtaining purified styrene from mixts. of styrene and ethylbenzene, the styrene is sepd. from the mixt. by polymerizing the styrene content for 16-48 hrs. at 180 - 140° to form easily pulverized resinous polymerized styrene, distg. off the ethylbenzene, heating the resinous polymer at 350 - 500° to form unpolymerized styrene and distyrene, and sepg. the styrene by distn. Cf. C. A. 23, 156.

Colored polymerized styrenes. IVAN OSTROMISLENSKII (to Naugatuck Chemical Co.). U. S. 1,705,264, March 12. Colloidal solns. of inorg. coloring substances are formed in styrene, e. g., by use of Au or Ag compds., and the styrene is then polymerized to the solid state to obtain a colored polymerized product. Cf. C. A. 22, 3893.

Condensation products of ethanol. CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE, G. M. B. H. Fr. 645,169, Dec. 5, 1927. EtOH is passed at high temps. over catalysts such as oxides, carbonates or alcoholates of Mn, Mg, Zn, V, Fe, Ba, Sr, Ca and Cu for the production of BuOH, acetone and acetic ester with simultaneous production of AcH. In examples, EtOH is passed at 420 - 430° over MgO supported on wood charcoal, a mixt. of BuOH, AcOEt and AcH being obtained. EtOH is passed at about 450° over MnCO_3 or ZnO on wood charcoal, a mixt. of BuOH and AcH being obtained in each case.

Condensation product of *m*-cresol and acetone. SCHERING-KAHLBAUM, A.-G. Fr. 645,271, Nov. 8, 1927. A new condensation product of *m*-cresol and acetone probably of the formula $[4,2\text{-Me}(\text{OH})\text{C}_6\text{H}_3]_2\text{CMe}_2$, m. 131 - 132° , is obtained by condensing of the ordinary or reduced temp. so as to avoid any spontaneous heating. Examples are given using HCl as condensing agent, with or without the addn. of dehydrating agents. Cf. C. A. 23, 1139.

Condensation products of the "benzodiazine" series. I. G. FARBENIND. A.-G. Fr. 645,585, Dec. 12, 1927. Condensation products of the "benzodiazine" series are prepd. by condensing 2,4-dihaloquinazolines with 2 mols. of a compd. which carries for one atom of N, S or O one or more atoms of H capable of reacting with the exception of water, NH_3 , alkali sulfhydrates and univalent aliphatic alcs. In examples, 2,4-dichloroquinazoline is dissolved in Me_2O , heated to 65° and poured drop by drop into a soln. of 1-amino-8-hydroxynaphthalene-3,6-disulfonic acid and AcONa in water. A condensation product is obtained in which 2 mols. of the disulfonic acid becomes attached through the amino group to the C atoms next to the N atoms in the ring. Other aminohydroxysulfonic acids may be used in the same manner. If 4-nitro-1-aminobenzene-3-sulfonic acid is used, 2 mols. become attached in the same manner through the amino group. If thio-*p*-cresol is used, 2 mols. become attached in the same manner through the SH group, and 2 mols. of phenol become attached through the OH group. Other examples are given.

Ionic equilibrium, phagocytosis, and age of colloids. V. KULIKOV. *Compt. rend. soc. biol.* 97, 1335-6(1927); cf. C. A. 22, 98, 113. H. L. D.

Action of mixed reagents on the viscosity of protoplasm. H. TIMMEL. *Protoplasma* 3, 197-212(1927).—Centrifuge expts. were carried out with the chloroplast of various plants and single or mixed salts, particularly K, and org. compds. B. C. A.

Influence of structure on the kinetics of desmolases. I. Uricase. System: uricase, uric acid, active and inactive charcoal and protein. Sr. J. v. PŁYŃECKI. Univ. Warsaw. *Z. physiol. Chem.* 178, 19-38(1928).—The action of purified uricase obtained from ox kidney and frog liver was studied both in homogeneous medium and

in the presence of adsorbents. A neutral substance (charcoal without metal) which does not act on the substance but adsorbs uric acid and uricase inhibits the enzyme by diminishing the uric acid concn. PrOH and BuOH which are eluents only for the adsorbed uric acid and not for the adsorbed enzyme accelerate the decompn. of uric acid by increasing its concn. An active adsorbent (Fe-contg. charcoal) which decomposes uric acid in the presence of O behaves in the same way. The total uric acid decompn. in the system: C-Fe, uric acid, uricase, is greater than in the system: uric acid, uricase. Uricase action alone in the system with C-Fe is feebler than in a homogeneous medium. In the system: C-Fe, uric acid, uricase, the uric acid decompn. is the sum of the sep. uricase and C-Fe actions. Both catalysts act independently of each other, the uricase action depending on the uric acid concn. and the C-Fe action on the quantity of uric acid adsorbed on the oxidizing surfaces. Similar relationships were observed with different O concns. In the system with C-Fe the alcs. accelerate the uricase action by their power of elution, but retard the uric acid decompn. under the influence of the C-Fe contact. An adsorbent (coagulated protein), which adsorbs mainly the enzyme but the substrate only slightly, inhibits uricase action only to a small extent. The same adsorbent in soln. (sol. egg albumin) inhibits the reaction still less.

Plasmalogen. I. Properties of plasmalogen, preparation and nature of plasmal. R. FEULGEN, K. IMHÄUSER AND M. BEHRENS. Univ. Giessen. *Z. physiol. Chem.* 180, 161-79(1929); cf. *C. A.* 22, 2602.—Plasmal, a substance characterized by its lipid nature and aldehyde reactions, has been obtained from a great variety of animal tissues. It does not occur as such in the fresh tissue, but is present as a complex with some unknown substance, probably joined through the aldehyde group, since the complex plasmalogen does not give the ordinary aldehyde reactions. The liberation of plasmal from plasmalogen by the action of 0.1 N HCl at 37° is complete in 3 hrs., but HgCl_2 brings about this cleavage instantaneously. If the tissue is given a preliminary extn. with H_2O , then extd. with EtOH and the EtOH evapd., an emulsion consisting largely of phosphatides remains which is very rich in plasmalogen. Pptn. from Et₂O by MeAc or from EtOH by CaCl_2 does not effect a sepn. However, the plasmalogen, although persistently accompanying the phosphatides through various purification procedures, is not a phosphatide, since none of the phosphatide components gives the plasmal reaction (blue color with fuchsin- SO_2), and since lecithin from egg yolk gives only a very faint reaction. Plasmal, on the other hand, can be sepd. from other substances by steam distn., or better, by sapon. of the phosphatides, acidifying and extg. with Et₂O, and finally removing the fatty acids from the Et₂O by dil. NaOH. The crude plasmal obtained by distn. in an atm. of CO_2 seps. as a greasy skin-like mass with m. p. about 25°. It forms a thiosemicarbazone which can be sepd. into 2 fractions. The fraction difficultly sol. in EtOH was recrystd. 15 times until it showed a const. m. p. of 107-7.5°. Ten kg. of horse meat yielded 1-2 g. of this product. Analysis showed the absence of O and a % compn. between the values calcd. for the thiosemicarbazones of stearic and palmitic aldehydes. Now the thiosemicarbazone of stearic aldehyde m. 111° and that of palmitic aldehyde m. 109°. Mixed m. ps. of these 2 derivs. were then detd. and the curve was plotted. The mixts. 77:23 and 10:90 both m. 107°. With the 1st mixt. the addn. of plasmal thiosemicarbazone depressed the m. p. below 100°; with the 2nd mixt. no depression occurred. The 2 known thiosemicarbazones react at different rates with fuchsin- SO_2 . Of the 2 mixts. m. 107° only the 2nd gave the same rate of reaction as the plasmal deriv. Crystallographic comparisons also showed the same agreement. Plasmal is, therefore, a mixt. of higher fatty aldehydes. Oleic aldehyde was not identified, but its thiosemicarbazone might reasonably be expected to occur in the fraction more easily sol. in EtOH. Other aldehydes are probably present as indicated by a peculiar odor of the crude plasmal which disappears on oxidation with Ag- NH_4OH or formation of the thiosemicarbazone. Plasmalogen is probably a complex mixt. and as difficult to sep. as the individual constituents comprising a natural fat.

The protease content of the pylorus secretion. OTTO KESTNER, RICHARD WILSTÄTTER AND EUGEN BAMANN. Bayer Akad., München. *Z. physiol. Chem.* 180, 187-91(1929).—By the Pavlov operation on a dog, a blind sack of about 4.5 cc. capacity was formed in the antrum pylori and the secretion collected through a fistula. After diln. with 2-3 vols. of H_2O and centrifuging to remove leucocytes, the secretion was tested for digestive action on albumin at pH 2 and 4.8, on casein at pH 8.9 and on dl-leucylglycine at pH 7.8. The increase in amino N was in each case either nil or negligible. The enzymes, pepsin, 2nd protease (cathepsin), trypsin and crepsin, were therefore absent. The leucocyte sediment showed a distinct ereptic activity.

A. W. DOX

Insulin. III. Remarks on the measurement of insulin. KARL FREUDENBERG AND WILHELM DIRSCHERL. Univ. Heidelberg. *Z. physiol. Chem.* 180, 212–6(1929); cf. *C. A.* 22, 2206.—A discussion of the method described in the previous paper. The method is based on the decrease in blood sugar of a 2 kg. rabbit to the "convulsion limit," where the reducing power of the blood corresponds to 0.045% glucose. About 1/2 of this residual value, however, represents reducing substances other than sugar. β 's arbitrary unit is equiv. to 1.8 international standard units. Abel's cryst. insulin is believed to be a protein which carries the hormone as a prosthetic group. Removal or breakdown of the protein should give a more active but less stable hormone prepn.

IV. The action of pepsin on insulin and its acetyl derivatives. WILHELM DIRSCHERL. *Ibid* 217–31.—The "acetylinsulin," prepd. by treatment of insulin with Ac_2O and pyridine, and the "regenerate" obtained therefrom by subsequent treatment with dil. alkali (NaOH) and possessing 1/3 the original activity, were compared to insulin with respect to their behavior toward pepsin. The destruction of insulin by pepsin is irreversible, and is unmistakably a proteolysis, since the effect increases with rise in temp., amt. of enzyme and duration of the expt. The action is greater at p_{H} 1.8 than at 2.2 or 1.1. It is not yet known whether the inactivation is due to digestion of a protein-like adsorbent whose presence is necessary for insulin action or whether the insulin itself is a protein with or without a prosthetic group and undergoes peptic digestion. The regenerate of acetylinsulin, whether in suspension or in soln. obtained by acidifying the alk. soln., also becomes inactivated by pepsin. This acetyl deriv. is hardly comparable to that of Jensen and Geiling (*C. A.* 22, 4653), since a different insulin was employed and pyridine was used in the acetylation. Formal titration by the Sørensen method showed in the insulin prepn. a ratio of amino to total N of 10%, in the regenerate about half this value, and in the acetylinsulin no amino N. All 3 prepn. gave a final value of 18% amino to total N after peptic digestion. The initial and final values of the regenerate correspond to those of ovalbumin. At p_{H} 7 insulin is inactivated by CH_3O . By warming with 0.1 N HCl 25% of its original activity is then restored but the active portion ppts. out. Insulin itself behaves in a similar manner when heated with HCl. A portion of the substance seps. out in pellicles with great activity but slight stability.

Porphyryns. XVIII. The chemism of porphyrin formation from β -hemins. WILLIAM KÜSTER AND W. V. DEGENFELD. Tech. Hochschule Stuttgart. *Z. physiol. Chem.* 180, 259–69(1929); cf. *C. A.* 23, 844.—By adding HBr to hemin obtained from horse blood and decomg. the product with H_2O , 2 fractions were obtained. The portion sol. in H_2O was shown to be Nencki's hematoporphyrin which is strongly basic and goes into soln. as the HBr salt. The insol. portion was a less basic EtOH-sol. porphyrin evidently formed by hydrolysis of a HBr salt originally present. When the CHCl_3 sol. monoethylated β -hemin was treated in this way the yield of insol. porphyrin was 50%, whereas the unesterified CHCl_3 -insol. β -hemin yielded only 25%. Crude hemin contains 20% of the mono-Et deriv., and hence the yield of weakly basic porphyrin therefrom is 30%. Analysis gave values corresponding to a β -bromo- α,α' -dihydroxymesoporphyrin. This could result from addn. of 2 HBr to the acetylene and 1 HBr to the vinyl group, followed by replacement of 2 Br by OH. The feebly basic character of this porphyrin, identified as such by the formation of complex salts, is due to its Br content and the α -position of OH on the acetylene side chain. Its HCl salt is completely hydrolyzed by H_2O , but the removal of Br requires treatment with hot NaOH. The fact that both porphyrins, Nencki's hematoporphyrin and the mesoporphyrin deriv., are obtained from monoethylhemin would indicate that the latter is a mixt. of 2 isomers or else both forms are present in a double mol. Fleischmann's monoethylhemin (*C. A.* 22, 526) added only 2Cl; hence only 1 of the isomers could have been present in his prepn. Removal of Br from the unesterified hemin-HBr addn. product by H_2O instead of MeOH, both of the above porphyrins being obtained thereby, would indicate a partial liberation of the acetylene grouping during the hydrolysis. Replacement of the 2 Br by OH instead of OMe decreases the basic properties of the resulting mesoporphyrin deriv. and facilitates its sepn. from the hematoporphyrin. From the bromodihydroxymesoporphyrin the Cu, Zn and Fe complex salts were prepd., and by treatment with HBr-AcOH followed by digestion with MeOH, the di-Me ester of the expected dimethoxyporphyrin was obtained.

XIX. The chemism of porphyrin cleavage in substituted hemins and the constitution of hemin. WM. KÜSTER AND KARL SCHAYER. *Ibid* 270–85.—When dichlorodimethylhemin is boiled 12–5 hours with abs. MeOH, an insol. residue of 10% remains, and the filtrate on treatment with dil. NaOAc yields a ppt. of monochloromonomethoxydimethylhemin (I) from which the unchanged dichloro deriv. is removed by extrn. with pentane. Treatment of I with HBr-AcOH

followed by esterification with MeOH converts it into monochlorohematoporphyrin di-Me ether (II). From the latter the complex Zn salt is obtained as a red ppt. by addn. of $\text{Zn}(\text{OAc})_2$ to the MeOH soln., but when the mixt. is boiled the ppt. consists of the Zn salt of the Zn complex. The complex Cu salt is obtained by treating the porphyrin in AcOH with $\text{Cu}(\text{OAc})_2$, and the complex Fe chloride salt by warming in AcOH satd. with NaCl with $\text{Fe}(\text{OAc})_2$. The Me ester of I was prepd. by boiling with MeOH contg. 1% HCl and pptg. with NaOAc, and this yielded a Fe chloride complex analogous to the above. Oxidation of I in 30% H_2SO_4 with CrO_3 converted it into hematic acid, and methylchloromethoxyethylmaleic imide. A second product from the prepn. of II was sepd. from the MeOH-Et₂O soln. by addn. of H_2O . This contained Fe and both Cl and Br. It was given a 2nd HBr-AcOH treatment and the portion then sol. in MeOH and pptd. by H_2O was identified as chlorobromodimethoxymesoporphyrin. The esterification, however, was not complete since a MeO detn. indicated the presence of 25% of the mono-Me ether. The insol. portion still contained Fe and was evidently a hemin. If the removal of Fe and the addn. of HBr are parallel reactions, a linkage of the Fe to the acetylene grouping would explain this stability. Boiling 3 hrs. with 7% KOH in MeOH removed the Br completely, the Cl and Me only partially. A further treatment with HBr-AcOH gave only an insignificant yield of Et₂O-sol. porphyrin. The insol. residue obtained in the prepn. of I was not altered by further boiling with MeOH. The porphyrin cleavage yielded chlorobromodimethoxymesoporphyrin, identified by the prepn. of its ester. By treatment of I with AcOH-HBr, evapn. of the solvent and extrn. with 1% HBr, a complete sapon. of MeO was effected without loss of Cl and Br. Treatment of the insol. residue with 5% Na_2HPO_4 removed Br and yielded a Cl-substituted hematoporphyrin. It was esterified with MeOH and HCl, and complex Zn, Cu and Fe salts prepd. from the ester.

A. W. DOX

The preparation of protoporphyrin. A. HAMSÍK. Univ. Brünn. *Z. physiol. Chem.* 180, 308-18(1929).—In the prepn. of protoporphyrin by various methods the yield depends on the quality of the chlorohemin or hydroxyhemin employed. The α -preps. afford the best yield, while the β - and especially the pseudo-preps. give smaller yields and correspondingly greater amts. of by-product. The by-product, a red-green-brown porphyrin, has to be sepd. from the protoporphyrin. This may be done through the Na salt and by crystn. from pyridine- H_2O . The protoporphyrin is pptd. as the Na salt by concd. NaOH while the other porphyrin remains for the most part in soln. The latter is similar to the porphyrins obtained by the action of aq. HCl or concd. H_2SO_4 and probably contg. Nencki's altered hematoporphyrin. The most satisfactory method of prepg. protoporphyrin is that with HCO_2H and Fe powder, where a yield of 40% may be obtained. It is best to add first the Fe to the HCO_2H , then the hydroxyhemin, and heat for only a short time. Other methods, viz., $\text{AcOH} + \text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$, $\text{HCO}_2\text{H} + \text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$, $\text{EtOH} + \text{N}_2\text{H}_4\cdot\text{H}_2\text{O} + \text{HCl}$, $\text{MeAc} + \text{SnCl}_2 + \text{HCl}$, $\text{SnCl}_2 + \text{HCl}$ and $\text{SnCl}_2 + \text{AcOH} + \text{HCl}$, with various modifications in technique, are discussed, but these methods are less convenient and give poorer yields. Protoporphyrin is altered by treatment with acids or acids and reducing agents. The complex Sn salt in alk. or AcOH soln. becomes altered on standing in the air, with change of color and spectrum.

Investigations on the biological actions of light. ALBERT EIDINOW. Natl. Inst. Med. Research, Hampstead. *J. Roy. San. Inst.* 49, 431(1929).—Ultra-violet irradiation of the skin causes the shed defibrinated blood tested *in vitro* to have bactericidal properties.

A. L. E.

A new phospho-organic constituent of red blood corpuscles. S. POSTERNAK. *Compt. rend.* 187, 1165-7(1928).—From the blood of the horse P. believes he has isolated a new phospho-organic principle, which he believes to be an α -ketotrihydroxyadipic acid diphosphate; the positions of the phosphate groups have not been detd. The highest rotation observed is 8.88° , and after neutralization with AmOH it is 15.04° . Except for a certain soly. in satd. solns. of alk. earth salts, the properties of the compd. and of its salts resemble those of *l*-glyceric diphosphate. To hydrolyze completely the free acid about 100 hrs. at 125 - 130° in an autoclave is required. The compd. is perhaps an intermediate in the formation of lactic acid in the muscle and other tissues.

S. L. B. FETHERTON

The chemistry of hemoglobin. III. R. M. FERRY AND ARDA A. GREEN. Harvard Medical School. *J. Biol. Chem.* 81, 175-203(1929); cf. C. A. 18, 2536. An improved method for the prepn. of hemoglobin is described. This depends on repeated crystns. of oxyhemoglobin from a cold concd. soln. after complete oxygenation and adjustment of the p_{H} to a point slightly more acid than p_{H} 6.8. Buffered solns. of hemoglobin of given p_{H} were made by the addn. of water, phosphate or borate buffers, to-

gether with enough alkali to change the p_H of reduced hemoglobin to the same value. These solns. were equilibrated with known gas mixts. and analyzed by the methods of Van Slyke. O dissoen. curves were constructed from the data so obtained and show the familiar S-shape and the decrease of percentage satn. with increasing acidity up to p_H 6.55. At higher H-ion activities the percentage satn. again rises. The affinity of hemoglobin solns. for O passes through a min. between p_H 6 and 7, apparently at 6.55. It is impossible to describe these data in terms of the simple mass law equation. More variables than have been commonly used must be employed. The equil. between O and hemoglobin solns. may be described by means of a simple empirical equation of the form: $[Hb] [pO_2]/[HbO_2] = 0.5 [H^+] (\log \% HbO_2 - 2.015)/0.013 (7.4 \times 10^{-8} + [H^+])$. These exptl. findings may also be expressed in terms of equations in which it is assumed that hemoglobin behaves as though it were a mixt. of substances, each obeying the general form of the mass law equation, where n is an integer. These data are also described in terms of the theory of intermediate compd. formation by the equation: % satn. =

$$\frac{0.25 K'_1 O_2 + 0.5 \times 0.32 (K'_1 [O_2])^2 + 0.75 \times 0.256 (K'_1 [O_2])^3 + 2.7 (K'_1 [O_2])^4}{1 + K' [O_2] + 0.32 (K' [O_2])^2 + 0.256 (K' [O_2])^3 + 2.7 (K' [O_2])^4}$$

If the theory of intermediate compd. formation be assumed, the change in position of O dissoen. curves with changing p_H , over the range 6.55 to 8.88, may be explained on the assumption that the salt and acid forms of hemoglobin have different affinities for O. A theoretical expression of the form $K'_1 = \frac{K'_R K'_S + K'_a [H^+]^2}{[H^+]^2 + K'_R}$

will explain the phenomenon. Because of the large no. of assumptions involved, any theory that may at present be advanced must await further investigation for its verification.

ALBERT L. HENNE

Enzyme studies in the placenta. WEHEFRITZ AND E. GIERHAKKE. *Arch. Gynäkol.* 135, 212-22 (1928).—Placentas of different ages contain the enzyme arginase. The activity of the enzyme arginase in splitting a 2% soln. of arginine nitrate varied from 24.4 to 71.2%. No mutual relation could be made out between the intensity of action of the arginase and the age of the placenta. A further splitting of urea to CO_2 and NH_3 by the enzyme urease did not take place in the placenta. H. F. H.

The use of electrolysis in biochemistry. A. WERNER KEIL AND HANS G. SCHIECK. *Univ. Wurzburg. Z. Biol.* 88, 153-6 (1928).—Electrolysis of bile yielded crystals of glycocholic acid. With Liebig ext. not only the salts were sepd. by this procedure but also creatinine.

FRANCES KRASNOW

Photochemistry in the service of therapy and biology. IVAN PLOTNIKOV. *Archiv. Hom. Farm.* 3, 5-18 (18-19 French) (1929).—An address. JAROSLAV KUČERA

Physicochemical studies of bioluminescence. VI. The mechanism of luminescence in Cypridina luciferin and luciferase suggested. S. KANDA. *Sci. Papers Inst. Phys. and Chem. Res.* (Tokyo) 9, 265-9 (1928).—*Cypridina hilgendorffii* was crushed, the shells were removed, and the bodies extd. with petroleum ether and then with Et_2O . The dry residue was then extd. with MeOH (40 cc. per g. substance), to remove luciferin, and with H_2O (100 cc. per g. substance) to remove luciferase. When equal vols. of each ext. were mixed there was no development of light. Upon addn. of 10 cc. H_2O to the mixt., light was produced; and upon addn. of 35-40 cc. H_2O , the max. amount of light was noted. The production of light may be caused by a rearrangement of the surface films of solvent around the particles of luciferin and luciferase when water is added.

W. D. LANGLEY

Regarding certain observations of P. and G. P. Eggleton on phosphagen. V. SIRACUSA. *Boll. soc. ital. biol. sper.* 3, 834-41 (1928); cf. *C. A.* 22, 3421.—According to Eggleton the process of phosphagen formation in muscle is represented by the following scheme: (a) phosphagen \rightarrow lactic acid + phosphoric acid; (b) phosphoric acid + glycogen \rightarrow lactacidogen; (c) lactacidogen \rightarrow phosphagen. In the presence of NaF the phosphagen is diminished but there is not a corresponding increase in inorg. phosphoric acid. These results led Eggleton to make the statement "fluoride completely inhibits reaction (c) in our scheme." The purpose of this investigation was to det. whether the diminution of phosphagen by NaF was due to some inhibition of the process of synthesis or whether it was due to some interfering action in detg. the P by Briggs colorimetric method. The results obtained are briefly summarized: (1) In strong concns. of NaF $M/2.5$ to $M/5$, solus. of inorg. P are either not colored at all by the Briggs reagents in 30 min. or are colored less intensely than the corresponding standard contg. the same amt. of phosphate. The addn. of trichloroacetic acid intensifies the phenomenon. (2) In weak concns. 0.1 M to 0.01 M the intensity of color after

30 mins. was equal to the standard. (3) In concns. of NaF where the color in 30 mins. is equal to the standard, the appearance of the color is nevertheless markedly retarded. (4) If NaF is allowed to act for a sufficient time directly on the muscle, there is always a diminution of phosphagen and inorg. P. Conclusions: Eggleton's results have been confirmed but the action of NaF is not due to any inhibition of the synthetic process giving rise to phosphagen, but is due to some interfering action in Briggs colorimetric method for detg. P.

PETER MASUCCI

New studies on protein denaturation. I. Alcohol denaturation. MONA SPIEGEL-ADOLF. Univ. Wien. *Biochem. Z.* 204, 1-13(1929).—The conditions under which electrolyte-free serum or ovalbumin and pseudo-globulin are pptd. by alc. were investigated as well as the properties of the ppts. Unlike serum, pseudo-globulin pptd. by heat from aq. soln. regains its soly. in H₂O only partly following treatment with alkali. Even when strong alc. concns. are employed (88%) over a very long time (6 weeks) only 60-70% of the treated serum is insol. in water. But through treatment with definite amts. of alkali and then removing this through electrodialysis this fraction regains its water soly. and typical properties of serum. Under similar exptl. conditions the soly. in water of the alc.-pptd. ovalbumin is very slight under alkali treatment. Pseudo-globulin in this respect is intermediate between serum and ovalbumin. The presence of definite concns. of acid can double the quantity of the fraction of the serum which remains water sol. after alc. pptn. On the other hand, the presence of neutral salt in the alc. pptn. just as in the heat pptn. practically completely prevents the returns of water soly. on treatment with alkali of the alc.-pptd. serum. The similarity in the denaturation caused by alc. or by heat indicates certain changes in the protein mol.

S. MORGULIS

Physicochemical studies on radiated proteins. V. The alterations in serum under the influence of penetrating radium rays and their relation to heat and light coagulation. A. FERNAU AND M. SPIEGEL-ADOLF. Univ. Wien. *Biochem. Z.* 204, 14-27(1929).—The behavior of electrolyte-free serum and in the presence of acids alkali or neutral salt was studied under the influence of penetrating Ra rays. This was compared with the results obtained under the influence of higher temp. or of ultraviolet rays under similar conditions. Furthermore, the properties of these coagula were compared with those of coagula produced by H₂O₂. It was found that serum freshly electrodialyzed and preserved with toluene loses its ability of being pptd. by Ra radiation unless it is preserved in the ice box. NH₃ can be demonstrated in this serum in such amts. that, when added to freshly electrodialyzed serum it would deprive it of its ability to coagulate under the influence of Ra rays. It is also shown that to prevent the visible changes by Ra rays much smaller acid and alkali (NH₃, KOH) quantities are required than for heat coagulation. Furthermore, Ra rays, unlike the heat, cause almost complete denaturation of the serum even when through addn. of HCl no visible changes are produced by the rays. The time required for coagulation by Ra rays is very largely independent of the concn. of the serum soln. except in the very concd. solns. The pptn. can be prevented through increased concn. of neutral salt. Contrary to the pptn. products formed by heat and in agreement with the coagula of serum produced by light the coagula formed by the Ra rays do not regain their soly. in water through treatment with alkali. The ppts. formed when serum is acted upon by electrolyte-free H₂O₂ show the same behavior as those formed by Ra rays upon treatment with alkali.

S. MORGULIS

A new titration method for studying lipase. LAJOS GÓZONY, JÁNOS GSELL AND FERENCZ HOFFENREICH. Königl. ungar. Pázmány-Péter-Univ., Budapest. *Biochem. Z.* 204, 126-39(1929).—When an aq. soln. of butyric acid is added to serum fatty acids are set free through lipase action which cause the pptn. of casein dissolved in NaOH at p_H 5.6. The amt. of ppt. or of turbidity depends upon the quantity of casein which becomes insol. A series of 10 tubes is prepd. contg. serum in dilns. of 1:2, 4, 8, 16, 32, 64, 128, 256, 512 and 1024, and to these a soln. of casein is added, the reaction of which had been previously adjusted to p_H 5.6. Ca stimulates the lipase reaction but in the concn. found in serum the effect is slight. PO₄ and K are somewhat inhibitory while CO₂ inhibits the reaction strongly. Serum increases greatly the serum lipase action but ovalbumin inhibits this. Also the amino acids, asparagine and glycocoll. have a strong stimulating effect. Urea at first stimulates and then depresses the lipase reaction. Glucose has no action. Lecithin inhibits even when it is not much increased while cholesterol even in very minute quantities stimulates. MnSO₄ stimulates the lipase reaction very little but CaCl₂ may double the effect while Na taurocholate causes strong inhibition. An exposure of serum to a temp. of 45° for 1/2 hr. has practically no effect on the lipase; at 50° only rat serum showed considerable loss of lipase activity;

at 56° rat and human sera lose their lipase activity while at 59° all sera lipases become inactivated. KCN in a 0.1% soln. has no effect while in a 1% soln. it causes serious damage to the serum lipase; quinine inhibits the lipase action markedly even in 0.1% concn.; NaF inhibits in a 0.2% concn. while atoxyl is the strongest lipase poison, even a 0.02% soln. causing complete inactivation.

S. MORGULIS

Stereochemical specificity of liver and pancreatic lipase. HANS H. WEBER AND R. AMMON. Univ. Berlin. *Biochem. Z.* 204, 197-207(1929).—The dissocn. const. of the combination of liver lipase with *d*-mandelic acid methyl ester is $10^{-3.76}$ and with the *l*-ester $10^{-2.9}$. The ratio of the hydrolysis const. of both combinations is 1:1.75. The dissocn. const. of the same combinations with pancreatic lipase are similar, $10^{-1.8}$, and the ratio between the hydrolysis const. is 1:1.7.

S. MORGULIS

The independence of its ionization of the hydration of protein. HANS H. WEBER AND D. NACHMANN-SOHN. Univ. Berlin. *Biochem. Z.* 204, 214-52(1929).—The "non-dissolving space" of ionized or electrically neutral protein may under certain circumstances be a measure of the hydration vols. of both systems. This "non-dissolving space" is entirely independent of the degree of ionization of the protein and is always 1 cc. per g. albumin and 1.3 cc. per g. globulin. Simultaneous detns. of osmotic pressure and viscosity in the same series show the remarkable dependence of these upon the ionization (pH). If a viscosity curve of an albumin prepn. is construed under conditions permitting the calcn. of the albumin vol. as a disperse phase, it is found that 1 g. albumin has a viscosity vol. which increases from 2.0 cc. at the isoelec. point to 15 cc. at the max. acid swelling. This extraordinary rise in the viscosity vol. with ionization and the corresponding change in osmotic pressure must depend upon the taking of H_2O in accordance with the Donnan law. The ionization of different proteins and amino acids does not produce a contraction of vol., as might be expected where there is a considerable rise in hydration, but a vol. expansion. In ionization with an equiv. of acid this is 7-9 cc. or in ionization with alkali 16-22 cc. according to the nature of the ampholyte. When the ionized ampholyte is again changed to the unionized state through neutralization of the acid or alkali the vol. expansion for one cycle becomes 22 cc., which under the special exptl. conditions corresponds to the formation of one mol. H_2O from H and OH ions. If the heat production in the ionization of protein is regarded, as would seem probable, as the heat liberated in the chem. reaction of ionization, there is no excess heat left to account for hydration heat assocd. with ionization. But according to Katz the hydration heat serves as a measure of the hydration energy in lyophile colloids. If, on the other hand, all the ionization heat is considered as hydration heat, the increase in hydration energy due to ionization is only 3% of the hydration energy of electrically neutral protein even where the ionization is maximal. The measurements do not sustain the assumption of a specific connection between protein hydration and ionization.

S. MORGULIS

The effect of ptyalin on starch. I. J. R. BROEZE. Reichsuniv., Leiden. *Biochem. Z.* 204, 286-302(1929).—The hydrolysis of starch by saliva has been studied by measuring the changes in the viscosity which gives very good results. The velocity of the hydrolysis is proportional to the concn. of the enzyme. The enzyme does not decrease under the influence of the starch. The temp. coeff. of the reaction velocity between 20° and 30° is 2. The heated enzyme cannot be regenerated.

S. M.

The influence of carbon monoxide and hydrogen cyanide on hematin catalysis. HANS A. KREHS. Kaiser Wilhelm-Inst., Berlin-Dahlem. *Biochem. Z.* 204, 322-42 (1929), cf. *C. A.* 23, 1655.—Hemin compds. show the same characteristic properties as the respiratory enzyme, and of these the pyridine compd. of hematin comes closest to the latter from the point of view of behavior toward CO or HCN. At 20° 1 mg. Fe of this compd. transfers 100,000 cu. mm. O_2 per hr. to cysteine, and the tervalent Fe of pyridine hematin is reduced to pyridine-hemochromogen while the bivalent Fe of the hemochromogen is again reoxidized by mol. O_2 . The tervalent Fe of pyridine-hematin does not react at all or reacts very slowly with the H_2 of the SH-groups of cysteine, this substance not being markedly oxidized. Such marked oxidation is observed only when the soln. contains an Fe compd. of cysteine. This is demonstrated schematically $(Fe^{+3})_H + (Fe^{+2})_C \rightarrow (Fe^{+2})_H + (Fe^{+3})_C$, where $(Fe)_C$ and $(Fe)_H$ designate ferrocytosteine and hematin, resp. The catalysis of this reaction is reversibly inhibited by CO, being produced by light. In the dark, the CO combines with the Fe^{+2} of hemochromogen and prevents its reaction with O_2 . Under the influence of light the CO-hemochromogen again dissociates into its components, this response to light being of the same magnitude as that of the respiratory enzyme. HCN similarly inhibits reversibly the catalysis of both. The HCN compd. is not reduced by ferrocytosteine to which factor the inhibition of catalysis is attributed. The mechanism of the 2 reactions

is thus entirely different, CO reacts with Fe^{++} of hemochromogen and HCN with Fe of higher valence. Although pyridine-hematin catalysis and respiration of living cells both show the same behavior towards CO and HCN the hematin catalysis cannot be inhibited by H_2S as respiration is.

S. MORGULIS

The action in the dark of fluorescent dyes on diastase. G. CLAUS. *Tech. Hochschule, München. Biochem. Z.* 204, 456-66(1929).—Seeds treated with eosin upon germination give rootlets with an abnormal geotropic growth and with a stronger diastase action than normal rootlets. Dyes of the fluorescein series or phenosafranine added to a starch-diastase mixt. cause an acceleration of the starch hydrolysis. Eosin and phenosafranine give 2 to 3; rose bengal, phloxin and erythrosin give about 2 times as much sugar formation as normally present. This acceleration is found only outside the opt. p_{H} range. Dilns. still effective were 1:1000 for erythrosin and 1:400,000 for eosin. This accelerating effect fails to appear when pure enzyme preps. are employed (Merck's diastase abs. and Maltin). These dyes produce a similar influence on the salivary diastase but with takadiastase the results are neg.

S. M.

Two cholesterol reactions. E. BAHL. *Univ. Königsberg i. Pr. Biochem. Z.* 204, 474(1929).—An acetic acid (glacial) soln. of benzidine gives a yellow-brown color with cholesterol. A soln. of rosaniline in CHCl_3 which is a light rose color becomes intensely red with cholesterol.

S. MORGULIS

The enzymic formation of l-malonic from fumaric acid. NILS ALWALL. *Univ. Lund. Skand. Arch. Physiol.* 55, 91-3(1929).—The enzymic formation of l-malonic acid from fumaric acid under the influence of muscle fumarase has been studied polarimetrically.

S. MORGULIS

Thermolability of glycerinophosphodehydrogenase. NILS ALWALL. *Univ. Lund. Skand. Arch. Physiol.* 55, 100-3(1929).—The glycerinophosphodehydrogenase has the same thermolability as succinodehydrogenase, so that these 2 enzymes cannot be thus differentiated.

S. MORGULIS

Globin and denatured globin. HENRY F. HOLDEN AND MAVIS FREEMAN. *Walter and Eliza Hall Inst. Australian J. Exptl. Biol. Med. Sci.* 5, [3], 213-22(1928). The chem. equiv. of globin is the same as that of globin in natural oxyhemoglobin. The sp. rotations of horse and of ox globins differ from those of the corresponding denatured globins. Denatured globin freshly prepd. by the Schultz method often contained a small amt. of globin. The combination between denatured globin and reduced hematin is discussed.

L. W. RIGGS

Affinity problems. V. HANS VON EULER AND RAGNAR NILSSON. *Arkiv kem. Mineral Geol.* 10A, No. 4, 7 pp.; cf. *C. A.* 22, 789.—The properties of enzymes depend on their degree of sepn. from the natural substrate. Dried bottom yeast invertase is partially removable by thorough washing. Phenol poisoning expts. were undertaken with a yeast prepn. freed from the fraction removable by washing. In one case this yeast prepn. was treated with phenol and then freed from phenol before cane sugar inversion; in a second expt. inversion took place in the presence of phenol. The inversion const. decreased by 16 and 17.5%, resp., indicating an irreversible reaction of phenol with substrate. Phenol decreased the inversion const. of a sol. invertase prepn. 18.6%. The inhibition of the action of mutase on acetaldehyde by phenol in various concns is shown.

F. U

Separation of the soluble proteins of rabbit muscle. WALTER S. RITCHIE AND ALBERT G. HOGAN. *Univ. of Missouri. J. Am. Chem. Soc.* 51, 880-6(1929).—A 10% soln. of NaCl has been used to ext. the sol. proteins of muscle tissue. If the ext. is kept near the f. p. the soly. of the proteins changes very slowly. When the ext. is satd. with NaCl, irradiated with a quartz Hg arc or dialyzed, a portion is pptd., to approx. the same extent by each method. It is assumed that this ppt. is a globulin fraction. The results indicate that this ext. contains about 2.5 times as much globulin as albumin.

C. J. WEST

The influence of Röntgen rays on the nitrogen and chlorine metabolism. ANNA JUGENBERG. *Vestnik rentgenol. i radiol.* 4, 291-304(1926); *Ber. ges. Physiol. exptl. Pharmakol.* 46, 159.—Guinea pigs (56) were irradiated (Coolidge tube) at a distance of 40 cm. with 200 kv., 3 milliamp. and through 0.5 Zn + 3.0 Al filter. The dose was $\frac{1}{2}$ H. E. D. for 36 animals while 12 received $\frac{1}{10}$ H. E. D. From 10 to 12 days after the irradiation 33 of the animals that had received $\frac{1}{2}$ H. E. D. showed signs of hemorrhagic pneumonia, pericarditis, pleurisy and gastric ulcer. The animals which had received $\frac{1}{10}$ H. E. D. stood the dose well. The body wt., amt. of nourishment and amt. of urine and feces were recorded in each instance. N was detd. according to Kjeldahl and NaCl according to Volhard. In the animals which had received $\frac{1}{2}$ H. E. D. there was a decided reduction in the N elimination. Further testing showed that the

N retention occurred chiefly in the internal organs, as the liver, spleen, kidneys and cardiac muscle. The N content of the blood (after $1\frac{1}{2}$ H. E. D.) was less than in unirradiated animals. On the other hand, the N content of the animals receiving $1\frac{1}{10}$ H. E. D. was larger than that of the controls (not irradiated). After $1\frac{1}{10}$ H. E. D. the N content in the organs was larger than normal also. Increased diuresis with high NaCl values in the urine followed $1\frac{1}{2}$ H. E. D. The N retention was highest in the liver. The body wt. decreased some.

Determination of iron (in organic substances). G. DOMINICI. *Folia Clinica* 3, 65-82(1928).—A critical review of the methods for detg. Fe in blood, urine, etc. The most satisfactory method with regard to rapidity and accuracy of results is considered to be the colorimetric method using thiocyanate.

B. C. A.

Detection of sugar in urine. J. SCHMID AND E. GLORIUS. *Süddeut. Apoth.-Ztg.* 68, 98-9(1928).—In Schmidt and Rubner's reaction the mixt. of urine, NH_3 and Pb acetate is preferably heated at 85° at one point, or immersed in water at 40-50°, when the development of a salmon-pink color will detect 0.05%; under these conditions lactose does not react similarly.

B. C. A.

An improved method of preparing urea from urine. S. KANNEGIETER. *Univ. Amsterdam. Pharm. Weekblad* 66, 129-31(1929).—Add 2-3 g. of norite per 100 cc. of urine and filter after 5 min. This treatment completely removes all color and odor. Evap. the filtrate on the water bath to a sirupy consistency (about $\frac{1}{6}$ the original vol.) and cool in ice water. While still cooling add an excess of concd. HNO_3 with stirring. Filter off the crystals of urea nitrate through asbestos and press between filter papers. Mix the urea nitrate with an excess of BaCO_3 and add EtOH until a pasty mass is formed. Treat this with warm EtOH and filter off the $\text{Ba}(\text{NO}_3)_2$ and excess of BaCO_3 . Evap. the filtrate to crystn. The urea thus obtained is colorless and odorless. The use of norite not only eliminates the unpleasant odor evolved when urine is evapd. directly, but also increases the yield of urea by removing org. substances which reduce HNO_3 to HNO_2 , which in turn decomp. the urea.

A. W. DOX

New technic of the colorimetric resorcinol-hydrochloric acid microchemical method of blood-sugar determination and comparison of the same with the Hagedorn-Jensen method. B. GLASSMAN AND MME. A. ZWILLING. *Z. physiol. Chem.* 180, 124-6(1929); cf. C. 1, 20, 437; 21, 751.—By the following modification the method is adapted to sugar detn. by color comparison at ordinary temp. instead of 60°, using the Duboscq colorimeter. Place 0.1 cc. of the blood or serum on a piece of blotting paper, allow the latter to dry 10-5 mins. in the air and insert in a test tube. Add 5 cc. of aldehyde-free EtOH and allow 15 mins. for extn. Transfer the alc. sugar soln. to a 2nd test tube, rinsing the paper with 2 cc. EtOH. Evap. the EtOH by immersing the tube in a boiling water bath.

To the residue add 2 cc. of 1% resorcinol and 4 cc. of 25% HCl, heat 1 hr. in a boiling water bath, filter hot into a 3rd test tube bearing a 6 cc. mark, cool, dil. to the mark if necessary and add 5 cc. EtOH. The EtOH redissolves any resorcinol-sugar condensation product that may sep. The standard soln. for color comparison is prepd. from 0.1 cc. of 0.1% glucose, 2 cc. resorcinol soln. and 4 cc. HCl by the same treatment, dild. to the 6 cc. mark and 5 cc. EtOH added. The difference between the 2 colorimeter readings, a and b , added to the higher reading, a , gives the corresponding sugar value in mm. of the colorimeter. The % of sugar, x , is then calcd. by the inverse ratio: $a + (a - b) : b = x : 0.1$. A no. of detns. by this method agreed with parallel detns. by the Hagedorn-Jensen method within the permissible limits of error. A. W. DOX

The occurrence of methylguanidine in the animal organism. I. Detection of methylguanidine in the muscles of a dog. I. A. SMORODINTZEV AND A. N. ADOVA. Univ. Moscow. *Z. physiol. Chem.* **180**, 192-7(1929).—Methylguanidine had previously been isolated by S. from muscle exts. of various animals by the $\text{AgNO}_3\text{-Ba(OH)}_2$ pptn. method. Ewins (*C. A.* **10**, 1872) subsequently questioned the reliability of this method and pointed out the fact that warming with Ba(OH)_2 hydrolyzes creatinine into methylguanidine. To meet this objection S. undertook the isolation of methylguanidine from dog muscle by another method in which the possibility of creatinine cleavage is largely obviated. The concd. ext. of muscle was treated with HgCl_2 and NaOAc and the ppt. decompd. by HCl and H_2S . The filtrate from the HgS was evapd., extd. with MeOH, evapd. and this treatment repeated several times with EtOH. The final ext. was pptd. with PtCl_4 , the Pt removed by H_2S and the base pptd. from the filtrate by picric acid. Fractional crystn. of the picrate yielded pure methylguanidine picrate, corresponding to 0.06% of the base from the fresh muscle. This is practically the same yield as that previously obtained by the Ag-Ba method. Direct pptn. from the alc. ext. by picric acid without the Pt pptn. diminishes the yield to $\frac{1}{3}$. A. W. D

The histochemical detection of adrenaline. S. BAGINSKI. *Bull. histol. tech. micr.* **5**, 129(1928); *Stain Tech.* **4**, 29.—The reagent-fixative soln. consists of the following: 2% $(\text{NH}_4)_2\text{CrO}_4$, 30 cc.; 1.25% AgNO_3 , 20 cc. and NH_3 (sp. gr. 0.912), 0.2-0.3 cc. Natural adrenaline, 0.1 p.p.m., when treated with this reagent gives a fine black ppt. C. R. F.

The use of mixed stains in histological technic. EMILIE HOUCKE. *Rev. Hyg. med. prev.* **51**, 154-60(1923).—Formulas are given for several stains. A mixt. of 1:100 aq. solns. of acid fuchsin and toluidine blue in the ratio of 5:11, or acid fuchsin and methylene blue in the ratio of 14:22, makes very good histological stains. C. R. F.

The atmospheric oxidation or dealkylation, of aqueous solutions of methylene blue. W. C. HOLMES AND E. F. SNYDER. U. S. Dept. Agr. *Stain Tech.* **4**, 7-10 (1929).—At approx. 25°, dil. aq. solns. of representative samples of methylene blue are stable below p_{H} 9.5. Oxidation, or dealkylation, begins between p_{H} 9.5 and 9.8 and increases in both rate and degree with increasing alky. Below p_{H} 11 the rate is slow and the total oxidation relatively limited. At p_{H} 12, however, oxidation is rapid and goes to practical completion in a few days. Trimethylthionine is decidedly less stable to atm. oxidation than is methylene blue and undergoes appreciable dealkylation at moderate alkalinities which do not affect the latter dye. C. R. F.

Elastic tissue staining. R. W. FRENCH. Army Med. Museum, Wash. *Stain Tech.* **4**, 11-12(1929).—The addn. of dextrin to samples of crystal violet and basic fuchsin employed in the prepn. of the elastic tissue stain using the Weigert technic insures better results. Crystal violet alone affords a bright greenish yellow elastin while the addn. of basic fuchsin gives a darker stain shading into dark blue as the proportion of basic fuchsin is increased. C. R. F.

Double staining of mitochondria and bacteria in plant tissues. J. DUFRENOY. Station centrale de phytopath. parasitologie, Paris. *Stain Tech.* **4**, 13(1929).—A technic is given for differential staining of mitochondria and bacteria in the root nodules of legumes. C. R. F.

The determination of the digestibility of protein by Bergeim's method. WILLIS D. GALLUP. Okla. Agr. Expt. Sta., Stillwater. *J. Biol. Chem.* **81**, 321-4(1929); cf. *C. A.* **22**, 800.—Silica may be substituted for the Fe_2O_3 used in Bergeim's method for detg. the digestibility of protein. ARTHUR GROLLMAN

A microchemical method for the estimation of total creatinine in muscle. SEVERO OCHOA AND JOSÉ G. VALDECASAS. Univ. of Madrid, Spain. *J. Biol. Chem.* **81**, 381-7(1929); cf. *C. A.* **22**, 3899.—A method is described for the estm. of total creatinine in quantities as small as 5 to 100 mg. of muscle. The muscle creatine is extd. and converted into creatinine by HCl in the autoclave. The proteins are pptd. by picric acid

and the creatinine is estd. colorimetrically in the filtrate by Folin's method. The accuracy of the method is 0.5 to 2%.

ARTHUR GROLLMAN

The determination of copper in biological materials. C. A. ELVEHJEM AND W. C. LINDOW. Univ. of Wis. *J. Biol. Chem.* **81**, 435-43(1929).—The method of Biazzo (*C.* **1**, 20, 2029) was modified for the detn. of Cu in biological material. Samples contg. as little as 0.02 mg. of Cu can be analyzed with accuracy.

ARTHUR GROLLMAN

Electrolytic determination of lead in urine. T. COOKSEY AND S. G. WALTON. *Analyst* **54**, 97-9(1929).—By titration with methyl red as indicator, det. the acidity of the urine and calc. how much AcOH must be added to 500 cc. to make it contain the equiv. of 3 g. of AcOH. Electrolyze with 0.3-0.4 amp., using a Pt cone as cathode and a Pt spiral as anode. A narrow beaker about 11 cm. high and 500 cc. content is recommended. When the electrolysis is finished (16-17 hrs.) a small quantity of phosphate is sometimes found adhering to the cathode. Carefully remove the beaker contg. the urine while the current is still passing and replace with a similar beaker contg. 250 cc. of water and 1 cc. of concd. HCl. Electrolyze for 2 hrs. longer. Then all the phosphate will have disappeared from the cathode. Next electrolyze half an hr. with 250 cc. of pure water as electrolyte. Wash the cathode with alc., dry and dissolve off the deposit with 4 cc. of hot HNO₃. Rinse with 10 cc. of 1.5 N HNO₃ and with 5 cc. of hot water. Evap. on the water bath to dryness, add 1 cc. of concd. HCl and again evap. to dryness. Warm the residue with 3 drops of HCl and a few drops of water, add 4 cc. of water to the soln. and heat on the water bath to make sure that the PbCl₂ is all dissolved. Transfer to a graduated cylinder and make up to 6 cc. Mix and pour out 3 cc. into a small test tube. Into similar comparison tubes, introduce standard Pb soln. in quantities representing 0.000, 0.005, 0.010, 0.015, 0.020, 0.025 and 0.030 mg. of Pb together with HCl and water as in the test, making 3 cc. in each case. Add to each tube 2 cc. of freshly prepd. K₂S₂O₈ soln., mix, allow to stand 1-2 hrs. and compare the turbidities. Normal urine analyzed by this method contains 0.4 mg. of Pb per l.

W. T. H.

A single electrometric comparator for the determination of hydrogen-ion concentrations. C. G. POPE. *Brit. J. Exptl. Path.* **9**, 225-31(1928).—A simple app. for the electrometric detn. of p_H is described, in which the e. m. f. to be measured is applied to a condenser which is subsequently discharged through a ballistic galvanometer. For a given temp. a scale giving direct readings of p_H values may be constructed, or for more accurate work the scale may be calibrated to read directly in millivolts. With the app. p_H values may be detd. with an error of 0.02 p_H unit or less on material unsuitable for colorimetric methods, the time required being less than that of the colorimetric method. The app. is suitable for use with electrode systems of high internal resistance, e. g. for detg. the p_H of solns. of low electrolyte content. Attempts to use glass electrodes with this app. have, however, proved unsuccessful because of their extremely high internal resistance (50,000,000-100,000,000 ohms). A simple form of quinhydrone electrode is described.

HARRIET F. HOLMES

Detection and determination of oxygen in the lungs and intestinal gases of the cadaver and its application to the forensic determination of breathing in the new-born. F. DYRENFURTH. Univ. Berlin. *Deut. Z. ges. ger. Med.* **12**, 23-9(1928).—Gas app. is described for O detn. by means of NaHSO₃.

FRANCES KRASNOW

Increase in the intensity of the benzidine reaction. FRITZ SCHWARZ. *Deut. Z. ges. ger. Med.* **12**, 216-8(1928).—Addn. of quinoline to the ordinary benzidine reagent for blood testing greatly intensified the reaction.

FRANCES KRASNOW

A simple device for the recognition of carbon monoxide blood. W. SCHWARZACHER. Univ. Heidelberg. *Deut. Z. ges. ger. Med.* **12**, 510-4(1928).—There are 3 tubes contg., resp. CO blood dild. 1-200 with water, normal blood, and an 0.2% Cu NH₄ sulfate. These are arranged so that the CO-blood is superimposed upon the Cu soln. (blue against a light background) with the control blood at the left (yellow against a light background). If observed so that the control blood is superimposed upon the Cu soln., it appears green and the CO-blood directly to the right of it is red.

FRANCES KRASNOW

A microchemical modification of the Keith-Rowntree plasma-dye method for the estimation of blood volume in the rat. GEORGE F. CARTLAND AND F. C. KOCH. Univ. Chicago. *Am. J. Physiol.* **85**, 540-5(1928).—This is a modification of the plasma dye method of Keith, Rowntree and Geraghty (*C. A.* **9**, 3261) for the extn. of blood vol., applicable to the white rat, and capable of repeated use on the same animal with an error not to exceed 4%.

J. F. LYMAN

Biochemical studies on the occurrence of small quantities of iodine and fluorine in organisms. V. A. MAYRHOFER AND A. WASITZKY. Univ. Wien. *Biochem. Z.* **204**, 62-77(1929).—Various important methods for the analysis of small quantities

of I, or F have been tested. For the detn. of small quantities of F an etching method is described.

S. MORGULIS

The separation and determination of blood components through the use of selective adsorption. B. SJOLLEMA AND A. EMMERIE. Lab. Veterinärchem., Reichsuniv., Utrecht. *Biochem. Z.* 204, 275-85(1929).—Two adsorbents (carbon from purest sugar and $\text{Al}(\text{OH})_3$) were prepd. entirely free from S, N or P, by means of which certain components of the blood could be sepd. Both thiasine and glutathione can be detd in blood filtrate by this procedure.

S. MORGULIS

A method for the preparation of chondroitinsulfuric acid. E. JORPES. Karolinsches Inst., Stockholm. *Biochem. Z.* 204, 354-60(1929).—The substance was prepd from the tracheal cartilages, carefully freed from connective tissue and preserved in alc.; they were cut in thin slices, and after drying in the air were ground to a fine powder. The best conditions for extn. of the chondroitinsulfuric acid from the mucoid was a 2% NaOH soln. acting 8-10 hrs. at 3°. To remove the protein the ext. was neutralized and slightly acidified with AcOH, then mixed with kaolin to a thick mass and filtered in the cold. The filtrate was biuret neg. On adding 2 vols. alc. a biuret-free Ca-Na salt of chondroitinsulfuric acid pptd. out. This method yielded about 50 g. of air-dry substance contg. about 4.5% S. To facilitate, however, the pptn. with alc. Jorpes recommends a preliminary extn. in the cold by shaking 1 kg. dry cartilage powder with 10 l. 10% NaCl for 12 hrs. To this enough AcOH is added to give a 1-1½% soln., which is filtered, treated with kaolin and once more filtered. This was pptd. with 2 vols. alc. The material was now reextd. with 1-2% NaOH, and after acidifying with AcOH to about 1-1½% the ext. was again mixed with kaolin and then filtered. The filtrate thus obtained was finally pptd. with 2 vols. alc. In 3 preps. the S:N ratio ranged from 1.5 to 1.95, probably because of some admixt. of protein. Although this method does not yield pure preps. they are distinctly better than previous preps. S. M.

The method for catalase determination in barley and malt. I. M. O. CHARMANDARIAN. Agr. Expt. Inst., Charkow. *Biochem. Z.* 204, 389-96(1929).—Protracted extn. diminishes the ability of the malt to decomp. H_2O_2 . This is not assocd with a change in the H-ion concn. of the medium. It is suggested that the increased or diminished enzyme activity is due to changes in colloidal dispersion. S. MORGULIS

A new characteristic color reaction for thymonucleic acid. ZACHARIAS DISCHE. Physiol. Inst., Univ. Wien. *Biochem. Z.* 204, 431-2(1929).—When to a 0.25% soln of thymonucleic acid enough HCl is added to make its concn. 0.5%, then 0.1-0.2 cc 1% alc. and the mixt. is heated in the boiling water bath 5 min. it acquires an intense orange coloration. On cooling the soln. becomes turbid, and on shaking with CHCl_3 it assumes a yellow-brown color. If a weaker HCl is employed (0.1%) the time of heating must be prolonged (15 min.). The color reaction cannot be obtained with plant nucleic acid and is apparently due to the carbohydrate component. S. MORGULIS

Ultrafiltration as a method for the determination of amino nitrogen and non-protein nitrogen in blood. B. A. VILENSKII. Biochem. Inst., Moscow. *Biochem. Z.* 204, 430-8(1929).—The app. used for the ultrafiltration consists of 2 glass tubes, of which A is provided

with a side armature for evacuation and is made of porous glass. It is covered with a layer of 4% ether-alc. soln. of collodion. The tube A is fitted into tube B which has the capacity of about 20 cc. At a vacuum of 15 mm. Hg within tube A 1 cc. of protein free filtrate can be obtained per min. from blood or plasma dild 1:10. The ultrafiltration of undild. plasma is also possible, but of course it is not so rapid. Very good results were obtained in the analysis of NH_3 , N or non-protein N. The tubes are made by the Ernst Leitz Firm.

S. MORGULIS

A method for determining the respiration of bacteria, tissue cultures and surviving cells. F. SILBERSTEIN AND F. RAPPAPORT. Inst. für Pathol., Univ. Wien. *Biochem. Z.* 204, 439-47(1929).—The method presents 2 essential features: The micro-organisms or cells are cultured in a soln. of hemoglobin which acts both as a plentiful source of O_2 and as an efficient buffer for absorbing CO_2 ; the change in CO_2 and O_2 of the solns. is detd. by means of gas analysis by Van Slyke's const.-vol. app. The hemoglobin soln. is prepd. from blood drawn aseptically into Na citrate and quickly centrifuged. The cells are washed with a NaCl-Na citrate soln. and hemolyzed through freezing with CO_2 snow and thawing off which is done twice, and the stromata are removed by centrifuging. The clear hemoglobin soln. so obtained is tested for sterility and should not change its CO_2 and O_2 content. Expts. were made with a pure culture of cholera vibrios, and a corresponding correction is introduced. The amt. of O_2 used

up or of CO_2 produced in the same time and under the same exptl. conditions by the same quantity of bacteria is independent of the amt. of hemoglobin soln. used provided the initial quantity is sufficient to supply the needs of the organisms. Likewise, similar results are obtained with variable amts. of living cells. Furthermore, the O_2 utilization and CO_2 production are proportional to the length of the exptl. time. S. M.

Preparation of silver salts of hexose-monophosphoric ester. FRITZ WEINMANN. Kaiser Wilhelm Inst. Berlin-Dahlem. *Biochem. Z.* 204, 493-4(1929).—Twenty g. of the Ba salt of carefully prep'd. hexose-monophosphate are dissolved in 50 cc. H_2O and treated with 12.47 g. $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$. The pptd. BaSO_4 is centrifuged off, and the soln., which must be free from Ba or SO_4 ions, cooled to the temp. of ice is mixed with an ice cold soln. of 20 g. AgNO_3 in 50 cc. H_2O and at once filtered. This is now poured with const. stirring into 4 vols. of abs. alc. when the Ag salt ppts. The ppt. is freed of all water with abs. alc. and is dried in an amber-colored vacuum desiccator over P_2O_5 and NaOH. The salt is easily sol. in H_2O , and is not affected by light. S. M.

Determination of value of thyroid preparations. J. R. MØRCH. *Dansk. Tids. Farm.* 2, 281-306(1928).—A standard method for the detn. of the value of thyroid preps. has been worked out on the basis of expts. on the CO_2 production on white mice, partly on normal conditions and partly on administration of glandula thyroidea sec. The optimal conditions found were: temp., 23° ; exptl. period, 24 hrs.; the standard diet was a mixt. of crushed barley, corn and milk powder. A table is given showing the accuracy of CO_2 production under these conditions. The CO_2 production changes with the weight of the animal and often changes during exptl. time. From the results obtained it was found that the CO_2 production increases proportionally to the area of the surface of the animal when the mouse gains weight, but decreases proportionally to the wt. of the animal when the mouse is losing wt. A table is given showing the area of mice weighing from 15 to 22 g. Feeding the same daily dose of glandula thyroidea to white mice causes an increase of the CO_2 production which reaches its max. at the earliest in 10 days (large dose) and the least in 3 weeks; to any given daily dose corresponds a definite increase in metabolism; when the increase maximal for the dose given is attained this level is maintained as long as the thyroid feeding is continued. To det. the metabolism increasing effect it is only necessary to est. the CO_2 production before the thyroid feeding and after 3 weeks' administration. It is practicable to distinguish with certainty between the effect of one dose and the effect of one 33% larger. The most accurate results in detg. the increase of CO_2 production are obtained by doses of thyroid giving 0-35% increase. It was therefore decided to compare diff. preps. on the basis of that dose which caused a 15% increase in CO_2 production. One thyroid unit is defined as: that amt. (wt.) of thyroid prep'n. which when given by mouth to white mice daily for 3 weeks and calcd. per 1000 g. of mouse is sufficient to cause a 15% increase in the CO_2 production. Tables and curves are given showing the necessity for detg. the value of thyroid preps. Hunt's and Seidell's acetonitrile method and C. O. Jensen's exolötl method are discussed and criticized. M. recommends the above method because of reliability and simplicity. O. A. NELSON

A simple method for the determination of the hydrogen-ion concentration in surgery. I. General and method. ERICH SIMENAUER. Stadt.-Kranken. am Urban, Berlin. *Arch. klin. Chir.* 150, 193-201(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 46, 10. The p_{H} was measured in very small quantities of biol. fluids by means of various indicator papers, as bromocresol purple, bromothymol blue, cresol red, methyl red, phenol red and thymol blue. The method is being checked by the Wulff colorimetric method. R. C. WILLSON

Method for the microchemical determination of combined sugar. NAOHICO IZUKA. *Kyoto-Ikadaigaku-Zasshi* 2, 83 90(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 46, 87. The combined sugar in the blood plasma (Bierry calls it the protein sugar) can be detected with an exactness up to 0.004 mg. % in 2-3 cc. blood. The free sugar is detd. by the Hagedorn-Jensen method after deproteinizing. In another sample the total sugar is detd. by the same method after hydrolysis with warm dil. H_2SO_4 and subsequent deproteinization. The difference between the results in the 2 tests represents the combined sugar. R. C. WILLSON

The velocity of the reaction of tributyrinolytic lipase in relation to the temperature. ELIO IANIERA. *Riv. patol. sper.* 2, 370-81(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 46, 261. To 1 cc. of serum there was added a mixt. of 1 cc. $\text{NaH}_2\text{PO}_4 + 7$ cc. K_2HPO_4 (N/3) and then 12.5 cc. of a satd. soln. of tributyrin. In testing the quinine-resistant fraction there was also added 0.5 cc. of a 0.2% soln. of quinine-HCl. In temps. between 37° and 45° the reaction is completed in 2-2.5 hrs.; at 47° it is incomplete after 3 hrs. while at 50° it apparently does not proceed to the end. The reaction velocity

is greatest at 45° and decreases gradually at temps. of 40°, 47°, 50° and 37°. At 37° and 25° the reaction is completed after longer periods of time, while at 13° and 5° it appears not to be completed. The addn. of quinine retards the reaction; it remains practically incomplete. Quinine hinders the reaction of the quinine-resistant lipase

R. C. WILLSON

Determination of minute quantities of Pb by electrolysis (SEISER, *et al.*) 7. Method for determining total N in urea-nitrate mixtures (LUCAS, HIRSCHBERGER) 7.

C—BACTERIOLOGY

CHARLES B. MORREY

The fermentation of cornstalks and their constituents. I. Studies on the pectin-fermenting bacteria. LLOYD A. BURKEY. Iowa State Coll. *Iowa State Coll. J. Sci.* 3, 57-100(1928).—The pectin-fermenting bacteria isolated belonged to the genera *Aerobacter*, *Bacillus* and *Clostridium*. Of *Aerobacter*, 29 cultures were studied and in tables, 101 results are reported for each culture. These include: characteristics of the bacteria, sources of the cultures, effects on milk and broth, effects on about 30 org. compds., mostly carbohydrates, with respect to the formation of gas and acid, effects on potato, carrot, parsnip and apple, and whether indole, acetylmethylcarbinol and uric acid are formed. In a similar manner reports are made on 4 members of the genus *Bacillus*. A bacteriological description of each organism is given and a bibliography of 55 references is appended.

F. E. BROWN

The preparation of *d*-tyrosine from racemic tyrosine by means of *Oidium lactis*. M. CHIKANO. Med. Acad. Osaka. *Z. physiol. Chem.* 180, 149-52(1929). Sterile culture media contg. sucrose, inorg. salts and *dl*-tyrosine were inoculated with *Oidium lactis* and the fungus was allowed to grow 20-5 days at 18° with occasional shaking. The mixt. was then boiled, filtered and evapd. *d*-Tyrosine crystd. out in yields of 40-60%. In 4% HCl it showed a sp. rotation of 10°. *d*-Hydroxyphenyllactic acid was recovered from the filtrate by acidifying with H₂SO₄ and extg. with Et₂O. A. W. D.

Oxidations by means of *Bacterium xylinum*. II. The formation of gluconic and 5-ketogluconic acid. K. BERNHAUER AND K. SCHÖN. German Univ. Prague. *Z. physiol. Chem.* 180, 232-40(1929); cf. *C. A.* 22, 3901.—On a sterile medium contg. 5% glucose, 0.5% yeast ext., and an acid to inhibit fungus growth, *B. xylinum* produces gluconic and ketogluconic acids, the max. yield being obtained in about 30 days at room temp. Addn. of butyric acid (0.02-0.01 *N*) to the medium gives a better yield than the same concn. of AcOH or CH₃CO₂. With or without the addn. of CaCO₃, as much as 80% of the glucose is thus converted into gluconic acid. This subsequently undergoes further oxidation to ketogluconic acid, especially in a slightly alk. medium. In the presence of CaCO₃ and *N*/150 butyric acid, glucose yields as much as 65% Ca ketogluconate in 20 days, but in the absence of butyric acid only 44%. A table is given for the detn. of ketogluconic acid by the Cu reduction method. A. W. DOX

A study of coliform organisms in samples of certified milk. C. H. CHALMERS. *J. Hyg.* 27, 294-305(1928).—British regulations require that certified milk contain no coliform bacilli in 0.1 cc. samples. Although the usual presumptive test for *B. coli* was negative in the case of 32 certified milk samples, upon culturing these same samples on bile salt agar, plates all proved positive and 268 coliform bacteria were isolated. Of these, 65.7% were true *B. coli* and 18.6% fell in the X and Y groups of Stewart. The presumptive test cannot be relied upon to give a true indication of the presence of coliform bacilli in milk. The inaccuracy is attributed in part to the faulty construction of Durham's fermentation tubes which fail to ensure collection of the gas produced.

C. R. F.

Staining methods for bacteria and yeasts. W. E. MANEVAL. Dept. Botany, Univ. Mo., Columbia. *Stain Tech.* 4, 21-5(1929).—Actively motile organisms 20-24 hrs. old were best for flagella staining. The bacteria were allowed to diffuse in sterile water for 20-30 min. and transfer droplets made to scrupulously clean slides. The following technic was adopted as very satisfactory: Treat 2-4 min. with a mordant consisting of tannic acid 10 or 20%, 50 cc.; FeCl₃ 5%, 10-15 cc.; carbolfuchsin (Ziehl-Nielson), 5 cc.; H₂O₂ 3%, 6-8 cc. Wash and stain 2-3 min. with a mixt. of satd. alc. basic fuchsin, 10 cc.; distd. water, 30 cc.; AcOH, 4%, 1 cc. Wash thoroughly with water and exam. For improving the staining properties of bacterial spores, a 10 min. boiling period in water is used.

C. R. F.

An adaptation of Bergeim's fecal indole method for the determination of indole in bacterial cultures. H. B. PIERCE AND R. B. KILBORN. Univ. of Rochester and

Pa. State Coll. *J. Biol. Chem.* 81, 381-7(1929).—Bergeim's method (*C. A.* 12, 45) for the detn. of fecal indole was adapted to the estn. of indole in bacterial cultures.

Alcoholic fermentation by *Aspergillus flavus*, Brefeld. JOHN L. YUILL. *Biochem. J.* 22, 1504-7(1928).—No kojic acid (cf. *C. A.* 18, 1665) was produced by a typical strain of *A. flavus*, but considerable alc. was obtained. Under the same conditions, *A. oryzae* produced no alc.

The purification and concentration of scarlet fever toxin. P. HARTLEY. *Brit. J. Exptl. Path.* 9, 259-75(1928).—Crude scarlet fever toxin, being the filtrate from cultures on tryptic digest broth of the Dochez strain of *Streptococcus scarlatinae*, has been purified and concd. by Walpole's method (*C. A.* 9, 3253). During the process over 99% of the nitrogenous constituents of the original crude toxin were removed and the vol was greatly reduced. The soln. of the purified toxin is greenish yellow to greenish brown, faintly opalescent, and almost free from visible particles. The soln. contains relatively small quantities of N. It is highly toxic for rabbits on intravenous injection. The toxin is apparently completely destroyed by heating to 100° for 1 hr., and is considerably weakened by heating to 56° for 1 hr. The toxin is neutralized by scarlet fever antitoxin. Two samples of puerperal streptococcus antitoxin also neutralized the concd. toxin. Three anti-streptococcus serums, known to have been prepd. by the injection of emulsions of streptococci, made from strains other than the *Streptococcus scarlatinae*, exhibited no protective or neutralizing action against the toxin. Normal horse serum was similarly inactive. The soln. of purified and concd. toxin can be reduced to dryness without loss of specific properties; simple addition of H₂O or NaCl soln. to the dry prepn. yields a soln. indistinguishable, as regards appearance and biol. properties, from the original soln. The dry prepn. retained its specific properties unchanged and unimpaired for at least 4 months. Comparative tests, carried out with a 20,000 fold diln. of concd. scarlet fever toxin and a 1000-fold diln. of ordinary crude toxin, gave identical skin reactions in 14 out of 15 human beings examd.; the group included both immune and susceptible individuals.

The experimental transformation of the intestinal flora. R. C. RUICKSHANK. *Brit. J. Exptl. Path.* 9, 318-26(1928).—A diet with a high carbohydrate content produced a simplified flora in the intestines of rats but failed to effect a radical transformation to an aciduric flora. Lactose and dextrin when added to a diet of bread, meat and oats quickly changed the intestinal flora to aciduric type. Sucrose had a much less marked effect: maltose, glucose, galactose and levulose produced no change. Acidophilus milk caused a transformation from normal to an aciduric flora in a comparatively short time. In combination with lactose the change was even more rapid and complete. The effectiveness of acidophilus milk is due not to its bulk or its acidity but to the combination of the living organism with the unfermented lactose in the milk. Under the foregoing conditions, *B. acidophilus* becomes established as the predominant organism in the intestine, probably because of its acid-resistant property. Lactose and dextrin are slowly absorbed from the intestine and the attack on available carbohydrate by the intestinal bacteria in the lower bowel produces a degree of acidity which is inimical to all save the acid-tolerant group.

Colony variants in hemolytic streptococci. G. H. EAGLES. *Brit. J. Exptl. Path.* 9, 350-6(1928).—"Rough" or very coarsely granular colonies and "smooth" or finely granular colonies have been identified by selective subculture of individual stock strains of hemolytic streptococci. Intermediate variants have also been described. Colony appearance is not a reliable indication of virulence in hemolytic streptococci in as much as the property of enhanced virulence in one strain is related to the "rough" and in the other strain to the "smooth" variety. In a toxin-producing strain "rough" and "smooth" variants have been found to produce apparently equal amounts of toxin.

A comparison of the prophylactic values of the H, O and R antigens of *Salmonella aertrycke*, together with some observations on the toxicity of its smooth and rough variants. H. M. IBRAHIM AND H. SCHÜTZ. *Brit. J. Exptl. Path.* 9, 353-60(1928).—The object of this research was to establish, if possible, the comparative prophylactic values of the various antigens that may be present in a bacterial vaccine. The microbe employed was *S. aertrycke* "Glasgow." The antigens considered were the H and O of the smooth salt-stable variant and the H and R of the rough salt-sensitive variant, H being the thermolabile antigen associated with the flagellar substance and a flocculent agglutination ppt., O and R being the thermostable antigens associated with the somatic substance and a granular agglutination ppt.; the exptl. animal was the mouse. The rough variant of *S. aertrycke* "Glasgow" possesses about 1/4 of the toxicity of its smooth counterpart. Heating to 100° lowers the toxicity of the smooth variant by about 1/4.

but the toxins of the rough variant do not appear to be so labile. Repeated washings with saline, undertaken with the view to removing the outer flagellar portion of the bacterium, do not lower the toxicity of the smooth variant. Only vaccine contg. agglutinogenically active H and O antigens in combination has been shown to be effective. Vaccines contg. only O antigen did not give prolonged protection, though they delayed death very definitely. Vaccines contg. only R or H + R antigens may be regarded as ineffective. That is to say, a vaccine not heated above 60° and derived from a smooth variant culture of *S. aertrycke* is capable of conferring good and lasting immunity against infection with the living homologous strain, whereas a similar vaccine heated to 100° for the most part merely delays death, while a vaccine derived from a rough variant culture of the same microbe, whether heated to 100° or merely to 60°, is incapable of immunizing. This failure may be due to the lack of combined H and O antigen in these O, R and H + R vaccines, or the fact that heating smooth variant culture to 100° in order to destroy the thermolabile H antigen coincidentally damages it as an immunizing agent.

HARRIET F. HOLMES

The conditions of amine formation by *Bacillus coli*. GEORG ROSKE. *Jahrb. Kinderheilk.* 120, 186-95(1928).—The production of amines by *B. coli* in artificial media was detd. by the biol. method. *B. coli* forms no demonstrable amines in peptone broth, which becomes strongly alk. on incubation. Large quantities of amines are formed in dextrose broth, which becomes more acid on incubation. Buffering this culture medium to prevent an increase of acidity prevents the formation of amines.

ELEANOR M. HUMPHREYS

Colloid biological studies on thrush. F. V. v. HAIN AND HERMANN JUNKER. *Jahrb. Kinderheilk.* 121, 85-100(1928).—The fungus which causes thrush in infants is a pleomorphic organism, growing at times with the formation of small yeast-like buds, at times with larger mycelial threads. The ability to form mycelia explains the power of the fungus to invade the body tissues. The authors studied the effects of numerous chemicals on the type of growth in culture media. The substances which act to depress the surface tension favor the formation of mycelia. This may be due to an alteration of the cell membrane which makes it more permeable to colloids, permitting an increase of the cytoplasmic mass. This "vitaminoid" effect recalls the observation that, in culture media which contain water-sol. B, the depression of the surface tension parallels the vitamin content. This raises a question as to whether water-sol. B exists, or is merely an expression of surface activity.

ELEANOR M. HUMPHREYS

The bactericidal action of some organic compounds of mercury on *Bacillus pestis*. J. F. CAIUS, S. A. KAMAT AND B. P. B. NAIDU. Haffkine Inst. Parel, Bombay. *Indian J. Med. Research* 15, 327-32(1927).—Aromatic mercurials are many times more active than the compds. from which they are derived. The general bactericidal power is proportional to the amt. of Hg present and little change is brought about by modification in chem. constitution. The compds. studied were: *o*- and *p*-diacetoxymercuriphenol, *p*- and *o*-chloromercuriphenol, *o*- and *p*-dichloromercuriphenol, the mono-, di-, tri-, beta-, penta, hexa-, hepta- and octo-acetoxy mercuri derivs. of trypan blue and trypan red and the mono-, di-, and tri-acetoxy mercuri derivs. of acid fuchsin and mercurochrome-220-sol.

FRANCES KRASNOW

The production of alkalinity by *B. pestis* in broth and the effect of this alkalinity on the toxicity and potency of the prophylactic. B. P. B. NAIDU AND JEMADAR SHAM-SHER JANG. Haffkine Inst., Parel, Bombay. *Indian J. Med. Research* 15, 335-41(1927).—The amt. of alky. present in the vaccine has no apparent effect either on toxicity or on the potency as estd. on rats.

FRANCES KRASNOW

The chemical study of bacteria. XXIV. A proximate chemical analysis of the timothy bacillus. ROBERT D. COGHILL AND ORSON D. BIRD. Med. Research Lab., Parke, Davis and Co. *J. Biol. Chem.* 81, 115-22(1929); cf. *C. A.* 21, 434.—The study was made to see what chem. differences could be found between the non-pathogenic timothy hay bacillus (*Mycobacterium phlei* (Moeller)) and the tubercle bacillus, (2 organisms so closely related biologically but differing so widely in their pathogenicity). Samples of the carbohydrates, proteins, fats, and the nucleic acid of the cell were also prepd. and are available for biol. comparison with the corresponding fractions of the tubercle bacillus. It is hoped that these comparisons will indicate which fraction or fractions of the bacteria are important from the biol. and therapeutic point of view. Enough gross chem. differences in compn. were found to differentiate between the 2 organisms in the chem. lab. The protein and N distribution in % of total N in the timothy and tubercle bacillus was, resp.: H₂O-sol. N, 13.2 and 35.7; H₂O-sol. protein N, 3.5 and 0.7; alkali-sol. N, 15.8 and 44.7; alkali-sol. protein N, 6.0 and 33.2. There is also a marked difference in the fat fractions.

A. P. LOTHROP

Acid formation by different species of *Penicillium*. T. CHRZASZCZ AND D. TRUKOW. Univ. Poznafi. *Biochem. Z.* 204, 106-24 (1929).—All species of *Penicillium* produce acids in sugar-contg. media. The amt. of acid varies depending first of all on the species; age and quantity of mycelium have no influence, though an extensive development of the mold membrane is unfavorable to the acid production. The acidity is due to citric, oxalic and such acids whose Ca salts are water-sol. Citric acid production is a normal phenomenon in the metabolism of all species of *Penicillium*, the degree of accumulation in the nutritive medium being dependent upon the species while the age or quantity of the mold has no effect. In fact, the changes in acidity are really a function of the changes in citric acid concn. Oxalic acid is produced irregularly and in very small amts., this depending upon external conditions. Acids whose Ca salts are water-sol. arise regularly, and this depends upon inner circumstances, being the result of an enzymic process. Some species of *Penicillium* can form ester or fat-like substances which combine with the acids. The amt. of acid produced, the kind of acid or its accumulation or diminution are in no wise associated with the botanical qualifications of the separate *Penicillium* species. S. MORGULIS

The biochemistry of *Penicillium glaucum*. A contribution to the problem of methyl ketone formation from triglycerides or fatty acids in the metabolism of molds. OSKAR ACKLIN. Tech. Hochschule, Zürich. *Biochem. Z.* 204, 253-74 (1929); cf. C. A. 23, 1151.—All normal monocarboxylic acids of the hydrocarbon series are changed to the corresponding methyl ketone in the metabolism of *Penicillium glaucum*, with the exception of butyric and valeric acids. The reason for this is to be found in the special mechanism of methyl ketone formation, the β -hydroxy form of the fatty acid not being a step in the formation of the ketone. The catabolism of caproic acid is always ketone-positive, which is not the case when the β -hydroxycapric acid is concerned, the caproic acid being directly changed to the keto acid and then through loss of CO_2 to methyl propyl ketone. The catabolism of butyric acid under all circumstances is always ketone-neg. as is also the case when β -hydroxybutyric acid is metabolized, and acetone cannot be demonstrated. The metabolism of propionic and of hydroxypropionic acids gives rise to the keto acid only as a transient product undergoing quick decompn. to CO_2 and H_2O . Thus, β -hydroxy acids cannot be attacked by *Penicillium*, making the appearance of acetoacetic acid and acetone impossible. The metabolism is thought to proceed from the fatty acid to the keto acid, then to the methyl ketone and the corresponding carbinol. In favor of this conception of the mechanism is offered the fact that carbinol frequently occurs alongside the methyl ketone, as in the coconut endosperm, in ripe fruit or in certain cheeses. A detailed study of the influence of the concn. of capric acid, as well as the concn. of the nutritive medium or of H-ions, on the methyl propyl ketone formation is included. S. MORGULIS

Note on the paper "The chemical constituents of the spores of *Aspergillus oryzae*." MIJIZUHO SUMI. Inst. phys. and chem. Research, Tokio. *Biochem. Z.* 204, 412-13 (1929); cf. C. A. 22, 4569.—The sterol previously isolated from spores of *Aspergillus oryzae* had an empirical formula, $\text{C}_{28}\text{H}_{48}\text{O}$. A purer prepn. was made which, however, has the empirical compn., $\text{C}_{27}\text{H}_{42}\text{O}$. It gives typical reactions and is considered to be an ergosterol. It has a behavior identical with that of ergosterol obtained from the edible Japanese mushroom, "*Cortinellus shiitake*." S. MORGULIS

Studies on the existence of a streptococcus antiviral as postulated by Besredka. N. LOUVROS AND E. GAESSLER. Staatlichen Frauenklinik, Dresden. *Centr. Bakt. Parasitenk.* I Abt., 104, 356-65 (1927); cf. C. A. 22, 805.—The growth-inhibiting property of Besredka's streptococcus filtrates is due to the action of acids and is not specific. Its immunizing power is the general effect of a foreign protein. Its poisonous action is due to a true toxin, which, however, is resistant to boiling or long standing. This is in accord with the chem. properties of streptococcus toxins. The technic of Besredka is an ingenious method of obtaining therapeutically useful acid protein complexes. It is not an antiviral in the sense of Besredka. JOHN T. MYERS

Observations on the individual characteristics of typhoid bacilli in homologous immune serum. K. HASHIMOTO. Univ. Sendai. *Centr. Bakt. Parasitenk.* I Abt., 110, 17-24 (1929).—The individuality of strains of *B. typhosus* is important. Strains vary in their reactions under different conditions. When grown in homologous immune serum with a high titer, 6 different colony forms were observed. Some strains became spontaneously agglutinable; some became less easily agglutinable, and some remain unchanged. There must be individual peculiarities in pathogenic properties and antigenic powers as well. This should be considered in making vaccines and immune sera. JOHN T. MYERS

Antiseptic power of disodium dibromohydroxymercurifluorescein. A. SILVEIRA

RAMOS. *Compt. rend. soc. biol.* 99, 1537-8(1928).—The antiseptic properties of mercurochrome 220 are doubtful in dilns. greater than 1 to 1000. In certain dilns. it shows no action to prevent the development of *Staphylococcus aureus*. In doses of 5 mg. per kg. of body wt. its concn. in the blood is not greater than 1 in 8000. L. W. RIGGS

Action of chloroform on development of yeast. M. N. MEISSEL. *Wochschr. Brau.* 45, 488-90(1928).—Young colonies of yeast grown on wort-agar showed more narcosis and death when exposed to CHCl_3 vapors than older colonies. In some cases CHCl_3 produced modified cell forms and colonies which were transmitted through successive cultures. A. SCHULTZ

Sporulation of yeast. HELEN STANTIAL. Univ. of Toronto, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 257-61(1928).—Grapefruit juice was found to contain an active principle which caused yeast cells to produce spores. A grapefruit prepn. contg. 25,000,000 cells of yeast per cc. of juice gave the optimum sporulation. The time for spore formation was found to differ from cell to cell. The active principle is not bios I nor bios II, nor citric acid and is not pptd. by basic lead acetate nor removed by charcoal. It is not injured by NH_4OH , by evapn. to dryness and heating to 110° , or by short boiling with dil. H_2SO_4 . It can be extd. by org. solvents. Apparently nutrition is not the only factor affecting the sporulation of yeast cells. J. W. SHIPLEY

Persistence of acclimatization to fluoride after sporulation of the yeast. HELEN STANTIAL. Univ. of Toronto. *Trans. Roy. Soc. Can.* [3], 22, III, 263-5(1928).—Tolerance of fluoride appears to be an inherited characteristic for yeast cells. Expts. on the progeny of cells produced from spores arising from yeast growing in wort contg. NH_4F showed that these were much more resistant to fluoride poisoning than the progeny from yeast cells grown in wort contg. no fluoride. J. W. SHIPLEY

Isolation and identification of bios I; its absorption by and recovery from yeast. EDNA V. EASTCOTT. Univ. of Toronto. *Can. Trans. Roy. Soc. Can.* [3], 22, III, 267(1928); cf. *C. A.* 22, 20, 3897.—Pure bios I identical with inactive inositol was prepd. from tea dust. Curves showing the rate of reproduction of yeast in solns. contg. salts, sugar, inositol, and bios II agree in form with those produced with solns. of sugar, salts and wort. Inositol taken up by yeast cells can be recovered quantitatively, each cell takes up and yields 1.2×10^{-13} g. of inositol. Yeast grown in solns. of sugar and salts alone also yields inositol on hydrolysis, but in less amount. J. W. SHIPLEY

Giant yeast cells. MARY HOLT. Univ. of Toronto, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 269-70(1928).—Expts. indicate that the formation of giant yeast cells was due to amino acids. Four effective chemicals were found in aspartic acid, glutamic acid, glycine and alanine, while arginine, asparagine, histidine, leucine, isoleucine, malic acid, phenylalanine, succinic acid, succinamide, succinimide, tryptophan, valine, and isovaline were without effect. The first large cells appear after 2-4 days, depending on the acid used. Aspartic acid produces as high as 60% yield of giant cells in 6 days. The production of giant cells may be peculiar to certain races of yeast. J. W. SHIPLEY

Chemical derivations of bios II. E. M. SPARLING. Univ. of Toronto, Can. *Trans. Roy. Soc. Can.* [3], 22, III, 271(1928).—Bios II can be purified by converting it into an inactive deriv. by heating with AcOH , Ac_2O , or AcCl , the product of such treatment being sol. in CHCl_3 . Fractional distn. of the CHCl_3 soln. seps. the CHCl_3 . At the temp. of boiling nitrobenzene, a non-activable acid comes over; at the temp. of boiling acetanilide an oil; and at that of boiling anthraquinone, an oil which deposits crystals on cooling. The last two distillates can be activated by treatment with NaOH . Large-scale operations for obtaining a chemically pure material are being continued. J. W. SHIPLEY

Production of monochromatic x-rays of long wave length. The quantic action on microbes. F. HOLWECK. *Compt. rend.* 188, 197-9(1929).—The K ray of Al (8 A. U.) and the L ray of Ag (4 A. U.) were produced in a Coolidge tube with a Ag anode and a window of Ag 5μ thick. Cultures of *B. pyocyaneus* were exposed to these rays. Knowing the intensity of the rays the coeff. of absorption in the microbic substance, the distance of the organism from the window and the angle of the rays one is able to calc. the quanta per sec. that are absorbed by each unit vol. The 4 A. U. rays are more germicidal than the 8 A. U. rays. M. H. SOULE

The study of the curve of probability relative to the action of x-rays upon bacteria. MME. P. CURIE. *Compt. rend.* 188, 202-4(1929).—A mathematical consideration. M. H. SOULE

Bacterial enzymes. VII. Lactase and lipase of the colon bacillus. LOUIS LOWENSTEIN, WM. L. FLEMING AND JAMES M. NEILL. Vanderbilt Univ. Med. School. *J. Exptl. Med.* 49, 475-9(1929); cf. *C. A.* 21, 3082.—Colon bacilli possess endocellular

heat-labile lactase and lipase enzymes which remain operative in sterile filtered solns. of the intracellular substances obtained through phys. disintegration of the bacillary bodies. The demonstration of the lactase and detection of the hexose products of its action constitute exptl. evidence that hydrolysis of the disaccharide is the 1st step in the fermentation of lactose by colon bacilli. C. J. WEST

Oxidation-reduction properties of sterile bacteriological media. RENÉ DUBOS. Rockefeller Inst. for Medical Research. *J. Exptl. Med.* **49**, 507-23(1929).—Sterile plain broth contains an active oxidation-reduction system. Under vaseline seal, the lot of broth used in these expts. reaches a reduction potential corresponding to reduced indigo disulfonate ($r_H = 10$). All the indicators with a more positive E'_0 are reduced; the others are not affected. It seems probable that fresh broth, which has not undergone oxidation by mol. O, would have a higher reduction potential. The max. amts. of different indicators that can be reduced correspond to equimol. concns. This seems to indicate either (a) that the broth does not contain several "independent" reducing systems (at least in appreciable amts.) or (b) that these hypothetical "independent" systems all have about the same reduction potential. The different indicators of oxidation-reduction potentials are reduced in the order of the electromotive series. The system seems to be reversible (this not excluding the possibility of irreversible autoxidations) and does not appear to be of the nature of a sugar. C. J. WEST

Comparison of numbers of *B. coli* in iced and uniced samples of water (ELLISON, *et al.*) **14**.

MACKIE, T. J., AND MCCARTNEY, J. E.: **An Introduction to Practical Bacteriology.** New York: Wm. Wood. 2nd ed., revised and enlarged. 390 pp. \$3.50. Reviewed in *Am. J. Pub. Health* **19**, 243(1929).

THOMAS G. PHILLIPS

Composition and metabolism of the tobacco leaf at different stages of growth of the plant. A. SMIRNOV, *et al.* *Ber. Centr. Inst. Tabakforsch. Krasnodar* **29**, (1926).—A complete account of the distribution of org. substances in the leaves is given for 4 stages in the life of the plant, *viz.*, at planting, at the stage of 8-10 leaves, in full bloom, and at the technically ripe state of the leaf. B. C. A.

Mucilage of the rhizome of *Polygonatum officinale* All. B. GAAL. *Ber. ungar. pharmac. Ges.* **3**, 133-9(1927).—Arabinose, dextrose and *d*-levulose (81.7%) are present. When oxidized by Tollens' method the mucilage did not afford mucic acid. B. C. A.

Occurrence of manganese in trees. M. KLEINSTUCK. *Chem.-Ztg.* **52**, 598-9 (1928).—The Mn content of different parts of various trees growing in the valley of the Elbe is recorded. The bark and leaves have in general a higher Mn content than the wood, and the Mn content of the leaves increases rapidly during the season. It is suggested that the Mn acts as a catalyst in the organs of assimilation and that its catalytic activity is destroyed by SO_2 ; this would explain the serious effect of SO_2 on vegetation. B. C. A.

Maintenance of seeds in a medium deprived of oxygen as a means of prolonging their germinative faculty. A. GUILLAUMIN. *Compt. rend.* **187**, 571-2(1928).—An atm. from which O has been removed is as efficient as a vacuum for the purpose of prolonging the germinative faculty of seeds (soy). B. C. A.

Pigment of elderberry (*Sambucus nigra* L.). T. J. NOLAN AND M. T. CASEY. *Proc. Roy. Irish Acad.* **38**, 93-9(1928); cf. Karrer and Widmer (*C. A.* **21**, 1652).—The coloring matter of elderberry skins was extd. by alc. HCl. The *anthocyanin chloride* (*picrate*) so obtained is a brown powder (cf. *loc. cit.*), readily sol. in water (orange-red), MeOH (violet red), and dil. mineral acids. When hydrolyzed with hot HCl it yields an *anthocyanidin chloride* (*sulfate*; *picrate*) which is almost insol. in cold water, is transformed by the action of warm water into an insol., violet product and does not contain methoxyl. Color reactions of the anthocyanin and anthocyanidin chlorides with several reagents are given. B. C. A.

Catalase and oxidase of the tomato as influenced by the soil reaction. E. S. HABER. Iowa State Coll. *Iowa State College J. Sci.* **3**, No. 1, 29-39(1928); cf. *C. A.* **23**, 1459. Tomato plants were grown in 3 soil plots in a green house. The significant difference in the soils was the acidity. The p_H values were 8.5-9.0, 6.5-7.0, and 4.0-4.5. The neutral plot gave the highest yield (dry wt.). The catalase activity was least for the product of the neutral soil. Soil reaction had no effect on oxidase activity. Oxidase activity was greater in ripe fruits than in green fruit. Catalase activity was greatest in green mature fruits. F. E. BROWN

The glutamine and allantoin content of sugar beets. C. RAVENNA AND R. NUCORINI. *Ann. chim. applicata* 18, 509-12(1928).—The glutamine content of beets was found to increase in the growing plant and then decrease until it disappeared and then allantoin was found. This indicates that glutamine has its origin in the metabolism of purines, and that its gradual disappearance is due to its gradual oxidation. A. W. C.

Beneficial action of potassium iodide on iodovolatilization. PIERRE DANGHARD. *Compt. rend.* 187, 1156-8(1928).—KI acts on the iodogenous layer, and probably furnished the cells which absorb the material for the production of free I. Thus if a fresh stipe of *Laminaria flexicaulis* is kept in a test tube of sea water contg. 1:1000 KI and the water be decanted and shaken with benzene, free I will be demonstrated. Algae poor in I, e. g., *Saccorhiza bulbosa* or *Himanthalia lorea*, do not show this behavior; neither does *L. flexicaulis* if it has been previously treated with either CHCl_3 or ether long enough to destroy the epidermis. Algae naturally little active, such as *Pelvetia*, *Ascophyllum*, and *Fucus*, also showed increased I volatilization under treatment but inactive algae, e. g., *Fucus platycarpus*, *Saccorhiza*, *Himanthalia*, *Chorda filum*, *Bifucaria*, *Halysdris*, etc., are not affected. Most of the Floridæ give no result, but *Gracilaria multipartita*, *G. confervoides*, *Colliblepharis jubata* and *Chondrus crispus* do respond. The method can be used for researches in algae I activity, where it will augment the phenomenon of I volatilization. S. L. B. ETHEERTON

Methods of collecting and preserving pollen. JAMES W. KELLY. Bur. Plant Ind., U. S. Dept. Agr., *Circ.* 46, 1-9(1928).—Pollen for the prepn. of exts. for hay fever diagnosis and treatment are best collected by cutting the plants when in bloom, wrapping up the stems in moist burlap and placing at an angle in a tank so that the flowers droop over the edge. By shaking gently daily the pollen falls on glazed paper where it can be recovered, sifted, dried and preserved. The yield of pollen for ragweed and timothy varies from 0.125 to 0.525% of the wt. of the air-dry plants. C. R. F.

Natural color preserved in sectioned green plant tissue. E. A. JIROUCH. Western Res. Univ., Cleveland. *Stain Tech.* 4, 17-9(1929).—The chloroplasts retain their natural colors and appearance by first fixing in Keefe's fluid (C. A. 21, 943) and freezing in a 20% gum arabic soln. The sections are then stained with Delafield's hematoxylin which brings out the nucleus without altering the green color of the chloroplasts. C. R. F.

The isolation of protocathechuic acid from pigmented onion scales and its significance in relation to disease resistance in onions. KARL P. LINK, H. R. ANGELL AND J. C. WALKER. Univ. of Wisconsin and U. S. Dept. Agr. Field Lab., Madison. *J. Biol. Chem.* 81, 369-75(1929).—Protocatechuic acid was isolated from pigmented onion scales. This acid appears to be of a group, the presence of which enables the onion to resist the inroads of the fungus, *Colletotrichum circinans*, responsible for onion smudge. ARTHUR GROLLMAN

Constituents of *Ginkgo biloba* L. leaves. I. SHU FURUKAWA. *Bull. Inst. Phys. Chem. Research Tokyo* 8, 62-74(1929); *Abstracts* 2, 5-7.—The maidenhair tree, *Ginkgo biloba* L., was investigated with a view to obtain components with insecticidal properties and yellow coloring matters from the leaves. The powder obtained from air-dried leaves was extd. with boiling alc. The alc. soln. was boiled, and the remaining resinous matter extracted as follows, yielding 5 components called A, B, C, D and E.

alc. extract

↓ H ₂ O sol.	Et ₂ O sol.	H ₂ O insol.	Et ₂ O insol.
Et ₂ O sol.	Et ₂ O insol.	alkali carbonate sol.	Alkali sol.
↓	↓	↓	↓
A. 0.01%	B. 0.04%	C. 0.2%	D. 0.02%

Substance A, $\text{C}_{11}\text{H}_{12}\text{O}_4 \cdot 2\text{H}_2\text{O}$, seps. from EtOH in colorless plates, m. 325° (decompn.); Ac deriv., m. 290-2° (from C_6H_6). When treated with a MeOH soln. of diazomethane, it gave a monomethyl ether, which was not further investigated. A hydroxy acid, whose Ag salt and Ac deriv. were confirmed by analysis, was obtained by heating the compd. with an excess of KOH on the water-bath. This fact shows that the compd. has evidently a lactone ring. Substance B, $\text{C}_{16}\text{H}_{18}\text{O}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$, m. 240° (from MeOH). When reduced with Mg and HCl in EtOH soln. in the presence of Hg, it gives a red coloration and is, therefore, considered as a homolog of flavone or flaconol. The tri-Ac deriv. m. 170-1°; di-Me deriv., m. 224-6° When fused with excess KOH, it gives *p*-hydroxybenzoic acid and a substance that to be a monomethyl ester of tri-

hydroxybenzoic acid. C is regarded as a secondary alc., $C_{27}H_{36}O$, m. 80–80.5°; Ac deriv., m. 43.5–44°; ketone m. 73–4° and ketoxime, m. 49–50°. It is probably identical with ginnol, which was obtained from the fruitage of the plant. D, after recrystn. from EtOH, m. 240–1°. An AcOH soln. of this substance gives a blue coloration by the Liebermann reaction. E, $C_{29}H_{40}O_4$, m. 296° (decompn.); di-Ac deriv., m. 169–70°, crystallizes from EtOH with a silky luster.

ALBERT L. HENNE

A leaf spot and blight disease of onions caused by *Alternaria palandui* nov. sp. C. RANGASWAMI AYYANGAR. Agr. Research Inst., Pusa, Bull. 179, 14 pp.(1928).—A new fungus causing leaf spot and blight of onions is given the name *Alternaria palandui*. It grows luxuriantly with profuse spore formation on a large variety of agar media. Growth in agar media contg. 1–3% sucrose, lactose or maltose was directly proportional to the concn. of sugar present, the kind of sugar having no noticeable effect. Best growth was obtained at acidities between +5 and –10 on Fuller's scale. The spores were found to be incapable of germination after steeping in $CuSO_4$ and germisan solns. of 0.05% and higher concns. for 30 min.

K. D. JACOB

Chemistry of the red and blue pigments of flowers and fruits. III. ERNEST H. HUNTRESS. Mass. Inst. Technology. J. Chem. Education 6, 52–8(1929); cf. C. A. 23, 1433.—The 28 anthocyanins known have been found to be derived from 5 substances—pelargonidin, cyanidin, delphinidin, and the 2 methylated anthocyanidins, peonidin and syringidin. The way in which the anthocyanidin and carbohydrate mols. combine to form an anthocyanin is not yet definitely known. LOUISE KELLEY

Studies on plant colloids. XXIII. Soluble starch obtained by oxidation reactions. M. SAMEC. Kolloidchem. Beihefte 29, 155–66(1929).—By the action of oxidizing substances, as they are used for the production of sol. starch, the starch is peptized while undergoing more or less oxidation during which acid groups are formed which are not found in the native starch. The P content generally remains const. L. F. M.

The capillary structure of softwoods. ALFRED J. STAMM. U. S. Forest Service, Madison, Wis. J. Agr. Research 38, 23–67(1929).—Physical and physical-chemical studies were made on the structure of wood. Values of endosmotic flow through the capillaries of several species of wood corresponded closely to the readiness with which the same woods take up preservatives. The contact potential between wood and H_2O varied from 0.0131 to 0.0144, av. 0.0136 v. Elec. cond. of wood satd. with H_2O is a surface phenomenon. The pressure required to overcome the surface tension of C_6H_6 was on the av. 40.7% of that required to overcome the surface tension of H_2O in the capillaries. Wood sections are somewhat permeable to colloidal Hg and India-ink sols, but they also act as partial ultrafilters. 37 references are given. A. L. MEHRING

River myall or sally wattle. A plant proved poisonous to stock. H. R. SEDDON AND H. C. WHITE. N. S. W. Dept. Agr., Glenfield. J. Council Sci. Ind. Res. (Australia) 1, 328–30(1928).—*Acacia glaucescens* was shown to be highly toxic to farm animals. The stomachs of animals which had died after eating it contained HCN. The leaves of the plant contain a cyanogenetic glucoside but no emulsin. A. L. M.

Dissection of wood fibrils by chemical means. GEORGE J. RITTER. U. S. Forest Products Lab., Madison, Wis. Ind. Eng. Chem. 21, 289–90(1929); cf. C. A. 22, 4149.—When delignified spruce and elm fibers are treated with 68–77% of H_2PO_4 at 60–65° for 15–20 min. the fibrils produced further sep. into spindle-like bodies, designated as "fusiform bodies." Various stages in the process are illustrated by photomicrographs.

LAWRENCE P. MILLER

Hexylresorcinol and phenylethylresorcinol as agents against plant pathogenic fungi. J. HOUBEN AND H. W. WOLLENWEBER. Biol. Reichsanstalt für Land- und Forstwirtschaft, Berlin-Dahlem. Biochem. Z. 204, 448–55(1929).—Prepn. of hexylresorcinol. 17 g. resorcinol, 15 g. capronitrile and 10 g. $ZnCl_2$ in 50 cc. abs. ether are satd. with HCl. After 2 days, an equal vol. ether is added and decanted; this process is repeated twice. Upon the addn. of ice, and removal of the last traces of ether there is obtained a mass of yellow crystals of the condensation product, $AmC(:NH)C_6H_4(OH)_2 \cdot HCl$. The ketone derived from this product is reduced to hexylresorcinol. The phenylethylresorcinol is produced by forming first a condensation of $C_6H_5(OH)_2$ with benzyl cyanide, which is hydrolyzed to a ketone and this is reduced. Hexylresorcinol 67.5–59°, b_D^{20} 1.198–1.199°, b_D^{25} 1.333–1.335°, at 18° gives in H_2O a 0.05% soln. Phenylethyl 132–134°, b_D^{25} 1.250° (decompn.) and gives at 18° a 0.041% soln. Much stronger concns. can be secured in colloidal soln. A number of fungi pathogenic to plants were tested. Hexylresorcinol killed these organisms in concns. of 0.01% and even 0.005%. The concns. which were inhibitory to the growth of fungi are summed up as follows: *Penicillium glaucum*, 0.0025 to 0.005%; *Nectria galligena*, 0.0025 to 0.005%; *Fusarium aurantiacum*, 0.005 to 0.01%; *F. l.*, 0.01 to 0.02%; *Gleospirium fructigenum*, 0.0025

to 0.005%; *Polystictus versicolor*, 0.03 to 0.04%; *Nonilia fructigena*, less than 0.0025%; *Calonectria graninicola*, less than 0.0025%. Good results were also obtained with phenylethyldresorcinol.

S. MORGULIS

Determination of small quantities of nitrogen in plant materials. J. T. SULLIVAN AND L. E. HORAT. Purdue Univ. Agr. Expt. Sta., Lafayette, Ind. *J. Assoc. Official Agr. Chem.* 12, 133-5(1929).—Two methods are suggested for plant materials high in org. matter but low in N, giving as accurate results as the regular Kjeldahl method, but with much smaller samples (2-10 mg.). For perfectly dry material a method similar to that of Folin and Farmer (*C. A.* 7, 1208) was found to be successful, digestion being carried out in a test tube and hastened by using superoxol. Exts. are evapd. to dryness and digested in a small Kjeldahl flask and then transferred to a test tube for aeration of the NH_3 in the Van Slyke-Cullen urea app. (*J. Biol. Chem.* 19, 211 (1914))

A. PAPINEAU-COUTURE

Chemical and biochemical researches on the *Magnolia grandiflora*. L. GIUSEPPE TOMMASI. *Ann. staz. chim. agraria sper. Roma* 10, 29-41, 53-8, 69-81, 83-96(1929).—This plant has persistent long coreaceous leaves, reaching 30 cm. in length and 12 in width, green in the upper portion and brown in the lower; white intensely perfumed flowers. Every 100 parts wet magnolia leaves dried at 105° gave 18, 44 moisture, 3.04-3.73 fat, 6.12-7.50 N substances, 10.40-12.75 raw cellulose, 5.55-6.81 ash, 56.45-69.21 non-N extractive substances; 100 parts ash contg. 12.48 K_2O , 24.28 CaO , 1.96 MgO , 12.65 Na_2O , 1.44 Fe_2O_3 , 2.47 P_2O_5 , 0.47 SO_3 , traces of Cl, 43.50 of SiO_2 and 0.02 of Mn. Two lots collected in April gave 1.2 per 1000 of oleous, slightly green, unpleasantly smelling essence, that became thick and sticky in the air. d_{15}^{20} 0.915-0.916, rotary power $+1^\circ 20'$ to $+1^\circ 30'$, refraction index n_D^{20} , 1.5014-1.5004; f. p., -16° ; b. p., 170° - 265° ; completely sol. in 95° alc., 1:30 in 90° alc., 1:90 in 80° alc.; acid value, 2.1-2.3, Et index, 28.14-26.90; ethers %, 9.85-9.42; Et index after acetylation, 51.0, total alc. % ($\text{C}_{10}\text{H}_{18}\text{O}$), 13.45; free alc., % 5.71. Colors Schiff's reagent. 100 parts of the flowers, with no moisture, contained 5.55 parts fat, 8.86 N substances, 15.50 raw cellulose, 7.15 ash, 62.94 non-N extractive substances, 7.85 reducing sugars, 3.15 hydrolyzable sugars, 10.90 total sugars, 15.00 pentosans, and 100 parts of ash 54.44 K_2O , 11.33 CaO , 5.92 MgO , 3.87 Na_2O , 2.03 Fe_2O_3 , 3.68 Al_2O_3 , 0.04 Mn, 5.46 P_2O_5 , 4.89 SO_3 , 2.12 Cl, 6.22 SiO_2 . The flowers have 0.4 per 1000 parts of a slightly yellow essence with the same smell as that from the leaves; d_{15}^{20} , 0.902; sp. rotation (α_D^{20}) $+3^\circ 20'$; rotation after acetylation $+6^\circ 50'$; refractive index n_D^{20} , 1.5250; solidification point, 16, b. p., 155-260°; soly. in 90° alc., small; acid value, 1.20; Et value, 54.20; acetyl sapon value, 75.50. Microchem. investigations were made for localizing the essence in the plant with Sudan III; this was found more abundant in the leaf lamina and also in the epidermis and hypodermis.

R. SANSONE

Synthesis of coproporphyrin by dried yeast. H. FINK AND K. WEBER. *Wochschr. Brau.* 45, 478-80(1928).—The coproporphyrin content of yeast can be increased by cultivating the yeast in an artificial nutrient soln. rich in sugar and by autolysis. Dried yeast was fermented at various p_{H} values in a soln. of 10% cane sugar, 0.04% MgSO_4 , 0.05% CaCl_2 and 0.1% carbamide. After 8-13 days the largest amount of porphyrin, approx. 0.147 mg. per 5 g. dried yeast, was present in the p_{H} 4-4.5 soln. It is not known what part the living cells in the dried yeast played in the synthesis of coproporphyrin.

A. SCHULTZ

Physicochemical investigation of proteins contained in soy bean. TETSUTARO TADOKORO AND KOKUJI TOSHIMURA. Hokkaido Univ. *Hokkaido J. Agr.* 20, 355-62(1928).—T. and T. sep'd. and purified H_2O -sol. glycinin A, legumelin, 10% NaCl soln. of sol. glycinin B, 0.2% NaOH soln. of sol. glutelin from the soy bean from Manchuria and Hokkaido. The ash and P contents of these proteins decrease in the order legumelin, glycinin, glutelin, while the N content increases in the same order. The p_{H} value of the isoelec. point is highest in glycinin and lowest in legumelin. The sp. rotatory power of the alk. soln. of each protein and the amt. of HCl which combines with each protein is highest in glycinin. The free amide N is greatest in glycinin, next in glutelin, and smallest in legumelin. The melanin N in glycinin is much larger than in others while the histidine N in legumelin and lysine N in glutelin are much larger than in others. The glycinin of soy bean seems from its chemical properties to be a much more highly condensed compd. than other proteins in soy bean, and is very different from oryzinin in rice.

K. SOMEYA

Some special constituents in the soy bean. SHUNSUKE MURAMATSU. Morioka Agr. Coll., *Memorial Publication Morioka Agr. Coll.* 1928, 1-15; cf. *C. A.* 19, 742.—M. has now isolated a new hydroxy acid, $\text{C}_{10}\text{H}_{16}\text{O}_4$, m. 240° , which forms many salts.

In the soln. obtained by digesting the degreased soy bean with 80% EtOH in the Soxhlet app. lecithin is present; the quantity of lecithin as calcd. from the P_2O_5 content of the fatty oil extd. by the ordinary digestion method at ordinary temp. does not give the total lecithin content. The amt. obtained from the fatty oil, from skin and cotyledons is 0.64%; that obtained from the degreased residue by EtOH extn., skin 0.07%, cotyledons 0.78%. A new sterol was isolated in the alc. ext. and its content detd. In this case also a part of it remains in the residue from Et_2O digestion and is extd. by warm EtOH. The alc. ext. also contains a new Et_2O -sol. easily crystallizable substance, $C_{21}H_{40}O_8$, m. 235° , which is a higher alc. Its content is almost negligible in the skin, but amounts to 0.62% in the cotyledons.

K. SOMEYA

The transformation of the chlorophyll in a green alga. A. PERRIER. *Compt. rend* 188, 339 41(1929).—A monocellular green alga belonging to the family of Protococci was cultured on the following medium: bean broth plus agar, KH_2PO_4 , $MgSO_4$, NaCl, $FeSO_4$, $MnSO_4$ and $(NH_4)_2SO_4$. To sep. 100-cc. portions of this basic medium 3 parts of the following substances were added: MeOH, EtOH, glycerol, mannitol, arabinose, glucose, levulose, galactose, sucrose, lactose, maltose and starch. These media were placed in tubes and two series were inoculated with the alga. One set was placed in diffuse light and the other in the dark. After 8 days an excellent growth was present in the tubes kept in the light. The arabinose, mannitol and glycerol media supported the poorest growth. The organisms grew fairly well in the dark and produced some chlorophyll. If the media contained only NH_3 nitrogen, the amts. of chlorophyll were very small. The power to produce the pigment was quickly regained when the cells were transferred to a favorable medium. H_2O also aided in chlorophyll production.

M. H. SOULE

The influence of one ion on the accumulation of another by plant cells with special reference to experiments with *Nitella*. D. R. HOAGLAND, A. R. DAVIS AND P. L. HUBBARD. Univ. of Calif. *Plant Physiology* 3, 473-86(1928).—The halogen content of *Nitella* cells was detd. under the known conditions leading to favorable accumulation of these ions (C. A. 18, 1003; 21, 942). The relation between Br ion concns. in the culture medium and in the cell sap was of a logarithmic type (C. A. 13, 1331). Hence, the factor obtained by dividing internal by external concns. has a much higher value for external solns. of low concn. than for those of high concn. The accumulation of Br in the cell sap was retarded by Cl or I ions in the culture medium, but not by SO_4 , NO_3 or PO_4 ions. Anions which themselves are incapable of rapid accumulation (e. g., SO_4) are also incapable of having marked influence on the accumulation of other anions. These anion and cation effects occur in very dil. solns. With the exception of the higher concns. of I, no injury resulted. The accumulation of Br ions was definitely influenced by the nature of the cation, being most rapid with solns. of KBr and RbBr and least rapid with solns. of LiBr, CaBr₂ and $MgBr_2$. Relative to the effect of H-ion concn., it was found that large accumulation of Br took place between p_H 5-8. All the observations are explicable on the assumption that ionic processes are involved. W. T.

The preparation of chlorophyll. F. M. SCHERTZ. U. S. Dept. of Agr. *Plant Physiology* 3, 487-97(1928); cf. C. A. 5, 2623; 6, 2934.—In response to repeated requests for information regarding the prepn. of pure chlorophyll, a detailed description of the method used by S. for the extn. and purification of chlorophyll ($\alpha + \beta$) from dry nettle leaves (C. A. 22, 3683) is given. S. recommends the purification of the chlorophyll by pptn. with acetone in preference to the petroleum ether method of Willstätter and Stoll. Samples thus purified had an av. ash content of 3.98%. This compares with 4.5% obtained by Willstätter and Hug (C. A. 5, 2623). Two samples of ash analyzed 92 and 100%, resp., of MgO. Tests used to det. the purity of chlorophyll are described.

WALTER THOMAS

Cumyl volatile oils and stearoptens as fungicides (KINGERY, ADKISSON) 17. Dimethylhydroresorcinol as a reagent for aldehydes and the assimilation of C (VORLANDER) 10. Constituents of lichens. II. Constitution of barbatic acid (PRAU) 10.

E—NUTRITION

PHILIP B. HAWK

Does commercial insulin contain what has hitherto been called vitamin B? CHARLES I. STUCKY. *Arch. Internal Med.* 42, 780-3(1928).—A com. insulin prepn., fed to young white rats, did not support growth or cure polyneuritis. J. B. BROWN

Production of renal injury in the white rat by the protein of the diet. Dependence of the injury on the duration of feeding, and on the amount and kind of protein. I. H. NEWBURGH AND A. C. CURTIS. *Arch. Internal Med.* 42, 801-21(1928).—In answer to criticisms of the authors' previous work (*C. A.* 13, 3229; 18, 705) white rats were fed over varying periods of time diets contg. increasing amts. of casein, beef muscle, beef liver and vegetable proteins. In one expt. protein N was replaced with an equiv. amt. of urea. The test for renal injury was based upon albuminuria and especially on the appearance of casts. It was found that the degree of injury was detd. principally by the type of protein, and, to a lesser extent by its concn. and the duration of feeding. Diets contg. 75% of dried liver produced a granular kidney in less than a year, but the same amt. of casein fed 16 months caused only a moderate tubular injury. The effect of beef muscle was intermediate. Urea was not a factor in producing renal injury. J. B. B.

A comparison of the effects of general diets and of standardized diets on tolerance for dextrose. J. SHIRLEY SWEENEY. *Arch. Internal Med.* 42, 872-6(1928).—The use of standardized diets over a period of several days did not affect the great individual variations in the dextrose tolerance test (blood-sugar curves) on young men. J. B. BROWN

Photochemistry of ergosterol. STANISLAW K. KON. *Nature* 122, 276-7(1928) Correction to *C. A.* 23, 422.—The last sentence should read: The results showed that the quantum efficiency of the formation of vitamin D is low even for monochromatic radiation, most of the energy being dissipated as heat or used to elicit complicated reactions leading to the formation of new products other than vitamin D. I. C.

The influence of dextrose on alimentary galactosuria. OSKAR WELTMANN. Med Univ.-klinik in Wien. *Wiener klin. Wochschr.* 42, 8-10(1929).—The ingestion of 40 g of galactose with 50 to 100 g. of glucose resulted in less galactose excretion than when the galactose was taken alone. The difference was significant in normal subjects but especially striking in liver diseases. This phenomenon indicates that dextrose increases the rate of absorption of galactose by the liver. D. B. DILL

The significance of plant sterols for the animal organism. RUDOLF SCHÖNHEIMER. Univ. Freiburg. *Z. physiol. Chem.* 180, 1-37(1929).—The expts. were designed to det the fate of the vegetable sterols contained in the food consumed by animals, the mode of synthesis of the sterol structure by the animal organism, and the possibility of pathogenic action of vegetable sterols as compared to cholesterol. It is known that the feeding of large amts. of cholesterol leads to deposition of cholesterol in certain organs, a phenomenon analogous to atherosclerosis in man. If, as is commonly supposed, a transformation of plant sterols into cholesterol is easily effected, the importance of these sterols from the nutritional standpoint has been underestd. The expts. here described were performed with rabbits, rats, mice, cats and dogs. The control animals were fed a ration contg. an abundance of fat (lard), while the exptl. animals received the same ration plus sitosterol and cholesterol, resp. After daily doses of 0.3 g. for periods ranging from 49 to 280 days the entire rabbits were analyzed for sterol content after removal of the brain and pelt. A large increase was found in the cholesterol animals, while the sitosterol animals showed the same sterol content as the controls. In the rat, mouse and cat expts. the liver was analyzed, and in all cases the cholesterol animals showed a large increase but the sitosterol animals showed none at all. Characteristic anisotropic fat-like globules were observed only in animals that had received cholesterol. Considering the variety of animals tested and the uniformity of results obtained, the conclusion is obvious that sitosterol feeding does not lead to a sterol deposition in higher animals. The sterol obtained in normal amt. from the sitosterol rabbits was examd further by detg. the m. p. of its acetate. Cholesterol acetate m. 114.5° and sitosterol acetate m. 125.6-137°; a mixt. in the proportions 100:1 m. 116°. The acetate obtained from the sterol of the sitosterol rabbits in no case melted above 114.5°; hence sitosterol was not present in appreciable amt. To det. whether the sitosterol is disposed of through the agency of an esterase, expts. were performed in which crystals of cholesterol and sitosterol, resp., were implanted under the skin of dogs. The cholesterol "pocket" after 11 days showed evidence of esterification, viz., rounding off of the corners and edges of the crystals, doubly refractive droplets and staining by Sudan dye, while chem. anal. showed that 10% had actually been esterified. The sitosterol crystals, on the other hand, showed no alteration whatever and the mere trace of ester found was within the limit of exptl. error. A sterol mixt. obtained from Calabar beans and coprosterol gave neg. sitosterol and 20% stigmasterol, also preps. of ergosterol and coprosterol gave neg. results when subjected to this treatment and tested for esterification. Of these various sterols cholesterol alone undergoes esterification in the subcutaneous connective tissue.

The others behave like foreign bodies in general. Expts. with rabbits were also performed to det. the sterol balance. After feeding 0.2 g. of cholesterol, 45-54% was recovered in the feces, while the same amt. of sitosterol gave a 94-99% recovery. Sitosterol is apparently not absorbed from the alimentary tract. The fecal sterol obtained after sitosterol feeding was purified and compared with the original substance. The optical rotation of the digitonide from each was practically the same, and the m. ps. of their acetates and benzoates were the same, as were also the mixed m. ps. Sitosterol evidently traverses the alimentary tract without alteration and is not converted into an analog of coprosterol. A. W. DOX

The mineral metabolism of the beef steer. E. B. FORBES, R. B. FRENCH AND T. V. LETONOFF. Inst. Animal Nutrition, Pa. State College. *J. Nutrition* 1, 201-8 (1929).—A series of 10 nutritive balances of the Ca, Mg, P and N of normal feeds at 4 planes of nutrition, with each of two 2-year old steers, was detd. in exptl. periods mostly 18 days in length. The planes of nutrition studied were, (a) half of the energy-maintenance requirement, (b) maintenance, or energy equil., (c) half more than maintenance, and (d) twice maintenance. A ration of corn meal and alfalfa hay, in equal wts., was fed at each of the 4 planes of nutrition; and in addn. a ration of alfalfa hay alone was fed at the energy-maintenance level, with each steer. The mineral metabolism of the steers was found to be of the normal character for growing animals, and not to be characterized by the peculiarities of the mineral metabolism of the milk-producing cow. The balance data signify that with the mixed ration of corn meal and alfalfa hay, at planes of twice maintenance, half more than maintenance and maintenance, the intake of Ca, Mg, P and N was adequate; that at the plane of half of the energy-maintenance requirement the intake of Mg was adequate, of Ca was at about the point of equil., and of P and N was definitely insufficient; while with the ration of alfalfa hay alone at the maintenance level the intake of all elements studied was adequate. It is concluded that 18-day balances of mineral elements such as Ca and P, which are utilized to the extent of considerable proportions of their usual intake, are of value as indicating the inadequacy of the quantities present to serve the nutritive requirements of the animal; but balances of mineral nutrients such as magnesium, which are utilized in small proportions of the usual intake, are of much less certain significance, and cannot be closely interpreted because of the great complication of factors, other than the quantity present, which enter into the detn. of the balance of intake to outgo. C. R. F.

A study of the utilization of the iron of meats as compared with other protein foods. R. C. MILLER, E. B. FORBES AND C. V. SMYTHE. Inst. Animal Nutrition, Pa. State Coll. *J. Nutrition* 1, 217-32 (1929).—This is a progress report of an investigation of the utilization of the Fe of protein foods for growth and other normal functions of albino rats, the especial purpose of which was the development of evidence as to the sp. value of meats as a source of Fe in human nutrition. Seventy-four individuals were fed for 5 weeks after which Fe was detd. in the entire body exclusive of the digestive tract. Comparisons were made on skim and whole milk powders, beef muscle, kidney, brain and liver, navy beans, peanuts and hen eggs. Fe was detd. by a modification of the colorimetric thiocyanate method. The growth from diets in which the sole source of protein and Fe was skim milk powder or whole milk powder was excellent, but after 5 weeks' feeding the Fe content of the bodies of the rats was reduced to approx. 50% of the N. After feeding for 7 months on the diet in which skim milk constituted the sole source of protein and Fe, female rats were unable to rear their young. The growth from the egg diets was excellent; from the muscle, liver and kidney diets was fair; and from the brain, bean and peanut diets were poor. The Fe content of the rats which received the meat foods was apparently normal in each case; the Fe content of the rats which received egg was much lower, the Fe content of egg apparently being less efficiently utilized than that of the meats; and the Fe content of the rats which received peanuts being the lowest of all, the Fe content of peanuts being especially low. Each of the 7 protein foods studied, other than milk, was much superior to milk as a source of dietary Fe for growing rats. C. R. F.

The absorption of glucose from the alimentary tract of rats deprived of the vitamin-B complex. H. B. PIERCE, H. S. OSGOOD AND J. B. POLANSKY. Pa. State Coll. and Univ. of Rochester, N. Y. *J. Nutrition* 1, 247-69 (1929).—The Cori method (C. A. 20, 3721) for detg. the glucose absorption by the whole alimentary tract was used. Results using 3 races of rats do not correspond closely and the absorption was extremely variable. The % of glucose absorbed during 1-, 2- and 3-hr. periods appeared to be dependent upon the amt. of glucose remaining unabsorbed in the alimentary tract. Two of the races of rats fed on vitamin B-deficient diets absorbed a lower % of the glu-

cose fed than did the normal animals. The Pa. State colony of rats showed no differences. In general, the work of Cori (*C. A.* 22, 1623) is confirmed. C. R. F.

The physiological effects of protein. HAROLD H. MITCHELL. Univ. of Ill. *J. Nutrition* 1, 271-92(1929).—A review of investigations, their correlation and interpretation. C. R. F.

Hygienic feeding and food deficiencies. E. LESNÉ. *Progrès méd.* No. 15, 615-20(1928); *Rev. Hyg.* 50, 938.—The calcul. of calcs. is no longer the basis of hygienic diets. Not only quantity but quality of food is becoming increasingly important. Deficiencies in H₂O, cellulose, proteins, certain amino acids, carbohydrates, fats, minerals and vitamins have all been shown to be important in the daily nutrition of the human body. Likewise a proper temp., purity of air and sunlight are equally as important as the food itself. The increasing emphasis being placed on deficiency diseases is a step in the right direction. C. R. F.

The meaning of vitamin A. HENRY C. SHERMAN. Columbia Univ., New York *Science* 68, 619-20(1928).—Exception is taken to the article by Jones (*C. A.* 23, 1166) suggesting a new set of provisional names, each to be distinguished by a prefix in accordance with the disease for which it is preventive. S. points out that the present admittedly colorless and non-descriptive alphabetical designations are probably desirable in view of the uncertain compn. of these substances and because knowledge concerning them may expand in all directions without danger of inconsistencies in nomenclature. With vitamin A, the development of an ophthalmia is only 1 of the manifestations of a lack of this vitamin. Probably this is not even its most important property. E. g., decreased resistance to respiratory disease is of greater actual significance than the ophthalmia, but cannot be as clearly demonstrated. Emphasis could readily be misplaced if a designation such as "antiophthalmic vitamin" were to be substituted for the broader term. C. R. F.

Preliminary studies of the Rosenheim-Drummond color tests of vitamin A in cod-liver oil. E. C. TOWLE AND E. C. MERRILL. *Am. J. Pharm.* 100, 601-2(1928).—The Rosenheim-Drummond colorimetric test for vitamin A in cod-liver oil makes no provision for temp. control using the Sb chloride method. The authors have found that (1) the speed of reaction is influenced very materially by the temp. of the reaction mixt., (2) the blue color formed by the Sb chloride addn. may be very definitely controlled by depressing the temp.; for instance, reaction commences to fade at 30°, within 1 min., but at 2° maintains for over an hr.; (3) the reaction appears to consist of 2 stages (a) development of blue color, (b) development of red color; (4) the speed of reaction may be increased by addn. of a small quantity of alc.; (5) the blue color of reaction may be brought back after fading has taken place by addn. of small quantities of distd water. The subject is worthy of further study with the opportunity of standardizing temp. control in order to assure a uniformity of results as well as to permit more accurate readings of the color by the Lovibond tintometer method. W. G. GAESSLER

Experimental studies on vitamin C. IV. The carbohydrate and nitrogen metabolism of experimental scurvy in guinea pigs fed on an exclusive oat diet. KOZO TOMITA. Tokyo Jikeikai Med. College. *Sci.-I-Kwai Med. J.* 47, No. 9, Eng. abs., 6-7(1928).—Guinea pigs maintained on an oats diet showed a progressive increase in the sugar content of the blood and in the amt. of urinary N excreted. The glycogen content of the liver did not decrease until just before the death of the animals. The excretion of creatinine, Ca and uric acid decreased with the development of scurvy while the rate of excretion of creatine increased. ARTHUR GROLLMAN

The vitamin B content of cancer. HENRY JACKSON, JR. AND CLEMENT I. KRANTZ. Huntington Memorial and Boston City Hospitals, Boston. *J. Clin. Investigation* 6, 609-12(1929).—Malignant tissue contains less vitamin B than normal liver and hence the hypothesis relating malignancy to excessive vitamin B content is not substantiated. ARTHUR GROLLMAN

The vitamin content of the nutrient preparation promonta. LUDWIG BITTER AND FRITZ WEIGMANN. *Klin. Wochschr.* 7, 1329-30(1928).—The presence of vitamins C and D in the nutrient preps. *maiztropolon*, *eisentropon*, *promonta* and *somatusc* could not be demonstrated. The vitamins originally contained in these preps. might have been destroyed by bacteria. One gram of the above preps. contained, respectively, 2100, 1900, 380,000 and 300 bacteria. MILTON HANKE

The significance of vitamins in early life. E. VOGT. *Klin. Wochschr.* 7, 1941-4(1928).—The vitamin requirements of the young are exceptionally great. The new born are fortified with a large vitamin reserve which has been taken from the mother. The vitamin content of colostrum is greater than that of milk. The colostrum and milk intake help to maintain a vitamin reserve during the first few months of life.

Mothers that are nourished on vitamin-deficient diets are apt to have improperly developed or dead babies. Addn. of cod-liver oil to the diets of mothers enhances the intra-uterine development of the child and reduces the intra-uterine or delivery death rate. Administration of irradiated ergosterol or of yeast preps. has a similar beneficial effect.

MILTON HANKE

Influence of irradiated ergosterol (Vigantol) on the cholesterol and calcium content of blood serum in adults. FRITZ LASCH. *Klin. Wochschr.* 7, 2148-50(1928).—Administration of Vigantol leads fairly regularly to an increase in the Ca and cholesterol content of the serum. This treatment proved to be beneficial in 2 cases of osteomalacia senilis.

MILTON HANKE

Lipoid metabolism studies on starving animals. H. WENDT. *Klin. Wochschr.* 7, 2183-5(1928).—The lipoid P and cholesterol content of the peripheral blood are increased during the first few days of starvation and are then decreased. The ratio of free cholesterol to its esters is about 1:1 at all times. Ingestion of triolein leads, normally, to a rise in lipoid P and in cholesterol esters. The same result is obtained, in an exaggerated form, in starving animals.

MILTON HANKE

Studies on the antineuritic vitamin. II. The properties of the "curative" substance. JOHN LEWIS ROSEDALE AND CHRISTOPHER JOSEPH OLIVEIRO. King Edward VII College of Medicine, Singapore. *Biochem. J.* 22, 1362-7(1928); cf. *C. A.* 22, 974. The antineuritic vitamin of an ext. of rice polishings is destroyed by fermentation and by sterilization. The potent curative ext. contains invertase and a lipolytic enzyme. In cases of "dry" beriberi, the pancreas shows no lipolytic and tryptic digestion.

BENJAMIN HARROW

Biological inertness of irradiated mycosterols other than ergosterol. OTTO ROSENHEIM AND THOMAS A. WEBSTER. National Inst. for Medical Research, London. *Biochem. J.* 22, 1426-8(1928).—Mycosterols, accompanying ergosterol in ergot, are biologically inactive after irradiation.

BENJAMIN HARROW

"Hypervitaminosis" and "vitamin balance." LESLIE J. HARRIS AND THOMAS MOORE. Nutritional Lab., Cambridge. *Biochem. J.* 22, 1461-77(1928).—Irradiated ergosterol, cod-liver oil and cod-liver oil concentrate are all harmful in excess, the degree of toxicity being proportional to the quantity of vitamin D present. Crystalline ergosterol, over-irradiated ergosterol and ergosterol resinized by heating are harmless when consumed for the same periods at levels lethal in the case of irradiated ergosterol. Rats receiving the normal allowance of marmite (B vitamins) suffered from no marked symptoms of vitamin-B deficiency when irradiated ergosterol was given at a rate 1000 times the minimal physiological dose. Normal gestation always failed in rats receiving a diet containing 15% cod-liver oil.

BENJAMIN HARROW

Fluorescence of some vitamin-A-containing fats. RONALD S. MORGAN AND KENNETH MACLENNAN. Food Research Laboratories, Lever Bros., Port Sunlight, England. *Biochem. J.* 22, 1514-22(1928).—When a beam of light from a quartz Hg vapor lamp, completely enclosed so that only light emitted has to pass through a filter cutting out nearly the whole of the visible portion of the spectrum, is allowed to fall upon any object in a darkened room, a characteristic fluorescence is observed. A method has been devised by which the actual brightness of the fluorescence of a solid fat, illuminated by ultra-violet light (filtered free from visible light), may be detd. and the color expressed in terms of 3 additive primaries: red, green and blue. Butter and margarine show dissimilar fluorescence: the former shows a fairly bright yellow color, whereas margarine is blue. This difference cannot be accounted for by difference in vitamin content.

BENJAMIN HARROW

Changes in the nuclear-plasmic ratio of mammals during hunger. ANTHONY DMOCHOWSKI. Warsaw Univ. *Biochem. J.* 22, 1555-61(1928).—The results confirm those of Truszkowski (*C. A.* 22, 615), who found that the nuclear-plasmic ratio of mammalian skeletal muscle remains const. throughout starvation.

BENJAMIN HARROW

The synthesis of 4(or 5)-glyoxalineethylmethylcarbinol and its behavior towards the polyneuritis of pigeons. YOSHIKAZU SAHASHI. *Bull. Inst. Phys. Chem. Research (Japan)* 7, 1191-5(1928); *Abstracts* 1, 114-5.— $\text{N:CHNHCH:CCH}_2\text{CH}_2\text{CMeOH}$ has

been prepd. It temporarily cures the severe spasmodic form of polyneuritis of pigeons. The animals never live longer than 7-10 days after the first appearance of the spasms. The curative power of this compd. is thus nearly equal to that of 2,6-dihydroxyquinoline derived from the β -acid obtained by hydrolysis of crude oryzanin.

A. L. LENNE

Has alcoholic extract of polished rice any noxious effect upon pigeons? YOSHIKAZU SAHASHI, TARO NOGUCHI AND NABETARO HASHIMOTO. *Bull. Inst. Phys. Chem. Research (Japan)* 7, 1196-1201(1928); *Abstracts* 1, 115-6.—Recently, it has been

stated that polyneuritis in birds is produced by a toxic substance in the alc. ext. of polished rice, but not by the deficiency of vitamin B. In order to prove this statement, 2 groups of pigeons have been fed, one group on rations consisting of well-washed polished rice and McCollum's salts, the other on a large quantity of alc. ext. of powd. polished rice daily besides the above diet. The pigeons of the second group lived somewhat longer than those of the first group, thus showing that the alc. ext. is not noxious. Polyneuritis appeared earlier in the group fed with extd. rice. ALBERT L. HENNE

Observations on the use of irradiated ergosterol in active rickets. JACOB SOBEL AND IRVING CLAMAN. *Arch. Pediatrics* 46, 1-16(1929).—A series of 9 rachitic children showed a normal blood Ca (9.5 to 11.6 mg. per 100 cc.) and a low blood inorg. P (2.1 to 4.1 mg. per 100 cc.). They received daily 1 to 4 mg. (at times 4 to 12 mg.) of ergosterol which had been irradiated with a Hg vapor lamp for 30 min. at a distance of 1 ft., then dissolved in oil to a 1% soln. Under this treatment, in a period of 1 to 10 weeks, according to the severity of the symptoms, the inorg. P of the blood attained normal values (5.4 to 6.9 mg. per 100 cc.) in all but 1 case. Hypercalcemia did not occur. Improvement was noted in such conditions as the calcification of the epiphyses, the rickety rosary, the open anterior fontanel, and craniotabes. Urinary examn demonstrated that the kidneys were not disturbed. The optimum daily dose of irradiated ergosterol is: for children under 1 year of age 1 to 2 mg. in divided doses, for children over 1 year old 3 to 4 mg. (in divided doses 2 or 3 times a day), for premature infants and as a preventive 0.4 to 0.8 mg. After its use for 3 to 6 weeks, frequently the dose may be reduced or the administration discontinued. JOSEPH S. HEPBURN

The physiology of vitamins. V. Cutaneous manifestations related to a deficiency of the vitamin B complex. G. R. COWGILL, C. J. STUCKY AND W. B. ROSE. *Arch. Path.* 7, 197-203(1929); cf. *C. A.* 20, 3488.—Lesions of the skin, frequently symmetrical, were observed in 6 dogs subsisting for long periods on artificial diets except for the vitamin-B complex. In 2 animals, the administration of a prepn. rich in vitamin B was followed by a definite healing of these sores without any other treatment. Animal 3, after a period of rest on an excellent diet, was again placed on the diet deficient in vitamin B, and 39 days later it again exhibited the sores. The administration of the vitamin corrected the partial anorexia and checked the further development of the lesions. The remaining 3 animals died suddenly of deficiency of vitamin B before treatment with the vitamin was effective. The relation of the individual components of the vitamin-B complex (heat-labile antineuritic fraction or heat-stable growth promoting substance) to such lesions of the skin remains to be detd. These observations may be of clinical value. As is well known chronic invalids subsisting on a "hospital" diet are particularly prone to develop decubital ulcers, which are discouragingly resistant to treatment by the usual methods employed. It is suggested that more attention should be paid to the content of vitamin B in the diets used in such cases. H F H

The influence of fat on the nutritional value of infants' foods. F. THOENES *Jahrb. Kinderheilk.* 120, 1-38(1928).—Carefully controlled metabolic studies contradict the prevalent belief that infants on a high-fat diet require an increased food intake. The energy quotient of infants on a butter-meat mixt. is no higher than on fat poor skim milk. Ca and P seem to be retained less well on a high-fat diet. F. M. H

Stone formation as a result of avitaminosis in man. SAMPOERNO. *Geneeskund. Tijdschr. Nederland. Indië* 68, 579-87(1928).—In a 6 months old child S. found clinical and pathological-anatomical phenomena, which are also observed in animals, caused by a lack of vitamin A. The expected combination of keratomalacia and stone formation in the urinal ducts, according to the latest researches in exptl. avitaminosis, is here established for the first time in man. J. C. JURRJENS

A particular case of disturbance of carbohydrate metabolism during infancy. S. VAN CREVELD. *Nederland. Maandschr. Geneeskunde* 15, 349-59(1928).—This case refers to a boy 7 years old. Several times in the morning a very strong hypoglycemia was found, from 0.03 to 0.046%. After giving a dose of 30-50 g. glucose, levulose or galactose, sugar was never found in the urine, not even if the same dose was given after a few hours. The sugar assimilation, however, proved to be very abnormal. One hr. after the levulose dose a high concn. of levulose (0.018%) was found in the capillary blood. The conversion of levulose to glycogen apparently was not normal. After the glucose dose the blood sugar curve was biphasic, showing a serious disturbance in the sugar assimilation. Other sugars apparently are not as well assimilated. After fructose there is acidosis for hours, while there is practically no rise in the respiratory quotient during the first 4 hrs. Adrenaline injections increased the acidosis. Insulin produced after 1 hr. serious symptoms of hypoglycemia, which disappeared after giving

the patient sugar and milk. Small doses of thyroxine over a long period had no effect on the blood sugar % and acidosis. J. C. JURRIJENS

The influence of irrigation on the nutritive value of rice. R. MCCARRISON. Pasteur Inst., Coonoor, S. India. *Indian J. Med. Research* 15, 915-20(1928).—The lower nutritive value of rice grown under wet conditions is due, in part at least, to its lower content of vitamins of the water-soluble-B class. The conditions of cultivation of rice, especially in regard to water supply during the growth of the crop, are factors of importance in detg. the endemicity of beriberi. FRANCES KRASNOW

Is infantile beriberi disappearing? Facts on infantile beriberi during the last thirteen years. JOSE ALBERT AND ALBINO M. OCAMPO. Univ. of the Philippines. *J. Philippine Islands Med. Assocn.* 8, 221-5(1928).—A gradual disappearance is noted. FRANCES KRASNOW

A guide to artificial feeding of infants. EUSEBIO B. SALUD. *J. Philippine Islands Med. Assocn.* 8, 307-11(1928). FRANCES KRASNOW

Photochemistry of vitamin D. STANISLAW K. KON. *Roczniki Chem.* 8, 502-17 (1928) (518 English).—Repeated boiling of cholesterol soln. in acetone with KMnO_4 removes completely the provitamin from cholesterol, which, purified in this way and irradiated, is antirachitically inactive, even in large doses. The photochem. formation of vitamin D under the influence of monochromatic ultra-violet light has been studied quantitatively for different lines. The quantity of radiant energy necessary to form an amt. of vitamin D sufficient to cause a demonstrable deposition of Ca in the bones of a rachitic rat has been found to be const. over a wide range of radiations, 700-1000 m μ being necessary for the 256, 265, 280 and 293 m μ lines. The quantum efficiency is independent of the state in which ergosterol is irradiated, the results being the same for irradiation of the solid or of solns. in alc. of varying concns. The quantum efficiency was the same for ergosterol acetate as that for ergosterol. The hydroxyl group plays no role in the process of activation. An application of the thermopile to the direct study of photochem. processes is described. It is shown that the formation of vitamin D from ergosterol is in all probability a complicated process with a low quantum efficiency even when monochromatic ultra-violet light is used. J. K.

Antirachitic factor in burbot-liver oil. BERTHA CLOW AND ABBY MARLATT. *Wise Univ. Ind. Eng. Chem.* 21, 281-2(1929).—Burbot, a fresh-water relative of the cod, is abundant in the Great Lakes and streams near them. The antirachitic potency of oil from burbot liver was studied by the healing of rachitic rats in 10 days as detd. by Stenbock's method. Tests showed 2% cod-liver oil equal to 0.125% burbot-liver oil, or 0.06% cod-liver oil equal to 0.007% burbot-liver oil. Since different samples of cod liver oil vary much in effectiveness, the superiority shown by the burbot-liver oil in this one test may be misleading. AMY LEVESCONTE

Nutritive value of milk. I. Production of nutritional anemia in albino rats through exclusive whole milk diets. W. E. KRAUSS. Ohio Agr. Expt. Sta. *J. Dairy Sci.* 12, 749(1929).—An exclusive whole milk diet fed to weaning rats from normal females produces severe anemia in 4 to 6 weeks. The preventive or curative power of different substances can be detd. by supplementing the milk diet with them. Substances which gave the best results in preventing anemia were a specially prepd. yeast, hog liver and solns. of Fe and Cu fed simultaneously. AMY LEVESCONTE

Nutritional value of copper in powdered whole milk. R. W. TITUS AND J. S. HUGHES. Kansas State Agr. Coll. *J. Dairy Sci.* 12, 90-3(1929).—The Cu content of whole milk powder resulting from the solvent action of milk on the Cu vacuum pans may tend to destroy vitamins. It may also help to prevent anemia. Rats fed on a daily ration of 8 g. milk powder, contg. about 0.05% Cu, supplemented only with 0.5 mg. Fe, showed excellent growth and hemoglobin production. No exptl. work with Cu has been done on human subjects. AMY LEVESCONTE

Comparison of the antirachitic potency of ergosterol irradiated by ultra-violet light and by exposure to cathode rays. ARTHUR KNUDSON AND CHESTER N. MOORE. Albany Med. Coll. and the Research Lab. of the General Elec. Co. *J. Biol. Chem.* 81, 49-61(1929); cf. *C. A.* 22, 2770.—Exposure to cathode rays with a tube operating at 180,000 to 200,000 v. does not render ergosterol as potent (0.0005 mg. per day) as when it is irradiated with ultra-violet light (0.00002 mg.). Exposure to ultra-violet light for 15 secs. renders ergosterol more potent than a 30 sec. exposure. The changes in the absorption spectra produced by cathode rays and by ultra-violet light are similar. The manner in which cathode rays produce their antirachitic action does not seem to be due to the production of ultra-violet light as they produce no activation through a quartz plate. A. P. LOTHROP

The tetany of fasting in experimental rickets. T. S. WILDER. Harvard Med.

School and Children's Hosp., Boston. *J. Biol. Chem.* **81**, 65-72(1929).—"Fasting of rachitic rats produces in the 1st 24-36 hrs. a marked elevation of the inorg. phosphate of the blood, accompanied by severe tetany. A moderate depression of Ca is also found. A study of the partition of P in the plasma and in the red cells before and during fasting demonstrates that increase of plasma inorg. phosphate is not derived from the other P factors of the blood. Measurements, however, of N in the urine indicate a destruction of body protoplasm to an extent easily sufficient to account for the observed rise in plasma phosphate. Comparison of the N:P ratio found in the urine with that for muscle tissue indicates an extensive retention of phosphate released by tissue destruction and no doubt deposited in healing bone. Measurements of blood sugar demonstrate that the convulsions, occurring in fasting rachitic rats, cannot be referred to hypoglycemia. Normal rats do not develop tetany when fasted. They do not show the elevation of blood phosphate seen in rachitic animals and their survival period is several times as long. A. P. LOTHROP

Cod-liver oil for reproduction. V. E. NELSON, ESTHER OHRBECK, R. L. JONES AND M. W. TAYLOR. Iowa State Coll. *Am. J. Physiol.* **85**, 476-81(1928).—Diets contg. casein 18, salt mixt. 3.7, yeast 12, cod-liver oil 1-10 and dextrin sufficient to make 100% were adequate for satisfactory growth, reproduction and rearing of the young of white rats. Conclusion: vitamin E was present in the particular cod-liver oil used. J. F. LYMAN

The influence of vitamin D deficiency on gaseous exchange in chicks. F. M. BALDWIN, V. E. NELSON AND C. H. McDONALD. Iowa State College. *Am. J. Physiol.* **85**, 482-8(1928).—The respiratory quotient of chicks fed normal diets varied from 0.94 to 1.00. After acute rachitic symptoms had developed, about 21 days after beginning the deficient diets, the respiratory quotient fell to about 0.70. Treatment of the rachitic chicks with ultra-violet light or with cod-liver oil resulted in a rapid rise in the respiratory quotient. J. F. LYMAN

Basal metabolism data on normal men and women (Series II) with some considerations on the use of prediction standards. FRANCIS G. BENEDICT. Carnegie Inst., Washington. *Am. J. Physiol.* **85**, 607-20(1928).—Basal metabolism was detd. for 27 normal men, 21 to 89 years of age and 33 normal women, 18 to 58 years of age. The actually measured metabolism of the men differed from that predicted by the Harris-Benedict, Aub-Du Bois and Dreyer standards, resp., by -1.8 (extremes +26.2 to -17.1), -4.4 (extremes +17.8 to -19.4), and -0.4 (extremes +13.6 to -11.3). Variations for the women from the three standards, respectively, were: -4.2 (extremes +10.9 to -16.7), -7.3 (extremes +11.3 to -19.3) and -4.0 (extremes +9.7 to -19.3). The widest discrepancies were with individuals of unusual configuration. If predicted values for basal metabolism are to be used as criteria for detg. medical or surgical treatment, a more critical consideration of the prevailing methods of prediction is imperative, especially as concerns the obese individual, those suffering from endocrine disturbances and those of unusual configuration. J. F. LYMAN

The basal metabolism of some browns and blacks in Jamaica. MORRIS STEGERDA AND F. G. BENEDICT. Carnegie Inst., Washington. *Am. J. Physiol.* **85**, 621-33(1928).—The av. deviation from that predicted by the Harris-Benedict standard for basal heat production for 37 male browns in Jamaica was -5.4%; for 5 female browns -3.4%; for 8 male blacks -2.0%. Climate and diet in Jamaica probably have no pronounced effect upon heat production. J. F. LYMAN

The basal metabolism of Mayas in Yucatan. GEORGE D. WILLIAMS AND FRANCIS G. BENEDICT. Harvard Univ. and Carnegie Inst., Washington. *Am. J. Physiol.* **85**, 634-49(1928).—The av. deviation from that predicted by the Harris-Benedict standard for 32 male Mayas in Yucatan was +5.2%. The av. mouth temp. was 97.2° F. Difference in configuration, the type of occupation or the state of nutrition cannot account for the high metabolism; presumably the difference is racial. J. F. L.

Age and basal metabolism in adults. FRANCIS G. BENEDICT. Carnegie Inst. *Am. J. Physiol.* **85**, 650-64(1928).—Basal metabolism values for one woman and 3 men (members of lab. staff) extending over 12-20 years are given. With 2 of the men subjects a distinct decrease in metabolism was noted as age increased. Basal metabolism may have great significance in indicating the relative physical fitness, the level of vital activity, or the physical powers of the individuals. J. F. LYMAN

Basal metabolism before and after a summer vacation. FRANCIS G. BENEDICT AND MARY D. FINN. Carnegie Inst. *Am. J. Physiol.* **85**, 665-71(1928).—The basal metabolisms of 20 members of the Nutrition Lab. staff have been detd. before and after a one month's summer vacation over a period of 17 years. On the whole there was no measurable effect; but in two cases basal metabolism was 21 and 32%, resp., higher

after the vacation. The results show a fixity of basal metabolism in the individual which should be strongly emphasized.

J. F. LYMAN

The absence of convulsive phenomenon in the experimental beriberi of the pigeon. G. AMANTEA. *Boll. soc. ital. biol. sper.* 3, 826-8(1928).—From numerous observations made on pigeons of both sexes, A. makes the assertion that if the symptoms are very carefully studied, the animals do not show any characteristic convulsions. This is true in typical beriberi with nervous phenomena and also when the disease is complicated by gastrointestinal toxic factors. The neuromuscular symptoms noted are not convulsions but excessive general agitation.

PETER MASUCCI

The relative utilization of different calcium compounds by hens in the production of eggs. G. D. BUCKNER, J. H. MARTIN AND A. M. PETER. Ky. Agr. Expt. Sta. *J. Agr. Research* 36, 263-8(1928).—A study was made of the comparative effectiveness of CaCO_3 , CaSO_4 , $\text{Ca}_3(\text{PO}_4)_2$, CaCl_2 and calcium lactate in the production of eggs when fed to hens as supplements to a wheat, corn and skim milk ration. CaCO_3 was most effective as judged by the degree to which it was utilized in the production of eggs, its influence on the wt. of egg contents and shells and the quantity consumed. CaSO_4 was readily eaten by the hens but produced fewer and lighter eggs. The lactate was apparently well utilized but the intake was small. CaCl_2 was not voluntarily consumed. Its addition to the basal ration caused only a small increase in egg production. The phosphate serves as a source of Ca but not as well as the carbonate.

A. L. M.

Dietary requirements for fertility and lactation. XVII. A dietary sterility associated with vitamin A deficiency. BARNETT SURE. Ark. Agr. Coll. *J. Agr. Research* 37, 87-92(1928); cf. *C. A.* 22, 4584.—Sterility characterized by resorption of the fetus during gestation, and assocd. with vitamin A deficiency, was produced in rats on a skim-milk diet contg. an abundance of vitamin E. Thirteen references are cited. XVIII. **The vitamin A content of wheat oil.** *Ibid* 93-9.—Sufficient vitamin A for excellent growth of rats during 16 weeks was obtained from 0.05 cc. of wheat oil per animal per day. This quantity of wheat oil per day serves as a potent remedy for severe eye lesions produced by previous lack of vitamin A. Depletion of vitamin A is accompanied by inanition.

A. L. MEHRING

The problem of standardizing vitamin D in butter and in vitamin-containing margarine. FERDINAND FLURY. Pharmacol. Inst., Univ. Würzburg. *Biochem. Z.* 203, 14-21(1928).—The antirachitic effect of margarine to which various quantities of irradiated ergosterol were added has been studied on rats. No rachitic changes were observed in rats which received in their otherwise vitamin D-free diet a daily addn. of 0.1-0.2 g. of this vitaminized margarine (0.9-1.8 antirachitic units or 9,000,000 units per ton). The control rats received a similar quantity of the best grade of butter, but have all developed rickets. These rats showed definite signs of bone healing in 10 days when 0.2 g. of the vitaminized margarine was added.

S. MORGULIS

Vitamin A action of lipochrome. BETH V. EULER, HANS V. EULER AND HARRY HELSTROM. Univ., Stockholm. *Biochem. Z.* 203, 370-84(1928).—Pure carotin and pure lycopin give the colorimetric reaction with SbCl_3 and CHCl_3 which is regarded as characteristic for vitamin A. Other carotinoids likewise give this reaction. The spectra of the resulting blue solns. and the shifting of the absorption maxima through fats were detd. spectrophotometrically. The carotin from carrots acts upon growth in the same characteristic manner as does vitamin A, great increase in wt. being secured with less than 0.005 mg. carotin per day. The vitamin A (SbCl_3) reaction of blood serum or of butter is due to the carotinoid content, and in blood serum the vitamin A plays obviously a large role through its oxidation-reduction activity.

S. M.

Experimental studies on the behavior of the blood sugar level following the ingestion of yeast. A. BICKEL AND G. NIGMANN. Pathol. Inst., Univ. Berlin. *Biochem. Z.* 203, 421-8(1928).—In rabbits which fasted 24 hrs. the ingestion of 5 g. dried yeast causes generally a marked fall in the blood sugar which attains a max. 4-6 hrs. after the feeding. These results were so far obtained with a specially prepd. yeast powder Levurinost.

S. MORGULIS

Contribution to the biochemistry of avitaminosis. XII. The creatinephosphoric acid content of white and red muscles in experimental scurvy and in polyneuritis. ALEXANDER PALLADIN AND S. EPELBAUM. Ukraina Biochem. Inst., Charkow. *Biochem. Z.* 204, 140-9(1929); cf. *C. A.* 23, 160.—The effect of scurvy and polyneuritis has been studied on the content of creatinephosphoric acid, creatine and lactacidogen in the red and white muscled of guinea pigs and pigeons. The animals were killed in the final stage of scurvy when they had lost much wt. The muscles of the legs of the guinea pigs under those conditions contained less creatinephosphoric acid than normally, and this was especially marked in the red muscles. Lactacidogen, on the contrary,

was higher than in the normal muscle. In the heart muscle of guinea pigs sick with scurvy no creatinephosphoric acid could be found at all, and the lactacidogen content likewise was considerably diminished. Chronic and acute polyneuritis differ materially from each other in the way they affect the creatinephosphoric acid as well as lactacidogen content of the muscles. In the chronic form of the disease the creatinephosphoric acid content of the muscle is much lower than normally while that of lactacidogen is higher. In the acute polyneuritis the creatinephosphoric acid is increased and the lactacidogen is diminished. In scurvy the creatinephosphoric acid content of the red muscles is more affected than in the white muscle although normally the red muscle contains less creatinephosphoric acid than the white muscle. Avitaminosis expts., as well as expts. with P or with tetrahydro- β -naphthylamine, show that in red and white muscle which possess different functions, the changes in creatinephosphoric acid are not similar, so that creatinephosphoric acid metabolism must be assoc. somehow with these different functions.

S. MORGULIS

The effect of starvation on the creatine content of muscles and on the creatine-creatinine excretion of cats. ALEXANDER PALLADIN AND S. EPILBAUM. *Ukraina Biochem. Inst., Charkow. Biochem. Z.* 204, 150-64(1929).—In fasting cats creatine in the urine appears on the fourth to sixth day of fasting. The creatinuria becomes progressively greater during the fast until in the end stage of starvation a much greater percent of the total excreted N is in the form of creatine than at the beginning. The creatinine elimination becomes on the contrary gradually less during starvation but the curve of the total creatine + creatinine excretion is continuously rising and especially in the final stage when also the creatine and creatinine curves cross. The creatine content of the muscles increases in cats during the early stage of starvation and this increase persists until the third fasting phase when it commences to decrease. In the end or fourth period of fasting the muscle contains less creatine than during the first period but nevertheless its creatine content is still higher than in the normal.

S. MORGULIS

Contribution to the problem of the simplicity of vitamin B. ERNST SCHMITZ AND ERICH GEORGE. *Univ. Breslau. Biochem. Z.* 204, 165-78(1929).—The attempt was made to produce in pigeons the purely neurotropic disease syndrome of B-avitaminosis by feeding rice and sunflower seeds. The observations seem to indicate with much certainty that the sunflower seeds possess distinct protective action also against the neuritic component of the B-avitaminosis in pigeons. When this neuritic disturbance does occur it is accompanied by a disturbance in body wt. which is not remedied even when the neuritic effects of the disease have disappeared.

S. M.

Experimental hypervitaminosis in rats through large doses of irradiated ergosterol. J. A. COLLAZO, P. RUBINO AND B. VARELA. *Biochem. Z.* 204, 347-53(1929).—With 5-mg. doses of antirachitic vitamin D (Vigantol) per rat there is produced a condition of cachetia loss in wt., arrest of growth, hypothermy and finally death. This condition is designated as vitaminismus. This dose of vitamin D is 5000 to 50,000 times greater than the active amt. present in the McCollum rachitic diet No. 3143; *i. e.*, the difference between the useful and lethal dose is extraordinarily large and impossible to reach in human therapy, though of course one must bear in mind the possibility of producing such hypervitaminosis in the humans. The effect of the overdose is thought to be due to some connection with a stabilization of the Ca in tissue metabolism by vitamin D.

S. MORGULIS

Vitamin action and surface tension activity. I. Utilization of capillary active vitamin-like substances in the avitaminosis of guinea pigs. N. E. SHEPILVSKII. *Nutrition Inst., Publ. Health Commissariat, Moscow. Biochem. Z.* 204, 371-88(1928).—Phenolphthalein, $MgSO_4$, alc. or kaolin have neither prophylactic nor therapeutic action in exptl. scurvy in guinea pigs. Expts. with a 0.015% Na oleate, which has no antiscorbutic effect, indicate that this substance does somewhat retard the loss in body wt. Greater concns. of Na oleate (0.03-0.05%) gave neg. results.

S. M.

Ergosterol isolated from the edible Japanese mushroom, "Cortinellus shiitake." Midzuho Sumi *Inst. phys. and chem. Research, Tokyo. Biochem. Z.* 204, 396-411(1929); *cf. C. A.* 22, 4595.—Ergosterol isolated from *C. shiitake* acquires antirachitic activity after 30 min. of ultra-violet radiation. Amts. of 0.0001 mg. of this radiated substance administered to rats weighing 35-45 g. produce healing. A longer radiation has no effect on the antirachitic activity provided this is not too protracted and causes actual destruction of the ergosterol. Its action is practically the same as that of Merck's Vigantol. The alc. group of the ergosterol has no relation to its antirachitic effect since the radiation of its various esters (acetate, benzoate, palmitate) has the same result. On the other hand, the presence of the double bond is most important for its

therapeutic value. Even the change in position of the double bond, as in iso-ergosterol, causes a loss of this property. It is evident that hydrogenation of the ergosterol inactivates it. Apart from the absorption bands already reported in previous works, a new absorption band has been found at 250μ . S. MORGULIS

Studies in experimental scurvy. II. The carbohydrate metabolism of the animal fed on a vitamin-C-free diet. TAKEYOSHI NAGAYAMA, HIKOSABURO MACHIDA AND YOSHIO TAKEDA. Jikei-Kwai Med. Coll., Tokyo. *J. Biochem. (Japan)* 10, 17-26 (1928).—The av. blood sugar content of a normal guinea pig is 0.109%. No noteworthy change was observed in animals on a vitamin-C-free diet, but in some animals there was an increase in the blood sugar level shortly before death. It is still doubtful whether the moderate reduction in the liver glycogen at the end of scurvy is an inanition or a vitamin-C-deficiency effect. The carbohydrate metabolism during scurvy is not appreciably disturbed. **III. The nitrogen metabolism of the animal fed on a vitamin-C-free diet.** TAKEYOSHI NAGAYAMA AND NOBORU SATO. *Ibid* 27-44.—In exptl. scurvy the urinary excretion of creatine increases and the creatinine coeff. also rises. The creatine content of the muscle remains practically the same as normally. The uric acid excretion generally does not differ from that found normally though toward the end of scurvy it may decrease. The NH_3 excretion, on the contrary, is somewhat greater than normally. The increased creatine excretion and the rise in creatinine coeff. are observed also in starved guinea pigs, but the creatine content of their muscles is less than that in the control animals. S. MORGULIS

Studies on experimental rickets. II. The influence of ultra-violet irradiation on the antirachitic value of soy-bean oil. SEIICHI IZUME, YOSHINORI YOSHIMARU AND ISAO KOMATSUBARA. Central Lab., So. Manchuria Railway Co., Dairen, Manchuria. *J. Biochem. (Japan)* 10, 177-82(1928).—Among the soy-bean oils the one produced by means of the hydraulic press was the highest, and the one prepd. by alc. extraction the lowest in antirachitic value, while the oil obtained by benzine extraction was intermediate in its effect. By the usual processes of refining the antirachitic vitamin of the crude oil was not appreciably destroyed. The antirachitic potency of the oil was much increased by ultra-violet irradiation. Phytosterol isolated from the unsaponifiable fraction of the oil was rendered antirachitic by irradiation and exhibited the well-defined ergosterol absorption bands in the ultra-violet spectrum. S. M.

Increased irritability of the heart vagus in rats suffering from deficiency in fat-soluble vitamins in the diet. BERTELON BONSDORFF AND RAGNAR GRANIT. Universit. Helsingfors. *Skand. Arch. Physiol.* 55, 30-40(1929).—In rats on a vitamin-free diet vagus stimulation of the heart occurs with a strength of current which has no effect on the control animal. S. MORGULIS

Fat-soluble vitamin E and reproduction in mammals. HERBERT MCLEAN EVANS. Univ. of Calif. *Bull. soc. hyg. aliment* 16, 382-97(1928).—An address describing E.'s work on the subject. A. PAPINEAU-COUTURE

Cause and treatment of nutritional disturbances after extensive resection of the intestine. I. Effect of diets rich in vitamin and lipid. HUBERT KUNZ AND HANS MOLLER. Univ. Wien. *Arch. exptl. Path. Pharmacol.* 132, 50-62(1928).—Diets rich in vitamin and lipid permit dogs to remain alive after resections which normally would invariably lead to death. G. H. S.

Lipoid-free diets. R. JAFFÉ. Pathol. Inst. Krankenhauses Moabit., Berlin. *Arch. exptl. Path. Pharmacol.* 132, 84-105(1928).—Mice cannot be maintained upon a lipoid-free diet indefinitely. When upon such a diet an initial period of apparent well-being with a slight gain in wt. is followed by a sudden loss in wt. and death. Animals upon a diet lacking lipoids exhibit an increased susceptibility to unfavorable environmental conditions, including infection. Apparently lipoid in the diet is also essential to proper function of the female sex glands. G. H. S.

Effect of unphysiological diets upon the composition of organs and changes in metabolism. I. Excessive intake of fats. W. BICKENBACH AND P. JUNKERSDORF. Univ. Bonn. *Arch. exptl. Path. Pharmacol.* 132, 129-44(1928).—When dogs were fed fat in excessive amts. after a period of hunger a considerable hypoglycemia developed shortly after the feeding. This was followed by an abrupt increase in the blood sugar. Analyses of the organs indicated that the sugar-regulating function of the liver was impaired because of the extensive infiltration of fat. G. H. S.

The difference between bios and vitamin B. The study of the growth of yeast. HIROSHI IIDA. Taiwan Hospital of Formosa. *Taiwan J. Med.* 279, 635-69(1928).—The degree of yeast growth, as measured by the volumetric method or the gas-volumetric method with the fermentation gas, gives almost the same results, i. e., it increases with the bios content, up to certain limits, beyond which it decreases. The substance

which inhibits the yeast growth above a certain limit is not a salt nor a sugar-like substance but is the bios itself. From these exptl. results the resistance of bios to heat and alkali was examd.; it is greater than that of vitamin B. Thus the strength of the bios begins to decrease gradually at the 5th hr. of heating at 100°, being halved by 21 hrs.' heating. The decompn. in a 3% NaOH soln. is 67.7%. In the case of vitamin B complete decompn. results on heating for 3 hrs. at 100°, and also in a 1% NaOH soln. Hence I. concludes that vitamin B always accompanies bios and that every vitamin B prepn. examd. by I. contained bios, although the concentrations of the two substances were not always parallel; so that it is also concluded that vitamin B and bios are not the same thing. Consequently I. also agrees with Funk's theory of vitamin D and remarks that the vitamin, as detd. by means of yeast, is not B, but D.

K. SOMEYA

Spectrographic verification of the activation of ergosterol by ultra-violet irradiation. GEORGE TIXIER. *Compt. rend.* **188**, 206-8(1929).--Ergosterol irradiated under certain conditions acquires antirachitic properties. To det. the amt. of this acquired power it is necessary to use rats that have been fed on a deficiency diet. This biological method is slow and expensive in addn.; the irradiated ergosterol loses its antirachitic power and may be valueless when the assay is completed. It is known that the transmission of irradiated ergosterol is increased in the zone 2400-2950 Å. U. This property was utilized to measure the activation of the product. Samples of ergosterol were irradiated at various intervals of time and it was found that the optimum antirachitic power did not coincide with the max. spectrographic change. It was possible to det. the change in optical transmission which corresponded to the max. antirachitic action by placing a soln. of the ergosterol in a quartz cup of variable thickness. The light was obtained from a Hg arc and the only variable was the thickness of the soln. In practice the spectrographic examns were made at the same time that the material was being irradiated.

M. H. SOULE

The action of cholesterol obtained from cod-liver oil upon photographic plates. L. HUGOUNENQ AND E. COUTURE. *Compt. rend.* **188**, 349-50(1929). Cholesterol obtained from biliary calculi, beef brains and cod-liver oil was placed on Lumière (Opta and Sigma) plates for intervals varying from 3 to 15 days. When the plates were developed black spots were always found where the cholesterol from the cod-liver oil had been in contact with them. The plates were unaffected by exposure to the other cholesterol. To det. whether this was a phys. or chem. reaction small quantities of the cholesterol from cod-liver oil were placed on pieces of quartz and glass and then exposed to the Lumière plates. The plates were acted upon by the cholesterol supported by the quartz and unaffected by the material supported by the glass. This demonstrates that the action is a phys. one. The authors call attention to the importance of this work in connection with the antirachitic action of cholesterol from cod-liver oil.

M. H. SOULE

Vitamins and tumor growth. II. Preliminary note on the non-consumption of vitamin B by growing chicken sarcoma. WARO NAKAHARA AND EIICHI SOMEKAWA. Inst. Phys. Chem. Research, Tokyo. *Proc. Imp. Acad. (Japan)* **5**, 55 6(1929), cf. *C. A.* **2**, 4595.--In spite of the extreme complexity of the problem, it may be reasonably concluded tentatively that vitamin B, which is essential for the growth of normal tissues, may be non-essential for the growth of the chicken sarcoma.

C. J. WEST

Studies of the changes in the blood constituents during avitaminosis. T. Muro. Univ. Fukuoka. *Fukuoka-Ikwadaigaku-Zasshi* **20**, 1269 79(1927); *Ber. ges. Physiol. exptl. Pharmakol.* **45**, 340. The erythrocyte count, hemoglobin content and sp. gr. are increased in various degrees during avitaminosis. Through disturbance of the carbohydrate metabolism and increase in the protein metabolism, the blood sugar and residual N are generally increased. The acetone bodies and lactic acid show a tendency toward the increase, but it is not intense. There is an increase in the total fatty acids and in the cholesterol. The PO₄ of the blood is reduced. Acetaldehyde is normally present in very small amts. if at all, but in rice-fed chickens the amt. is very much increased. In both fasting and rice-fed chickens the sp. gr., viscosity, residual N, acetone and β-hydroxybutyric acid all show a slight increase. In the fasting chickens the erythrocyte count and the hemoglobin content were reduced, in contrast to the rice-fed ones.

The significance of adenylic acid for the muscle function. II. Deamination of adenylic acid by muscle pulp and ammonia formation in muscle contraction. G. EMBDEN, C. RIEBELING AND G. E. SELTER. Univ. Frankfurt. *Z. physiol. Chem.* 79, 149 60(1928); cf. *C. A.* 21, 3076.—When very fresh rabbit or frog muscle is finely minced and allowed to stand in contact with 2% NaHCO_3 at $38-40^\circ$ there is a liberation of NH_3 which reaches its max. in 3–4 hrs. Addn. of urea does not increase the amt. of NH_3 , but adenosinephosphoric acid causes a considerable increase, representing 50% of the NH_2 group present therein. If isolated frog muscles are stimulated by induction strokes until a certain degree of fatigue sets in, the stimulated muscles show a much higher NH_3 content than the resting muscles, and after severe fatigue the increase in NH_3 is a high multiple of the control value. A brief tetanic stimulation of 2–3 seconds also results in a distinct liberation of NH_3 . In the great majority of ppt. a noticeable increase was brought about by tetany of less than 1 sec. duration. Contrary to the prevalent views, the breakdown of a nitrogenous substance is one of the regular phenomena accompanying muscle contraction. The often observed increase in N excretion by man after strenuous muscular work may well be due only in part to increased protein breakdown and in part also to NH_3 formation from adenosinephosphoric acid in the muscle. The view expressed by Burian more than 20 years previously, that endogenous purine metabolism is intimately assocd. with muscular work is thus supported. III. The behavior of ammonia formation in muscular work under various biological conditions. G. EMBDEN AND H. WASSERMAYER. *Ibid* 14, 185.—The lively esculenta frogs in May show a much higher content of NH_3 -forming substance than in winter and than is observed in the sluggish summer frogs. After considerable jumping these frogs show a high NH_3 content in their muscles, and this is much further increased by 100 induction stimuli. Under similar conditions the increase brought about by stimulation is far greater in *Rana esculenta* than in *R. temporaria*. This observation fits in with the well-known fact that the muscles of the latter are more easily fatigued. After subsequent resting the high NH_3 content disappears. The same decrease in NH_3 is observed when the May frogs are kept in the lab. As their liveliness diminishes toward the end of May and in June, the amt. of NH_3 -forming substance, the NH_3 of the resting muscles and that developed by 100 induction gradually decrease. When the sluggish autumn temporaria frogs are kept several days at $26-27^\circ$ their liveliness increases, as also the amt. of NH_3 -forming substance, and the NH_3 both before and after stimulation. Frogs poisoned by P, which is not fattened in the ordinary sense, although their mobility is greatly impaired, show an increase in NH_3 before and after stimulation. The ratio of lactic acid to NH_3 in isolated gastrocnemii after stimulation is not const. but is subject to wide variations. IV. Cleavage and resynthesis of the ammonia-forming substance in muscular activity. G. EMBDEN, M. CARSTENSEN AND H. SCHUMACHER. *Ibid* 18, 225.—The liberation of NH_3 during contraction of frog muscle is a reversible process. The rate of disappearance of the liberated NH_3 after a brief tetany varies with the liveliness of the frogs as detd. by the season of the year. The reversibility of the process is not diminished in winter, but on the contrary it is intensified to such an extent that to demonstrate the liberation of NH_3 a longer tetany is required. The muscles thus injured so that a resynthesis no longer occurs or at least does not occur during the 1st min. of relaxation. With equal no. of stimuli, equal intensity and equal but the liberation of NH_3 varies with the stimulation frequency. With high frequency, i. e., shortening of the rest intervals, the NH_3 formation is most apparent, while with low frequency it may be so slight as to escape observation. The resynthesis or reformation thus occurs during the intervals between individual stimuli. The fact that 100 or more maximal contractions can occur without any evidence of NH_3 formation while considerable lactic acid is formed shows that the ratio between NH_3 and lactic acid formed during work may be infinitely small, and confirms the authors' previous inference that no const. or even approx. const. relationship exists between these 2 substances produced during muscular work. The variation in reversibility of NH_3 formation also precludes any such proportionality. V. The source of the ammonia formed in contraction. G. EMBDEN AND H. WASSERMAYER. *Ibid* 226–37.—On the assumption that only adenosinephosphoric acid serves as the source of NH_3 , and that only this substance and its decompn. products are pptd. by $\text{CuSO}_4 + \text{Ca(OH)}_2$, a definite relationship should exist between the NH_3 formed and the N content of the ppt. Of the 5 N atoms in adenosinephosphoric acid only 1 is present as NH_3 and capable

of yielding NH_3 by deamination. The increase in NH_3 N resulting from 4 hr. contact at 40° of the powder prepd. by means of liquid air from frog and rabbit muscle is actually $\frac{1}{3}$ of the N in the Cu-Ca ppt. obtained from the same material. Adenine, guanosinephosphoric acid, guanosine and guanine do not yield NH_3 under these conditions. Adenosinephosphoric acid, on the other hand, when mixed with muscle pulp or treated with enzyme solns. prepd. from muscle, liberated $\frac{1}{3}$ of its N as NH_3 . No other substance is known to yield NH_3 in this ratio and under these conditions, with the exception of adenosine which has not been identified as a muscle constituent.

Ional effects on aging in muscle press juice, especially the influence of hydrogen-ion concentration. II. WASSERMEYER. Univ. Frankfurt. *Z. physiol. Chem.* 170, 283-311(1928).—Press juice from rabbit muscle, in contrast to muscle pulp, retains for a considerable time its power of synthesizing org. P derivs. from glycogen and H_3PO_4 . The synthesis occurs most readily when an acid reaction is maintained. Addn. of alkali diminishes it in proportion to the resulting decrease in H-ion concn. until at neutral or alk. reaction the synthesis is strongly inhibited. The effect of NaHCO_3 is greater than that of NaOH or NH_4OH at the same p_{H} ; hence there must be an ional effect in addn. to that of H-ion concn. With NaOH and especially with NH_4OH there is even a favorable effect on synthesis provided the added alkali is not sufficient to raise the p_{H} value materially. That the inhibition by NaHCO_3 is due in part to CO_2 is shown by the fact that satn. of the press juice with CO_2 gas inhibits synthesis without altering the p_{H} , and subsequent removal of the CO_2 by aeration restores it. Loss of synthesizing power is a characteristic of aging and of ultimate rigor mortis of muscle. This is known to be accompanied by a decrease instead of an increase in acidity as was formerly supposed, and to be accelerated by CO_2 . Addn. of 0.01 N lactic acid to the press juice has a favorable effect on synthesis. This harmonizes with the recent evidence that muscular fatigue and rigor mortis are not due to lactic acid formation but rather to the decrease in H-ion concn. caused by liberation of NH_3 and to the formation of CO_2 . The reaction is accompanied by an alteration in the colloidal state of the proteins which occurs even in the press juice where the cell structure has been destroyed.

Studies on the blood of birds. I. The corpuscles of the pigeon. WALTER P. KENNEDY AND DAVID R. CLIMENKO. Edinburgh Univ. *Quart. J. Exptl. Physiol.* 19, 43-9(1928).

FRANCES KRASNOW

The amide nitrogen of blood. III. Muscular exercise: the role of ammonia in the neutralization of lactic acid. SIMPLY BLISS. McGill Univ. *J. Biol. Chem.* 81, 137-58(1929); cf. *C. A.* 23, 1149.—"Tissues possess the function of detoxifying NH_3 by the synthesis of amides of the blood proteins. This is shown by the fact that after a dog has recovered from the poisoning caused by the intravenous injection of $(\text{NH}_4)_2\text{CO}_3$ solns., it can receive a similar amt. of the solu. via the femoral artery without any toxic symptoms, and in both instances there is a rise in the amide N content of the blood. The order of injection is immaterial. Dogs with normal kidneys quickly reduce the higher level of blood amide N that is caused by the injection. It has been demonstrated that the tissues of the leg of the dog possess the power of rapidly synthesizing amides from injected NH_3 . Short periods of muscular exercise are followed at 20 min. by a moderate lowering of the amide N content of arterial blood with a return to normal within an hr. This lowering is considered to be caused in part by the excretion of extra NH_3 at this time and also by the relative alk. plethora which follows the resynthesis of the lactic acid precursor in muscle. Comparison of simultaneous samples of blood taken from the femoral artery and the femoral vein before and after exercise shows that after exercise the venous blood contains more amide N than the arterial blood. The increase in amide N content is as high as 76% with a method shown to be accurate to within less than 1%. The results are in harmony with the view that NH_3 plays a part in the neutralization of acids formed in muscular exercise, the NH_3 , so used, appearing in the blood of the femoral vein not as an NH_4 salt, but as an amide of blood protein."

A. P. LOTHROP

Avitaminosis. II. The inorganic phosphorus content (A), lactacidogen, and glycogen of the pectoral muscles of normal, fasting, and avitaminosis pigeons. A. PUGLIESE. *Arch. sci. biol.* (Italy) 12, 251-61(1928); cf. *C. A.* 22, 4605. The phosphorus A, and lactacidogen of the pectoral muscles of fasting pigeons showed a small decrease in contrast to the homologous muscles of normal animals. In pigeons fed with polished rice, there was a noticeable increase in lactacidogen, and an enormous increase in phosphorus A. If the amt. of phosphorus A found in the pectoral muscles of normal pigeons is given a value of 100, then for fasting animals it is 91, and for the

avitaminosis 270. The accumulation of inorganic P in pigeons which have become polyneuritic following an exclusive diet of polished rice constitutes an important manifestation of avitaminosis. PETER MASUCCI

Respiration across resistances. I. A standard resistance scale. GINO SIMONELLI. *Boll. soc. ital. biol. sper.* 3, 672-5(1928).—The scope of these general studies was to investigate from many points of view the effects produced in the organism by the interposition of resistances which obstruct the free passage of the respiratory current. To accomplish this a well-defined standardized series of resistances was necessary. An app. was constructed by means of which a const. supply of air was obtained at variable velocities. The construction of the resistance scale consisted of a brass tube 1.5 mm. external diam. and 0.75 mm. internal diam. The tube was cut into segments 72 mm. long and grouped into bundles which were placed into another concentric tube. By varying the no. of tubes in each bundle it was possible to obtain 6 different resistances. The characteristics of each resistance showing the pressure in mm. H₂O and the vol. in l. of air per min. are given in tabular form. II. **The influence of inspiratory resistance upon the pulmonary ventilation of man at rest.** *Ibid* 676-7.—The results but not the details of the method are given. Pulmonary ventilation across inspiratory resistances was always diminished in contrast to that without resistance in the corresponding period of time. The same subject did not always present the same diminution with the same resistance: at times strong resistances produced min. variations, and weak resistances max. variations. The interposition of inspiratory resistances in man at rest gives rise to a const. reduction in the vol. of air ventilated per unit time. As resistance increases the organism may act in 2 ways: (1) by lowering gradually the pulmonary ventilation; (2) by increasing the inspiratory force to keep the ventilation value at a level slightly below the normal. After the removal of the resistance there is no compensatory increase in ventilation. III. **Considerations of and studies on certain methods for determining oxygen consumed.** G. SIMONELLI AND G. FERRI. *Ibid* 678-9.—The variations in the thoracic capacity and their effect on the results obtained by Krogh's method for detg. O₂ consumed were investigated. O₂ consumed was measured by Krogh's app. and by Haldane's app. Spirometric detns. were made relative to the air expired, complementary air, reserved air and vital capacity. Thus it appeared that there are modifications in the av. thoracic capacity of such a degree that they do not change in a practical way the general results obtained on O₂ consumed by Krogh's method and that there is no quant. relationship between the modifications and O₂ consumed. IV. **Modifications in oxygen consumed caused by inspiratory resistances in man at rest.** G. FERRI. *Ibid* 680-2.—The 6 series of resistances previously mentioned and Krogh's app. were used on 5 healthy men. The subject was allowed to rest for 30 min., 15 min. of which he was in a supine position. Two detns. were then made, one in which the subject simply breathed across the app., and the other by interposing one of the 6 resistances. The results obtained from 89 expts. are as follows: every inspiratory resistance, even slight, causes in the organism at rest a diminution of O₂ consumed. This assumes different values according to the subject. The diminution varies directly as the degree of resistance. P. M.

The imbibition of iron salts by the walls of the cerebral capillaries in proximity to old hemorrhagic foci. L. PICCHI. *Boll. soc. ital. biol. sper.* 3, 699-701(1928).—P. touches upon the histological and biological significance of the hemosiderin reaction. PETER MASUCCI

The absorption capacity of red blood cells for levulose. GEORG EISNER AND FRITZ LEWY. *Biochem. Lab. Krankenhaus Moabit, Berlin. Biochem. Z.* 202, 91-8 (1928).—Glucose is taken up by red blood cells as was shown by Loewi, but they take up none or only very little levulose. As for the influence of insulin, the results with glucose are extremely variable, but on the whole it seems that the insulin does not increase the acidity of the red cells either for glucose or for levulose. S. M.

The causation of "mitogenetic" radiation. WERNER W. SIEBERT. *Med. Universit.-klinik, Berlin. Biochem. Z.* 202, 123-30(1928); cf. *C. A.* 23, 855.—Stimulated muscle, bone marrow and tumor tissue exert an action at a distance which is detected by an increased budding process in a special yeast culture. The various metabolic products (lactic acid, H₃PO₄, choline) when added to the resting muscle fail to impart to it this inductor capacity. It was, however, found possible to do this when lactic acid was added to resting muscle and exposing this to a stream of O₂. O₂ alone failed to activate the resting muscle. The fact that the activation may be assocd. with an oxidative process is further corroborated by exptl. evidence showing that even without the O₂ stream this effect can be produced when a trace of CuSO₄ soln. is added (expts. with peroxidases and oxidases gave neg. results). The idea that the activation

of the radiation is bound up with the process of oxidation received strong support from the observation that Warburg's oxidation models ($C_2O_4H_2$ + charcoal + O_2 + levulose + phosphate buffer + O_2) or Willstätter's model (pyrogallol + peroxidase + H_2O_2) all acted just like faradized muscle. Besides, if in Warburg's second model a phosphate buffer of p_H 6.0 instead of 8.0 was used when the levulose is scarcely oxidized, or when the oxidations were suppressed with HCN, the distant effect upon the yeast culture disappeared. This was found to be the case also when HCN was added to the faradized muscle pulp.

S. MORGULIS

Carbohydrate metabolism of white mice with and without insulin. IV. E. J. LESSER AND R. AMMON. Städt. Krankenanstalt, Mannheim. *Biochem. Z.* 202, 294-8(1928).—Eight expts were performed in each of which 3 pairs of mice were used. One pair received an intraperitoneal injection of 45-50 mg. glucose and was killed 3 hrs. later. The second pair received another injection at the end of 3 hrs. and was killed an hr. later. The third pair received an injection of glucose together with 0.45 insulin units per 100 g. and was also killed an hr. later. 'The animals were frozen with CO_2 snow, and were rubbed up in 95% alc cooled to -20° . Glucose and glycogen detns. were made on all of them. On the av. the animals of the first group had 59 mg. glucose and 172 mg. glycogen. When the glucose injection was repeated and the animals were examd. an hr. later the amt. of glucose increased to 140 mg. and the glycogen to 205 mg. In other words, in the course of an hr 13.7% of the glucose was changed to glycogen and 33.6% was in the tissues, the rest having disappeared. But in the animals treated also with the insulin the glycogen diminished now to 148 mg., so that glycogen was actually destroyed, and the injected glucose had almost disappeared as only 88 mg. were found. Insulin has therefore stimulated the utilization of the glucose through oxidation, since 84% of the injected glucose was consumed and in addn. also 24 mg. glycogen.

S. MORGULIS

Studies on the relation between cholesterol metabolism and the formation of bile acids. YORISADA HORIYE. Univ. Bern. *Biochem. Z.* 202, 409-20(1928).—An attempt has been made to study the endogenous cholesterol metabolism of the liver with the view of detg. its relationship to the formation of bile acids, but the results entirely exclude such a relationship. Oral administration of decholin increases the cholesterol content of the liver. This indicates a storing of cholesterol in the liver which can be partly made available through stimulation.

S. MORGULIS

Structure of the hemoglobin molecule. I. The nitrogen distribution in the hemoglobin molecule of horse blood. A. POLYAKOV. State Univ., Kasan. *Biochem. Z.* 204, 88-96(1929).—The melanin ppt. in hemoglobin hydrolyzates comes almost entirely from hematin, which makes up 4.5% of the blood. The melanin N constitutes about 6% of the total hemoglobin N. The analytical values are as follows: total N in hemoglobin of horse blood 17.22, melanin N 1.05, NH_3 N 0.19, diamino N 7.02, and monoamino N 9.09%. These values agree better with the results of Harnum than with those of Abderhalden. Of the basic acids P. found arginine 6.25%, histidine 13.78, lysine 5.76 and cystine 1.2%. The cystine constitutes 63% of the total S, which is in good agreement with Osborn's findings. **II. The nitrogen distribution in the globin molecule of horse hemoglobin.** *Ibid* 97 105(1929).—The analytical values are total N in globin 16.4, melanin N 0.066, total NH_2 N 16.34, NH_3 N 0.18, total monoamino acid N 9.2, NH_2 N of monoamino acids 8.01, imide N 1.22, total diamino acid N 7.04, NH_2 N of diamino acids 3.04, nonamino N 4.00, arginine N 2.0, histidine N 3.61, cystine N 0.142, and lysine N 1.17%.

The significance of serum colloids for cardiac activity. N. NIELSEN AND D. PALM. Univ. Upsala. *Skand. Arch. Physiol* 55, 41-8(1929).—A frog heart which upon perfusion with a salt soln. of the proper compn. loses its strength cannot be invigorated when perfusion is continued with an ultrafiltrate of serum. On the contrary, perfusion of the weakened heart with serum causes considerable gain in strength which is thus attributed to the colloidal components of the serum.

S. MORGULIS

Kidney function. Relation between the action of urea, diuresis and mineral metabolism. ROBERT E. MARK. Univ. Würzburg. *Arch. exptl. Path. Pharmacol* 137, 143-67(1928).—The effect of urea upon normal animals differs from that upon animals which have undergone the extirpation of one kidney and a partial ligation of the arterial circulation of the other. Normally the amt. of K eliminated per g. of urea excreted varies but little, but in animals with a kidney insufficiency the administration of urea increases the K output. Unlike K, Ca and NaCl excretion is not modified by urea. The relation of urea to water excretion also differs in the 2 types of animals, in that under normal conditions urea causes a prompt diuresis, while in the animal deprived of kidney diuresis is delayed.

C. H. S.

The heart-lung-adrenal preparation. S. V. ANICHKOV AND A. I. KUZNETZOV. Militär-Med. Akad. Leningrad. *Arch. expil. Path. Pharmacol* 137, 168-79(1928).—With the heart-lung-adrenal prepn. properly adjusted the fluid passing through the adrenal receives adrenaline, the amt. of which is materially increased by direct elec. stimulation or by nicotine. G. H. S.

Effect of the ingestion of water and of salt solution upon kidney function. M. M. LOMIKOVSKII. Ukrainischen Inst. Psychoneurologie. *Arch. expil. Path. Pharmacol.* 137, 348-61(1928).—Detns. made upon dogs with a ureteral fistula showed that under normal conditions the amt. of urine after the first hr. gradually diminished, and the % of NaCl also decreased while the abs. amt. diminished to a less extent than did the amt. of urine. When distd. water or saline was given by mouth changed relationships as regards excretion resulted, the nature of the change being detd. by the fluid ingested. With isotonic saline the max. fluid output took place within the first hr., the greatest abs. amt. of NaCl was excreted during the second hr. With hypertonic saline the max. urine secretion occurred in the second hr. When water was ingested max. excretion was in the first hr., while the abs. amt. of NaCl excreted throughout the whole period was but 86% of the normal value. G. H. S.

Absolute reaction of the contents of different sections of the intestinal tract in horses and cattle. RUDOLF DANNINGER, KARL PERAGNER AND HANS SCHULTES. Tierarztl. Hochschule, Wien. *Arch. ges. Physiol* (Pflüger's) 220, 430-3(1928).—The contents of the cecum of horses and cattle had an av. p_H of 8.125 (horses); 8.224 (cattle). Material in the ileum of horses gave 7.088, of cattle 8.208; while the contents of the jejunum in cattle had a p_H of 8.416. In horses the duodenal contents had an av. p_H of 6.722, in cattle 6.678. G. H. S.

Shortening reflex of the intestine. ALFRED FLEISCH. Univ. Tartu-Dorpat. *Arch. ges. Physiol* (Pflüger's) 220, 512-23(1928).—Mech. stimuli applied to the guinea pig intestine induce a shortening reflex, both the ileum and jejunum acting in the same way. The period of contraction lasts from 5 to 30 secs., and the shortening varies between 5 and 40%. The segment involved reaches from the point of stimulation to 9 cm. in the oral, to 28 cm. in the anal direction. Nicotine in a diln. of 1 to 2 million causes a complete blockade, which is reversible. In dilns. between 1:15 and 1:30 million acetylcholine intensifies the reaction in some instances; ergotamine is without obvious effect, and adrenaline (1:10 million) regularly causes a reversible blockade. G. H. S.

Fate of the thyroid hormone in the body of the hyperthyroidized mammal. G. ASIMOV AND M. LAPINER. Swerdlov-Univ., Moskau. *Arch. ges. Physiol* (Pflüger's) 220, 588-92(1928); cf. *C. A.* 22, 982.—Thyroid hormone is excreted from mammals more promptly than from birds, for after 24 hrs. it can no longer be detected in the hyperthyroidized mammal. After feeding upon thyroid the greatest amt. to be found in the blood is present after 8-14 hrs. Excretion by way of the urine is at its max. between the 6th and 18th hrs. after the ingestion. It seems that by the repeated ingestion of large amts. of thyroid the capacity of the body for destroying the hormone is increased. G. H. S.

Schlesinger's fluorescence in the veins of the internal organs. YU. DUMSHITZ AND GEORGE FRYNCKELL. Leningrader Med. Inst. *Arch. ges. Physiol* (Pflüger's) 220, 627-27(1928).—Under normal conditions cat blood, both peripheral and organ, contains substances which cause fluorescence in the presence of Zn acetate, the amt. present varying with the organ. Blood leaving the liver has the highest content. Apparently the amt. to be found is unrelated to intestinal fermentation or to the output of bile. G. H. S.

Contraction of muscle. VII. Role of potassium in contraction. F. ERNST AND J. SCHIEFFER. Univ. Pécs. *Arch. ges. Physiol* (Pflüger's) 220, 655-71(1928); cf. *C. A.* 22, 2606.—In the frog gastrocnemius the normal content of K is about 1.7% of the dry substance, while if the muscle is perfused with normal Ringer soln. for 5-6 hrs. there is a 6% loss in the amt. of K; if perfused with K-free Ringer soln. this loss is 15%. Direct stimulation causes a loss of K; amounting to from 30 to 50%. In stimulated muscle the Na content increases more than does the Cl content. VIII. **Water transport in contraction; osmotic theory of contraction.** F. ERNST. *Ibid* 672-90. Contraction is due to a change in the water relationships consequent to ionization. G. H. S.

and Gases in the Animal Body. Philadelphia and London: J. B. Lippincott Co. Monograph on Experimental Biology. 62 pp. 10s. 6d., net. Reviewed in *Nature* 123, 200(1929).

G—PATHOLOGY

H. GIDEON WELLS

Value of the diazo test on blood. S. M. ROBSON AND L. JACOBS. *Arch. Intern. Med.* 42, 386-9(1928).—Evidence is cited against the use of the diazo test on blood as a specific means of differentiation between uremic coma and that of other origin. A high creatinine content of the blood usually accompanies a pos. diazo test, although no definite creatinine value can be established as the point at which the pos. diazo test appears.

The urea tolerance test. S. EDWARD KING. *Arch. Internal Med.* 42, 877-92 (1928).—The normal blood-urea curve following oral ingestion of 1 g. of urea per 10 lb. body wt. was detd. The blood urea returned to the control level in 14 hrs. after a sharp rise in 1 hr. Under similar conditions a radically different curve was obtained in cases of definitely impaired kidney function and even in the early stages of renal impairment. In such cases blood urea did not return to the normal rest level at the end of 14 hrs. Early degrees of renal impairment were frequently indicated by marked polyuria, although the blood-urea curve remained normal. A simple test of kidney function is described.

Ingested creatine. Its utilization and rate of excretion by arthritic and normal subjects. F. A. CAJORI, L. M. WRIGHT AND ELEANOR STILZ. *Arch. Internal Med.* 42, 901-8(1928).—Single 10-g. doses of creatine were given by mouth to 7 normal and 7 arthritic subjects. The rate of excretion of creatine was studied. Considerable individual variations were found in the amt. of creatine utilized. Both groups of subjects were equally efficient in retaining creatine, when the differences in creatinine coefficients were considered. The rate of excretion of the excess creatine was slower in the arthritic patients, and creatinuria persisted longer. The delay in excretion of creatine may be comparable to a similar delay in dextrose excretion in arthritis.

The effects of serums from normal and from anemic persons on the growth of seedlings. LOVE B. UPJOHN, RAPHAEL ISAACS AND FELIX G. GUSTAFSON. *Arch. Internal Med.* 42, 910-5(1928).—Seedlings of *Lupinus albus* grown in Shive's nutrient saline soln. and contg. 1% serum from normal persons showed an av. rate of growth of 76% of the rate of growth in Shive's soln. alone. Growth in serum from anemic persons was not appreciably different, nor was there any correlation between the coeff. of growth and the clinical condition of the patient such as illness, red cell count, hemoglobin, bilirubin.

Bile acids in jaundice. ICHIRO KATAYAMA. *Arch. Internal Med.* 42, 916-30 (1928).—Normal blood serum contains 5-12 mg. of bile acids, estd. as Na glycocholate, the av. being 7 mg. Normal urine is free from bile acids. Patients with cholecystitis, disease of the liver, catarrhal jaundice, obstructive jaundice, cardiac decompensation and duodenitis showed a marked increase in the bile acids of the blood serum and urine, the excretion in the urine being small and variable. There is no correlation between bile acids and bilirubin in the blood. Bile acids appear in the urine when their concn. in the serum exceeds 20 mg. per 100 cc. In obstructive jaundice of long standing there is continuous excretion of bile acids through the kidney, causing depletion of the total amt. in the body.

Distribution of blood sugar between corpuscles and plasma in diabetic and in alimentary hyperglucemia. MICHAEL SOMOGYI. *Arch. Internal Med.* 42, 931-8(1928).—By the fermentation method normal human blood gives an av. of 0.77 for the ratio true corpuscle sugar

true plasma sugar In a series of selected specimens ranging from 9 to 438 mg of true blood sugar per 100 cc. the above ratio gave an av. of 0.75. In these same specimens the apparent sugar varied from 33 to 462 mg. per 100 cc., and the ratio apparent corpuscle sugar

apparent plasma sugar gave widely differing results from 2.64 to 0.82. The lower the blood-sugar concn. the more pronounced is the discrepancy between the 2 ratios. The relative sugar content of the corpuscles is the same in the blood of diabetic and nondiabetic subjects, disproving the conclusion that sugar fixation by corpuscles is inhibited in diabetes. The distribution of sugar is unaffected by changes in the blood-sugar level caused by alimentary factors.

The chemistry of the bone marrow in experimental anemia. H. JASTROWITZ. Univ. Halle. *Z. ges. expit. Med.* 55, 523-46(1927). F. L. DUNN

Blood regeneration in severe anemia. XV. Liver fractions and potent factors. WARREN M. SPERRY, C. A. ELDEN, FRIEDA S. ROBSCHT-ROBBINS AND G. H. WHIPPLE. Univ. of Rochester. *J. Biol. Chem.* 81, 251-65(1929).—Practically all fractions and residues prep'd. from beef liver were found to contain materials of use in blood regeneration by the dog. The view is supported that a number of factors (organic and inorg.) are concerned in the liver effect in simple expit. anemia. ARTHUR GROLLMAN

The metabolism of sulfur. XIV. A metabolic study of a case of cystinuria. HOWARD B. LEWIS AND S. ALLAN LOUGH. Univ. of Mich. *J. Biol. Chem.* 81, 285-97(1929).—The excretion of cystine in a case of cystinuria was found to be independent of the cystine content of the diet, but varied with the total N excretion. The patient could oxidize 2 or 3 g. of ingested cystine. An endogenous origin of the cystine excreted in cystinuria is, therefore, suggested. ARTHUR GROLLMAN

Microscopic and x-ray investigations on the calcification of tissue. NELSON W. TAYLOR AND CHARLES SHEARD. Mayo Foundation, Rochester, Minn. *J. Biol. Chem.* 81, 479-93(1929).—An optical study was made of several types of calcification, including bone, dental enamel, dentine, rachitic bone, salivary calculus and a calcified lung. *Conclusion.*—The solid inorg. phase in these materials consists essentially of very small crystals of apatite minerals of the general formula, $3\text{Ca}_3(\text{PO}_4)_2 \cdot \text{CaX}$, where X represents CO_3 , F_2 , $(\text{OH})_2$, O or SO_4 . The n serves as a measure of the degree of calcification of dried tissues, being low for bones and high for dental enamel or in certain pathological depositions. Similarity of the diffraction patterns of x-rays were obtained by the powder method for apatite, dental enamel, normal bone, salivary calculus, pulmonary calcification and synthetic $\text{Ca}_3(\text{PO}_4)_2$. ARTHUR GROLLMAN

Total acid-base equilibrium in health and disease. X. The acidosis of nephritis. JOHN P. PETERS, A. M. WAKEMAN, ANNA J. EISENMAN AND CARTER LEE. Yale Univ. and New Haven Hospital. *J. Clin. Investigation* 6, 517-49(1929).—An extreme variability of almost every electrolyte component of the serum occurs in nephritis. HCO_3^- is low while SO_4^{--} and org. acids are less important in detg. acidosis than has been supposed. Undetd. acid is usually high only in the presence of carbohydrate starvation. B^- and Cl^- are more often low than high. In some cases true HCO_3^- deficiency occurs. **XI. Hypochloremia and total salt deficiency in nephritis.** J. P. PETERS, A. M. WAKEMAN AND C. LEE. *Ibid* 551-75. —The hypochloremia and base deficiency observed in advanced nephritis result from (1) an abnormal loss of these constituents in the urine, (2) by vomiting which produces some Cl^- loss and an interference in the salt intake and (3) by loss of Cl^- in the feces in certain cases. The therapeutic implications of these findings are discussed. **XII. A study of renal edema.** J. P. PETERS, A. M. WAKEMAN, A. J. EISENMAN AND CARTER LEE. *Ibid* 577-96. —The concn. of base, protein, HCO_3^- , Cl^- and inorg. P in the serum, and the N and Cl^- metabolism of patients with nephrosis and nephrotic types of chronic glomerular nephritis were detd. The serum protein deficiency was the only abnormality definitely related to the presence or absence of edema. ARTHUR GROLLMAN

Goiter and iodine metabolism. GULBRAND LUNDE. Royal Frederick Univ., Oslo, Norway. *Proc. Staff Meetings Mayo Clinic* Aug. 22, 1928; cf. *C. A.* 22, 1370, 1785, 23, 101. —An address summarizing the findings and conclusions of L. and his co-workers regarding the I content of the blood, and its relation to thyroxine and goiter. ARTHUR GROLLMAN

The influence of alcohol taken by mouth or other routes upon the Wassermann and Sachs-Gyorgi reactions. MASAO NISHIO. Tokyo Jikeikai Med. College. *Sei-I-Kwai Med. J.* 47, No. 9, Eng. Abs. 5(1928).—Oral or intravenous administration of alc. reduced the degree of the Wassermann and Sachs-Gyorgi reactions. ARTHUR GROLLMAN

The residual nitrogen fraction of the secretion of the vagina in leucorrhoea. E. RAAB. *h. Gynakol.* 134, 519-45(1928).—The secretion of the vagina in leucorrhoea has a protein content of 2-7%. The N of the secretion is divided between protein N and residual N. The protein is broken down by the cell enzymes and all stages are found, both mol. proteins, peptones, polypeptides and amino acids. Tyrosine, histidine and arginine are found but not tryptophan. From 60 to 90 mg. tyrosine are found in 100 g. of the secretion. The H-ion concn. is between p_H 4.2 and 6.4 and the amt. of amino acids increases with increasing p_H . The proteases of the tissues, which are set free on the death of the cells, are responsible for the proteolysis, the enzymes of bacteria present playing a subordinate role. In acid p_H the proteolysis resembles the action of pepsin (little amino N, no NH_2) and in alk. p_H resembles a peptidase reaction

(much amino N, trace of NH_3). The lactic acid present in the vagina is a necessary factor for the occurrence of an intensive proteolysis. From 90 to 95% of the secretion is H_2O and it passes through the epithelium as a transudate carrying urea with it.

HARRIET F. HOLMES

Ovarian function and lipid metabolism. I. The relations between cholesterol metabolism and ovarian function. C. KAUFMANN AND O. MÜHLBOCK. *Arch. Gynäkol.* 134, 603-25(1928).—Four hundred fifty-four detns. were made in a study of the relation between ovarian function and lipid metabolism. In healthy women with normal ovarian function the av. cholesterol content is 125 mg. for 100 cc. blood serum. At the time of menstruation there is usually a fall in cholesterol content of 40% in the pregravid phase of the cycle there is often a rise in cholesterol content to 50-5%. In women with disturbed ovarian function there is no rhythmic effect on the cholesterol content nor is there such an effect when the ovarian function is normal but the cholesterol metabolism deranged, as in lues. There is no marked change in cholesterol content of the serum with cessation of ovarian function. In only one case was there a marked rise in cholesterol content after the menopause in a woman who gave no sign of illness.

HARRIET F. HOLMES

The effect of the menstrual cycle on water metabolism. H. EUTINGER AND R. SPIEGLER. *Arch. Gynäkol.* 135, 223-31(1928).—The onset of menstruation in many cases brings about an easily detected chemicophys. change in the colloids of the body which theoretically might cause changes in the H_2O metabolism of the organism. Clinically, by use of the Kauffmann diuresis test, it was possible in a series of cases to detect in 47% of all cases in women with a normal circulatory system an increased tendency to edema in the pre-menstrual period and during menstruation as compared with the intermenstrual period.

HARRIET F. HOLMES

The value of the pyrimidone test in the diagnosis of interrupted tubal pregnancy. S. M. KLEIN. *Arch. Gynäkol.* 135, 256-61(1928).—Jegeroff's modification of the pyrimidone test was used in testing the sera in 68 gynecological cases. To a test of 3 cc. of a 5% alc. pyrimidone soln., 8 drops 3% H_2O_2 and 8 drops 50% AcOH 1 drop of the serum to be tested was added. An amethyst blue color indicated the presence of hematin. In 90% of the cases of disturbed ectopic pregnancy (21 cases) and which were confirmed by operation, a pos. result was obtained. The only other pos. results were in 2 cases of apoplexia ovarii and in 5 cases of intermenses. The test is easily carried out and should be of help in diagnosing interrupted tubal pregnancy.

H. F. H.

Basal metabolism in circulatory disturbances. E. ROSENBLUTH AND H. UBERALL. *Wien. Arch. inn. Med.* 16, 38-50(1928).—Basal metabolism was detd. in 32 cases of circulatory disturbance with defective heart valves or arterial high pressure and was often found increased over the normal. Cases with decompensated hearts showed greater increase in basal metabolism and usually the increase was in proportion to the degree of decompensation. The increase in basal metabolism cannot be accounted for wholly by factors such as increased activity of the heart, dyspnea with increased activity of the respiratory musculature or increased destruction of lactic acid following deficient resynthesis of glycogen. It is possible that the thyroid gland plays a role as it is frequently increased in size in such cases through active or passive hyperemia.

HARRIET F. HOLMES

A hyperglucemic reaction in diseases of the joints and in sciatica. R. LOEBL. *Wien. Arch. inn. Med.* 16, 107-18(1928).—Fifty-one cases of joint disease were examined for alimentary hyperglucemia. Alimentary hyperglucemia was found almost always in acute articular rheumatism and gout, often in infectious rheumatoid and arthritis deformans and less often in primary chronic polyarthritis while 4 cases of the relatively rare morbus Bechterew gave an almost normal reaction. No relation could be made out between the type of blood sugar curve and the clinical course of the disease. A case of acute polyarthritis showed in the acute stage a markedly lowered tolerance and in convalescence an almost normal curve. In 5 of 8 cases with severe sciatica there was alimentary hyperglucemia which disappeared with convalescence.

HARRIET F. HOLMES

Splenic atrophy with calcium and iron incrustations (nodular splenic atrophy). Report of a case. G. A. BENNETT. *Arch. Path.* 7, 71-7(1929).—The interesting features of the spleen described in this paper are its extreme smallness, and the presence of Fe and Ca incrustations in the walls of the blood vessels and in fibrous and elastic tissue of the trabeculae. Lesions of a similar nature could not be found, nor was there evidence of similar changes in the blood vessels elsewhere in the body. It is probable that because of Fe in isolated fibers and in areas of considerable size without the presence of Ca, the Fe was of primary importance. It also seems that there was some etiologic

actor, either in hemorrhage or in necrosis, or possibly in both, to cause the deposition of such a large amt. of Fe. It is interesting that both this case and a similar case reported by Goldberg occurred in young negroes whose blood gave pos. reactions in Wassermann tests.

HARRIET F. HOLMES

Migration of leucocytes in blood clots. I. The influence of phosphates of sodium and potassium. HOWARD T. KARSNER AND ALICE T. MERRILL. *Arch. Path.* 7, 11 (1929).—Wright's method (*Lancet* 1, 129(1928)) for studying the migration of leucocytes was used with slight modification. Diffusion of phosphates from agar into H_2O , and presumably into blood clot in the agar cells, occurs promptly. The migration of leucocytes to the walls of the cells is a true migration influenced little by gassing. Since the largest no. of leucocytes adherent to the slide is different with different concns. of the Na and K phosphates, adhesion is probably not detd. entirely by H-ion concn. or salt concn. When the p_H of the agar is altered by the addn. of $Na_2HPO_4 \cdot 2H_2O$ the greatest migration of leucocytes occurs in the most alk. p_H in a range between about p_H 6.8 and p_H 8.2. If K_2HPO_4 is employed instead of $Na_2HPO_4 \cdot 2H_2O$, the greatest migration is in the medial p_H , namely about p_H 7.5. Thus, the H-ion concn. is not the sole or even the principal factor governing migration and adhesion. Where $NaHPO_4 \cdot 2H_2O$ and $K_2H_2PO_4$ are mixed so as to maintain a fairly const. p_H with approx. the same ratio of Na to phosphate as in $Na_2HPO_4 \cdot 2H_2O$, the addn. of increasing quantities of the mixed salts leads to a marked increase in migration of leucocytes. Thus the concn. of salt in the agar and presumably in the blood clot is of greater significance for migration of leucocytes than is the H-ion concn. within the ranges studied.

HARRIET F. HOLMES

The stability of glycerinated antisheep hemolysin. R. A. KILBUFFE AND B. SHEFMAN. *Arch. Path.* 7, 113(1929).—Glycerinated antisheep amboceptor that had been kept partly at room and summer temps., and partly in the ice box, was titered 7 and 12 years after its original prepn. (1916). The original titer of Kolmer's method, using 0.3 cc. of complement in the diln. of 1:30, was 1:20,000. After 7 years, the titer was 1:16,000. The present titer, after preservation for 12 years, is 1:10,000 with 0.3 cc. of complement in diln. of 1:30.

HARRIET F. HOLMES

Chromaffin cell tumor of the suprarenal medulla (Pheochromocytoma). C. B. RABIN. *Arch. Path.* 7, 228-43(1929).—A case of pheochromocytoma of the suprarenal medulla assocd. with hypertension is reported. The hyaline droplets found in the cells of the tumor as well as those of the normal suprarenal medulla are differentiated from the hyaline droplets of degeneration by the staining reactions. The droplets probably represent an intermediary state of the secretion of adrenaline. The tumor is actively secretory. Quant. examn. shows that it contains a total amt. of adrenaline much in excess of that which is found in normal suprarenal glands at autopsy. A large percentage of the cases reported in the literature presented clinical symptoms that might well be explained as due to the absorption of excessive amts. of adrenaline. Chem. proof of the causal relationship between the clinical states and the tumor would consist in the demonstration of an increased concn. of adrenaline in the blood. H. F. H.

The division of cells under varying tensions of carbon dioxide. J. C. MOTTRAM. *Brit. J. Exptl. Path.* 9, 240-4(1928).—When normal cells are cultivated *in vitro* under varying tensions of CO_2 , mitoses are observed to be most abundant at a CO_2 tension approximating to that of normal living tissues, which is 40 mm. Mitoses occur over a wide range of CO_2 tension, from 0 to 200 mm. Under high CO_2 tensions abnormal mitoses occur, the abnormality consisting of an irregular migration of the chromatin to the centrosomes. The abnormal mitoses occurring in assocn. with high CO_2 tensions suggest that somatic mutations might be caused in the tissues by an interference with blood supply, so that the hypothesis of somatic mutations as an explanation of cancer could cover a wide field and not be confined to cancer following radiation (Mottram, *C. A.* 22, 2003).

HARRIET F. HOLMES

A dilution phenomenon observed in the titration of the serum of fowls immunized against the virus of fowl plague. C. TODD. *Brit. J. Exptl. Path.* 9, 244-52(1928).—A mixt. of fowl plague virus with the corresponding immune serum, so prepd. as to be just non-virulent when injected intramuscularly into a fowl, is rendered virulent by simple diln. with saline. This diln. phenomenon takes place even after the undiluted mixt. has been kept at 37° for 4 hrs., showing that the action of the immune serum is

strong enough immune serum to render the mixt. harmless to fowls when injected intramuscularly on intravenous injection gives rise to acute fowl plague, although the fowl is apparently not more susceptible to intravenous than to intramuscular in-

jection of the virus. This behavior of mixts. of the virus with its immune serum resembles the behavior of toxin-antitoxin mixts. observed in tetanus, diphtheria and certain other toxins. The diln. phenomenon is of practical importance in the titration of immune sera against the corresponding viruses as the degree of diln. of the infected mixt. may, within certain limits, influence the result of the injection. H. F. H.

The concentration and purification of streptococcal toxin. R. J. V. PULVERTAFT. *Brit. J. Exptl. Path.* 9, 276-82(1928).—Filtrates from cultures of the Dochez strain of *Streptococcus scarlatinae* have been prepd. which are fatal to rabbits in doses of 2.5 cc. to 10 cc. Breeds of rabbits vary in their susceptibility to this toxin; Chinchilla rabbits are uniformly susceptible. By means of pptn. of whole cultures with ice-cold abs. alc., concn. and purification of toxin may be effected. Such a concd. toxin is sometimes lethal in doses as small as 0.1 cc. Complete protection is afforded to rabbits against large doses of toxin by streptococcal antitoxic sera. Tetanus and diphtheria antitoxins and normal horse serum are without effect. By means of this toxin the strength of antitoxic sera may be estd., the rabbit being used as test animal. H. F. H.

A comparison between the antigenic properties of whole and lipid-free sera. S. H. C. ROBINSON. *Brit. J. Exptl. Path.* 9, 299-300(1928).—Expts. were carried out with lipid-free horse and ox sera to det. whether they differed from unextd. sera in antigenic property. The findings confirmed the observation of Scimone and Torn (C. A. 18, 553) that the use of a lipid-free serum as an antigen gives an antiserum which differs from one prepared with an unextracted serum in being more specific in its action. HARRIET F. HOLMES

A study of the bactericidal power of "whole" blood by the method of culture in slide-cells. J. M. ALSTON. *Brit. J. Exptl. Path.* 9, 300-17(1928).—The slide-cell method of testing the bactericidal power of whole blood is a reliable exptl. method, and the results obtained are consistent within fairly appreciable limits. The bactericidal power of healthy persons and animals exhibits diurnal variations. The apparent changes produced in the bactericidal power of the blood of man and animals by certain agents are transient. In man such changes are not of much greater extent than the normal diurnal changes. In animals more marked alterations, often greater than the usual diurnal variations, followed exposure to ultra-violet radiation and the intravenous injection of bacteriologic bouillon, Na nucleinate, colloidal Mn and normal ox serum. The processes involved in the bactericidal action of the whole blood are probably of more complex nature than can be explained in terms of phagocytosis, opsonin and bactericidal complement. No work was done in regard to the enzymes of the blood but the possibility of their participation in producing changes in the bactericidal power of the blood must be kept in mind. HARRIET F. HOLMES

The phagocytosis of hemolytic streptococci of high and low virulence by the blood of patients infected with that organism. R. HARE. *Brit. J. Exptl. Path.* 9, 337-52(1928).—The leucocytes in the defibrinated blood of patients infected with hemolytic streptococci have a stronger phagocytic action on virulent strains of hemolytic streptococci than do the leucocytes of normal persons. This is shown to be due for the most part to a high opsonic power in the serum. This opsonic power is heat-stable, resisting 55° for 30 min. When small quantities of such serum containing heat-stable opsonins are added to normal defibrinated blood, the rate of growth of hemolytic streptococci in that blood is materially reduced. This is shown to be due to increased phagocytosis of the microbes by the leucocytes. HARRIET F. HOLMES

Physico-chemical theory of cancerization. C. LAVILLE. *Néoplasmes* 7, 257-65(1928).—The precancerous state which precedes the formation of tumors is marked by a break-down in the acid-base equil. of the cells in the direction of an alkalosis. Cancer originates in predisposed cells whenever pos. charges of electricity are communicated to the cells with an intensity or a frequency that does not permit the re-establishment of their normal electrostatic equil. Treatment should be directed toward bringing about a condition of "negativation" and toward restoring the normal acid-base equil. of the cells. HARRIET F. HOLMES

Water storage in infancy in connection with the exudative diathesis. RELLA BECK. *Jahrb. Kinderheilk.* 120, 108-11(1928).—Studies were made on the rate of resorption of 0.8% NaCl, injected intradermally. No significant differences were observed between the rate in normal infants and in infants with the symptoms of the exudative diathesis. However, in both groups, the rate is markedly accelerated as compared with the rate observed with normal adults. This is in accord with other observations on the important role of the skin and subcutaneous tissues in water storage in infancy. ELEANOR M. H. MATHREYS

The role of amines in dyspepsia and intoxication. H. RÖTHLER. *Jahrb. Kinder-*

heilk 120, 162-85(1928).—R. compared the effect of histamine and of exts. of feces and urine in producing contraction of smooth muscle. Conclusion: Amines are formed in the intestines of both normal and dyspeptic children. In the former, the large bowel is the chief site of amine formation; in the latter, the small bowel. In dyspepsia, there is a large increase of amines in the stool, and in some cases of severe intoxication amines are also present in the urine in large amts. The possibility of primary enterogenous poisoning by amines must be considered. F. M. H.

Metabolic studies in cirrhosis of the liver in children. HANS KNAUER AND KURT FRIEDLÄNDER. *Jahrb. Kinderheilk.* 120, 292-305(1928).—Repeated observations of the blood lipoids of a child with cirrhosis of the liver gave the following data. The phosphatides gradually rose to abnormally high levels during the course of the disease, but decreased shortly before death. Cholesterol decreased from an initial high normal to a subnormal value. The fatty acid content was normal. As the lipoids decreased in the blood they increased in the ascitic fluid. The blood bilirubin increased but not sufficiently to cause jaundice. A lowered tolerance for ingested levulose and galactose, and the protracted curve of the blood sugar after administering dextrose, indicate a lessened ability of the liver to form and store glycogen. Tetraiodophenolphthalein was secreted at the normal rate, a fact which emphasizes the error in applying conclusions drawn from one functional test to the function of an organ as a whole.

ELEANOR M. HUMPHREYS

Icterus neonatorum, a sequel of the phenomenon of isoagglutination. GEORG LENART. *Jahrb. Kinderheilk.* 121, 134-55(1928).—Isoagglutination and isolysis of the red blood corpuscles lead to an increased formation of bilirubin. The extent of the process after birth is detd. by the relationship of the maternal isoagglutinins and the fetal isoagglutinogens during intrauterine life. According to the amt. of bilirubin formed, there may be a simple hyperbilirubinemia, icterus neonatorum of the common type, or icterus gravis.

ELEANOR M. HUMPHREYS

Dissociation of neutral vaccine virus-immune serum mixtures. PERRIN H. LONG AND PETER K. OLITSKY. Rockefeller Inst. for Med. Res., New York. *Science* 69, 72(1929).—It has been shown that the mixt. of a virus and its sp. anti-serum which is innocuous when introduced into the animal organism becomes disease-producing after diln. with appropriate amts. of Ringer soln. Certain aspects of this reaction have led to the conclusion that the diln. phenomenon resembles the hydrolysis of the salt of a weak acid and weak base, and that the observed dissocn. probably follows the law of mass action. This is indicated by results obtained from qual. studies of the degree of dissocn. following diln. of neutral and over-neutralized mixts. of vaccine virus and immune serum, from cataphoresis expts. and from the observation that the dissocn. is reversible.

J. A. KENNEDY

Isolation by cataphoresis of virus from vaccinia-recovered rabbits. PETER K. OLITSKY AND PERRIN H. LONG. Rockefeller Inst., N. Y. *Science* 69, 170(1929).—The conditions of cataphoresis were: time 3 hrs., millamp. 2 to 4.8, drop in potential 1.2 v., 1/2 of the suspension (100 cc.) of the tissue 6.9 to 7.8. Active vaccine virus in suspensions of testicles from rabbits which had recovered from exptl. cutaneous vaccinia was isolated by this method. The animals were injected intracutaneously with neurovaccine virus from 12 to 56 days prior to the expt. At the time their testicles were removed for examn. the animals were wholly recovered from the cutaneous vaccine lesions and were apparently normal. The isolation of the virus from animals wholly recovered from infection and in healthy condition, and the failure thus far to obtain immunity in the case of filterable viruses unless living virus is used should be considered in relation to the possibility that immunity in virus diseases is linked with the presence in the body of living virus.

J. A. KENNEDY

Japanese literature on isohemagglutination. 1916-1928. ANON. *Japan Med. World* 8, 321-2(1928).—This is a complete bibliography of the subject. N. KOPELOFF

Can the Abderhalden reaction in early pregnancy be employed in forensic medicine for the recognition of abortion? M. KERNBACH AND D. BERARIU. Univ. Cluj. *Deut. Z. ges. ger. Med.* 12, 487-95(1928).—The reaction is not diagnostic in abortion. However, it is helpful. The Abderhalden reaction is positive throughout pregnancy and menstruation.

FRANCES KRASNOW

The possibility of using corpse blood for the production of isohemagglutinin standard sera. P. SEREBRIANIKOV AND M. LEICHICK. Inst. für ger. med., etc., Odessa. *Deut. Z. ges. ger. Med.* 12, 496-505(1928).

FRANCES KRASNOW

Investigations on precipitin. J. OLBRYCHT AND S. SNIEZKO. Univ. Krakau. *Deut. Z. ges. ger. Med.* 12, 515-48(1928).

FRANCES KRASNOW

Carbohydrate tolerance in two cases of muscular dystrophy. T. A. HUGHES

AND D. L. SHRIVASTAVA. King Edward Medical College, India. *Indian J. Med. Research* 15, 437-43(1927).—Both cases showed a high fasting blood sugar and a defective power to store glucose. Nitrate and phosphates were administered to the patient. There was an improvement in the glucose tolerance and in the general condition.

FRANCES KRASNOW

The Wasserman reaction. I. The effect of an excess of the hemolytic amboceptor on the minimum hemolytic dose of the complement. S. D. S. GREVAL. Central Research Inst., Kasauli. *Indian J. Med. Research* 15, 523-8(1927). F K

Liver function in sprue. S. S. SOKHEY, S. K. GOKHALE, M. A. MALANDKAR AND H. S. BILLIMORIA. Haffkine Inst., Bombay. *Indian J. Med. Research* 15, 553-63(1928).—Liver function is not impaired.

FRANCES KRASNOW

The hemolysis of red blood corpuscles by bile salts and the inhibiting action of normal serum and egg albumin, with reference to the permeability change of the stroma. K. C. SEN AND S. K. BASU. *Indian J. Med. Research* 15, 581-7(1928).—Glycocholate is a much stronger hemolytic agent than taurocholate. Blood serum inhibits this effect by increasing the coagulability of the stroma.

FRANCES KRASNOW

Notes on the cholesterol content of Indian blood in health and in leprosy. T. C. BOYD AND A. C. ROY. Medical College, Calcutta. *Indian J. Med. Research* 15, 643-51(1928).—The normal cholesterol ranged from 0.082 to 0.181 g. per 100 cc. whole blood. Early cases of leprosy ranged from 0.080 to 0.130 g. and advanced cases from 0.070 to 0.109. In advanced treated cases the blood cholesterol does not return to normal.

FRANCES KRASNOW

The experimental production of stone-in-the-bladder. IV. R. MCCARPSON. *Indian J. Med. Research* 15, 801-6(1928); cf. C. A. 22, 103.—The disease in rats is due to the insufficiency in the exptl. diet of a substance or substances (probably vitamin A) which whole milk of good quality provides in abundance. This substance is not present in sufficient quantity in certain of the vegetable oils (linseed and sesame) in common use in India.

FRANCES KRASNOW

The hydrogen-ion content of vaccine lymph and its relation to the potency and keeping properties of lymph prepared under tropical conditions. J. CUNNINGHAM AND K. S. MHASKAR. *Indian J. Med. Research* 15, 819-26(1928).—In 25 freshly prepd. batches of lymph the p_H varied between 7.2 and 8.0, the majority lying between 7.4 and 7.8. There is a tendency in most lymphs in the tropics to become more acid on storage and exposure, and, as the formation of acid has a deleterious action on the vaccine virus, it is recommended that each batch should be carefully adjusted to a p_H between 7.6 and 7.8.

FRANCES KRASNOW

Studies on the physical properties of different blood sera. I. Isoelectric points of blood sera and their significance in the antimony test for kala-azar. R. H. CHOPRA AND S. G. CHAUDHURI. Calcutta School of Tropical Med. *Indian J. Med. Research* 15, 895-905(1928).—The isoelec. points of globulin and albumin in normal and pathol. sera are 5.5 and 3.8, resp. In some lepers and kala-azar cases, the isoelec. point of albumin is 4.0. The ppt. formed by the addn. of a soln. of urea-stibamine is mainly euglobulin.

FRANCES KRASNOW

Pancreatic function in sprue. S. S. SOKHEY AND M. A. MALANDKAR. Haffkine Inst., Bombay. *Indian J. Med. Research* 15, 921-33(1928).—The pancreas as far as the external secretion is concerned functions normally in sprue.

F K

Blood calcium in leprosy. M. C. CRUZ, C. B. JARA AND E. M. PARAS. Cullion Leper Colony. *J. Philippine Islands Med. Assoc.* 8, 216-21(1928).—Seventy cases were studied. Serum Ca in leprosy is usually within normal limits and the type, advancement, duration of the disease, antileprosy treatment and the presence of bone changes have no influence on the serum Ca level.

FRANCES KRASNOW

The effect of colectomy on the incidence of parathyroid tetany and blood calcium. ERIC OLDBERG AND E. L. WALSH. Northwestern Univ. Med. School. *Am. J. Physiol.* 85, 531-9(1928).—The removal of the colon prior to the removal of the parathyroids in meat-fed dogs had an ameliorating effect on the incidence of tetany, and removal of the colon of the normal dog caused a rise in the blood Ca of from 1 to 3 mg. per 100 cc. over its former level, in the course of a week. The theory is supported that parathyroid tetany is due to Ca deficiency.

J. F. LYMAN

Further studies on the metabolism of fatty substance in pathological conditions. The action of India ink on the infiltrative liposis of arsenic. G. TRIMARCHI. *Boll. soc. ital. biol. sper.* 3, 828-29(1928); cf. C. A. 23, 637.—India ink was dild. with 0.9% NaCl in the proportion of 1:3 and administered intraperitoneally to white rats. The As in the form of As_2O_3 was given subcutaneously. The materials were administered simultaneously on 4 successive days, on alternate days, or the As_2O_3 was given for 4

days and then followed by the ink for 4 days. Twenty-four hrs. after the last treatment the rats were killed and the organs examd. histologically. In the rats treated with As_2O_3 alone, there was a marked liposis in the hepatic cells; the Kupfer cells were free from fat. In the rats treated with ink, the As not only prevented infiltrative liposis but the hepatic cells showed no degenerative changes. PETER MASUCCI

The behavior of the digestive leucocyte reaction following splenectomy. GRU-SEPPE SOLARINO. *Boll. soc. ital. bio. sper.* 3, 842-5(1928).—Splenectomy in itself produces in dogs a distinct and const. leucocytosis which generally disappears 25-40 days after the operation when the no. of leucocytes becomes normal again. This is followed by a period in which the leucocyte titer is lower than that previous to splenectomy. The digestive leucocyte reaction presents a variable behavior depending on the length of time after splenectomy. Immediately after the operation, HCl, peptone, and meat produce a marked leucocytosis in comparison to the normal; 20-30 days afterward the same substances have no effect. This period is followed by one in which leucocytosis is again marked and equal in intensity to that before the operation. P. M.

The behavior of digestive and alimentary hyperglucemia following splenectomy. GRUSEPPE SOLARINO. *Boll. soc. ital. bio. sper.* 3, 846-9(1928).—In splenectomized dogs there is no variation of the glucemic titer compared to that before the operation. In general, splenectomy produces a slight digestive hyperglucemia. With regard to the sugar tolerance, this varies according to the time elapsed since the splenectomy. Glucose increases the hyperglucemia if administered shortly after the operation; but decreases the hyperglucemia if administered at a later period. PETER MASUCCI

Neutrality regulation in patients with and without epileptic fits. JOHNS. NORVIG. Aarhøvskeanstalt, Birkerød, Denmark. *Acta med. scand.* 70, 50-96(1929).—Individuals with no organic disease and manifesting no epileptic fits show ortho-regulation on a full diet, as well as on a pure meat, milk or vegetable diet contg. 1500-2000 cal. Under exactly similar conditions patients with no other disease except epilepsy exhibit dysregulation. The probability is suggested that the total N plays an important part in preserving the relation between the NH_4 value and the pH . It is shown that it is not possible to explain dysregulation as a result of variations in the blood pH . S. MORGULIS

Experiments on the concentration of antibody sera by means of physico-chemical methods (electrodialysis and adsorption). M. FISLER AND M. SPIEGEL-ADOLF. Staatliche therapeutisches Inst., Wien. *Biochem. Z.* 204, 28-45(1929).—An attempt to concentrate the active principles in immune sera through fractionation of the serum protein. Through electrodialysis under repeated addn. of acid all the fractions contg. the antibodies are pptd. from a typhus bacilli agglutinating serum. On soln. in neutral salt the activity is apparently unaffected. The protein content of this soln. corresponds to the 1/2 satn. with $(NH_4)_2SO_4$ fraction. A process is also described to adsorb on the ppt. of $Al(OH)_3$ formed in the soln., the active portions from horse serum contg. typhus bacilli agglutinins, from horse, rabbit or goat hematin toxic sera or from diphtheria antitoxin horse serum. The adsorbed substance can then be leached out with various reagents. By repeating this process it is possible to reduce the protein of the agglutinating serum to 1/6 its original concn. but retaining the greatest portion of the agglutinin. In antitoxic sera only the albumin fraction could be eliminated. Control expts. with electrolyte-free protein fractions show a striking parallelism in the behavior of immune bodies and of those true serum protein fractions which like the first manifest the same property of salting out. S. MORGULIS

Comment on Ottensooser and Strauss article "Immunochemical studies on globin and globin derivatives." LUDVIG HEKTOEN AND KAMIL SCHULHOFF. *Biochem. Z.* 204, 1250(1929), cf. *C. A.* 22, 2784. S. MORGULIS

The Millon reaction of the urine of insane patients. E. SCHEINER. Univ. Florence. *Biochem. Z.* 204, 361-70(1929).—The urine of patients in conditions resembling dementia gives a strongly pos. Millon reaction without preliminary hydrolysis, which is often found even when the urine had been dild. 100 times. Attempts at fractionation of the urine lead to the conclusion that the substance giving the Millon reaction is present in the "Histidin fraction" (Weiss) and betrays many similarities to imidazole derivs. in chem. behavior (pptd. by phosphotungstic acid, by $AgNO_3$ in $Ba(OH)_2$ and pos. diazo reaction). The hydrolysis of this "histidin fraction" with HCl showed unmistakably the presence of a phenol nucleus. The substance responsible for the Millon reaction can be adsorbed by C from which it can be quantitatively recovered by means of acetone. Upon purifying the acetone ext. the substance could be obtained in beautiful needle-shaped crystals. The hygroscopic needles m. 40° and b. 70° , and yield very little ash in which no test for Fe could be obtained. An aq. soln. of

these crystals gave also the Folin-Denis phenol reaction and, besides, reactions with aromatic aldehydes. The red coloring matter resulting from Ehrlich's reaction could be crystd. out in alk. solns. According to its soly. and spectroscopic characteristics this isolated chromogen is regarded as the mother substance of the pigment obtained from urine with Ehrlich's and Hári's reagent.

S. MORGULIS

Is the aerobic glucolysis specific for tumors? OTTO WARBURG. *Biochem. Z.* **204**, 482-3(1929).—The following is a list of conditions where aerobic glucolysis occurred: reversible inhibition of embryonic respiration by HCN; irreversible inhibition of embryonic respiration by O_2 want; loss of nucleus in erythrocytes; irreversible suppression of Pasteur's reaction in embryos by Ringer soln.; reversible suppression of Pasteur's reaction in embryos by the Et ester of HCN; spontaneous depression of respiration and its final disappearance in the embryonic lense as the epithelium is transformed into connective tissue; the irreversible suppression of respiration in white bone-marrow cells by Ringer soln.; suppression of Pasteur's reaction and of respiration in the retina through heat. In other words, aerobic glucolysis is not specific for tumors. But whereas normal cells are destroyed while glucolyzing aerobically, aerobically glucolyzing tumor cells live and actually grow unrestrained under such conditions. The presence or absence of the respiratory function or the extent of that function is no longer regarded as a good basis for tissue classification. Tumor cells possess extensive aerobic glucolysis whether their respiration is great or small. However, in either case the respiratory function is damaged because it is unable to suppress fermentation. Evidently both forms of damage of the respiratory formation (its intensity or its effect) occur in tumor cells.

S. MORGULIS

Pepsin-acidity curve. TAKASHI MURAYAMA. *Okayama Med. Coll. Okayama J. Med.* **40**, 520-30(1928).—The stomach of a hungry healthy man just after early rising contains about 50 cc. of gastric juice, free acid value 6, total acid value 27.5. It also contains pepsin, and frequently bile, and some viscous liquid, but no food residue. M. next examd. the gastric juice obtained from stomachs of men with various stomach diseases and of habitual alc. drinkers. The acidity is generally lower than in the case of Boas' artificial food supply, which is probably due to back streaming of the duodenal juice. The curves obtained with the patients having various stomach diseases are to a certain extent characteristic, so that the secretion curve is of diagnostic significance.

K. SOMIYA

The formation locally of antitoxins in the cerebrospinal fluid. M. S. MITTER MILCH AND MILE. E. SALAMON. *Compt. rend.* **188**, 205-6(1929).—Tetanus anatoxin and diphtheria anatoxin were injected into rabbits. One group received the anatoxin (2 cc.) intraperitoneally, the others received the anatoxin (2 cc.) intraoccipitally. The injections were repeated 4 times at 8-day intervals. After each inoculation a sample of blood and one of spinal fluid were taken and tested for antitoxin content. The antitoxin content of the spinal fluid was very small following the intraperitoneal injections. The introduction of the anatoxin directly into the meningeal cavity elicited a very high antitoxin titer in the spinal fluid. The authors conclude that the antitoxin formed in the blood due to intraperitoneal injections of anatoxin is unable to diffuse through the vasculo-meningeal system. The appearance of antitoxin in the spinal fluid following intrameningeal injections of anatoxin is due to the production of antitoxin by local cells of unknown nature.

M. H. SÖPHE

Outlying acidosis due to functional ischemia. PEYTON ROUS AND DOUGLAS R. DRURY. Rockefeller Inst. for Med. Research. *J. Exptl. Med.* **49**, 435-60(1929).—In various functional conditions involving peripheral vasoconstriction a more or less widespread change toward acidity takes place within certain tissues. The change is frequently independent of any in the blood; indeed, the blood can become more alk. while the tissue acidosis is developing. When the blood vol. is diminished abruptly but not too greatly, by hemorrhage or by anhydremia, the acidosis which develops in the superficial connective tissue and in the skeletal muscles is patchy in distribution, being limited to areas of local ischemia which are the result of a compensatory vasoconstriction which affects certain regions only. There is a 2nd type of patchy ischemia (and of acidosis) which occurs under circumstances of moderate depletion and is referable to local pressure differences that are so slight as to be ineffective under normal circumstances. A generalized acidosis throughout to superficial tissues develops when depletion is extreme. All these are outlying acidoses, since they lie without the influence of the blood. In the viscera no such acidoses have been found. C. J. WEST

Nature of the hyperglucemia associated with anaphylactic shock in the dog. ISOLDE T. ZECKWER AND J. ERNEST NADLER. Univ. of Pennsylvania Med. School. *J. Exptl. Med.* **49**, 481-95(1929).—Nine unoperated dogs showed a rise in blood sugar

during anaphylactic shock; in 6 of these dogs the rise was 60 mg. or over. Six dogs in which 1 adrenal had long previously been extirpated and the opposite splanchnic nerve cut, show a low preliminary level of blood sugar and a relative rise of blood sugar during anaphylaxis, but of less degree than in the unoperated animals; in no case was the rise greater than 52 mg. Anoxemia did not appear to be a complicating factor, as evidenced by detn. of the O content of the arterial blood before and during shock. The rise in blood sugar, which occurs in spite of the loss of adrenal activity, is probably due to the venous stasis of the liver seen in anaphylaxis in the dog, because this rise in blood sugar can be simulated in a normal non-sensitized dog by mechanically constricting the hepatic veins for a brief interval. There are, therefore, probably 2 factors responsible for the hyperglucemia assocd. with anaphylaxis in the dog, sympathetic stimulation by way of the splanchnic nerves involving the activity of the adrenals and glycogenolysis resulting from venous stasis of the liver. C. J. WEST

Toxicity of human serum for the guinea pig. SUSAN G. RAMSDELL AND I. DAVIDSON. Research Inst. of Cutaneous Medicine, Philadelphia. *J. Exptl. Med.* **49**, 507-508(1929).—All fresh human serum appears to be toxic for the guinea pig; this toxicity tends to disappear 48 hrs. after bleeding and its manifestations are strikingly similar to those of the heterophilic antibody in immune rabbit serum. There is an increased toxicity in the serum of antisera-treated human cases; this is usually coincident with the production of other antibodies; it tends likewise to disappear in time after treatment; differential absorption expts. indicate that its character is heterophilic and its manifestations differ from those of anaphylaxis in that certain circulatory effects—hemorrhage and increased edema in the lungs and distention of the right heart—are added to the usual findings in true anaphylactic deaths. C. J. WEST

The influence of cholesterol blood content on the growth of tumors in the mouse. Preliminary communication. VLADIMIR MORAVEK. *Arch. Clin. Cancer Research* **3**, 99-100(1927); *Ber. ges. Physiol. exptl. Pharmakol.* **46**, 43.—The growth of transplantable sarcomata was accelerated by the intravenous administration of cholesterol and retarded by lecithin. The growth of carcinoma cannot be influenced by intravenous injections of cholesterol; on the other hand the growth of tumors was raised for a short time by the administration of lecithin to which a small quantity of cholesterol had been added. R. C. WILLSON

The metabolism in surgical diseases in connection with the appearance of post-operative ketonuria. M. A. AWDEJEW, E. L. THAL AND E. L. PROWATOROWA. *Arch. Clin. Cancer* **149**, 649-651(1928); *Ber. ges. Physiol. exptl. Pharmakol.* **45**, 632.—It is now known that ketonuria and acidosis can appear entirely independently of each other. Similarly the acidosis after an "acid-forming diet" is not attended by a ketonuria. Under the influence of a carbohydrate deficiency a ketonuria can develop without alteration of the CO_2 tension of the blood. The authors' studies show that there is no direct relation between postoperative ketonuria and the carbohydrate metabolism. The use of glucose brings about a rapid removal of the acetone bodies in all cases. The antiketogenic action of sugar cannot depend on an equalization of the carbohydrate metabolism. R. C. WILLSON

The action of indole on the development of embryomata. MARIO IAPIDARI. *Bull. soc. med.-chir., Pavia* **2**, 763-65(1927); *Ber. ges. Physiol. exptl. Pharmakol.* **46**, 42; cf. *C. A.* **22**, 3230.—In white rats repeated injections of indole are not able to convert an embryoma into a malignant growing tumor; furthermore, they are not able to influence the growth of the embryoma. In chickens simultaneous injection of embryoma broth and a 1:5000 soln. of indole can lead to the development of an enclosed teratoma. These tumors are always malignant, cannot be transplanted into other animals and are not filtrable through the Berkefeld filter. R. C. W.

The aromatic substances of the blood in relation to the function of the kidney. MATTE. MONTEGUTI. *Bull. sci. med., Bologna* **5**, 437-43(1927); *Ber. ges. Physiol. exptl. Pharmakol.* **45**, 520.—Becher has detd. that in individuals suffering with kidney diseases the amt. of ether-sol. aromatic substances in the blood is increased to a remarkable degree. This detn. is made by means of the xanthoprotein reaction, the color intensity of which is compared with that of a $\text{K}_2\text{Cr}_2\text{O}_7$ soln. in an Autenrieth colorimeter. M. extended these studies to persons ill with other diseases. In normals the results showed a colorimetric difference of 15-25 units. In nephritics without exception higher values were found, the highest values being found in persons suffering with uremia or renal tuberculosis. In prostatic hypertrophy the aromatic substances in the serum were increased. Definite relations to the retention of urea were not found regularly. No important increases were found in diseases of the other organs. R. C. WILLSON

An arrow poison with a heart action from the New World. C. G. SANTESSON, Karolinisches Inst., Stockholm. *Skand. Arch. Physiol.* 55, 230-57(1929).—See C. A. 22, 4649. S. MORGULIS

Localization of the action of nicotine on the adrenal. S. V. ANICHKOV AND A. I. KUZNETZOV. Militar-Med. Akad., Leningrad. *Arch. exptl. Path. Pharmacol.* 137, 180-6(1928).—After exposure to nicotine the chromaffin tissues of the adrenal exhibit an increased sensitivity to direct elec. stimulation. In this, the effect of nicotine is reversible. Nicotine acts directly on the chromaffin cells. G. H. S.

Comparative study of the susceptibility to drugs of the ureter of non-gravid and gravid animals. J. SANO. Imperial Univ., Kyoto. *Japan J. Obstet. & Gynecol.* 10, 41(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 836.—Rabbits and guinea pigs were studied. Adrenaline and pituitrin paralyze the action of the ureter while pilocarpine and Ba stimulate it in both gravid and non-gravid animals. The minimal dose is larger in the gravid animals. With the ureters of freshly killed guinea pigs the results were the same except that in rare instances small doses of adrenaline and pituitrin had a stimulating action in pregnant animals. The minimal dose of adrenaline and Ba was larger in pregnant animals, while there was no difference in that of pilocarpine and pituitrin. Conclusion: During pregnancy the sensitivity of the ureter is reduced which is a good basis for the pyelitis of pregnancy. R. C. WILSON

The action of some poisons on the function and blood vessels of the suprarenal capsule. A. KUZNETZOV. *Russ. Fisiol. Zhurnal* 9, 172-3(1926); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 836.—The studies were made on isolated suprarenal capsules according to the method of Skaveria and Kuznetsov and the concn. of adrenaline was detd. according to Folin's method or by detg. the degree of contraction of the blood vessels in the ear of a rabbit. Results: Strychnine nitrate in concns. of 1:2,000,000 to 1:10,000 increases the secretion of adrenaline; stronger solns. are inactive. Curare in small doses increases the secretion while large doses stop it. Picrotoxin increases the secretion. Quinine in doses of 1:1000 stops the secretion, while smaller doses are inactive. Morphine has no influence on the secretion. HgCl₂ in doses of 1:100,000 decreases the secretion and small doses increase it. R. C. WILSON

I—ZOOLOGY

R. A. GORTNER

Influence of certain water conditions, especially dissolved gases, on trout. JAMES S. GUTSELL. U. S. Bur. Fisheries, Beaufort, N. C. *Ecology* 1, 77-96(1929).—Exptl. data on brook, brown and rainbow trouts obtained at the Cornell Univ. hatchery showed that a marked increase in % of CO₂ and decrease in O content in spring and brook water took place as the warm season advanced. This change is attributed to the increased rate of activity of the soil bacteria and if the O content fell below approx. 1.3 p. p. m., death always occurred. The *p*_H and temp. of the water were shown not to vary greatly and were not considered vital factors. Trout gradually accustomed to reduced O survived O contents considerably below those which were fatal to trout from well oxygenated water. By means of numerous transfer expts. from water rich in O to water poor in O, trout were asphyxiated in every case when the O content fell below 1.3 p. p. m. Partial asphyxiation and sluggishness often occurred at O concns.

of from 2.5 to 1.3 p. p. m. though some fish survived several days. Above 2.5 p. p. m. of O, trout usually were normal. If partially asphyxiated trout were removed from the low O water to an oxygenated water, recovery occurred in as low O concns. as 2.67 p. p. m. Limited data indicate that brook trout are able to survive lower O tensions than brown or rainbow trout. CO₂ up to 28 p. p. m. was not markedly harmful and in amounts up to 39 p. p. m. did not increase the ill effects of reduced O tension. Trout inhabit both acidic and basic waters and, providing the O content is sufficient, are hardly to considerable variation in H-ion concn. C. R. F.

Studies in comparative hematology. I. Camelidae. ERIC PONDER, J. FRANKLIN YEAGER AND H. A. CHARIPPER. New York Univ. and the New York Zoological Soc. *Quart. J. Exptl. Physiol.* 19, 115-26(1928). II. Primates. *Ibid* 181-95.

FRANCES KRASNOW

The action of isotonic salt solutions on the unfertilized eggs of *Thalassema neptuni*. A. D. HOBSON. Univ. of Edinburgh. *Brit. J. Exptl. Biol.* 6, 65-78(1928).—Isotonic salt solutions induce artificial parthenogenesis in the eggs of *Thalassema neptuni*. At the H-ion concn. of sea water CaCl₂ is an efficient activating agent while NaCl, LiCl and KCl fail. Solns. of CaCl₂ with alk. metal chlorides in certain proportions cause parthenogenesis. Two maxima are obtained in K-Ca solns., one with a high and one a low concn. of Ca. Two optimal exposure times have also been found, 6-9 mins. and 30 mins. C. M. M.

A study of the effect of surgical shock on insects. WM. ROBINSON. Univ. of Minn. Agr. Expt. Sta. *J. Agr. Research* 37, 743-8(1928).—Injury produces effects in insects that may be analogous to surgical shock in mammals. This was shown by a considerable drop in the percentage of bound H₂O and rise in the f. p. of pupae of *Telea polydorus* being produced by piercing with a needle or by crushing. Since detn. of the pH of body fluids, temp., f. p., etc., of insects as sometimes made involves injury to the insect, the data may not represent the actual conditions in normal individuals.

A. L. MEHRING

Effect of cyanide on the protoplasm of Amoeba. FLOYD J. BRINLEY. Univ. Penn. *Gen. Physiol.* 12, 201-6(1928).—This paper deals with the effects of HCN and KCN upon the viscosity of the protoplasm of a species of *Amoeba* belonging to the *proleus* group. The toxicity of these compds. to *Amoeba* results from their effect on the cell membrane and not upon the internal protoplasm. Immersion in concd. solns. (0.1 N-0.001 N) of HCN or KCN produces an initial increase in viscosity of the protoplasm followed by liquefaction and disintegration of the cell. Immersion in dil. solns. produces a decrease in the viscosity of the protoplasm. Injection of HCN or KCN into *Amoeba* brings about a reversible decrease in viscosity of the protoplasm. C. H. R.

The brightness of the light of the West Indian elaterid beetle, *Pyrophorus*. E. NEWTON HARVEY AND KENNETH P. STEVENS. Princeton Univ. *J. Gen. Physiol.* 12, 261-72(1928).—The prothoracic light organs of an unnamed species of *Pyrophorus*, measured at Princeton, N. J., gave a max. brightness of 0.045 lambert, or 0.045 lumen per sq. cm. at 20°, corresponding to 0.0002 candle for one organ or 0.0004 candle for the pair of organs. C. H. RICHARDSON

Ionic antagonism in the regeneration of the hydra. M. KOSACK. Med. Inst., Odessa. *Zhurnal exptl. Biol. Med.* 8, 515-24(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 44, 747. A toxic concn. of NaCl can be detoxified by the addn. of CaCl₂. A toxic concn. of KCl can be detoxified by the addn. of CaCl₂ or NaCl. The upper limit of the concn. of KCl is 0.024 M KCl, beyond which detoxification is not possible. Toxic concns. below the upper limit are not only neutralized by the necessary minimal quantities of CaCl₂ or NaCl, but also by the half of each of these quantities when both antagonists of the KCl are used together. Toxic concns. of NaCl and KCl can be detoxified at the same time by the addn. of CaCl₂. R. C. WILLSON

Studies of the chromatophores of the frog. II. Influence of pharmaceuticals. EIKIZO KOBAYASHI. Univ. Kyoto. *Folia pharmacol. Japan* 6, 280-4(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 45, 135.—Adrenaline, pilocarpine, tyramine and acetylcholine cause clumping of the chromatophores and thereby make the frog light colored. The action of acetylcholine was far below that of the other pharmaceuticals. Pituitrin has an expanding effect and thereby makes the frog dark colored. R. C. W.

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Comparison of the Monier-Williams and the Association of Official Agricultural Chemists methods for the determination of sulfurous acid in food products. J. FIFELSON. U. S. Food, Drug and Insecticide Administration, Philadelphia, Pa. *J. Assoc. Official Agr. Chem.* 12, 120-9(1929).—The use of Cu salts as a wash trap to remove sulfides from the distillate of the official Assoc. Official Agr. Chem. SO_2 detn. produces inaccuracies. Brining of onions reduces the proportion of volatile S compds. and does not produce SO_2 in the onions in any appreciable quantity. The accuracy and reliability of the Monier-Williams method for detg. SO_2 in the presence of volatile S compds. (cf. *C. A.* 21, 2510, 2742; distg. through a reflux condenser in a current of CO_2 , absorbing in cold neutral H_2O_2 and detg. H_2SO_4 by titration or by pptn. with BaCl_2 in the cold) was verified. The results of a series of comparative detns. of SO_2 in various food products by both the official Assoc. Official Agr. Chem. distn. method and the Monier-Williams method emphasized the advisability of using a more accurate method than the present official one for detg. SO_2 in food products contg. volatile S compds.

A. PAPINEAU-COUTURE

The chemical laboratory of the Feeding Research Station of the Société d'hygiène alimentaire annexed to the Institute of Agronomic Research. M. JAVILLIER. *Bull. soc. hyg. aliment.* 16, 398-411(1928).—A description of its activities during the period 1923-28.

A. PAPINEAU-COUTURE

A new volumetric method for the determination of tin in preserves and foodstuffs. B. GLASSMANN AND S. BARSUTSKII. Betriebslab. des Nahrungsmitteltrasts, Odessa. *Z. Untersuch. Lebensm.* 56, 208-12(1928).—A 50-g. well-mixed sample is dried, ignited and the ash extd. with 30 cc. of dil. HNO_3 (1:2) to remove Fe, Cu and Pb, after filtration the residue and filter are reignited. The Sn is reduced to the metallic form by fusion at low red heat using 1 g. KCN. The mass is extd. with 150 cc. of H_2O , filtered and the residue including the filter is digested with 25 cc. of concd. HCl in a flask fitted with a Bunsen valve. In order to complete the reduction, 1 g. of Zn is added, the soln. cooled in CO_2 and titrated with 0.02 N soln. of $\text{K}_2\text{Cr}_2\text{O}_7$, using KI and starch. The dichromate soln. should be prepd. by standardization against pure Sn similarly treated. About 6 hrs. is required to make the detn. With fish products, a max. error of -7 mg. in 50 mg., or -2.5 mg. in 10 mg. was observed. A sample of canned *Gobius*, 32 months old, gave 154.6 mg. per kg. of Sn, while after it had been opened for 12 days, the Sn content had increased to 420 mg. per kg. The samples of canned fish contained from 17.5 to 154.6 mg. per kg. of Sn.

C. R. F

Analysis of dietary products, gluten and almond breads. R. LECOQ. *J. pharm. chim.* 7, 539-48(1928).—Conclusions: (1) The total results of a % analysis of dietary products as usually conducted and calcd. cannot sum up to 100%, unless cellulose has also been detd. (2) While the ratio of N to pure gluten is about 1:7, the factor 6.25 is preferable for the calcn. of the proteins; the results agree better with the av. compn. of the N-bearing vegetable or animal components liable to enter into the formulas of dietary breads. (3) Expressing gluten in terms of av. proteins, and sugars in terms of starch causes the sum total to be less than 100, the deviation increasing with the sugar or the gluten entering into the prepn. of the products. (4) In employing the usual methods for the detn. of fats, the value found for fats is probably too low, especially with breads or biscuits rich in fatty matters. (5) On the basis of the analysis of simple products prepd. solely from the flour of gluten or of almonds, it is possible to arrive by trial or by calcn. at an approx. detn. of these components; with fresh breads, it is well previously to calc. the results of the analysis to a basis of about 10% H_2O . (6) Most frequently the figures thus found cannot be abs., as it is impossible to be exactly informed as to the nature of the primary materials and the substitutes eventually used.

S. WALDBOTT

The chemical composition of some Ceylon paddies, rices, and milling products. A. W. R. JOACHIM AND S. KANDIAH. Ceylon Dept. Agr. Peradeniya. *Trop. Agr. (Ceylon)* 70, 195-206(1928).—Thirty-five samples of rice products, typical of Ceylon, were analyzed and the results are presented in 11 tables. The av. compns of Ceylon

paddies, hand-husked rice, polished rice, bran and husks were as follows: moisture 12.01, 11.64, 12.21, 12.51, 11.35%; protein 6.69, 9.10, 7.64, 13.17, 3.90%; fat 1.91, 2.42, 1.00, 10.12, 1.26%; fiber 10.40, 0.65, 0.33, 14.05, 40.22%; carbohydrate 63.84, 74.79, 77.90, 38.72, 25.83%; ash 5.26, 1.41, 1.00, 11.44, 17.43%; N 1.04, 1.46, 1.22, 1.71, 0.62%; P_2O_5 0.54, 0.71, 0.43, 2.93, 0.50%; and CaO 0.078, 0.064, 0.043, 0.280, 0.27%, resp. Ceylon paddies and hand-husked rices appear to be richer in protein and minerals than those of other countries. Hill paddies are poorer in minerals than irrigated paddies. Polishing rice causes a marked decrease in the fat, H_3PO_4 , fiber and protein contents. This is greater with machine polishing than with the so-called village method of pounding. The aleurone layer contains the more valuable nutritive constituents. Parboiling does not affect the compn. of rice products, except slightly to lower the fat content.

A. L. MEHRING

• **Determination of chlorides in milk.** G. RODILLON. *Ann. fals.* **26**, 576-8(1928).—A reply to the criticisms of Raquet and Kerlevoe (*C. A.* **22**, 1194) of R.'s method (defecation by means of CCl_3CO_2H), which is claimed to be simple, rapid and accurate.

A. PAPINEAU-COUTURE

Influence of freezing of milk on its acid fermentation. V. W. WINTER. *Chem. Indst.* **22**, 357-61(1928).—The solid fraction of partly frozen milk has a lower sp. gr. and a higher acidity than the original milk, while the contrary is the case with the liquid fraction. Both fractions on incubation at the ordinary temp. for 2-3 weeks exhibit a lower acidity than milk not previously frozen.

B. C. A.

Physicochemical studies of cow milk and preparations made from it. MASAMI NAKAYAMA. *Med. Akad., Kyoto. Kyoto-Ikadaigaku-Zasshi.* **2**, 537-48(1928); *Ber. ges. Physiol. exptl. Pharmacol.* **46**, 36.—At 25° the milk has a pH of 6.37 (standard deviation 0.09% and deviation coeff. 1.41%). The pH increases with rise in temp. At 25° the milk can buffer $N/640$ HCl and $N/1280$ NaOH. The pH of milk powder varies between 6.00 and 7.00. "Kintars," "Dry Milk" and "Lactogen" can buffer $N/640$ HCl, "Eagle Brand" and "Bear Brand," $N/1280$ HCl, and all these preps. can buffer $N/2560$ NaOH. The buffer curves against alkali are the same for the first 3 preps. The curves against alkali are very different.

R. C. WILLSON

The fatty acids and component glycerides of some New Zealand butters. T. P. HILDITCH AND EVELINE E. JONES. *Analyst* **54**, 75-96(1929).—In a study of New Zealand butter, methods were developed for detg. the ratios of the fatty acids present, and a semi-quant. method was developed for detg. the manner in which the acids are combined to form the component glycerides of the natural fat. The compn. of the mixed fatty acids was detd. (1) by removing as much as possible of the lower acids by prolonged distn. with steam, the distillate being fractionated, and (2) by sepg. the non-volatile acids into 2 groups by the Pb salt and alc. method, followed by conversion of the acids of the sol. and insol. Pb salts into methyl esters, which were fractionated at low pressure in the usual manner. The approx. compn. of the acids was found to be butyric 3, caproic 2, caprylic 1, capric 2, lauric 4, myristic 11, palmitic 28, stearic 9, oleic 33.5 and linoleic 4.5%. There is consistent evidence of the presence of a small percentage of acids less satd. than oleic acid. The procedure adopted for the study of the component glycerides consisted in oxidizing the butter fat under conditions in which all the unsatd. components were transformed into acid products, while glycerides contg. only satd. acids were unaltered. The resulting data showed that the butter fat contained about 30% of fully satd. glycerides contg. the same fatty acids as are found in the whole fat and in about the same proportions. There appears, however, to be somewhat less volatile acids in the fully satd. part and a correspondingly slight concn. of the higher satd. acids in this group of the glycerides. Probably all of these glycerides are of the complex mixed type. The remaining 70% of the fat consists of mixed glycerides of satd. and unsatd. acids in the ratio of 104:100. At least 36% of the original fat consists of mono-oleo-disatd. glycerides, and there cannot be more than 18% of triolein (or 36% of di-oleo-mono-satd. glycerides). It is, in fact, probable that but little triolein is present. The approx. compn. of the fat is, therefore, 30% of mixed, fully satd. glycerides, 36% of mixed, mono-oleo-disatd. glycerides and 34% of mixed di-oleo-mono-satd. glycerides.

W. T. H.

Detection of margarine in butter. H. P. STADLE. *Z. Untersuch. Lebensm.* **55**, 404-5(1928).—The Litterscheid pocket polarization microscope was found useful in detecting adulteration by observing the presence of starch grains and fat crystals. Pure butter fluoresces faintly yellow or not at all, while margarine shows a blue luminescence. An ether soln. of the sample is prepd., and microscopic examn. of the insol. residue is made. An addn. of 15% margarine to pure butter can be detected readily.

B. C. A.

The iodine content of Norwegian fish and fish products. GULBRAND LUNDE, KARL CLOSS, HELMER HAALAND AND SIGURD O. MADSEN. *Aarsberetning vedkommende Norges Fiskerier* 1928, No. IV, 3-41; cf. *C. A.* 23, 1443.—Reference is made to the observation that endemic goiter appears most frequently in those inland mountain districts where the concn. of I in the surroundings is extremely low. It is proposed that the I deficiency be overcome through the use of foods contg. a relatively high concn. of I such as fish and fish products. The I in org. combination is more suitable for this purpose than that in inorg. iodides. Several tables and graphs are given to show the I content in various kinds of fresh and dried fish, fish oil, fish and herring meal. Although the av. I content in fish is small (from 0.26 to 6.33 mg. per kg. for fresh fish and 0.50 to 29.34 mg. per kg. on the dry basis) it is amply sufficient to furnish the needed I. According to analysis the ordinary non-marine foods have a low I content, usually less than 0.05 mg. per kg. Fish varieties rich in fat show a lower % of I than those that are lean. The Norwegian fish products are richer in I than all other foods that have been examd. A detailed description of the method of *detg. small quantities of I* is given. The method consists in decompng., sapong. and dissolving a weighed amt. of the material by heating in a 10-25% soln. of KOH to which EtOH has been added. An aliquot portion of the soln. is evapd. to dryness, the residue is ashed, the ash is extd. with EtOH, the ext. is evapd. and the resulting residue is gently ignited. This process is repeated. The final residue is dissolved in 0.3 cc. H₂O, transferred to a small tube, 0.015 to 0.04 cc. of CHCl₃ and a drop of a dil. soln. of a mixt. of KNO₃ and H₂SO₄ added, and the tube shaken. The liberated I imparts a rose red color to the CHCl₃. The amt. of I is detd. colorimetrically by comparing with standards. If the amt. of I is sufficiently great, the residue is dissolved in H₂O and oxidized to KIO₃; the latter is allowed to act on an excess of KI, the liberated I being titrated with a 0.004 N soln. of Na₂S₂O₃.

The determination of cacao germ in cacao products. W. SCHMIDT. Stat. lichen chem. Untersuchungsamt für die Auslands fleischbeschau, Cleve. *Z. Untersuch. Lebensm.* 56, 198-9(1928). After boiling the sample with 25% HCl, followed by 5% KOH, the microscopic prepn. is stained with safranine to facilitate examn.

C. R. F.

Coffee from Mauritius, Sierra Leone and Sudan. ANON. *Bull. Imp. Ind.* 26, 418-23(1928).—Liberian coffee grown in Mauritius had the following compn.: H₂O 10.7, crude proteins 12.2, caffeine 1.4, fat 10.4, N-free ext. 50.6, crude fiber 10.9, ash 3.8, hot-water ext. 30.6%. Robusta coffee grown in Sierra Leone had the following compn.: H₂O 10.4, caffeine 1.3, crude proteins 10.3, fat 10.1, N free ext. 48.6, crude fiber 15.7, ash 3.6, hot-water ext. 29.0%. A sample of Abyssinian coffee from Sudan was slightly below the usual standard of Abyssinian coffee.

A. P. C.

The microscopic detection of Durian and Nillu fruits (Salpamisri). An addendum to an article on "Lukutate" fruits. C. GRIEBEL. Govt. Food Research Lab., Berlin. *Z. Untersuch. Lebensm.* 55, 453-9(1928); cf. *C. A.* 22, 2798. —The dextrin grains of the Durian seeds are characteristic as to shape and size especially when treated with I. Their surface is irregular. By heating, the arillus cells are likewise characteristic. In the case of Nillu (Salpamisri), the parenchyma cells are flattened out and, together with the peculiar secretion cells, may be used for identification. Ten figures are given.

C. R. F.

Removal of spray residue from apples and pears in the Pacific Northwest. H. C. DIEHL, et al. U. S. Dept. Agr., *Circ.* 59, 1-19(1929).—A summary of spray-removal investigations in Wash. and Ore. Concns. of HCl from 0.3 to 1.2% have given satisfactory results in As and Pb spray removal. If not too heavily sprayed a 2% Na₂CO₃ soln. was also effective. The use of disinfectants such as CH₂O in the washing soln. is not recommended. The cleansing process of acid or alkali does not hasten ripening or injure the keeping quality of the fruit.

C. R. F.

Chemical basis for industrial citriculture in Paraguay. I. JOÃO SCHRODER. *Bol. ministerio agr. ind. com.* 17, 376-408(1928).—The orange contains 84.3% The

40.93; Na₂O 2.84, 2.29; 2.13, 2.02, CaO 2.11, 1.87; 8.71; MgO 5.72, 4.26; 5.15, 4.45; Fe₂O₃ 1.36, 1.42; 0.77, 2.57; P₂O₅ 12.63, 5.66; 13.532; SO₃ 5.14, 2.69; 3.08, 2.00; SiO₂ 1.28, —; 0.75, 0.91; CO₂ —, 29.73; —

28.78; Mn_2O_4 0.40, 0.45, Cl 0.81, 1.12; 0.48, 0.96. One hundred kg. of fresh citrus fruit contains about 60 g. phosphoric acid, 230 g. K_2O , 16 g. N, 140 g. CaO , and 60 g. MgO . A crop of 20,000 kg. per hectare will impoverish the ground by 12 kg. P_2O_5 , 46 kg. K_2O , 36 kg. N, 28 kg. CaO , and 12 kg. MgO ; these should be returned to the soil. The compns. of the fruit, trunk, branches and foliage are given, arranged on similar lines. S. considers the sour orange as the most important of the citrus, medicinally and commercially. Fruits which were analyzed contained 86 g. pulp, 47 g. rind and 2 g. seed in a weight of 135 g. fruit. Whole fruit and pulp contain, resp: water 82.8, 88.0; dry matter 17.2, 12.0; invert sugar 3.2, 4.2; sucrose 0.8, 1.6; citric acid 2.8, 3.6; proteins 0.9, 0.9; fats 0.4, —; cellulose —, 2.3; ash 10.07. These values for pulp agree fairly well with the results of König and of Puig. The compns. of sweet oranges, leaves, fresh seed, air-dried seed, seed dried for oil extn., and of the residue are given and also the yield. Similarly the *Citrus madurensis* Lour, *C. limonium* Risso, *C. decumana* Wild, or the common grapefruit, *C. medica* L., *C. limetta* Risso, *C. bergamia* Risso and Port, *C. trifoliata* L. are also dealt with. S. L. B. E.

Banana pectin (a preliminary report). HARRY VON LOESECKE. United Fruit Co., Boston, Mass. *Fruit Products J. and Am. Vinegar Ind.* 8, No. 6, 14-16; 30(1929).—The object of this investigation is to det. the feasibility of extg. pectin from banana peel. Results indicate that pectin can be extd. from the peel of bananas, the pectin obtained thus far being lower in jellying power than com. apple pectin. Both the dried banana pectin and the pectin concentrate have poor keeping qualities at the present state of the work. Further work is in progress to include both the peel and the entire fruit. J. A. KENNEDY

The use of successive generations of yeast in the preservation of fruit-juice beverages. S. C. VANDECAVEYE. Wash. Agr. Expt. Sta., Pullman, Wash. *Fruit Products J. and Am. Vinegar Ind.* 8, No. 6, 24-6(1929); cf. C. A. 23, 1988.—This method produces a very attractive beverage which will retain the delicate flavors and aromas of the freshly pressed and cleared juice. J. A. KENNEDY

Sugar, the master preserver. STROUD JORDAN. Henry Heide, Inc., N. Y. *Food Industries* 1, 207(1929).—Although invert sugar has an apparent soly. of 85%, a concd. sirup is not stable. Dextrose crystallizes out upon long standing or exposure to low temp. To offset this condition mixts. of sucrose and invert sugar are used. The com. applications of the use of *invertase* in candy making are pointed out. C. R. F.

Hungarian honeys of 1927. JEAN STITZ. Roy. Hong. Sta. Exp. Agronomique. *Bes. Ann. fuly.* 21, 572-6(1928); cf. C. A. 23, 914.—Analyses of 20 samples of known purity are tabulated. A. PAPINEAU-COUTURE

Quantitative determination of hydroxymethylfuraldehyde in honey. J. FIENE. Preusschen Hyg.-Inst. Landsberg a. W. *Z. Untersuch. Lebensm.* 56, 200-3(1928).—In the Troje reaction (C. A. 20, 3753), an ext. of honey in anhyd. Et acetate is evapd. *in vacuo* at 45° and the residue oxidized by an alk. soln. of I, the excess of I being back-titrated with $Na_2S_2O_3$ standard soln. F. shows that the results obtained by Troje's method are affected by the presence of org. acids, sugars, aromatic compds. and coloring substances present in honey. High values for hydroxymethylfuraldehyde are obtained even in the entire absence of this substance. C. R. F.

The effect of exhausting on the formation of hydrogen swells in canned-ready-to-serve prunes. E. M. AND P. H. RICHERT. Univ. of Cal. *Fruit Products J. and Am. Vinegar Ind.* 8, No. 6, 17-9(1929); cf. C. A. 23, 1182.—Variations in the time, temp. and method of exhausting had a marked effect on the rate of formation of H swells in canned prunes. The rate of formation of H swells is least in canned prunes exhausted for 10 mins. at 210° F.—apparently optimum exhaust under the conditions. Spoilage was more pronounced at all other exhausts used. At temps. below 210° F., the rate of spoiling decreased with increase in time of exhausting. At 210° F. this occurred only up to 10 mins. The rate of H formation in canned prunes exhausted for 20 and 40 mins. was slightly faster than for only 10 mins. The rate of formation of H swells decreased when the temp. at which the canned prunes were exhausted was increased to 210° F. The rate of formation under steam pressure was faster than in those exhausted at 210° F. for 10 mins. Evacuation prior to exhausting was without effect. To avoid loss of sirup during exhausting, allowance must be made for expansion in heating. Some head space is necessary and the cans should not be refilled before sealing. J. A. KENNEDY

Detection and estimation of carbon bisulfide in fumigated almonds. GEORGE MARSH AND W. V. CRUESS. Univ. of Cal. *Fruit Products J. and Am. Vinegar Ind.* 8, No. 6, 31, 34(1929).—This is a modification of the method proposed by Huff (cf.

C. A. 20, 561) for use in small gas vol. For solid samples such as almonds it is necessary to volatilize the CS_2 from the sample and collect in alc. KOH. A tentative method is given in detail. J. A. KENNEDY

Detection of rice flour in pepper powder. M. WAGENAAR. *Nahr-Untersuchungsamte*, Rotterdam. *Z. Untersuch. Lebensm.* 56, 205-8(1928); cf. C. A. 22, 1811.—The fuchsin staining method followed by microscopic examn. is not applicable to mixts. of rice flour and pepper powder. The characteristic fine network structure of the rice aleurone layer is best brought out by staining with a soln. of carmine in NH_3 and glycerol. C. R. F.

Table to be used in the determination of nitrogen and proteins in stock feeds. GUNNER JORGENSEN. *Ann. fals.* 21, 601-4(1928).—A table is given for finding directly the % N and crude proteins ($\text{N} \times 6.25$) from the cc. 0.1 N acid required per g. of sample. A. PAPINEAU-COUTURE

Phosphorus deficiency in forage feeds of range cattle. SAMUEL G. SCOTT. Mont. Agr. Expt. Sta. *J. Agr. Research* 38, 113-30(1929).—Many Montana-grown forage crops contain much Ca but very little P in proportion. This condition produces a P deficiency and Ca excess in the metabolism of cattle fed upon them and gives rise to physiol. disorders. Forage crops from areas where cattle show bone-chewing proclivities were analyzed and found to contain less P and more Ca than corresponding proclivities were unaffected areas. Soil samples from affected areas were high in Ca but apparently normal in P content. Since the crops grown on them are P-deficient the soil P is believed to be practically unavailable for plant assimilation. Drinking water from the affected areas contained only a trace of P but an av. of 56 p.p.m. of Ca. Mg does not appear to have any significant effect in causing the disorders studied. Twenty-two references are given. A. L. MEHRING

The feeding value of grass for milk production. HAROLD T. CRANFIELD. Midland Agr. and Dairy Coll. *Fertiliser, Feeding Stuffs and Farm Supplies J.* 14, 103-5(1929).—This is a general discussion summarizing the results of recent expts. to det. the relation between the stage of growth of pasture grass and its compn. and value as a food for dairy cows. K. D. JACOB

Dried grass cakes. Possibilities for conserving young, leafy pasturage. H. E. WOODMAN. *Fertiliser, Feeding Stuffs and Farm Supplies J.* 14, 105-6(1929).—Cattk. food contg. 8% H_2O and 25% protein was prepd. by drying young, leafy pasture grass and compressing it into cakes of such density that 25 cu. ft. weigh 1 ton. The product closely resembles newly mown pasture grass as regards odor and appearance. It swells and disintegrates when placed in water. Feeding expts. indicated that the product can satisfactorily replace oil cakes in the winter rations of fattening bullocks and dairy cows. The possibilities for the com. production of dried grass cake are discussed. K. D. JACOB

Determination of hoof meal. W. F. STERLING. Food, Drug and Insecticide Administration, Washington, D. C. *J. Assoc. Official Agr. Chem.* 12, 129-32(1929).—A method has been devised consisting essentially in grinding to pass a 40 mesh sieve, treating in a separatory funnel with sufficient CHCl_3 or CCl_4 to float the meaty portion, treating the washed and dried bone portion with 50 cc. 0.1 N HCl contg. 0.1 g. U. S. P. pepsin at 37-40° for 48 hrs., neutralizing with normal NaOH, washing repeatedly by decantation (preferably with centrifuging), and finally filtering, washing, drying and weighing. The wt. of residue times 1.54 = hoof meal. The method gives fairly satisfactory results when no vegetable tissue is present. A microscopic examn. of the final weighed residue should be made, and when vegetable tissue is found a correction should be applied if it is possible to est. approx. the quantity present. Efforts are being made to eliminate the interference of vegetable tissues. A. P.-C.

LARSON, CARL W.: *Dairy Cattle Feeding and Management*. London: Chapman & Hall, Ltd. 2nd ed., revised by H. O. Henderson. 450 pp. 20s. net. Reviewed in *J. Ministry Agr.* 35, 1091(1929).

Food. **SHIRLEY A. McDUGALL** (to Dextora Co.). U. S. 1,705,332, March 12. Malted milk 85 and sucrose 15% are mixed together and then with about 10% of their quantity of liquid such as water, and the mixt. is subjected to a steam pressure of about 10 lbs. per sq. in. and, after the steam is shut off, subjected to a vacuum which is gradually increased to about 27 in. in 5 mins. and continued at this reduced pressure for 15 min.

Food from wheat. **WALLACE D. SMITH and BONEITA A. SMITH.** U. S. 1,705,034, March 12. Wheat grains submerged in water are cooked under 15 lbs. pressure until the starch is hydrolyzed, cold water is added until the kernels are fully swelled, excess water is then sepd. by centrifuging and the temp. of the grain is raised to substantially the l. p.; the material is then submerged in a vegetable oil such as coconut oil at a temp. of about 205° until moisture is expelled and the grains are browned, and excess oil is sepd. by centrifuging.

Irradiating foods, etc. **G. BROWN.** Brit. 294,502, July 22, 1927. In exposure of foods to sunlight, ultra-violet or other active rays, liquids are treated in the form of a film or spray and preferably in a state of turbulence such as is obtained by passing over plates with an undulated or other suitably irregular surface. Solids are treated in thin layers on surfaces transparent to the rays used, so that the material may be radiated on both sides. The irradiation may be accompanied by elec. treatment and may be effected under pressure, *in vacuo* or in a deoxidizing atm.

Radiating foods with filtered and concentrated rays from the sun. **JACQUES W. D. CHESNEY** (to Solar Research Corp.). U. S. 1,704,173, March 5. An app. is described designed for filtering out from sunlight rays other than those between 2900 and 3700 Å. U. and concg. the rays between these limits by use of a lens or reflector for use on foods in developing the antirachitic principle.

Preserving food. **HENRY WILLIS.** Australian 10,250, Nov. 7, 1927. Eggs, fruit and vegetables are preserved by spraying them with a viscous fluid made of Irish moss or agar-agar dissolved in boiling water to which a small amt. of acriflavine or gentian violet dissolved in alc. is added.

Preserving food. **EDWARD J. R. HALLETT.** Australian 10,682, Dec. 2, 1927. Food, such as fish, is gradually cooled before being placed in cold storage by passing it through a refrigerating chamber on a conveyor upon the under side of which refrigerant is sprayed.

Apparatus for sterilizing air used in food preservation, etc. **W. S. LEECH and A. E. SHERMAN.** Brit. 294,586, Jan. 27, 1927. The air may be passed through a spray contg. nascent O formed from freshly admixed solns. of HCl and KMnO₄.

Preventing fermentation in dough prior to baking. **ADALBERT JARABEK.** Austrian 112,123, Sept. 15, 1928. The dough, prepd. for baking, is placed in an airtight container and subjected to a sufficient pressure, *e. g.*, by forcing in CO₂, to prevent evolution of gas from the dough.

Preserving milk, etc. **G. PARCUS** (to F. Seidel and A. Giani). Brit. 294,903, July 28, 1927. Sterilization of milk or other nutrient liquids is effected at a raised but non-injurious temp. (suitably below 66° with milk) under vacuum by elec. treatment and the liquid is then cooled and hermetically sealed in containers. An app. is described.

Cheese. **JOSEPH R. BREHM.** U. S. 1,704,458, March 5. A hydrolyzed protein decomposition product such as one prepd. from casein or yeast is mixed with a milk material inoculated with a pure culture of *Lactobacillus acidophilus* in the proportions of 100 times as much milk as of original dried protein, max. growth of the added culture is established at a temp. of about 37° and inoculation to a new medium is effected each time the milk is coagulated (or once a day if the coagulation period is shorter than a day), and the prepd. bacterial cultures thus obtained are used as starters in fermenting milk to produce cheese.

Apparatus for drying fish flour or similar material. **E. L. RICHARDSON and W. WEST.** Brit. 294,914, April 29, 1927.

Apparatus for curing meat by smoking. **LEO BRAND.** U. S. 1,704,650, March 5. **Fatty acids.** **HERMANN WEYLAND and STANISLAUS DEICHSEL** (to Winthrop Chemical Co.). U. S. 1,703,129, Feb. 26. The fatty acids contained in the fraction of the raw coemic acids, b₁₀ 163–80°, is converted into the corresponding methyl ketones (suitably mixing with glacial HOAc and passing at 450° over thoriated pumice),

the ketones thus obtained are treated with an oxidizing agent such as $\text{Na}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 and the resulting mixts. may be converted into the polybasic alc. esters by reaction with glycerol. The products may be used as *foods by diabetic persons*.

Chocolate. A. NYROP. Brit. 294,790, Sept. 14, 1927. The initial materials, instead of being subjected to intensive grinding, are liquefied and atomized into heated air or other suitable gas; the powder thus obtained may be pressed into molds. Various details of prep. the materials, etc., are given.

Chocolate-treating apparatus. BAKER, PERKINS, LTD., and SOC. ANON. DES ANCIENS ÉTABLISSEMENTS A. SAVY, JEANJEAN ET CIE. Fr. 645,767, Dec. 15, 1927.

Apparatus for producing refined cacao juice. BAKER, PERKINS, LTD. and SOC. ANON. DES ANCIENS ÉTABLISSEMENTS A. SAVY, JEANJEAN ET CIE. Fr. 645,838, Dec. 17, 1927.

Apparatus for continuous expelling and clarifying of fruit juices. FRED W. MANING. U. S. 1,703,535, Feb. 26.

Preserved fruits and preserves. CHARLES FRAISSE. U. S. 1,703,730, Feb. 26. Fruit is placed in sirup the progressive increase in density of which is effected by diffusion of the denser sirup placed under pressure toward a weaker bath, through a wall which is provided with fine perforations. An app. is described.

Preserving figs. THOMAS C. MOORE (to Mor-Pak Preserving Corp.). U. S. 1,704,367, March 5. Figs are perforated and placed in a lye bath to remove milk draining from the perforated figs and to soften the skins, and then placed in hot water and agitated to remove the skins and wash the figs.

Apparatus for brushing fruit and treating it with paraffin or the like. ALBERT HAWORTH (to Brogdex Co.). U. S. 1,703,144, Feb. 26.

Treating fresh fruits to prevent decay. WILLIAM R. BARGER (to the Government and people of the U. S.). U. S. 1,704,456, March 5. In treating citrous fruits to prevent decay such as that caused by *Penicillium digitatum* and *Penicillium italicum* an aq. soln. is used contg. 0.5-4% of CdSO_4 and contg. also CdCl_2 0.5-4%.

Treating citrous fruits to prevent decay. WILLIAM R. BARGER (to the Government and people of the U. S.). U. S. 1,704,072, March 5. Fresh fruits such as citrous fruits are treated with a 0.5-4.0% CdSO_4 soln. to prevent decay such as that caused by *Penicillium digitatum* and *Penicillium italicum*. U. S. 1,704,073 specifies the similar use of a CdCl_2 soln. of 0.5-4.0% strength.

Beverages. HERMANN HOFER-MASSARD. Fr. 645,120, Dec. 5, 1927. A beverage or sirup which will keep indefinitely is prepd. by mixing milk with ground fruits, e. g., almonds, fruit juices or parts of plants, sepg., condensing and sterilizing the liquid which then contains the fatty, mineral and aromatic substances of the fruit. The product may also be used as a *cosmetic* for the care of the skin.

Animal food. CHRISTIAN N. KJAERGAARD. Fr. 644,732, Nov. 29, 1927. An animal food contains dregs of dried barley 40, sugar-beet parings 20, wheat bran 10, barley flour 10, molasses 7, dry yeast 5, powd. blood 4, malt germ 2 and salt 2%.

Preserving green food materials. KARL SCHMIDT. U. S. 1,703,782, Feb. 26. Part of the air and other gases are withdrawn from material such as grass or other green fodder while at the same time the material is subjected to pressure and a bactericidal gas such as CS_2 vapor is introduced into it. U. S. 1,703,783 also relates to app. for similar purposes.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

Chemical engineering memoranda. VIII. Flue gases and waste heat in drying and calcining practice. CHARLES H. BUTCHER. *Ind. Chemist* 5, No. 48, 25 (1929) — B. continues his series of calcns. using the lb.-mol. system. Calcns. are given to show a convenient method of computing certain data which will be useful in the design of oil-fired drying and calcining plants.

Chemical engineering building at Iowa State College. LIONEL K. ARNOLD. *J. Chem. Education* 6, 292-8(1929).

Fellowships and graduate work in chemical engineering at the University of Michigan. EDWIN M. BAKER. *Ind. Eng. Chem., News Ed.* 7, No. 5, 6-7(1929).

Our foreign trade in chemicals and related products in 1928. OTTO WILSON. *Ind. Eng. Chem.* **21**, 300-4 (1929). E. H.

The possibilities of developing new industrial markets for farm products. RUDOLF A. CLEMEN. Armour and Co., Chicago, Ill. Agr. Expt. Sta., *Circ.* **339**, 1-24 (1928). Chem. utilization of waste and unused farm products is recommended. Corn sugar from corn, fructose from Jerusalem artichokes, casein from milk, furfural and paper from straw, corncobs and cornstalks, and new uses for cotton are advocated. C. R. F.

Patentability of broad claims based on an inadequate disclosure denied. LLOYN V. LOREN. *Ind. Eng. Chem., News Ed.* **7**, No. 5, 2 (1929). E. J. C.

The application of pH control. W. A. TAYLOR. La Motte Chemical Products Co., Baltimore, Md. *J. Chem. Education* **6**, 36-43 (1929); cf. *C. A.* **22**, 4192.—Control of pH is discussed in relation to water purification, corrosion, sewage digestion, treatment of textile wastes and wool-washing liquors, sizing paper and recovery of valuable material from white water of paper mills, making dyes and pigments, manuf. of various salts, analytical seps, electroplating, fermentation, jelly making, canning foods and soil management. W. C. EBAUGH

Solvent recovery. JOSE VIDAL. *Quim. e. ind.* **6**, 1-4 (1929).—Et₂O and EtOH are recovered in the varnish, paint, plastic, dye, cellulose, explosive, Chardonnnet silk, peramoid and artificial leather and perfume industries. Benzine is recovered in the rubber, artificial leather, paint, varnish and fatty-acid industries. (CH₃)₂CO, CS₂, amyl acetate, CCl₄ and MeOH are also recovered. V. gives a graph showing the amts. of Et₂O, EtOH and CS₂/satd. cu. m. of air, and considers recovery by (a) condensation over cold surfaces, (b) condensation by expansion and (c) soln. with subsequent evap. with 3 line layouts. S. L. B. ETHERTON

Quantitative relations of the counter-current washing process. SMITH D. TURNER. Humble Oil and Refining Co., Baytown, Texas. *Ind. Eng. Chem.* **21**, 190 (1929).—A simplification of the equations suggested by Silberstein (*C. A.* **22**, 3938) is offered to apply to cases when a system of N tanks is considered, $\tau/L = W(A^{N+1} - A)/(A^N - 1)$, where L = wt. of solute recovered, W = wt. of solute fed, N = number of tanks and τ = wt. of liquor transferred as liquid/wt. of liquor transferred adhering to solid. W. C. EBAUGH

A comparative study of World War casualties from gas and other weapons. HARRY L. GREENGLASS. *Separate* 51 pp (1928). F. H.

Electrical insulating materials from the chemical standpoint. W. H. NUTTALL. *Trans. I. & Rubber Industry* **4**, 313-35 (1928); cf. *C. A.* **23**, 1701.—A crit. review and discussion of the subject, dealing with dielec. strength (breakdown voltage), dielec. const., insulation resistance, the insulating properties of various substances, sp. inductive capacity and the relation between dielec. const. and chem. constitution. Graphs and tabulated data show the variation of breakdown voltage with the thickness of dielectric, decrease of breakdown voltage with the temp. (varnished cloth, paper, mica, Muller board, mica and varnished paper), the effect of heat-conducting electrodes on the time of breakdown, the effect of water in oil on the breakdown voltage, water absorbed by varnished films in water, the insulation resistance of moist, and varnished cotton, the variation of capacity with temp. of the impregnating oil, the relation between dielec. const. and the combined S. Also in *India Rubber* **77**, 227-30, 263-8 (1929). C. C. D.

Air purifying. OSCAR MURY, MARC PELET and SOC. D'ENTREPRISE ET D'EXPLOITATION ATELIERS D'ARLOD. Fr. 33,416, Apr. 30, 1927. Addn. to 620,108. In a centrifuge for sepn. of dust, etc., from air or gases, the series of flat plates of the prior case are replaced by superimposed cones which may be curved inwardly at the inner outer edges.

Gas-liquefaction plant. STUDIENGESellschaft FÜR GASINDUSTRIE M. B. H. Fr. 645,168, Dec. 5, 1927.

Separating gaseous mixtures. IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 645,564, Dec. 12, 1927. Gaseous constituents of different density in a mixt are sepd in a centrifugal app. the rotor of which has a peripheral speed of at least 600 m. per sec.

"Cold accumulators" or recuperators for use in separating gases by liquefaction. M. FRÄNKL. Brit. 204,944, Aug. 1, 1927. Structural features.

Rectification system for separating oxygen and nitrogen or other gases by liquefaction. W. L. DE BAUFRE (to S. G. Allen). Brit. 204,994, Jan. 3, 1927.

Recovering adsorbed gases. METALLGES. A.-G. (Georg Müller, inventor). Ger. 470,727, Feb. 7, 1924. In recovering gases or vapors adsorbed in media such as C. or silica gel by external heating, with or without internal heating, of a vessel contg the medium, a part of the used heating gas is mixed with fresh heating gas so as to avoid the application of too high a temp. The heating gas is preferably free from O so that part can be diverted and used for sweeping out the vessel. App. in which the heating gas is used in a cycle is described.

Rectification of gaseous mixtures. SAMUEL G. ALLEN. Fr. 645,259, Oct. 29, 1927. An app. is described for rectifying air, etc., by liquefaction in which both trays and tubes are used in the column, heat exchange taking place only in the tubular portion. More gas is compressed than is rectified and an external cycle gives auxiliary cooling. Fr. 645,260 describes an app. for the same purpose in which more gas than is to be rectified is compressed to a pressure just sufficient to ensure its liquefaction by the cooling effect of the gas being rectified.

Desulfurizing gases. WALTER RAFFLOER. Ger. 470,844, June 3, 1927. Desulfurization is effected by passing the gas through layers of finely divided purifying material at such a velocity that the material is whirled in the gas stream. The treated gas traverses a cyclone separator from which the purifying material is returned for re-use.

Use of gases such as ammonia in a boiler and turbine to generate power. ALLGEMEINE ELECTRICITÄTS GES. (to International General Electric Co.). Brit. 204,882, July 30, 1927. An app. is described.

Crystallization. CHEMISCHE FABRIK GROSS-WEISSANDT. G. M. B. H. Fr. 645,365, Dec. 7, 1927. See Ger. 467,233 (*C. A.* 23, 655).

Crystallization. APPAREILS ET ÉVAPORATEURS KESTNER. Fr. 645,080, Dec. 2, 1927. Substances which liberate heat on crystn., such as NH_4NO_3 , are crystd. by submitting a warm satd. soln. of the substance to energetic stirring and exposure to an air circulation sufficient to remove moisture liberated by evapn. caused by crystn.

Colloidal solutions. ODERBERGER CHEM. WERKE A.-G. Ger. 470,837, May 30, 1922. Colloidal solns. of high concn. are prepd. by intensive mech. disintegration in the presence of the dispersion medium, a protective colloid, and an electrolyte, e. g., NaCl, preferably in an amt. normally sufficient or nearly sufficient to effect flocculation. The prepn. of colloidal solns. of S and Fe_2O_3 is described by way of an example.

Filtering material. MAX LEHMANN. Fr. 645,610, Dec. 13, 1927. Silk in the wild state is used as a filtering material for warm, acid or alk. gases or liquids.

Refrigerating liquid. A. L. FABER & Co. G. M. B. H. and GEORG REINHART, JR. Fr. 645,054, Dec. 2, 1927. A refrigerating liquid of low f. p. is obtained by mixing an aq. soln. of $MgCl_2$ and an aq. soln. of KCl or NH_4Cl .

Refrigerant. FRANK C. MALIN and ALFRED E. GEORGE. Australian 9902, Oct. 7, 1927. A refrigerant which will function at low pressures and which will gradually gasify when allowed to expand contains CH_2Cl 80-94, SO_2 6-3, Br 4-1, CCl_4 10-2%.

Refrigerators. FRANK C. MALIN and ALFRED E. GEORGE. Australian 10,140, Oct. 31, 1927.

Refrigerators. FABRIQUE D'APPAREILS ÉLECTRIQUES FR. SAUTER S. A. Fr. 645,366, Dec. 7, 1927.

Absorption refrigerator. SULZER FRÈRES (S. A.). Fr. 645,368, Dec. 7, 1927.

Refrigerating apparatus. PLATEN-MUNTERS REFRIGERATING SYSTEM AKTIEBOLAG. Ger. 471,028, July 27, 1926. Absorption refrigerating machines in which an inert gas passes through the evaporator and the absorber are constructed so that the cold must from the evaporator cools the inert gas passing back from the absorber to the evaporator and also the unevapd. refrigerant passing to the evaporator from a second evapng. chamber serving to cool the rectifier or water-separator.

Refrigerating system of the absorption type. NAAMLOOZE VENNOOTSCHAP KODOWA REFRIGERATOR CO. Brit. 294,999, Aug. 4, 1927.

Refrigerating system of the reversing absorption type. SULZER FRÈRES SOC. ANON. Brit. 295,009, Aug. 6, 1927.

Refrigerating system of the automatic circulation type. CLYDE E. MOLESWORTH, JOHN DUDMAN and CARL G. ZOKELT. U. S. 1,703,351, Feb. 26.

Thermostatic control system for refrigerating apparatus. ALFRED M. THOMSON (to Leop. Mercadante). U. S. 1,704,352, March 5.

Thermostatic and pressure control of refrigerating systems. THOMAS SHIPLEY (to York Ice Machinery Corp.). U. S. 1,703,965, March 5.

Thermostatic- and pressure-actuated control devices for refrigerating systems. GEORGE M. TROUP (to Frigidaire Corp.). U. S. 1,704,522, March 5.

Insulating material. I. G. FARBENIND. A. G. Fr. 645,621, Dec. 13, 1927. Waterproofing substances such as natural or artificial resins, asphalts, paraffins or waxes are added to impermeable and insulating materials made from nitrocellulose varnishes and triethyl phosphates.

Heat- and sound-insulating masses. REMED G. M. B. H. Ger. 471,047, Feb. 5, 1924. Waste cellulosic products, e. g., cork waste, are treated with $NaOH$ and CS_2 in a known manner so as to effect superficial conversion into viscose, and the product is molded without the application of high pressure. The masses so obtained are dried at a temp. not exceeding 50° .

Vacuum jackets for heat insulation. I. G. FARBENIND. A.-G. Brit. 294,170, July 19, 1927. Residual gases are absorbed from the vacuum jackets of vessels for holding liquid air, etc., by use of materials such as dehydrated chabasite or alumina or silica gels or similar materials.

Electric and thermal insulation. ANDRÉ A. SAMUEL. U. S. 1,704,629, March 5. S. chloride is caused to react on a condensation product of a phenol and a reactive CH_2 compound such as CH_2O to obtain a product which may be worked like wood.

Electric insulation. J. E. G. LAHOUSSE. Brit. 294,931, Aug. 1, 1927. In prepg. insulating paper impregnated with metal resinsates such as described in Brit. 275,958 (C. J. 22, 2121), the paper during manuf. is admixed with a metal oxide such as ZnO and then impregnated with resin (suitably at a temp. of $120-200^\circ$) to form the resinate.

A century of the Pittsburgh waterworks. E. E. LANPHER. *Proc. Eng. Soc. West. Penn.* 44, 331-46(1929). E. H.

Water supply of Berlin. KÜHNE. *Gas u. Wasserfach* 72, 11-16(1929).—A de- R. W. R.

Iodine in the public water supplies of Massachusetts. H. W. CLARK. *J. New Eng. Water Works Assoc.* 42, 132-6(1928); *Pub. Health Eng. Abs.* E-711, 4.—Very wide variations occurred among the 97 water samples analyzed for I. The usual range

was from 0 to 4.3 p. p. b. The very diverse soil and rock characteristics are considered as contributing factors in I distribution in the water of Mass. C. R. F.

Potable-water supply. E. FOURNIER. Faculté Sci. Besançon. *L'Eau* 21, 179-80 (1928).—In limestone areas, ground waters should be the subject of the closest scrutiny, because of the danger of remote contamination. The use of fluorescein in the detection of polluted sources is advocated. C. R. F.

Water and its hygienic role. H. LABBE. Faculté Med. Paris. *L'Eau* 21, 181 (1928). C. R. F.

Are your wells and reservoirs contaminated? HARRY F. FERGUSON AND CLARENCE W. KLASSEN. *J. Am. Water Works Assoc.* 21, 50-65(1929); cf. *C. A.* 22, 4680. D. K. FRENCH

The underground water from the oil field of Akita. ITSURO MIKAWA. *Tôhoku Imp. Univ. (In Japanese.) J. Jap. Min. Ind.* 44, 563-70; *J. Geol. (Japan)* 35, 110-11(1928).—The notable thing in the underground water from the oil field of Akita is that the sulfate content is small and the Na and Cl contents are large. Ca and Mg are not present in large quantities. Carbonate, high in foreign waters of this kind, is low. This confirms the theory that this is a kind of remanent sea water, left at the time of sedimentary rock formation. K. SOMEYA

Ground-water volume as related to measurable precipitation. CHR. MEZGER. *Gas u. Wasserfach* 72, 25-31(1929). R. W. RYAN

Comments on methods for determination of residual chlorine. LINN H. LINDSEY. *Md. Water and Sewerage Assoc.*, Apr. 1928, 39-49; *Pub. Health Eng. Abs.* E-711A, 13.—In applying the *o*-tolidine test for the detection of residual Cl in highly buffered waters, sewage, and trade wastes, 0.5 cc. of the reagent contg. 18-20% HCl should be used to each 15-20 cc. of sample. When interfering substances are present in the water or sewage the result may be corrected by collecting samples just before and after the Cl soln. is applied. *o*-Tolidine is added to both samples and the results are caused by the interfering substances compensated for. Fe does not interfere with the *o*-tolidine-HCl test. Manganic compds. render the test useless. C. R. F.

False results of the *o*-tolidine test for residual chlorine. LEROY FORMAN. *Pub. Health News* 13, 282(1928); *Pub. Health Eng. Abs.* E-699C, 94.—Because of high residual Cl found in a chlorinated surface water supply by the *o*-tolidine method, an investigation was made to find the interfering substances. The trouble was found to be due to Mn. It is known that manganic salts interfere with the test but expts. showed that when manganous salts are converted to the hydrate with NaOH, oxidation takes place rapidly and hydrous oxides give the color reaction with *o*-tolidine. It is suggested that a residual-Cl test be made on the unchlorinated as well as on the chlorinated water in order to correct for interfering substances. C. R. F.

Algae control by chlorination at Kansas City, Kansas. L. B. MANGUN. *J. Am. Water Works Assoc.* 21, 44-9(1929).—The reservoir in question was a 13 million gal. part of the distribution system. During a five-month period annually algal growth was luxuriant. CuSO_4 could not satisfactorily be applied in the large distribution reservoir. Chlorination was tried and found most successful. The concn. of Cl in the inflowing water where treatment was applied averaged 5 p. p. m. D. K. F.

The sterilization of sea water by ozone. Application of the method to purification of contaminated shellfish. H. VIOLE. Univ. Marseille. *Rev. hyg. méd. publ.* 51, 42-6 (1929).—Ozone is a powerful disinfectant for sea water. Sea water, seeded heavily with each, *B. typhosus*, *B. coli*, *B. proteus*, *V. cholerae*, *B. pyocyaneus* and *B. dysenteriae*, in Wood flasks became sterile after 7-8 mins. of ozonization. Ordinary surface sea water contains I only in org. combinations in which form the I is unaffected by ozone. To prove that the sea water contained no bactericidal substance, ozone was bubbled through sea water for 15 mins. and after aeration for a few sec., bacterial suspensions were added. After 18 hrs. incubation, samples were withdrawn into broth. All showed active growth. Lab. expts. using contaminated oysters were made. The ozone was twice the concn. necessary to sterilize the sea water. The water was changed twice daily. The oysters were sterile after 5-6 days but 15 days is considered the max. time necessary to purify oysters by ozone. The appearance, vitality and flavor of ozone-treated oysters were normal. C. R. F.

The diurnal variation of the gaseous constituents of river waters. IV. ROGER W. BUTCHER, FREDERICK T. K. PENTELow AND JAMES W. A. WOODLEY. Government Lab., Strand, London. *Biochem. J.* 22, 1478-80(1928); cf. *C. A.* 23, 458.—The factors governing the dissolved O content of river water are the time of day in connection with the processes of photosynthesis and respiration; the season of the year; the prevailing actinic conditions; the phys. characters of the river; temp. variations; the

ln. of O from the air; and the degree and nature of the pollution. Throughout the run the pH curves were very similar in structure to those of satn. of O. The concn. CO_2 is roughly inversely proportional to that of O_2 . BENJAMIN HARROW

Report of the water-softening and purification works for year 1927. CHARLES HOOVER. Ann. Rept. Div. of Water and Sewage Disposal, (Columbus, Ohio). *Supplement to City Bull.* 1927, 52-9; cf. *C. A.* 23, 656.—An av. of 28.5 million gals. of water softened and filtered each day. The per capita usage per day is 98 gals. To reduce the hardness of the water from an av. of 230 to 87 p. p. m., 25.4 tons of soda ash and 215 tons of CaO are required. The cost of CaO , soda ash, alum and Cl per million gals. is \$14.00. The treatment reduces the turbidity from 121 p. p. m. to 0. An av. flow of 21 p. p. m. is reduced to 1. A carbonation plant was built consisting of gas holder, burner, return tubular boiler, steam driver, air compressor, diffuser, and a carbonation scrubber and dryer. Coke is used as the fuel. An av. of 261 lbs. CO_2 added per million gals. of water. This requires 87 lbs. of coke, the av. for 4 months in 1927. C. R. F.

Concentration control provides good quality boiler-feed water. LUCIUS A. FRITZ. In ELWOOD W. SCARRIT. Elgin Softener Corp., Elgin, Ill. *Power* 69, 346-9(1929).—Boiler water is circulated through a settling tank which may be inside or outside the boiler. Flocculent solids rise; heavy, scale forming solids settle, and clarified water returned to the boiler from near the center of the tank. From 25 to 150% of the boiler capacity may be treated, the proportion depending on conditions.

Phosphate in boiler-water conditioning. R. E. HALL, et al. *J. Am. Water Works Assoc.* 21, 79-100(1929).—The disadvantages of soda ash, previously suggested for boiler water conditioning, are outlined, and phosphate, which possesses none of them, is recommended. A discussion of foaming follows, which stresses the importance of dissolved solids as a producing factor and of alk. salts of tannic and other org. acids, as well as the Ca ion, as preventives. Many water-insol. materials with foam-resisting characteristics are mentioned. D. K. FRENCH

A non-chemical method for the prevention of scale accumulation in boilers, Diesel engines, and water circulating systems in general. A. T. RIBOUT. *Domestic Eng.* London, 48, 163-5(1928). The system described utilizes colloids in feed water. The starch is extracted in a colloidal form from linseed without extn. of the oil by steam treatment of the seed in a cast steel receptacle with a perforated canister. The carbonates are infused in a colloidal condition. The oil is not extd., because no crush-mechanism is brought about. The starches are extd. in about 24 hrs. and 1 lb. (453.6 g.) of seed is sufficient for 2000 gals. (7570 l.) of feed water. The cost of up-keep is low; the cost of installation and the difference in space occupied as against a water softener are small. Acid attack of the boiler and galvanic action have been arrested. It is noted that salt water feed is possible. Bare plates are impossible, because the colloid is deposited at the junction of the water and the plates. This results in the formation of a thin film of protective scale, which is easily removable. W. H. BOYNTON

Corrosion of metals in water-distribution systems. F. N. SPELLER and E. L. CHAPMAN. *J. Am. Water Works Assoc.* 21, 40-3(1929).—Corrosion is principally due to dissolved O in water. The results are either choking up with rust or penetration. The former condition can sometimes be overcome. Deaeration, chem. treatment, and the application of pipe coatings or linings all have value as preventives. D. K. FRENCH

The automatic formation of a protective film from cold water in iron pipes. (1). The adsorption of carbon dioxide by ferric hydroxide. J. TILLMANS, P. HIRSCH and P. SCHMIDT. *Gas u. Wasserfach* 72, 49-53, 78-82(1929).—Quant. evidence is given for the adsorption of CO_2 by $Fe(OH)_3$. The $Fe(OH)_3$ formed in the rusting process in water containing lime and aggressive CO_2 adsorbs CO_2 from the interface, and if the excess of CO_2 is small, may upset the lime- CO_2 equil., so that the water becomes supersaturated with respect to $CaCO_3$, which is then deposited, restoring the equil. As the water now contains less free and bound CO_2 , the $Fe(OH)_3$ - CO_2 equil. is disturbed and CO_2 given up to the soln., so that the water becomes aggressive again. Once formed, the $CaCO_3$ crystals are built up by successive repetitions of the above cycle until they touch and form a protective coating with the aid of the $Fe(OH)_3$, which protects the iron from further corrosion. R. W. RYAN

The determination of dissolved oxygen with the micro-Winkler apparatus of Thompson and Miller. A. W. SNOKE. Univ. of Wash., Seattle. *Ecology* 10, 163-4(1929); cf. *C. A.* 22, 3319.—The app. has been found useful not only for the detn. of dissolved O where small samples (10 cc.) were necessary, but also in many cases where

the original macrochem. method would normally be used. Data on 3 samples show as great accuracy for the microchem. method as for the macrochem. method, and the former's convenience and accuracy recommend it for field work. C. R. F.

The composition of water and mosquito breeding. WILLEM RUDOLFS AND JAMES B. LACKEY. *Am. J. Hyg.* 9, 160-80(1929).—Data are furnished correlating the chem. compn. of H_2O and biol. growth in it with the abundance of mosquito breeding. Larvae are killed within 24 hrs. when the p_H of natural H_2O is changed rapidly, while a gradual change in reaction fails appreciably to affect the death rate. It is possible that under certain conditions waters with low p_H values are more favorable to mosquito breeding than those with medium or high p_H values, and *vice versa*. Breeding of *Culex* occurs in liquid contg. from 15 to 120 p. p. m. free NH_3 . Apparently, albuminoid N_2 present in quantities ranging from 0.4 to 9.6 p. p. m. does not affect breeding. Breeding of *C. pipiens* in liquid contg. 42 p. p. m. of N_2 in this form has been observed, and interesting data are given describing the employment of various compounds in artificially changing the reaction of waters in which larvae were introduced. The relation between the no. of microscopic animals and plants with mosquito breeding is stressed. Tables and graphs illustrating the salient facts presented are furnished, and a bibliography is appended. FREDERICK G. GERMUTH

Comparison of numbers of *B. coli* in iced and uniced samples of water. G. ELLISON, H. W. HACKLER AND W. A. BUICE. *Southern Med. J.* 21, 948-9(1928); *Pub. Health Eng. Abs.* E-699C, 96.—Duplicate samples of water (1 iced and 1 uniced) were collected and shipped to the lab. for analysis. The time required for shipment prior to planting was 20 to 72 hrs. Sixty samples were examd. from 12 sources and the examn. was in accordance with Standard Methods, Am. Public Health Assoc. Seventeen of the uniced samples showed more *B. coli* than the iced duplicates. Thirty-eight samples were in agreement with their duplicates. Of the iced samples 62% gave pos. tests for fecal coli. In uniced duplicates, 67% gave pos. tests for fecal coli. In all cases ice was completely melted when the samples were received. In all instances but one, the iced samples were cooler than the uniced when received. C. R. F.

Pollution and natural purification of the Illinois river. T. C. SCHAEZLE. *J. Am. Water Works Assoc.* 18, 753-6(1927).—An abstract of Public Health Bulletin No. 171 dealing largely with the effect of Chicago's diluted sewage and waste on the river. D. K. FRENCH

Use of chlorine in sewage treatment. A. L. FRICK. *Ariz. State Bd. Health, Bull.* July, 1928, 29-31.—Cl absorption by sewage effluents is extremely rapid, the reactions being completed in 10 mins. It is necessary thoroughly and rapidly to mix the Cl with the sewage. Dosage of Cl varied considerably, but 5-15 p. p. m. gave the best results. The dosage must be varied according to conditions to reduce the costs to a minimum. C. R. F.

Tests (of sewage) at Davis, Porterville and Livermore, Calif. E. A. REINKE. *Sewage Works J.* 1, 61-3(1928).—A Cl dosage of 10 p. p. m. was necessary to control odors in Imhoff tanks. Smaller quantities of Cl were helpful in reducing H_2S , but were not considered satisfactory. CaO , which raises the p_H of the sewage from 6.6 to 7.4, proved to be of little value. C. R. F.

Composition and decomposition of fresh sewage solids collected from different parts of a settling tank. H. HEUKLEKIAN. *Sewage Works J.* 1, 19-30(1928); cf. C. A. 22, 1205; 23, 459.—Fresh solids were collected in suspended pails from the Plainfield, N. J., Imhoff tanks and incubated in bottles at 15.5-20°. Fat and N detns. were made on the dried samples obtained from both seeded and unseeded fresh sludges. Both the fat and the content of solids collected from the inlet of the tanks were uniformly lower than those from the outlet. In the unseeded samples the time of digestion was lowest for the outlet samples, presumably because of the high % of cellulose in the material at the inlet. When the fresh solids were seeded with ripe sludge in the ratio of 2:1, the rate of gas production of outlet samples was highest in 1 expt., but when repeated was lowest. Likewise the total yield of gas in the first expt. was highest for the outlet sludge, and in the second test was lowest. The conclusion is that the total yield of gas is not correlated with the fat content of the sludge. C. R. F.

Effect of age of sewage solids upon their digestibility. GORDON M. FAIR AND LOUIS KLEIN. *Sewage Works J.* 1, 14-9(1928); cf. C. A. 22, 1203. Expts. to det. the effect of age upon the Imhoff digestion process were conducted at 2 plants: 1 at Fitchburg, Mass., treating a domestic sewage, and the other at Brockton, Mass., where considerable leather-working wastes are present. Sewage solids were collected in pails suspended in the settling tanks, and after standing for definite intervals of time were mixed with well-digested sludge in the ratio of 2 to 1. These mixts. were then

placed in sealed glass bottles, where the gas formation and p_H could be observed. The results were not entirely consistent. There is seemingly no regular and progressive deterioration of the digestibility of fresh sewage solids that are left unseeded. Their behavior is different during various intervals of time. In the absence of interfering industrial wastes, however, it seems desirable that the settling solids reach the digestion tanks as soon as possible, even though at certain periods of decompn., unseeded material will digest very readily. In the presence of certain trade wastes or other modifying factors, digestion may proceed better if the solids remain unseeded for a limited number of days. C. R. F.

Deterioration of materials caused by the action of sewage and sewage gases. H. A. WOOD. *Australian Munic. J.* Aug. 31, 1928; *Pub. Health Eng. Abs.* E-711B, 5.—A central pumping station at Sydney pumps the sewage 2.7 miles to the head of the outfall sewer, which is connected by gravity flow to the sewage farm 16 miles away. H₂S is present in large amts. The total solids average 2600 p. p. m. and suspended solids 250 p. p. m. The H₂S causes profound deterioration of concrete, mortar, metals and cement walls. An impermeable surface was obtained with vitrified tile closely joined so as to produce a minimum of exposed permeable material. C. R. F.

Sewage filters. F. H. WARING. *J. N. Carolina Sect. Am. Water Works Assoc., Proc. 7th Ann. Meeting* 5, 191-200(1927).—A discussion of trickling-filter operation including the necessity of such lab. tests as the methylene blue, dissolved O, biochem. O demand and nitrate detus. C. R. F.

The control of foaming and odors of Imhoff tanks. CHESTER COHEN. *Sewage Works J.* 1, 58-61(1928).—Expts. carried on in Texas for 90-day periods showed that when Cl was applied to crude sewage in a dosage of 20 p. p. m., no residual Cl could be detected in the tank effluent. A Cl dosage of 3 p. p. m. from 8 A.M. to 5 P.M. was sufficient to control foaming but continuous addn. of the Cl was necessary to prevent objectionable odors. CaO also was used to condition the sludge in an attempt to control foaming and odor but with unsuccessful results. C. R. F.

The activated-sludge process. A. KUFFERATH. Berlin. *Z. angew. Chem.* 42, 65-7(1929).—Berlin with 4 million people has to treat 160 l. of sewage per capita per day. The purification process is described. The optimum p_H value for the process is 7.2. The addn. of small amts. of FeCl₃ or FeSO₄ proved beneficial. The sludge analyzed 63% H₂O, 0.77% N and 0.28% P₂O₅. The cost per 100 kg. is approx. 3 M. C. R. F.

Activated-sludge progress and problems. A. J. MARTIN. *Proc. 10th Tex. Water Works School* 1928, 266-72; *Pub. Health Eng. Abstracts* E-676B, 65. C. R. F.

Bacteriological isolation and study of the filamentous organisms in the activated sludge of the Des Plaines River sewage-treatment works. C. C. RUCHHOFT AND J. H. WATKINS. *Sewage Works J.* 1, 52-8(1928).—A species of *Sphaerotilus* occurs in great abundance. Dextrose is required for optimum growth in lab. media. Expts. indicate that 500 p. p. m. of CaO dissolves or disintegrates the filaments in a short time. Amts. under 100 p.p.m. have little effect on the sludge in which the organism occurs. C. R. FELLERS

Carbohydrate wastes stimulate growth of undesirable filamentous organisms in activated sludge. R. H. MORGAN AND A. J. BECK. *Sewage Works J.* 1, 46-51(1928).—The illicit distg. and fermentation industries of certain Chicago areas seriously affect the operation of the activated-sludge plant on the Des Plaines River. Dextrose was present at times to the extent of 10,400 p. p. m. or 12,800 lbs. per day, thus enormously increasing the biochem. O demand. The regular treatment became ineffective. Bulking of the sludge occurred due to *Sphaerotilus* growth encouraged by the presence of carbohydrates. Expts. with various chemicals, except CaO proved, negative. CaO greatly improved the condition but complete relief was obtained only after diversion of the sugar sewage. C. R. FELLERS

Sanitation of bathing beaches. WARREN J. SCOTT. *Conn. Health Bull.* 42, 166-72(1928); *Pub. Health Eng. Abs.* E-711C, 1.—A pollution standard of an av. of not over 1 *B. coli* per cc., with a max. of not over 10 per cc., is suggested for bathing beaches. C. R. FELLERS

The treatment of organic wastes. W. WEAVER. Birmingham Corp. Salvage Dept. *J. Roy. San. Inst.* 49, 479(1929); cf. *C. A.* 23, 227.—Substances that would produce obnoxious odors are burned. Grease is extd. with benzene. The Iwel Fry Rendering Process has been adopted. Vegetable refuse treatment consists in de-watering of the waste. A. L. E.

The treatment of industrial wastes. EDGAR WHEDBEE. *Proc. 10th Tex. Water Works School* 1928, 273-83; *Pub. Health Eng. Abs.* E-676B, 65. C. R. FELLERS

Disposal of industrial wastes. F. W. MOHLMAN AND A. J. BECK. *Ind. Eng. Chem.* **21**, 205-10(1929); cf. C. A. **20**, 3765.—Steepwater is concd. and used with other parts of the corn in stock food. Escape of gluten and starch by overflow is prevented. Loss of sol. matter is prevented by recirculation and evapn. These changes reduce a potential population equiv. of 400,000 to 50,000—75,000. Vapors from evapn. of steepwater contain volatile acids, 50% propionic, and alcs., mainly ethyl. Some entrainment losses occur. Since 80% of the O-demand substances distil in the first 15% of distillate, by stripping this it should be possible to eliminate treatment of the balance of the steepwater distillate, reducing the population equiv. by about 32,000. Refinery wash water cannot be handled by activated sludge but a trickling filter at 1.5 m. g. d. per acre reduces the O demand over 90% and would reduce the population equiv. to about 13,000. It may be possible to reduce the population equiv. of the plant to 20,000. Waste from a paint plant reduced the efficiency of the Calumet Treatment Works, cutting activated-sludge tanks from 2 m. g. d. to 1 m. g. d. each and increasing the air required by 200%. The waste made the sewage more acid, decreased dissolved O, increased the O demand and decreased bacterial action. The principal wastes were H_2SO_4 waste from *p*-nitroaniline, Cu and As from Paris green and sodium sulfite waste from the manuf. of β -naphthol. The total vol. including miscellaneous wastes was 2.0 m. g. d. in a total for the Calumet plant of about 40 m. g. d. Neutralization of the acid waste is possible with CaO or $CaCO_3$. For the present it is to be equalized by an 18,000-gal. tank which will bring the av. pH to 6.4 or higher. A plant is to be installed to ppt. Cu by Fe filings, arsenic is not to be removed, since it occurs less than 1.0 p. p. m. Sulfite wastes may be used for neutralizing acid sulfonation liquors, and the SO_2 can be absorbed in alkali or discharged through a stack. Treatment of these 3 wastes amounting to 60,000 gals. will probably eliminate the necessity of treating the balance.

FOSTER DEE SNELL

Purification of (sugar house) waste waters. G. A. PARK ROSS AND L. FORTIER. *REAUX DE FROBERVILLE. Suppl. circ. hebdom. centr. fabr. sucre France* No. 2011, May 27, 1928; *Chimie et industrie* **20**, 1067(1928).—A survey was made of the processes of waste-water disposal in use in Scotch distilleries and in beet-sugar factories of Northern France, to suggest a waste-water treatment suitable for the cane-sugar factories of Natal. It is recommended that all the waste waters be combined and treated either by carbonation (make alk. with milk of lime, heat to 50–52°, neutralize with CO_2 , ppt. $CaCO_3$, by heating to 90–95° and decant) or by chem. pptn. (treat with Fe sulfate and CaO , allow the ppt. to settle and decant). The sludge obtained in either process can be dried and used as fertilizer.

A. PAPINEAU COLLEGE

Experiments on the purification of beet-sugar wastes by stream flow aeration. MAX LEVINE AND A. H. NELSON. *Sewage Works J.* **1**, 40–5(1928).—A stream flow aeration process was used. The waste was forced over a series of cleats in a thin stream into a trough, thus increasing aeration. The storage tank was 80' emptied each hr. Examn. of the effluent was made after 6 and 22 hrs'. aeration. Av. results on 3 runs in p. p. m. of the raw waste and % reduction obtained by the treatment follow: Total solids, 2557, were reduced 44% in 6 hrs. and 61.4% in 22 hrs.; suspended solids, 545, were reduced 76.6 and 79.2%; org. N, 38.1, was reduced 49.2 and 65.2%; while the 5-day biochem. O demand, 1120, was increased from 67.2% in 6 hrs. to 89.6% in 22 hrs.

C. R. FELLERS

Improvements in the operation of a textile wastes treatment plant. STUART E. COBURN. *Sewage Works J.* **1**, 77–9(1928).—The wastes consist principally of spent dye liquor, washer wastes and rinse waters, and are highly colored and turbid. There is also considerable soap, dirt, wool fiber and oils. The waste flows by gravity to 5 sedimentation tanks, to the sludge-drying beds and intermittent sand filter. H_2SO_4 is used to increase the H-ion concn. to pH 6 before the addn. of alum. A clear, stable, and practically colorless effluent is obtained. The filters are cleaned but twice a yr.

C. R. FELLERS

Chemical treatment of trade wastes. V. Waste from wool washing. FOSTER DEE SNELL. *Ind. Eng. Chem.* **21**, 210–3(1929); cf. C. A. **22**, 1204. A combination of acid cracking and $Al_2(SO_4)_3$ coagulation gives an effluent suitable for discharge into a stream or for reuse. By recovery of wool grease and Al a small profit is obtained. The process is grit settlement, $Al_2(SO_4)_3$ coagulation, mech. filtration, decompn. of filter cake for Al recovery and treatment of the sepd. fat. Nitrogenous fertilizer material and potash may be, but are not necessarily by-products.

FOSTER DEE SNELL

Treatment of laundry wastes. L. E. SAKERS AND F. M. ZIMMERMAN. Mid Water and Sewerage Assoc. *Proc. Second Ann. Conference* 70–3(1928).—Wastes from a large laundry consisted of soapy H_2O , dyes, grease and dirt. Exptl. work showed that the

addn of Fe and CaO with agitation was beneficial. After settling in tanks, the settled wastes flowed through a baffled ditch to a cinder bed. Ten lbs. of CaO and 2.5 lbs. of FeSO_4 were added to each 1000 gals. of waste H_2O at a cost of approx. 12.3¢ per 1000 gals. Sludge from the tanks was removed and dried on a small drying bed. The dry substance contained 2.6% grease and 1% N. Approx. 60 cu. ft. of sludge was removed each week. Chem. tests of the raw and treated wastes for turbidity, color, total solids, suspended solids and O consumed showed improvements of 92.9, 64.4, 65.5, 96.7 and 89%, resp., between raw and treated wastes. C. R. FELLERS

Purification of the atmosphere and the struggle against smoke. CHALUMEAU. *Tech. sanit. munic.* 23, 300-9(1928).—Committee report. The following measures are recommended as aids in smoke nuisance amelioration: electricity in place of steam, the use of gas generators, the mixing of combustible vaporized liquid or pulverized solid fuels with the correct amt. of air and the use of coal dust in conjunction with non-bituminous oils and coke with special care being taken to provide for the pptn. of the unburned dust. Flue-gas analysis, increasing the temp. of the furnace, improvement and better management of draughts, water sprays and elec. pptn. of soot are also useful means of smoke elimination. For private dwellings, fuel should be limited to coke and non-bituminous oils. The use of fuel oils high in volatile matter should be suppressed. The exhaust gases of automobiles contained an av. of 7% CO, the limits being 0.5-14%. The max. % of CO in air which is not harmful to human health was 0.4 p. p. m. This max. should never be exceeded in garages or tunnels. Germinated dust is probably the cause of many respiratory diseases, anemias and lesser indispositions. C. R. FELLERS

Report on smokes from private dwellings. FRESSON. Office tech. Chauffage, Paris. *Tech. sanit. munic.* 23, 310-14(1928).—Domestic fuels should be limited to such non-smoky fuels as coke, semi-coke, gas and mazout. The burning of green vegetation, hay, etc., is an important cause of smoke during the spring and autumn. C. R. FELLERS

Report on the smokes and dusts of barges, boats and railroad locomotives. F. BORDAS. Services d'hygiene de la prefecture de Police, Paris. *Tech. sanit. munic.* 23, 314-20(1928). The human body requires about 6 times as much air per day as the total wts. of solids and liquids. The heavy smokes from barges and locomotives can be diminished largely by careful stoking, better draught control, higher temps. in the air boxes, and a more appropriate choice of fuels. C. R. FELLERS

Refuse incineration at Louisville. J. L. ESCHRICH. *The Am. City* 38, 127-8 (1928). *U. S. Pub. Health Repts.* 43, 3436.—The new Heenan type incinerator has a 10-ton capacity for 10 hrs. No addnl. fuel other than the garbage collected is required. The cost is approx. \$100 a ton. No objectionable odors are evolved. C. R. F.

Collection and disposal of refuse in Chicago. LORAN D. GAYTON. *J. Western Soc. Eng.* 34, 102-16(1929).—Both incineration and reduction methods of disposal are used. The former method is favored because of low cost and efficiency. For the reduction plant, garbage is sepd. by the householder from all other refuse, hauled to the plant in iron box trucks, crushed and dried. The 6 driers are of the cylindrical, direct heat type, rotating at a speed of 9 r. p. m. A temp. of 1080° is obtained by the use of fuel oil. The H_2O content is reduced from 65 to 30%. A second drier removes all but 10% of the H_2O from the garbage. Grease is then extd. by percolation with naphtha, the naphtha being recovered by means of steam distn. and subsequent condensation. The grease is obtained by evapn. The residual degreased garbage contg. 25% H_2O is passed through rotary screens and dried on mill driers to a H_2O content of 10%, in which condition it is suitable for fertilizer. Approx. 6 million lbs. of garbage grease are manufd. per year. The net cost of disposal is from \$3 to \$6 per ton of raw garbage. The new incinerator plant on Goose Island has a capacity of 600 tons per 24 hr. Rubbish is used as fuel to assist in burning the relatively moist garbage. Forced draughts, specially designed grates, well-lined chimneys and air preheaters are necessary for efficient service in an incinerator. The water-jacketed type of incinerator is unsatisfactory and inefficient. Incineration of garbage is an inoffensive, economical and convenient method of disposal. C. R. F.

Comparison of Paris green and paraffin oil as larvicides. H. DE ROCK AND N. H. SWELLEN-RABEEL. *Bull. soc. path. expt.; Rev. hyg. méd. prév.* 51, 73.—Although costing 5 times as much, oil is preferred to Paris green in N. Holland, where the expts. were conducted. Paris green was found useful only in treating the larger canals. C. R. FELLERS

Hatching of eggs and stimulus thereto in the yellow-fever *Stegomyia*. E. ROUBAUD. *Trop. Dis. Bull.* 25, 810(1928); *Pub. Health Eng. Abs.* E-711C, 2.—Dormant eggs of

Aedes mosquitoes were made to hatch under the influence of weak NaOH solns. In the case of yellow-fever epidemics it is recommended to treat the breeding areas first with NaOH to hatch the eggs, followed by 0.1% NaOCl for larval destruction.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Annual report of the agricultural chemist. P. F. LANDER. *Rept. Operations Dept. Agr. Punjab, Year Ending June 30, 1926*, 1, pt. 2, 47–66(1928).—The simple flooding of soils to remove toxic salts had no beneficial effect on certain Punjab soils which contained excessive quantities of Na_2CO_3 , NaHCO_3 , NaCl and Na_2SO_4 . On the contrary, heavy irrigation with canal water added, in some cases, as much as 3.5 tons of salts to the acre of soil irrigated. Treatment of soils with gypsum tended to diminish the concn. of O_2 in the soil gases. This may prove of importance in combating the cotton root rot disease as it has been found that the % of O_2 in the soil gases increases at the beginning of the root rot season and then diminishes as the season progresses. Tables are given showing the no. of *N-fixing organisms* and total no. of bacteria in raw canal water, and the amts. of N fixed by these organisms in synthetic media. Examin. of the Lyallpur city drinking water showed a high bacterial content resulting from too great a rate of flow of water through the filter beds. Higher counts of bacteria in water were obtained by plating on ordinary nutrient agar than on synthetic media. Preservation of lemon juice; Growth of organisms in lemon juice was prevented by steam sterilization at 70° for 10 mins. but the natural aroma and taste of the juice were seriously affected by the treatment. Preliminary expts. indicated that a satisfactory product could be obtained by adding the freshly extd. juice to a thick sirup contg. citric and boric acids. The thick cloudy ppt. forming on storage may be removed and the liquid can be safely used as a beverage.

K. D. JACOB

The soils of Prince Edward Island: Their nature and composition. FRANK T. SMITH. Canada Dept. Agr., *Bull.* 100, 20 pp.(1928).—Mech. and chem. analyses are tabulated for 25 cultivated surface soils and their corresponding subsoils from 17 localities in Prince Edward Island. The results indicate that in general the soils of Prince Edward Island are somewhat below the av. for good Canadian soils in their content of N, P_2O_5 , K_2O and CaO . The surface soils were higher in N and CaO , and lower in P_2O_5 , MgO and K_2O , than the corresponding subsoils. In all cases the content of MgO greatly exceeded that of CaO in both the surface soils and subsoils.

K. D. JACOB

Reaction studies on Delaware soils. C. R. RUNK. Del. Agr. Expt. Sta., *Bull.* 155, 1–17(1928); cf. *C. A.* 22, 3479.—The lime requirement of 264 Delaware soils was detd. by the Comber, Truog and Na tests and in each case compared with the p_{H} value. Approx. 90% of the soils had a p_{H} value between 5.5 and 6.5. There was very poor correlation among the lime requirement results. The buffer capacity of 23 soil types was detd. on moist samples. The titration curves show great differences in the capacities to resist changes in reaction. It is therefore desirable to det. the buffer capacity of a soil before adding lime to it. Some soils resist changes in H-ion concn. while others have a very low buffer capacity.

C. R. F.

Mechanical analysis [of soils]: national and international. B. A. KEEN. Rothamsted Expt. Sta., England. *Proc. Int. Soc. Soil Sci.* (Supp.) 1, 43–9(1928).—The British Official Method now differs from the Intern. Method only in that the former retains the detn. of air-dry moisture content and the expression of results on the air-dry basis. The results reported by the British Method are therefore: (1) moisture in air-dry soil; (2) carbonates, (3) loss by soln. in HCl and H_2O_2 treatment; (4) coarse sand, passing 2 mm. sieve and retained by 0.2 mm. sieve; (5) fine sand, by sedimentation, critical velocity greater than 10 cm. in 4 min. 48 sec.; (6) silt, by pipet sampling, critical velocity, 10 cm. in 4 min. 48 sec.; (7) clay, by pipet sampling, critical velocity, 10 cm. in 8 hrs.; (8) difference—org. matter removed by H_2O_2 and errors of expt. Total 100.

I. A. DENISON

Soil adsorption. D. J. HISSINK, J. VAN DER SPEK, A. DEKKER, M. DEKKER AND H. OOSTERVELD. *Proc. Int. Soc. Soil Sci.* (Supp.) 1, 4–42(1928).—Comparison is made of various methods for measuring soil adsorption. These methods may be divided into 2 classes: (1) Methods for detg. the amt. of exchangeable bases, that is, the so-called value S. To this class belong the methods of Kelley, Hissink, Kelley (NH_4 absorbed) and Bobko-Askinasi; (2) methods for detg. the amt. of CaO or BaO absorbed by the soil under certain conditions, either from a soln. of a neutral salt (Gedroiz BaCl_2) or from a soln. of a salt of a weak acid (Hutchinson, CaHCO_3 ; Kappen Ca acetate), or from a soln. of $\text{Ca}(\text{OH})_2$ (Gehring; titration curves) or $\text{Ba}(\text{OH})_2$ (Hissink). With the aid of the S-value and the amt. of CaO or BaO adsorbed, the degree of satn. of the original soil according to each method can be calcd. Also from the potential adsorption a degree of satn. can be calcd. The data given show wide variation in the values for

degree of satn. calcd. according to the different methods. The relation between the various methods and detns. of p_H and lime requirement of soils are discussed.

I. A. DENISON

The correlation between the soil salinity and flowering date in cotton. J. ARTHUR HARRIS. Univ. of Minn. *J. Agr. Research* 38, 109-12(1929); cf. *C. A.* 23, 1460. — Soil salinity was measured in terms of elec. resistance. In every case a low neg. correlation was obtained between soil resistance and the no. of days between planting and flowering of 3 varieties of cotton. This indicates a delay in flowering due to increased percentages of sol. salt in the soil soln.

A. L. MEHRING

Methods for determining the hydrogen-ion concentration of soils. E. F. SNYDER. Bur. of Chem. and Soils, Wash. D. C. U. S. Dept. Agr., *Circular* 56, 1-29(1928); cf. *C. A.* 22, 835. — Electrometric and colorimetric methods for the detn. of the p_H of soils are described in detail. The H, quinhydrone and Sb electrodes and Gillespie's drop-ratio method are given particular attention. Factors affecting the H-ion concn of soils are discussed and helpful suggestions for its detn. are given. Sixty-eight references are appended.

A. L. MEHRING

The determination and application of the electric resistance and p_H value in irrigation soil surveys. ARTHUR STEAD. Division of Chem., Pretoria. *S. African J. Sci.* 25, 149-55(1929). — The methods used in the field operation are described. They are substantially the same as those recommended by the U. S. Bur. of Soils. Emphasis is brought on the false impression conveyed by surface indications.

A. L. H

Base exchange in orthoclase. J. F. BREAZEALE AND O. C. MAGISTAD. Ariz. Agr. Expt. Sta., *Tech. Bull.* 24, 609-29(1928). — The attempt was made to det. the nature of certain colloidal complexes in orthoclase from which K may be dissolved, and to correlate the reactions of these complexes with those of the hydrated Al silicates (zeolites) of the soil. The soly. in H_2O of the K in orthoclase varies with the origin of the sample, fineness of subdivision, and the ratio of solid to liquid. Investigators have found the soly. to vary from 0 to about 300 p. p. m. of K. A small % of K in orthoclase hydrolyzes in H_2O , forming KOH, most of which, in turn, reacts with Al_2O_3 to form $AlKO_2$. All samples of orthoclase examd. showed properties of base exchange. Treatment with alk. salt solns. increased, while acid solns. decreased, the base-exchange capacity of finely ground orthoclase. The base-exchange properties of orthoclase may be destroyed by ignition. Digestion of ignited orthoclase with alk. solns. sometimes cause a build-up of the base-exchange capacity beyond that of the non-ignited. When solid orthoclase occurs in the soil in the presence of Ca, Mg or Na zeolites, an equil. will exist between the K in soln. and the zeolites. The plant very probably feeds largely upon hydrolyzed, zeolitic K. The zeolites of Ca, Mg, and Na may act as stabilizers in that they fix much of the sol. K during periods of little plant growth, and slowly liberate this K as rapidly as it is absorbed by plants. A theoretical discussion of base exchange and a bibliography are appended.

C. R. F.

Soil zeolites and plant growth. J. F. BREAZEALE. Ariz. Agr. Expt. Sta., *Tech. Bull.* 21, 499-520(1928). — K zeolite supplies most of the K that is readily available to plants and exists in the soil as hydrated, K Al silicate. This zeolite hydrolyzes and ionizes; the K ion is split off and it is upon this ion that the plant largely depends for its supply of K. The concn. of K in soil solns. is always very low and cannot exceed the sum of the solubilities of the K in the zeolite and in the orthoclase. This explains why a heavy application of a K salt as a fertilizer does not increase proportionately the concn. of the soil ext., although it may affect decidedly the crop yield. It also explains why K is not readily leached away by irrigation and rain waters. The K that occurs in soil zeolites is readily available to plants. The presence of other salts with replaceable bases, particularly nitrates, stimulates the absorption of K from solns. contg. K zeolites. When the K is absorbed from a zeolite by plants, a residue is left that is not acid and has no replacement capacity. This residue may be the broken-down components of the zeolite, Al_2O_3 and SiO_2 , existing either in a colloidal state or held together in some way. The broken-down residue of the zeolite may be built up into a zeolite at a suitable p_H by the addn. of a salt soln. that carries a replaceable base. Ignited and acid-treated soils that have lost their property of base replacement are partially restored by treatment with salt solns. that have a neutral or alk. reaction.

C. R. F.

The hydrolysis of sodium and potassium zeolites with particular reference to potassium in the soil solution. O. C. MAGISTAD. Ariz. Agr. Expt. Sta., *Tech. Bull.* 22, 521-47(1928). — With artificially prepd. Na and K zeolites, the amt. of hydrolysis at any diln. is a function of the no. of H ions present in the total vol. of H_2O at the start

and can be mathematically expressed. Na zeolite on hydrolysis gave NaOH which in turn reacted with Al_2O_3 to produce NaAlO_2 . The amt. of Al_2O_3 present in soln. as NaAlO_2 is a logarithmic function of the p_{H} value of the soln. In a similar way, K zeolite hydrolyzes to form KOH which in turn reacts to form KAlO_2 . K zeolite at equal dilns. hydrolyzes less than does Na zeolite. Ca zeolite depresses the hydrolysis of K zeolite. In solns. charged with CO_2 this depression appears to be less. Na zeolite and K zeolite in mixts. mutually depress the hydrolysis of the other. This may be caused by the common OH ion produced and the competition of both bases for a common aluminate ion. By means of the equation " K " in p. p. m. = $501.2 Y^{0.537}$, where Y = cc. of H_2O per milli-equiv. of exchangeable base, the concn. of K in p. p. m. at 1 diln. of soil to H_2O , the concn. at all other dilns. can be calcd. The agreement between values so calcd. and values obtained by different investigators at various dilns. is exceptionally good. If the amt. of replaceable K per 100 g. of soil is known, the amt. of K in the soil soln. at all dilns. can be calcd. The agreement with experimentally detd. values is good. The importance of the amt. of replaceable K and its rate of hydrolysis to plant feeding are discussed. If 2 p. p. m. of K, constantly maintained, are necessary to grow a crop, some replaceable K is necessary because minerals very probably cannot furnish K to the soil soln. at a rate sufficient to maintain this concn. for a continued period. A bibliography of 28 references is appended. C. R. F.

Relation of water-soluble potash, the replaceable, and acid-soluble potash to the potash removed by crops in pot experiments. G. S. FRAPS. Texas Agr. Expt. Sta., *Bull.* 391, 18 pp. (1929).—The water-sol K in the soil, the K in 12% HCl, and the replaceable K in the soil are all related to the K removed by crops in pot expts. and to the active K of the soils. The water-sol K lost from the soil by cropping and the replaceable K lost by cropping are related to the amt. of K taken up by the crop grown on the soils and to the active K lost by cropping. The amt. of K taken up by 2 crops usually averages 5 to 6 times the water-sol. K in the soil and about $\frac{1}{2}$ the replaceable K in the soil. The amt. of K removed by the crops from the soil is usually 8 to 16 times the water-sol. K lost in cropping and about twice the replaceable K lost in cropping. The loss of replaceable K in cropping is greater than the loss of active K by cropping. The difference in the amts. of K removed by a first and second extn. of soils with 0.2 N HNO_3 becomes greater as the K taken up by the crops in the pot expts. increase. When a soil neutralizes 85% or less of the acid used, the interpretations of the results are more closely in accordance with the results of the pot expts. when the correction is not made for the neutralization of the acid, than when it is made. When the soils neutralize more than 85% of the acid, the interpretation of the results varies a little less from the actual results when correction is made for acid consumed than when it is not, but in both cases the deviation is more than that for less basic soils. It appears better not to correct for neutralization but to take the highly calcareous nature of the soil into consideration in making the interpretation of the results. J. J. SKINNER

Growth studies with potash salts on acid soils. H. KAPPEN. *Ernähr. Pflanze* 25, 6-10, 25-31 (1929).—Expts. with potash salts on various limed and acid soils indicate that these salts are not physiologically acid in soil cultures. Potash salts will cause a change in p_{H} whether or not a crop is grown. This change is due to activation of the exchange acidity in acid soils and to an increase in OH-ion adsorption in neutral and alk. soils. LAWRENCE P. MILLER

The principal agrogeological properties of Java cane soils and the identification by a standard formula. G. BOBERG. *Arch. Sukkerind.* 36, II, 1023-33 (1928).—A system is described, worked out by the Expt. Sta. for detg. phys. properties of the soil and the results are given in a formula. Thousands of soil samples from the whole island were examined by the Atterberg test and classified. Ten types from coarse sand to very heavy clay cover all degrees of texture. Atterberg's test will show important differences in soils of the same genetic type, and results from soils of different parts of Java may be compared reliably. The color of the soil was detd. also and is given in 20 different shades. The other phys. properties of the soil are given as usual. It is pointed out that the new formula does not change the description of the soil properties used so far but is an addn. in order to have a genetic-geological classification. P. R. P.

Are ultravisible organisms active in arable soil? CHR. BARTHEL AND N. BENGTSSON. *Medd. Centralanstalt försöksväsendet jordbruks.* No. 341, *Bakteriol. avdel.* No. 47, 14 pp (1928). (Swedish with English summary).—The object of the expts. was to prove the occurrence of ultravisible organisms in soil. Sterilized soil contg. $(\text{NH}_4)_2\text{SO}_4$, urea or cellulose was inoculated with soil ext. filtered through a Pukall filter. No nitrification, urea fermentation or cellulose decompn. took place. If ultravisible organisms do exist they must be parasites on bacteria and not free living (saprophytes). Ultra-

visible organisms very probably do not take part in biochem. metabolism occurring in soil.

Rapid determination of the phosphoric ion in soils and fertilizers by the cerulean molybdate colorimetric methods. GEORGES DENIGES. *Ann. fals.* 22, 27-8(1929).—See C. A. 22, 2426.

The role of the rarer elements in soils, foods and drugs. OSWALD SCHREINER. Bureau of Chemistry and Soils, Washington, D. C. *J. Assoc. Official Agr. Chem.* 12, 16-30(1929).—An address.

Experiments with fertilizers on rotated and non-rotated crops. E. F. REYNOLDS. Tex. Agr. Expt. Sta., *Bull.* 390, 1-39(1928).—Expts. were conducted over a period of 14 yrs. to study the effect of fertilizers, manure, removal of crop residues, and rotation on the yield of crops. The fertilizer treatments included superphosphate; superphosphate and manure; superphosphate and cottonseed meal; manure; rock phosphate, and rock phosphate and manure. Cotton and corn were grown continuously on the same land and in rotation with oats and cowpeas. The soil responded more readily to nitrogenous than to phosphate fertilizers, indicating a deficiency of N. The increases in yield, however, resulting from the fertilizer treatments were not in general very profitable. Manure was the most profitable treatment on cotton, giving an av. yearly profit of \$6.36 per acre. None of the fertilizer treatments applied to corn was very profitable, rock phosphate gave the largest profit, which was only 88¢ per acre a yr. Superphosphate and rock phosphate were equally effective in increasing yields, but the rock phosphate was the more profitable because it was less expensive than superphosphate. The removal of crop residues over a period of 14 yrs. produced a slight but not significant, decline in the productiveness of the soil. Rotation produced significant increases in the yield of cotton and corn. The yield of cotton was increased 14% and the yield of corn 47.5% in comparison with the yield of continuous cotton and corn, resp. Rotation produced larger increases in yield than fertilizer, but the largest yields were obtained where rotation and fertilizer were used together. In fact, the increase in yield resulting from the combined use of rotation and fertilizer was greater than the sum of the increases produced by rotation and fertilizer when used separately.

Further experiments on the nitrification of manures and fertilizers and of tea prunings. A. W. R. JOACHIM AND D. G. PANDITSEKERE. Ceylon. Dept. Agr. Peradeniya. *Trop. Agr. (Ceylon)* 71, 131-40(1928).—The nitrate content of the soil in both pot and field expts. was detd. fortnightly for 5 months after adding urea, guano, castor pomace, animal tankage, fish scrap and ammo-phos. In all cases 2 periods of nitrification were observed. The maxima occurred in about the 7th and 13th weeks. Nitrification percentages ranged from 85 to 114. The high values may have been due to mineralization of some of the soil humus or to a partial failure of the modified phenol-disulfonic acid method for nitrates. Drying of tea prunings prevents decompn. and nitrification. Green tea prunings turned under gave a max. nitrification of only 10%. Pots to which tea prunings were added lost more N than the control pots, the loss in total N amounting to from 12.5 to 16.4% of that originally present.

Losses of nitrogen from green manures and tea prunings through drying under field conditions. A. W. R. JOACHIM. Ceylon Dept. Agr. *Tropical Agr. (Ceylon)* 71, 348-51(1928).—*Gliricidia* leaves lost 2.5 and 10.1% of the org. matter and 1.12 and 43.7% of the N originally present when dried and decompd., resp., on the surface of the field. The loss of N from partly decompd. *dadap*, *tea* and *grevillea* leaves was 37.6, 34.5 and 12.1% of that originally present. It is therefore recommended that such material be turned under while green.

Synthetic organic manure. F. HARDY. Imperial Coll. Trop. Agr. St. Augustine *Trop. Agr. (Trinidad)* 5, 172-3(1928).—A review. Eleven references are given.

Adco manure. Its composition in Trinidad. F. HARDY AND G. RODRIGUEZ. Imperial Coll. Trop. Agr. St. Augustine. *Trop. Agr. (Trinidad)* 5, 144-6(1928).—Analyses are given of sugar cane trash, megass and bamboo grass both before and after decompn. in cattle pens and after being composted with "adco." Some of the synthetic compost compared favorably with the natural manure. However, megass did not decompose very well with adco and probably needs special treatment to humify it.

The comparative effect of different nitrogen fertilizers on bearing apple trees low in vigor. A. L. SCHRADER AND E. C. AUCHTER. Univ. of Maryland. *Proc. Am. Soc. Hort. Sci.* 1927, 229-34.—In comparing the effect of NaNO_3 and $(\text{NH}_4)_2\text{SO}_4$ on apple trees it was found NaNO_3 caused a greater terminal spur and trunk circumference growth. There was a greater amt. of total and sol. N in spurs of trees that received NaNO_3 .

Starch content of the spur in June was higher when $(\text{NH}_4)_2\text{SO}_4$ was used. The yield was in favor of NaNO_3 . J. J. SKINNER

Preparation and properties of the ammonium phosphates. WM. H. ROSS, ALBERT R. MERZ AND K. D. JACOB. Bur. of Chemistry and Soils, Washington, D. C. *Ind. Eng. Chem.* **21**, 286-9(1929).—The prepn. and properties of the meta-, pyro-, and ortho-phosphates of NH_4 are discussed with particular reference to methods proposed and in use for the manuf. of the NH_4 orthophosphates. The soly. of $\text{NH}_4\text{H}_2\text{PO}_4$ increases from 19.9 g. per 100 g. of H_2O at 0° to 177.2 g. at 100° . 0.1 M solns. of $\text{NH}_4\text{H}_2\text{PO}_4$, $(\text{NH}_4)_2\text{HPO}_4$, and $(\text{NH}_4)_3\text{PO}_4$ are, resp., alk. to Mc orange but acid to Me red; neutral to cresol red; and neutral to thymol blue in alk. range, the p_H values being 4.4, 8.0, and 9.4. Possible difficulties in the continuous production of $\text{NH}_4\text{H}_2\text{PO}_4$ by saturator methods are pointed out. K. D. JACOB

Sewage as a fertilizer. J. W. JAREO. *The Am. City* **39**, No. 2, 111-2(1928); *U. S. Pub. Health Repts.* **44**, 14-5.—After 6 months, digestion in the settling tanks, the sludge from the Madison, Wis. Sewerage Works, is dried from 1 to 3 weeks and sold at 50¢ a cu. yd. for fertilizer. It is odorless and based on P, K and N analyses is valued at 86.25 per ton. Approx. 50% of org. matter is present, making the sludge a valuable soil amendment. Av. analyses show the dry sludge to contain 2-3% P, 0.1-0.5% K and 2.5-3.5% N. Fertilizer tests show that for corn, potatoes, tobacco and celery, marked yield increases were obtained. C. R. F.

Chlorosis of crops on land treated with sewage; its cause and remedy. P. MAZE AND P. EVENS. *Compt. rend.* **188**, 191-3(1929).—Garden crops grown on land treated with sewage develop a chlorosis in areas of low elevation. This is not due to a specific parasite. The sewage is rich in CaCO_3 which coats the soil particles, depriving the plant roots of Fe salts. The only plants that can thrive on this soil are those whose roots have an acid excretion to dissolve the CaCO_3 . Addn. of Fe compds. to the soil or to the leaves is sufficient treatment. A. LEVESCONTE

Potash fertilization as a protection against yellow rusts. F. VON MEER. *Landw. Hochsch. Bonn-Poppelsdorf. Ernähr. Pflanze* **25**, 73-7(1929).—The chloride is much more effective than the sulfate. LAWRENCE P. MILLER

Determination of the toxic substance in insecticides. IV. Volumetric determination of mercury in seed preservatives. J. BODNAR, L. E. ROTH AND I. TERGINA. *Z. anal. Chem.* **74**, 81-105(1928).—To 0.2 g. of material in a 200 cc. Erlenmeyer flask, add 5 cc. of concd. H_2SO_4 and 1-2 cc. of perhydrol. Heat under a reflux condenser until all of the org. matter is destroyed. There will be no loss of Hg with a 40 cm. condenser unless chloride is present. To the strongly acid soln. add NaOH until alk. and 15 cc. of 10% formaldehyde soln. After an hr. at room temp., filter off the pptd. Hg, dissolve it in 10 cc. of HNO_3 and add enough 5% KMnO_4 to give a distinct color to the soln. After the KMnO_4 has been fully decolorized and all of the Hg is dissolved add ferric alum soln. and titrate with 0.04 N NH_4CNS . W. T. H.

Fumigation. II. HAROLD E. BOX. *Rev. ind. agr. Tucumán*, No. 3-4, 110-4 (1928). CS_2 is one of the cheapest and most effective substances that can be used to fumigate cereals, legumes, etc. Because of its low b. p., it does not require heat for its volatilization. The vapors are heavier than air and are of great penetrability; they are very poisonous to all forms of insect life, thus destroying the plague, whether as egg, larva, pupa or adult both within the seed or grain or outside it. In using it, light should be guarded against, but otherwise it is no more dangerous to use than gasoline. Dose: 1 kg./10 cu. m. for 48 hrs. at 21° or for 15 cu. m. at $30-35^\circ$. Below 21° , CS_2 is not advisable. For small packages 50 gr./cu. m. is preferable. S. L. B. E.

Formaldehyde dust for the control of oat smut. J. D. SAYRE. Ohio Expt. Sta., *Bimonthly Bull.* **14**, 9-11(1929); cf. *C. A.* **22**, 1011.—Field and exptl. plot tests showed perfect control of oat smut by the use of 4-6% CH_2O . The treated oats showed approx. 0.1% smut as against 13.1% in the untreated controls. The dust is thoroughly mixed with the seed and allowed to stand 12 hrs. before sowing. C. R. F.

The problem of the arsenical spray residue. HOWARD W. AMBRUSTER. *J. Franklin Inst.* **206**, 597-604(1928).—The problem of As spray residues on fruits and vegetables intended for human consumption is complicated by the following conditions: need for research on the human tolerance for As and Pb as most of the As is applied to fruits and vegetables in the form of Pb arsenate; need for a legal tolerance as the so-called British tolerance and the U. S. official standard of tolerance are not officially recognized in either country. The entomologist is vitally interested because As substitutes will be threatened by the same ban that affects As compds. The insecticide manufacturer is interested because he fears to extend existing industries or develop new

ones on account of the unknown factor of spray tolerance. Shippers of fruit and vegetables fear official seizure and public reaction against their products. C. H. RICHARDSON

Sulfuric acid spray: A practical means for the control of weeds. J. G. BROWN AND R. B. STREETS. *Ariz. Agr. Expt. Sta., Bull.* 128, 299-316(1928).— H_2SO_4 from smelters is commercially available in Ariz. at low cost. Expts. on the use of H_2SO_4 as a weed spray showed that a 2% soln. will destroy puncture weed, careless weed, field mustard, ground cherry and prostrate pig weed; 3.5% will destroy lamb's quarters, knot weed, yellow sour clover and croton; 5% destroys sow thistle, dodder, horse nettle and rayless golden rod; 8% kills bindweed, stink grass, bermuda grass, green foxtail, and barnyard grass, while 10-15% kills Johnson grass and nut grass. Any type of sprayer is satisfactory though a pressure of 150 lbs. per sq. in. is desirable. If metal spray equipment is coated with cylinder oil or cup grease, little or no corrosion occurs. C. R. F.

"Rose lizard" (*Pectinophora gossypiella*, Saunders) of the cotton plant. HAROLD E. BOX. *Rev. ind. agr. Tucumán* 19, 106-10(1928).—B. gives photographs of various stages of this plague together with large drawings of the insect. After discussing the existence and growth and difficulty of control, B. recommends fumigation of the cotton with CS_2 . S. L. B. ETHERTON

P deficiency in forage feeds of range cattle (SCOTT) 12. Collection and disposal of refuse in Chicago (GAYTON) 14. Hexylresorcinol and phenylethylresorcinol as reagents against plant pathogenic fungi (HOUBEN, WOLLENWEBER) 11D. Citric acid solubility and hardness of Thomas slags (WEISS) 9. The carbonyl number of some humic acids (LEOPOLD) 10. Apparatus for drying fish flour, etc. (Brit. pat. 294,914) 12.

EMERSON, FREDERICK V.: **Agricultural Geology.** New York: John Wiley & Sons, Inc. 377 pp. 16s. Reviewed in *Bull. Imp. Inst.* 26, 536(1928).

Fertilizer. FRITZ ROTHE and HANS BRENEK (to Rhenania Verein Chemiker A.-G.). U. S. 1,704,218, March 5. A mixt. is formed contg. mineral phosphates and contg. also for every mol. proportion of P_2O_5 about one mol. proportion of alkali metal oxide in the form of a salt such as K_2SO_4 and at least one mol. proportion of silica, together with sufficient lime to provide for the production of Ca orthosilicate in addition to alkali Ca phosphate; this mixt. is heated to at least 900° in the presence of steam. Cf. C. A. 23, 1208.

Fertilizer. GEORGE P. WALTON and ROBERT F. GARDINER (to the Government and people of the United States). U. S. 1,703,504, Feb. 26. Perishable org. material such as slaughter house offal is intimately mixed with a quantity of an acid salt such as $Ca(HPO_4)_2$ sufficient to develop in the mixt. a degree of acidity which will preserve it, and the mixt. is stored under conditions permitting natural or spontaneous air drying. Gypsum, peat, etc., may be added.

Fertilizer. ELEKTRICITÄTSWERK LONZA. Brit. 294,117, July 14, 1927. A mixt. of Ca nitrate and phosphate which does not readily become damp is prepd. by reacting upon crude phosphate with HNO_3 of such concn. (suitably about 60%) that the product contains less water than the normal content of water of crystn. A small proportion of urea may be added which serves to prevent subsequent formation of N oxides.

Fertilizer. I. G. FARBENIND. A.-G. Brit. 294,654, July 29, 1927. In prep. a mixed fertilizer, NH_4NO_3 is caused to react in aq. soln. with a mixt. of NaCl and KCl and the mixt. of salts obtained is sepd. from the liquor. NH_4Cl may be added. Cf. C. A. 23, 1208, 1462.

Fertilizers. GUILLAUME BARODY and RENÉ GILLES. Fr. 645,166, Dec. 5, 1927. An oxidizing and antiseptic agent such as $KMnO_4$ is added to $(NH_4)_2SO_4$, NH_4Cl , $CaCN_2$ and other fertilizers.

Fertilizers. CORRADO LUMIA. Fr. 644,694, Nov. 29, 1927. Fertilizers sol. in water are prepd. by treating powdered phosphorites or natural phosphates and degelatinized bones with H_2SO_4 , then with a mixt. in equimol. quantities of $(NH_4)_2SO_4$ and H_2SO_4 , the treatment being completed by decanting, filtering and crystn. The product may be treated with NH_3 before drying.

Fertilizers. GEORGES TRUFFAUT. Fr. 645,533, Dec. 10, 1927. Malt dust or yeast contg. vitamin B_2 and org. Fe, and anaerobic bacteria are added to fertilizers.

Fertilizers. SOC. D'ÉTUDES CHIM. POUR L'INDUSTRIE. Swiss 128,015, Dec. 24, 1926. The product obtained by treating insol. $Ca_3(PO_4)_2$ with HCl is treated with K_2SO_4 so as to remove $CaCl_2$ by double decompn. Instead of HCl, the soln. resulting from the decompn. of $CNNH_2$ with HCl may be used.

Stimulating germination of seeds. METHODI POPOFF (to Bayerische Stickstoff Werke A.-G.). U. S. 1,703,362, Feb. 26. Separate portions of a batch of seeds such as rye, wheat, oats or barley are treated with different stimulating materials such as $MgCl_2$ and $MgSO_4$ and KBr or $MnSO_4$, and the different portions are mixed before planting them.

Insecticides. E. VON AMMON and K. SZOMBATHY. Brit. 294,646, July 29, 1927. Lupanin is used instead of nicotine in plant washes, or together with nicotine, and such insecticides may be rendered effective against caterpillars by admixture with AmOH, EtOH or MeOH; alkalis and soap may also be included in mixts. which are described. Brit. 294,647 also specifies insecticides contg. lupanin or nicotine together with a wax solvent such as resinic acid or its salts, for destroying insects such as *Schizoneura lanigera* which are protected by a waxy coating.

Fungicide. I. G. FARBENIND. A.-G. Fr. 645,643. A fungicide and bactericide for seeds consists of compds. of PhOH and Hg mixed with an inert colloidal substance and an alk. substance. An example contains mercuric chlorophenolsulfate 6, mercuric nitrophenolsulfate 2, Na_2CO_3 1.5, colloidal clay 90.5%. Cf. C. A. 23, 928.

Borer's gum. LUTHER E. SMITH. U. S. 1,705,100, March 12. A plastic mixt. suitable for coating fruit trees to prevent damage by borers and which is impervious to air and to moisture comprises a resinous material such as rosin 12, beeswax 1.5, soap 1.5 lbs. and pine tar 1 qt.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Determination of alcohol by distillation. K. AMBERGER. Z. *Untersuch. Lebensm.* 55, 447-53(1928).—In order to avoid loss of EtOH in distn., the still wine to be analyzed should be dild. so that the distillate contains less than 30% EtOH. App. and precautions are detailed. C. R. F.

Refractometric rapid analysis of alcoholic spirits and distilled liquors. R. SAAR. Nahr.-Untersuchungsamt, Halle a. d. S. Z. *Untersuch. Lebensm.* 56, 144-58(1928).—By means of the sp. gr. and n , the EtOH and ext. content of liquors (25-40% EtOH) are calcd. with nearly as great accuracy as by the distn. method. The refractometric method is inapplicable to sweetened liquors or wines. C. R. F.

Studies on hydrogen-ion concentration and its significance in spirit distillation. II. W. DIEMAIR and K. SICHERT. Hochschule Weihenstephan. *Biochem. Z.* 204, 414-59(1929), cf. C. A. 22, 4710.—A knowledge of H-ion concn. and buffering is very essential in the fermentation of corn in connection with the work of spirit distilleries. Corn mash differs from potato mash very considerably in the matter of acidity and N, and these peculiarities appear also during the fermentation process, the potato mash possessing a lower p_H max. (4.7). S. MORGULIS

Open and closed fermentation vessels. F. W. WINDISCH. *Wochschr. Brau.* 45, 517-73(1928).—Fermentation in closed vessels from which the CO_2 was collected improved the quality of the yeast and also that of the beer (cf. C. A. 22, 3483). The CO_2 recovery plant netted a profit of 25% in the brewery in question. A. S.

Closed tank fermentation. WILLY BELGEONNE. *Bull. assoc. elevs. inst. sup. fermentation Gand* 30, 27-35(1929).—A description of the process and discussion of its merits. A. PAPINEAU-COUTURE

Hydrogen sulfide in fermentation carbon dioxide. WANDERSCHNECK. *Wochschr. Brau.* 45, 441-6, 463-8(1928).—The H_2S liberated by yeast during fermentation is detd. by passing through a $Pb(NO_3)_2$ soln., dissolving the ppt. with aqua regia and detg. the Pb colorimetrically as PbS . High alternated yeasts produce more H_2S than yeasts of low alternating power. The S-contg. proteins of barley and malt furnish most of the gas. Gypsum is also a source while SO_2 , sulfured hops and free S give off larger amts. Low-temp. fermentations such as 6-8° diminish the amt. of H_2S evolved. The flavor of the beer is seldom affected because most of the gas is carried out of the beer by the CO_2 . A. SCHULTZ

Formol titration. P. KOLBACH. *Wochschr. Brau.* 45, 446-51(1928).—Lüers' procedure of Sørensen's formol titration method was used. More concordant results were obtained by titrating to an end point of p_H 9.00 as given by an alkaline-borate buffer than to the more variable end point (p_H 9.18) of a M/15 solution of Na_2HPO_4 . A. SCHULTZ

Algerian musts of the 1928 vintage. POUGET and BONNIER. *Ann. fals.* 21,

582-94(1928).—Analyses of 90 samples are tabulated and briefly commented.

A. PAPINEAU-COUTURE

Cold and warm malting. H. LÜERS. *Wochschr. Brau.* 45, 569-74(1928).—A Pilsener type malt grown at 14° was superior to one grown at 23° while in the Munich malt the opposite was the result.

A. SCHULTZ

(Troubles encountered with) new malts (of 1928). P. PETIT. *École de Brasserie de Nancy. Brasserie et malterie* 18, 289-92(1928); 305-8(1929).—The 2 chief troubles encountered in practice have been slow saccharification and dense and compact spent grain which slowed up filtration. These troubles are attributed to the climatic conditions which prevailed during the growing season, which was drier than usual and increased evapn. in the grain. As a result, the substances enveloping the starch granules are more resistant and retard saccharification because a higher temp. is required to burst open the starch granules. The compactness and slow-filtering properties of the spent grain are attributed to the fact that the albuminoid N (hordein) of malt increases in a dry season, while the sol. N remains the same as in normal season, so that the spent grain contains more viscous, glutinous nitrogenous matter, and this is further increased when the acidity of the wort is low.

A. PAPINEAU-COUTURE

Troubles encountered in brewing with raw grain. J. RAUX. *École de brasserie de Nancy. Brasserie et malterie* 18, 308-13, 325-30(1929).—A brief discussion of the troubles which may be encountered in the use of raw grain and of the methods of overcoming them.

A. PAPINEAU-COUTURE

Kilning of malt. R. SCHLENK. *Wochschr. Brau.* 45, 415-8, 426-30, 436-40, 451-6(1928).—A mathematical treatise of kilning conditions with diagrams showing the relations of air at different temps. and moisture on malt temps. and moisture contents.

A. SCHULTZ

Objective determination of color of malt worts. F. DUCHÁČEK. *Wochschr. Brau.* 45, 359-62, 369-73(1928).—Sandera's "universal objective photometer" was used. This measures the intensities of light by means of the current produced at the surface of metallic K in a photoelec. cell. With 100 cc. of wort color differences of 0.015 cc. of 0.1 N I can be distinguished.

A. SCHULTZ

Photometric determination of the color of malt worts. F. MĚSTAN. *Wochschr. Brau.* 45, 373-7(1928); cf. *C. A.* 23, 1322.—An improved form of the Zeiss "step photometer" is described which replaces Ostwalds gray filters by Aubert's adjustable apertures. An accuracy of 4% is claimed on the color of malt worts for color differences corresponding to 0.01 cc. of 0.1 N I.

A. SCHULTZ

Influence of artificial acidification of mash or wort on the composition of the resulting worts and beers. W. WINDISCH, P. KOLBACH AND W. BANHOLZER. *Wochschr. Brau.* 45, 523-8, 535-9, 553-8(1928).—The max. amt. of ext. was obtained with the final p_H of the wort at 5.0-5.2 while the max. for fermentable ext. was from 5.3 to 5.7. The optimum for proteolysis is about p_H 4.8. Acidification of the mash increased the buffer value over the phosphate and protein ranges so that even though the initial p_H values of the worts were lower than that of normal worts the p_H of the final beers was unaffected. Acidification of normal worts did not change the buffer value and the p_H of the beers was lower than normal.

A. SCHULTZ

Comparative determinations of hydrogen-ion concentration of worts and beers by the hydrogen and quinhydrone electrodes. F. STOCKHAUSEN AND E. F. ROTHENBACH. *Wochschr. Brau.* 45, 459-62(1928).—The H electrode of Michaelis and Luers gave results that agreed closely. The results of the quinhydrone electrodes of Luers and Trénel were usually more acid, sometimes as much as 0.15 p_H . The quinhydrone electrodes are accurate enough for routine purposes.

A. SCHULTZ

Darkening of worts during the preparation of pale beers. H. STADLER. *Wochschr. Brau.* 45, 579-82(1928).—The color of the beer depends a great deal on the chem. compn. of the brew water and the quality of the barley and hops. Raising the p_H of the brewing liquor by addn. of gypsum exts. less of the red coloring matter from the hops. During spraying the color and p_H increase as the amt. of solids decreases.

A. S.

Nitrogenous constituents of wort assimilable by yeast. W. WINDISCH, P. KOLBACH AND E. HENNECKE. *Wochschr. Brau.* 45, 389-93, 399-400, 409-15, 421-6, 431-5(1928).—The decrease of amino N during fermentation of a wort accounts for about 60% of the N assimilated by the yeast. Polypeptides and amino acids are assimilated while the more complex proteins and peptones are not.

A. SCHULTZ

Determination of the fusel oil content of brandy by Rose's method. B. LAMPE AND W. KILP. *Z. Spiritusind.* 51, 199-200(1928).—A simple method is described which is based on the fact that alc. contg. fused oil when extd. with $CHCl_3$ causes a greater vol. increase of the $CHCl_3$ than pure alc.

A. SCHULTZ

De-odorization of brandies by activated charcoal. J. CAFFRE. *Viti-Viniculture* (July, 1927) 241; *Ann. fals.* 21, 604(1928).—A non-potable brandy which was not amenable to treatment by other absorbents was treated with 500 g. of activated charcoal per hectoliter, which eliminated the bad taste and reduced the non-als. by 26.5%. A similar treatment applied to a com. brandy caused a decrease of 26% in acidity, 6% in aldehydes, 27% in furfural, 46% in esters, no change in higher alcs. and reduced the alc. by vol. by 0.6%; the brandy lost most of its organoleptic qualities and is similar to a dil. rectified alc.

A. PAPINEAU-COUTURE

Characteristics of Polish fruit wines. WACŁAW IWANOWSKI. Warsaw Polytech. *Chem.* 11, 521-8(1927).—In the production of Polish fruit wines the tendency toward white and strong table wines. It is usually the economic factors which impair the quality, but usually the product is of the highest grade.

A. C. ZACHLIN

Influence of acidity in the preparation and conservation of wines. JULES VENTRE. *Chim. ind.* 38, 2-8(1929).—A titration of the total acidity means nothing because the presence of several acids having different p_H values. Too great an acidity will prevent the proper fermentation; if too low, the wine is without resistance against the development of pathogenic bacteria. In general, a wine with a p_H of 3 will conserve itself well. The addn. of plaster, tartaric acid and SO_2 is justified by the resulting higher p_H . Phosphate salts are harmful for they form salts of lower p_H than the original salts. The NH_4 salt is especially bad because of the formation of N which helps the growth of disease germs. Diseases affect the acidity. Anaerobic bacteria decrease the p_H by decompn. of a strong acid, tartaric, into weak acids, propionic and acetic. SO_2 decreases the acidity because of oxidation and the slow decompn. of malic acid.

P. THOMASSET

Determination of acetic acid in beer: application of the Duclaux method for volatile acids. J. STEENBERGHEM. Univ. de Louvain. *Bull. trimest. élèves è ole sup. brasserie* (November 28, 1928) 161-72(1928).—According to Duclaux, on distg. a dil. (not over 2%) soln. of a volatile acid and titrating successive fractions of the distillate, any given acid gives a characteristic curve, by which the nature of the acid can be identified if it is alone, and if 2 acids are present each one behaves as though it were alone. If the nature of the volatile acid is known, the amt. can be detd. by distg. a given portion of the liquid under specified conditions, titrating and referring to the distn. curve. S. detd. the distn. curve of AcOH by measuring 110 cc. of soln. in a 250-cc flask, distg. 100 cc. in 10-15 mins., and titrating every 10 cc. fraction; the proportion of AcOH distd., expressed as % of the total AcOH taken and as % of the total AcOH, resp., was:

Distillat. (in cc.)	10	20	30	40	50	60	70	80	90	100
% of total AcOH	5.9	12.2	18.7	25.6	32.7	40.4	48.7	57.5	67.5	80
% of AcOH distd.	7.4	15.2	23.4	32.0	40.9	50.5	60.6	71.9	84.4	100

In applying the method to the detn. of AcOH in beer, the latter is prepd. as follows: remove CO_2 by shaking 15-20 mins.; neutralize 200 cc. to a p_H value of 7.2-7.4 (e. g., by titrating with NaOH using α -naphtholphthalein, or else titrating in presence of phenolphthalein to a pale pink and then adding 1-1.5 cc. $N H_2SO_4$); evap. to 50-33% of the original vol.; add $N H_2SO_4$ equal to the NaOH originally added + 4 cc.; dil. to exactly 200 cc., and distil and titrate 110 cc. as described above for detg. the distn. curve of AcOH. It is preferable to distil only 80 cc. instead of 100 cc. The results obtained with different types of beer showed that the only volatile acid is AcOH, that the presence of lactic acid (0.5% added) does not interfere, and that the method is more accurate and much more rapid than steam distn.

A. PAPINEAU-COUTURE

Determination of glycerol in beer. H. LACROIX AND S. KROPACSY. *Wochschr. Brau.* 45, 490-1(1928).—Zeisel and Fanto's method with slight modifications is more rapid and gives better results than the lime or dichromate methods.

A. SCHULTZ

Silicic acid in beer. H. NETSCHER. *Wochschr. Brau.* 45, 582-5(1928).—Silicic acid is present in all brewing materials and is not entirely pptd. during the process. In 5 beers 0.012-.020 g. of silica per 100 cc. was found. Those with the highest amt. of silicic acid developed the most haze. Conclusion: Silicic acid is a factor in the colloidal system of beer.

A. SCHULTZ

"Bacteriophage," a new formic acid anti-ferment. R. MARCILLE. Lab. des services administratifs et la de répression des fraudes de la régence de Tunis. *Ann. fals.* 22, 19-22(1929).—The prepn. was essentially a 150-g. per l. soln. of formic acid. It was claimed to be effective for sterilizing musts, etc., 14-20 cl. per hl., being sufficient but the amt. required was found to be 4-5 times as great.

A. PAPINEAU-COUTURE

The effect of successive generations of yeast on the alcoholic fermentation of cider. S. C. VAN DECAVEYRE. Wash. Agr. Expt. Sta. *J. Agr. Research* 37, 43-54(1928); cf.

C. A. 23, 1965.—The N and P contents of cider are low. All but traces are readily removed by coagulation at a temp. of 45°. Qual. analyses indicated the absence of NO₃ and NO₂ ions and the presence of PO₄ and NH₄ ions in small quantities in all samples. Clear cider, contg. 0.53% C₂H₅OH, and possessing a natural flavor, was obtained in an unfermentable form by growth of yeast, heating to 45°, re-inoculating with yeast and again heating. The temporary unfermentability was due to lack of N and PO₄ and not to the presence of toxic products or disease of the yeast. A. I. M.

The supposed separation of methylglyoxal in alcoholic fermentation. CARL NEWBERG AND MARIA KOBEL. *Biochem. Z.* 191, 472-7(1927).—Methylglyoxal cannot be isolated by means of semicarbazide. The isolated, poorly sol. substance was s-hydrazinedicarboxylamide, a product of decompn. of the semicarbazide. S. M.

"Activator Z." IV. A specific accelerator of fresh yeast fermentation. HANS V. EULER, EDVARD BRUNIUS AND STIG PROFFE. *Univ. Stockholm. Z. physiol. Chem.* 178, 202-8(1928); cf. *C. A.* 22, 3172.—Attempts were made to purify "activator Z" the diffusible, EtOH-sol. substance in boiled yeast ext. which accelerates fermentation of fresh yeast. Since the fermentation curve here is not a straight line, the activation cannot be expressed by the ratio, cc. CO₂ per hr. : g. activator prepn. The measure of activity is therefore taken as the no. of mg. of prepn. required to activate the fermentation to half its max. velocity. For boiled yeast ext. this value is 3.3, for the yeast nutrient "marmite" 2.8, and for other materials it is much higher, i. e., the activity is lower. The following purification treatments of the boiled yeast ext. gave increased activities in the filtrate in the order named: Ba(OH)₂ pptn., Pb pptn., phosphotungstic acid pptn., dialysis, UO₂(OAc)₂ pptn., Ag pptn., Hg pptn. The most active prepn. was obtained by successive dialysis, Pb(OAc)₂ pptn. and Hg(NO₃)₂ pptn., the final filtrate being 8 times as active as the initial ext. A. W. DEX.

Brewers' pitch. F. KUTTER. *Wochschr. Brau.* 45, 473-8, 483-7, 493-7, 503-4 517-21(1928).—A discussion of lab. tests which are designed to differentiate between various kinds of brewers' pitch. A. SCHULTZ

Yeast extract, a new and satisfactory pill mass excipient (SCHNELLBACH 17. Briquetting carbon, coal, etc. [with recovery of acetone, AcH, EtOH, glycerol, etc.] (Brit. pat. 294,879) 21. Treating alkaline waters [from breweries] (Ger. pat. 7039) 14.

Oeuvres de Pasteur. Tome V. "Études sur la bière." Paris: Masson & Co. F. 120. Reviewed in *Brasserie et malterie* 18, 350-1(1929).

Dujardin-Salleron, père et fils: Notice sur les instruments de précision appliqués à l'oenologie et à la brasserie. 6th ed. Paris: Dujardin-Salleron. 1100 pp. Domestic F. 50., foreign F. 54. Reviewed in *Ann. fals.* 22, 43(1929).

Apparatus (with three distilling columns) for continuous production of absolute alcohol. ELOI RICARD (to U. S. Industrial Alcohol Co.). U. S. 1,704,213, March 5. A plant is described suitable for distg. aq. alc. after the addn. of a substance forming an azeotropic mixt.

Diastases. AUGUSTE BODIN and JEAN EFFRONT. Ger. 470,710, July 4, 1923. See Brit. 221,860 (*C. A.* 19, 1028).

Enanthic perfumes. ÉMILE A. BARBET. Fr. 33,499, Jan. 20, 1927. Addn to 623,459. An app. is described for the total extn. of the perfumes produced by the fermentation of wine.

Cover for vinegar vats. ARTHUR STEINMETZ. Ger. 470,741, Aug. 5, 1927. A cover for the vats used in the quick vinegar process is made of stone, is conical in shape, and has an internal peripheral channel in which condensed liquid accumulates and from which liquid can be withdrawn. The cover is also channelled externally so that cooling liquid sprayed on to it can be conveniently run off.

Vinegar and yeast. M. J. J. BOUTTEAUX. Brit. 294,209, July 20, 1927. Vinegar is produced by oxidation of the wort sepd. from the beer yeast discharged from fermenting vats. Alc. obtained from distn. of a part of the wort may be added. The yeast is strained, washed, bleached with (NH₄)₂CO₃ and decanted to remove the sound cells, which are dried.

Yeast cultivation in treated waste sulfite liquor. GUSTAF O. W. HEIKENSJÖLL (to Aktiebolaget Båsta). U. S. 1,703,272, Feb. 26. The liquor is rendered alk., suitably by the addn. of CaCO₃, "mesa" or NH₃, pptd. material is removed and the treated liquor is then added to yeast propagating wort and the character of the latter is regulated so that it is alk. at the end of the process. An app. is described. Cf. *C. A.* 22, 3778.

Yeast. S. SAK. Brit. 294,123, Jan. 14, 1927. During yeast propagation, yeast-contg. wort is withdrawn and centrifuged, and fresh wort or solns. of nutrient substances, centrifuged wort or water are usually simultaneously added. A portion of the centrifuged yeast is returned to the propagating vat in regulated manner with the purpose of maintaining during a desired time a certain wt. of yeast per unit volume of wort in the fermenting vat. The withdrawn wort may be completely fermented and may or may not contain alc. Various details and modifications are described, among which is the "rejuvenation" of the yeast by adding fresh yeast, and the passage of the centrifuged yeast, before its return, through auxiliary vats contg. nutrients such as sugar in the same mutual concn.

Yeast. S. SAK. Brit. 294,131, Jan. 14, 1927. In the production of seed yeast and contg. yeast by a process in which yeast-contg. wort is withdrawn during the process and in which suitable addns. to the wort may be made, a constant wt. of yeast per unit volume of the liquid in the propagating vat is maintained during a suitable period of the process by controlled addns. of yeast from an extraneous source. The process may be so regulated that the wort withdrawn either contains alc. or is free from alc. Brit. 294,132 relates to a similar process in which fresh wort, centrifuged wort, or other suitable solu. or water is continuously added. Brit. 294,133 specifies a continuous process in which wort withdrawn is centrifuged and transferred to a distn. app. where it is wholly or partly freed from alc. and continuously returned to the yeast propagation vat. Distn. may be effected at a temp. of 70° under reduced pressure and the wort cooled before return to the propagation vat. Brit. 294,134 specifies withdrawal and centrifuging of a portion of the wort and transfer of the centrifuged yeast to another vat contg. nutrient liquid, the concn. of which in respect to certain nutrients is higher than that of the first vat; the yeast may be passed through several vats before being returned to the first vat. Various details are described.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Stability and value of chlorine water. GYULA MIKÓ. *Ber. ungar. pharm. Ges.* 2, 374(1926).—The directions of the Hungarian Pharmacopeia are criticized.

B. C. A.

Bromometric examination of ointments and fats. O. ANDRISKA. *Ber. ungar. pharm. Ges.* 3, 140 3(1927).—The Br-I values of numerous oils, fats and ointments of the Hungarian Pharmacopeia (3rd ed.) have been detd. The bromoacetic acid method is preferred to the K bromate process.

B. C. A.

Evaluation of ergot of rye. B. GAAL. *Ber. ungar. pharm. Ges.* 4, 32-42(1928).—The origin of which was not discovered, was obtained when the ethereal acid of physiologically inactive samples was rendered alk.

B. C. A.

Microchemistry of theophylline (1,3-dimethylxanthine). M. WAGENAAR. *Pharm. Weekblad* 66, 131 3(1929).—The reactions discussed are sublimation, pptn. by addn. of $(\text{NH}_4)_2\text{SO}_4$ to the alk. soln., and pptn. as complex salts by HgCl_2 , AuCl_3 , $\text{KI} + \text{I}$, $\text{SbBr}_3 + \text{Br}$, $\text{KI} + \text{BiI}_3$ and $\text{KI} + \text{SbI}_3$. For purposes of microchem. identification the HgCl_2 reaction is the most useful, then the I and Br reactions. The others are about equally sensitive.

A. W. DOX

Simplified estimation of cresol in cresol soap in preparations. GREGOR KOGAN. *Pharm. Zentralhalle* 69, 536-7(1928).—Into a 500-cc. distg. flask introduce 20-25 g. of the sample, add 50 cc. 10% BaCl_2 soln., then distil off the cresols with steam, stopping the operation after 1 hr. Now add 10 g. NaOH to the distillate and remove the hydrocarbons by extn. with benzine, petr. ether or Et_2O . On treating the aq. soln. with NaCl and HCl to acid reaction the cresols are pptd. and extd. with petr. ether. After drying over anhyd. Na_2SO_4 , filter the petr. ether soln., wash the salt and filter with 5 cc. addnl. petr. ether, evap. the solvent, dry $1\frac{1}{2}$ hr. at 100° and weigh.

W. O. E.

Certain volatile oils and stearoptens as fungicides. L. B. KINGERY AND A. ADRISSON. *Arch. Dermatol. Syphilis* 17, 499(1928); cf. *Rcv. hyg. médic. prév.* 51, 153.—The essential oils of clove, cinnamon, thyme, lemon, eucalyptus and peppermint as well as menthol, S, camphor and benzoic acid were used in studies with *Epidermophyton*, *Trichophyton*, *Microsporon*, *Achorion*, *Sporotrichium* and other fungi. Aq. solns. of the oils were used in several concns. The most active were *thymol* and the oils of cinnamon and clove. The possible clinical use of these substances in combating fungus pathogens is indicated.

C. R. F.

Quinine valerate. O. WILLMANN. *Magyar Gyógy. Tarsasag Ért.* 4, 130(1928).—When cryst. quinine valerate is ground in porcelain or glass gallipots there is observed a characteristic light emission. This can be seen in daylight, or better in a dark room when a striking violet color appears. After the salt is ground to a dust, no further light emission was observed. Other quinine salts and zinc valerate failed to emit light. Hence this is a qualitative reaction for cryst. quinine valerate. S. S. DE FINÁLY

Color reactions of ethereal oils. L. EKKERT. *Magyar Gyógy. Tarsasag Ért.* 4, 203-312(1928).—Color reactions of ethereal oils with phenol, thymol, carvacrol, pyrocatechol, resorcinol, hydroquinone, orcinol, phloroglucinol, pyrogallol, β -naphthol, α -naphthol and eugenol are described. S. S. DE FINÁLY

The iodine content and biologic activity of different thyroid preparations. A. STASIAK. *Magyar Gyógy. Tarsasag Ért.* 4, 385-91(1928).—The I content of various thyroid tablets, detd. as described in C. A. 22, 1437, 3953, varied greatly. Also several aq. thyroid exts. were found to contain only traces of I (some thousandth mg. per cc). None of the examd. aq. exts. could increase the acetonitrile-resistance of white mice. Thus such aq. thyroid exts. have no physiologic activity and should not be treated as drugs. Only thyroid powders or tablets should be approved as drugs which are signed and labeled to show their exact I content. Such preps. could be standardized. S. S. DE FINÁLY

Neutralization of ethyl acetate used for the estimation of opium preparations. Gy. MIKÓ. *Magyar Gyógy. Tarsasag Ért.* 4, 392-6(1928).—AcOEt having an acid reaction is shaken with lime water until neutral. S. S. DE FINÁLY

Reactions of holocaine. L. EKKERT. *Magyar Gyógy. Tarsasag Ért.* 5, 19-20(1929).—A mixt. of 0.01 g. holocaine-HCl, 0.01 g. resorcinol and 0.5-1.0 cc. concd. H_2SO_4 , on heating, shows continually darkening red colors, varying from wine-red to raspberry red. Holocaine can thus be distinguished from novocaine, alpine, stovaine, cocaine and tropacocaine. Novocaine-HCl, alpine and stovaine yield green to greenish black colors; cocaine shows wine-red; tropacocaine gives an onion-red to violet color on the above mentioned treatment. Also in *Pharm. Zentralhalle* 70, 120(1929). S. S. DE FINÁLY

Reactions of morphine. L. EKKERT. *Magyar Gyógy. Tarsasag Ért.* 5, 21-4(1929). cf. C. A. 22, 1828.—Several drops of an approx. 5% alc. soln. of anisaldehyde are added to 1 or 2 cg. morphine. The mixt. shows various colors on addition of a few drops of concd. H_2SO_4 . The colors change during warming. Also codeine, ethylmorphine, heroine, peronine, paracodine, apomorphine, narcophine and narcotine show similar colors. S. S. DE FINÁLY

Determination of camphor in Oleum camphoratum. L. DÁVID. *Magyar Gyógy. Tarsasag Ért.* 5, 25-7(1929).—Mix 4 g. Oleum camphoratum and 5 g. freshly made $Ca(OH)_2$ with 110-120 g. water, boil up, and distil. To 60 cc. of the distillate in a cylinder add 20 g. NaCl and ether to make the shaken-out mixt. up to 60 cc. Pour about half into a glass of known wt., dry on the steam-bath and weigh. The camphor content in percent can be calcd. by $(KE^*/E)(100/4)$, in which K is the camphor content part of the distillate evapd., E^* is the vol. of the original ethereal soln. in the cylinder, and E the vol. of the ethereal soln. poured out. S. S. DE FINÁLY

Determination of alkaloid content of Herba and Tinctura Lobeliae. L. DÁVID. *Magyar Gyógy. Tarsasag Ért.* 5, 28-32(1929).—After the materials have been prepd for analysis, they are treated with NaOH and $Ca(OH)_2$ and shaken out with ether. The ethereal soln., contg. all alkaloids, is purified by adding tragacanth dust moistened with a little water. As lobeline decomposes on heating, the ether should be evapd. partly on the steam-bath and partly in a desiccator contg. $CaCl_2$ or H_2SO_4 . S. S. DE FINÁLY

Determination of the saponin content of Hungarian Gypsophila paniculata L. G. MATOLCSY. *Magyar Gyógy. Tarsasag Ért.* 5, 33-42(1929).—Lather no detns. can only be made with material freed from mucilaginous impurities. The method is as follows: Purify an aq. soln. of saponin, cool to 4°, pour into a calibrated cylinder, produce a lather in a shaking machine, cool the lather to 4°, add $CHCl_3$ and read the vol. of lather after 15 min. Viscosity of saponin solns. at const. temp. increases with the concn. and at const. concn. decreases with rise of temp. Three methods were found useful for saponin detn.: (1) quinine-HCl was added to the soln. and the resulting ppt. was weighed. (2) The drug was extd. with 75% MeOH and the ext. was poured into acetone (d. 0.80). Then the pptd. saponin was dried and weighed. (3) The volumetric method can be used instead of weighing. Saponin is pptd. in the above-described manner and acetone is added from a buret until the soln. becomes opalescent. The concns. corresponding to opalescence are given in a table. The fish-index was detd. according

to L. Kofler with saponin of *Gypsophila paniculata* L.; it is 1500 for gold fish and 680 for carp.

S. S. DE FINÁLY

Determination of iodoform content of iodoform gauzes. E. SCHULEK AND G. VASTAGH. *Magyar Gyógy. Tarsaság Ért.* 5, 43-7(1929).—The gauze is covered with alc. in an Erlenmeyer flask, and the iodoform is sapond. on steam bath with reflux condenser. Then the cooled soln. is poured into a 1-l. measuring flask, the gauze washed out with water and the soln. made up with distd. water to 1 l. Ten cc. of this soln. is evapd. in a Ni crucible on the steam bath, the residue is melted with powd. KOH, and the molten mixt. filtered through cotton and dild. to about 90 cc. Fifty% H_2SO_4 soln. is added to neutralization, then 1 cc. N HCl added, iodides are oxidized to iodates by means of Cl water, and after boiling Cl off, I is detd. in the form of iodate. The content of iodoform is not influenced by the various fixatives used (glycerol, paraffin oil, colophony). Iodoform gauzes have a const. iodoform content, even if kept for several weeks in a lab. at 28-30°. Iodoform losses can result only from the drying of the gauzes; therefore drying should be very carefully done. Also in *Pharm. Zentralhalle* 70, 117-9 (1929).

S. S. DE FINÁLY

Herba Centaurii. B. GAAL. *Magyar Gyógy. Tarsaság Ért.* 5, 58-72(1929).—Five kg. of the drug was extd. with petr. ether. Free fatty acid content was 13.01%, sapon. no. 101.54-101.63, mol. wt. of fatty acids 314. Satd. acids included cerotic, palmitic and stearic acids.

S. S. DE FINÁLY

Preparation and determination of fluid extract of Hydrastis canadensis. Z. CSIPKE. *Magyar Gyógy. Tarsaság Ért.* 5, 73-85(1929).—Perfect extn. results by using 20-22 times as much alc. as of the material to be extd. The end of percolation can be detd. by Gluksman's berberine reaction. The gravimetric hydrastine detns. of the pharmacopoeias of different countries yield various results. The volumetric method of the Swedish Pharm. X, with a mixed indicator consisting of Me red and methylene blue is the most exact and simplest. This will be accepted by the Hungarian Pharm. IV, now under prepn.

S. S. DE FINÁLY

Alkaloid content of chlorophyll produced from leaves of Datura stramonium. M. JANICSEK. *Magyar Gyógy. Tarsaság Ért.* 5, 86-95(1929).—Chlorophyll was extd. from leaves of *Datura stramonium* by the technical alc.-benzene method. To det. the alkaloids, the chlorophyll was boiled with water contg. a little H_2SO_4 , the excess acid was neutralized with $BaCO_3$, an aliquot part of the soln. was evapd. and then the procedure of Pharm. Helv. IV for alkaloids was followed. Toxic alkaloids are contained in the chlorophyll. Hence the leaves of toxic plants should be used for chlorophyll production or perhaps the product should be washed with a slightly acid water to remove toxic alkaloids.

S. S. DE FINÁLY

Yeast extract, a new and satisfactory pill mass excipient. WOLFGANG SCHNELLENBACH. *Am. J. Pharm.* 101, 137-40(1929).—Dried and powd. beer yeast and also yeast ext. (an ext. of yeast albumins) as suggested by Heinz (Erlangen, Germany) are both efficient excipients equal to or better than older and well-known substances and in addn. have a therapeutic advantage. The dry cells of yeast absorb H_2O and swell, making the pills absorbable by the stomach. They also stimulate gastric secretions. The German Pharm. recognizes 2 kinds of medicinal yeast: "Faex medicinalis" which is bottom beer yeast washed, deprived of bitterness, dried at a temp. of at least 40° reduced to moderately fine powder and still retains the ability to ferment. A second form called "Extractum Faecis" (yeast ext.) is prepd. from bottom beer yeast, freshly taken from fermenting tubes, washed frequently with H_2O in a decanting vessel at a low temp., sifted through a sieve having openings of approx. 0.15 mm. diam., deprived of bitterness by treatment with a 1% soln. of Na_2CO_3 , washed until the H_2O no longer shows an alk. reaction to litmus paper and is clear and colorless, the adhering H_2O removed from this purified yeast by pressure; 20 parts of this yeast mixt. with 10 parts H_2O , 1 part HCl is allowed to autoferment for 12 hrs. at 40° to 50°, the product is heated for a short time on a water bath and the liquid removed by straining; the residue is again heated with 10 parts H_2O on a water bath and the liquid removed by straining; the combined liquids are filtered and concd. under vacuum to a thin ext., and this ext. is mixed with 25 times its wt. of medicinal yeast which has previously been dried for 2 hrs. in a drying oven at 100° to destroy the activity of the yeast cells; the mixt. is heated to dryness under vacuum. Yeast ext. is a brown powder (should not be black-brown) having a spicy taste (not a bitter or an empyreumatic taste); its soln. in H_2O is turbid. Only the yeast ext. is used as an excipient for pills and is recommended with sufficient of a mixt. of equal amts. of H_2O and glycerol in case there is only a small portion of ingredients to be combined. If there is a large amt. of dry powders to be amassed it is recommended that the "Ex-

tractum Faecis Spissum" be used, unless some other vegetable ext. is present. This highly concd. yeast ext. and another prepn. on the market in Germany, a dry powd. yeast ext., are recommended and frequently used by pharmacists as excipients for the prepn. of pills. Powd. digitalis leaves and quinine-HCl are ingredients which are especially difficult to form into a mass. Very often they are prescribed in an amt. which does not permit the addn. of much massing material without making the size prohibitive. It has been found that 10% of the official ext. of yeast is sufficient to form these into a very satisfactory pill mass. In pill preps. calling for large amts. of liquid constituents such as volatile oils, balsams, creosote, etc., dry yeast ext. or the official yeast ext. also yielded good results.

W. G. GAESSLER

The quinic acid content of young shoots of *Picea excelsa* and a method for its extraction. ALEX. KIESEL. *Planta Abt. E, Z. wiss. Biol.* 6, 519-25(1928).—Young shoots of *Picea excelsa* yielded 10% quinic acid on a dry wt. basis. Isolating quinic acid as the Cu salt is not regarded as entirely quant. The procedure for extn. is: air dry material is ground and extd. first with benzene, the benzene evapd. off, and then extd. 3 times with hot H₂O; all liquid possible is pressed from the residue; Pb acetate is added to the combined exts. and the soln. evapd. to 1/2 vol. on H₂O bath; excess Pb is removed with H₂SO₄, the soln. filtered and the filtrate evapd. to a sirup in a vacuum, repeated treatment with cold and hot alc. causes a viscous mass to sep. out; after cooling transparent crystals of quinic acid form on the sides of the container, the first crystals appearing in regions adjacent to the viscous material. Phys. and chem. properties of the cryst. material agree very closely with those for C₇H₁₂O₆, indicating that the method of extn. probably gives a pure quinic acid. It is believed that the simplicity of this method will encourage a more intensive study of the origin and function of quinic acid especially in the higher plants.

A. E. HITCHCOCK

The nitrate content of tobacco and the sources of error in the present methods for its determination. THALES ANDREADIS. Kaiser Wilhelm Inst., Berlin Dahlem *Biochem. Z.* 204, 484-92(1929).—The usual procedure for detg. nitrate in tobacco consists in the reduction of HNO₃ to NO by means of HCl contg. FeCl₂, and measuring the NO gasometrically. But this gas is contaminated with CO₂, which it is shown arises from the pectins contained in the tobacco. The pectin is a condensation of galacturonic acid, and like this yields with HCl furfurole, CO₂ and H₂O. The same source of error of course, exists in the nitrate detns. in other plant preps. contg. pectins, gums, mucilages, etc. Dry tobacco powder is refluxed for 1 hr. with a 40% AcOH to which dil NaOH was added until slightly alk. The ext. was cleared by centrifuging. An aliquote portion was treated with the HCl-FeCl₂ reagent with the usual precautions and the gas collected under H₂O. After the vol. was detd. KOH was admitted into the tube and the contracted vol. again measured.

S. MORGULIS

Studies on the stability of solutions of cocaine and pseudococaine. ERIK SÄDOLIN. *Dansk. Tids. Farm.* 2, 309-15(1928).—S. demonstrated that when a soln. of cocaine-HCl is kept at room temp. less than 10% is hydrolyzed in a month, and no further hydrolysis takes place during a year. By means of tables and curves it is shown that cocaine is more stable than pseudococaine. In 0.1 N NaOH cocaine is completely hydrolyzed in 9 hrs. while pseudococaine requires only 5 hrs. In the expts with NaHCO₃ solns. are hydrolyzed 20 and 30% resp. after the corresponding periods. In 1 hr. 15 and 20%, resp., are hydrolyzed.

O. A. NELSON

Liquor Aluminii Acetici. ALFRED WØHLK. *Dansk. Tids. Farm.* 2, 320-3(1928).—Since Al₂(SO₄)₃·18H₂O of commerce seldom contains 18 mols. H₂O and since CaCO₃ is hardly ever pure, W. suggests analyzing these compds. previous to prepg. liquor aluminii acetici from them. In Al₂(SO₄)₃·18H₂O, det. SO₄⁼⁼ with BaCl₂ soln. and for CaCO₃ dissolve the sample in slight excess standard HCl, boil off CO₂ and titrate back with standard NaOH using methyl red as indicator. Prepn. of c. p. liq. aluminii acetici now becomes easy.

O. A. NELSON

The determination of pilocarpine. P. BOURCET. Faculté de Pharmacie de Paris *Ann. fals.* 22, 23-4(1929).—The following method is recommended as having given satisfactory results for many yrs.: moisten 25 g. of jaborandi leaves (ground to pass a 30-mesh sieve) with 200 cc. of 10% Na₂CO₃ soln., ext. in a Soxhlet app. for 2 hrs. with hot C₆H₆, cool the ext., shake immediately with 30, 20, 20 and 10 cc. 1% H₂SO₄, filter the ext., neutralize (using Congo red indicator) with NH₄OH, oxidize with 1% KMnO₄ soln. (a stronger soln. might ppt. pilocarpine permanganate), add excess NH₄OH, ext. with 10 × 5-6 cc. CHCl₃, filter through anhyd. Na₂CO₃, exactly neutralize with 1:50 HNO₃, evap. to dryness on the water bath, take up with cold Me₂CO, filter through a Gooch crucible, dry below 100° and weigh. The m. p. of the pilocarpine nitrate is 174-5°, and should not fall below 165°. With certain batches of jaborandi leaves,

it has been observed that if the C_6H_6 soln. of the alkaloids is allowed to stand 24–48 hrs before converting into sulfate, the pilocarpine content found is over 50% lower than if the C_6H_6 soln. is immediately extd. with H_2SO_4 . This can be prevented by extg. the leaves with petr. ether or C_6H_6 before moistening with Na_2CO_3 soln. The phenomenon is being studied.

A. PAPINEAU-COUTURE

The terpinol and terpineol industry. L. DESALBRES. *Bull. inst. pin* No. 56, 10–4 (Jan., 1929).—A brief description of the prepn. and purification of terpinol and of the prepn., uses and by-products of terpineol.

A. PAPINEAU-COUTURE

Perfumes obtained from spirits of turpentine. M. MOURIER. *Bull. inst. pin* No. 56, 14–5 (Jan. 1929).—A brief review of the products derived from spirits of turpentine which are used as raw materials for perfumery.

A. PAPINEAU-COUTURE

Utilization in medicine of oil and of liquid tar of *Cedrus atlantica*. R. MASSY. *Publ. inst. pin* No. 56, 30–1 (Jan. 1929).—The liquid tar obtained by destructive distn. of the wood of *Cedrus atlantica* is stated to be superior to the best oil of cade, and its recognition in the French Codex is recommended. In 1899 Gémey found that the oil obtained by steam distn. of the wood of *C. atlantica* was at least as efficient as sandalwood oil for the treatment of blennorrhoea and was better tolerated by the organism. The properties of the oil are: sol. in less than 10 vol. of 90% alc. at 20°, d_{20}^4 0.939–0.945, α_D^{20} (100 mm. tube) +45° to +55°, acid no. not more than 1, Ac no. about 20 or more. The properties of the liquid tar are: d_{20}^4 less than 1.05, H_2O less than 3%, residue on distg. to 300° at atm. pressure less than 30%, sol. acidity (as AcOH) less than 1 g. per 100 cc., α_D^{20} of oil obtained by steam distn. (100 mm. tube) over +20°, Hirschsohn-Papan reaction ($Cu(OAc)_2$ -petr. ether) color varying from light yellow to brownish yellow.

A. PAPINEAU-COUTURE

Composition of oil of spike lavender (*Lavandula spica*). B. N. RUTOVSKII AND N. N. MAKAROVA-SEMILYANSKAJA. *Riechstoffind* 3, No. 4, 28–9 (Feb. 15, 1928); *Chimie et industrie* 21, 110–11 (1929).—Seven samples of oil prepd. by distn. of different portions of plants grown in Caucasia gave the following results on analysis: yield 0.13–24%, d_{20}^{25} 0.9067–0.9263, α_D^{20} 0.72–11.52°, n_{20} 1.4660–1.4756, acid no. 0.88–2.71, sapon no. 3.0–19.06, Ac no. 49.0–108.2, camphore 12.46–25.5%, cineole 27.5–64.3%. Fractional distn. over Na of one of the samples gave:

Fraction	Pressure	B. p.	Yield %	d_{20}^{25}	$[\alpha]_D^{20}$	n_{20}
Ia	760 mm.	162.4°	5.3	0.8940	+7.9°	1.4612
IIa	760	164.70°	16.6	0.9147	+3.96°	1.4593
IV	20	88–96°	33.3	0.9130	+4.8°	1.4613
V	20	96–102°	12	0.9061	+4.59°	1.4639
VI	20	102–20°	4	0.9061	+5.43°	1.4661
VII	20	120–50°	3.3	0.9332	+9.4°	1.4831

Cineole and α -pinene were identified in Ia and IIa; linalool in IV, *d*-camphor, linalool and a small quantity of borneol in IV, V and VI. Five samples of oil prepd. by distn. of different portions of plant grown in Crimea gave the following results on analysis: yield 0.22–0.93%, d_{20}^{25} 0.9024–0.9349 (a value 0.9802 is given, but is probably a misprint), α_D^{20} –2.05° to +9.8°, n_{20} 1.4658–1.4863, acid no. 0.85–2.21, ester no. 11.51–14.84, Ac no. 45.07–105.57.

A. PAPINEAU-COUTURE

Use of the quartz lamp for the analysis of essential oils. A. MULLER. *Riechstoffind* 3, No. 4, 29 (Feb. 15, 1928); *Chimie et industrie* 21, 111 (1929).—Attempts to detect adulteration of essential oils by examn. of the fluorescence did not give any characteristic results.

A. PAPINEAU-COUTURE

Citronellol and rhodinol. J. DORVILLE. Science Thesis, Lyon, 1928; *Chimie et industrie* 21, 112–3 (1929).—See Grignard and D., *C. A.* 22, 3879, 4104. A. P.-C.

Bioassay of commercial pituitary powders. W. T. McCLOSKEY AND J. C. MUNCH. Food, Drug and Insecticide Administration, Washington, D. C. *J. Assoc. Official Agr. Chem.* 12, 135–6 (1929).—The activities of com. samples representing current output (obtained directly from the mfrs.) were studied. Com. whole pituitary powders showed a ratio of activity of 1 part of posterior substance in 8 parts of the whole body when assayed by the U. S. P. X method on the isolated guinea pig uterus, standard posterior powder being used as a basis for comparison. The exts., which were made according to the U. S. P. directions for liquor pituitarii, contained the activity of 10 mg. of powder per 1 cc. of soln. Com. anterior pituitary powders were uniformly inactive. Com. posterior pituitary powders showed activities varying from 30 to 50% of the standard posterior pituitary powder, U. S. P. X. The following standards for physiol. activity are suggested: (1) Pituitarium, U. S. P.—50% of the activity of the U. S. P. X official

standard posterior pituitary powder; (2) desiccated whole pituitary powder—5% of the activity of the U. S. P. X official standard posterior pituitary powder. A. P. C.

The destructive action of heat on aqueous solutions of insulin. E. TROCELLO. *Nat. Med. Pharmacol. Inst. "Seroni."* *Rass. clin. terap. sci. affini* 27, 504-5(1928).—Citing the researches of Krogh and Hemmingsen and the expts. carried out by himself and Cruto (*C. A.* 19, 1903; 20, 1130) T. points out that insulin intended to be shipped to warm countries should be sent as a dry powder, which is stable, while the solns. are easily affected by an elevated temp.

G. SCHWOCH

A new series of double salts of alkaloids, the iodozincates. R. DANET. *J. pharm. chim.* 7, 548-50(1928).—Iodozincates of codeine, $ZnI_2 \cdot 2(\text{Codeine-III})$, and of quinine, $ZnI_2 \cdot \text{Quinine-2HI}$ have been prepd. Mix warm solns. of ZnI_2 and the HI salt of the alkaloid acidulated with HI; allow to cool very slowly (for 48 hrs. in a "thermos" bottle kept in sawdust). Addn. of some $NaHSO_3$ prevents formation of I. Quickly dry the sepd. crystals on paper, then expose these to the air for several days, finally remove traces of H_2O and HI by keeping the crystals over solid NaOH in a desiccator.

S. WALDBORT

Some salts of pelletierine. G. TANRET. *J. pharm. chim.* 8, 112-20(1928).—The present com. salts of pelletierine differ much in compn. and activity from the standards for these salts in the French Codex of 1884 and 1908, in which pelletierine (A) and isopelletierine (B) alone are specified, in 1884 as tannates, in 1908 as sulfates. U. S. P. IX and other foreign pharmacopeias define the drug as a mixt. of the tannates of the 4 chief alkaloids of pomegranate. A com. (German) sample contained 31.28% of sulfate of pseudopelletierine (C) and 36.14% of sulfate of B. A com. tannate sample (of the same source) contained 17.25% total alkaloids consisting of C 46.5% and B 53.5%; A was totally absent in both cases. In the prepn. of tannate of C, $C_9H_{15}NO \cdot 2C_{11}H_{19}O_6$ (19.20% C), and the tannate of A, $C_8H_{15}NO \cdot 2C_{14}H_{19}O_9$ (17.96% A), a study is made of the loss of product by dissocn. through diln. and washing with H_2O . From the sulfates (1 g.) in concd. solns. (1:5) set free the alkaloids by adding the calcd. quantity of NaOH (0.17 g. NaOH for C, 0.21 g. for A), then add soln. of tannin (3.1 g. in 30 cc. H_2O) drop by drop, which yields a white ppt. easily washed out. The tannate of C thus prepd. contained 16.57% C, or 14.47% when a much more dil. tannin soln. was used (4 g. in 300 cc.). The tannate of A similarly contained 17.38% A, or 12.22% (3.1 g. tannin in 300 cc.). Petit's method of prepn. (Codex 1884; add tannin to the sulfate, then neutralize with NH_4OH) is unsatisfactory. To det. the alkaloids in these tannates, dissolve 3 g. tannate in 10 cc. cold 15% NaOH, ext. with 100 and then with 25 cc. $CHCl_3$, filter the united solns., shake out with 20 cc. 0.2 N H_2SO_4 and titrate back with 0.2 N NaOH adding 2 drops of 0.02% nitrophenol as indicator. The no. of mg. acid consumed $\times 0.3122$ gives the wt. of C, $\times 0.2877$ the wt. of A in the tannate employed. The frequent failure of the com. drug as a teniafuge is caused not only by faulty manuf., but also by incorrect dosage directed in pharmacopeias; the doses given in Brit. Pharm. and U. S. P. should be 10 times stronger.

S. WALDBORT

Organo-Sb compounds (NIVOGY) 10. Apparatus for disinfecting and deodorizing by emanations (Fr. pat. 645,754) 1. Preserving mixtures of iodides with NaCl (Austrian pat. 112,104) 18. Therapeutic molecular compound of butylchloralhydrate and 4-dimethylamino-1-phenyl-2,3-dimethyl-5-pyrazolone. SOC. CHIMIQUE DES USINES DU RHÔNE and J. ALRWEGG. *Brit.* 294,092, May 16, 1928. This compd. is stabilized by adding a small proportion of magnesia.

Therapeutic thiosemicarbazones of arsenophenolaldehydes and ketones. I. G. FARBENIND. A.-G. Brit. 294,263, July 21, 1927. A hydroxyaldehyde-arsenic acid or an hydroxyketone-arsenic acid is treated with thiosemicarbazide before or after its reduction to the arseno compd. An example is given of the production of 4,4'-arseno-3,3'-dihydroxybenzaldehyde thiosemicarbazone from 3-hydroxybenzaldehyde-4-arsenic acid by using hypophosphorous acid and HI as reducing agents; the product forms a Na compd. with NaOH.

Therapeutic mercury compounds. AUGUST ALBERT and JOHANNES PFLEGER (to Winthrop Chemical Co.). U. S. 1,704,694, March 12. By heating *p*-acetophenone-carboxylic acid with 1.5 times its wt. of $\text{Hg}(\text{OAc})_2$ on an oil bath at 130–40° for about 15–25 min. a new compd., sol. in Na_2CO_3 and caustic alkali, is produced; by using a large proportion of $\text{Hg}(\text{OAc})_2$ there is formed a di-Hg compd., probably $\text{AcOHgCHCO}-$
 $\text{C}_6\text{H}_5\text{CO}_2\text{Hg}$. Similarly, *p*- $\text{ClC}_6\text{H}_4\text{Ac}$ yields $\text{ClC}_6\text{H}_4\text{COCH}_2\text{HgOAc}$, m. above 270°,

and *p*- $\text{HOOC}_6\text{H}_4\text{Ac}$ yields the corresponding OH compd., which decomposes at about 175°. *p*- $\text{H}_2\text{NC}_6\text{H}_4\text{Ac}$ heated with $\text{Hg}(\text{OAc})_2$ above 100° forms a dark brown melt, which decomposes after purification at about 215°. $\text{Ac}(\text{HO})\text{C}_6\text{H}_3\text{CO}_2\text{H}$ and $\text{Hg}(\text{OAc})_2$ form a product of the probable formula $\text{Ac}(\text{HO})\text{C}_6\text{H}_3\text{COCH}_2\text{HgOAc}$ and *p*- $\text{H}_2\text{O}_3\text{AsC}_6\text{H}_4\text{CMc}-\text{NNHCONH}_2$, dissolved in NaOH and treated with pptd. HgO , forms $\text{Na}_2\text{O}_3\text{AsC}_6\text{H}_4\text{C}(\text{CH}_2\text{HgOH})\text{NNHCONH}_2$.

Complex antimony compounds. HANS HAHN (to Winthrop Chemical Co.). U. S. 1,703,732, Feb. 26. *Trypanocidal compds.* are derived from the reaction of starting materials such as pyrocatecholdisulfonic acid and antimonyl pyrocatechol. Cf. C. A. 23, 1216, 1474.

Organo tin compounds. C. T. J. VAUTIN and C. V. STEPHENS. Brit. 294,287, April 22, 1927. Methylstannic triiodide is obtained in water-sol. form suitable for therapeutic uses by first forming methylstannoxylic acid by interaction of MeI and an alk. stannous soln. in the presence of alc. at a temp. of 30–40° and then heating it with HI. Various details and modifications are described.

Derivatives of substituted quinolinecarboxylic acids. SOC. ANON. POUR L'IND. CHIM. À BAILE. Brit. 294,118, July 15, 1927. Therapeutic compds. are made by causing a 2- or 4-hydroxy- or dihydroketoquinolinecarboxylic acid or a deriv. or a quinolinecarboxylic acid halogenated in the 2- or 4-position to react with an amino alc. or an ester or alkali compd. of such an alc. and if necessary hydrolyzing the product or treating with an alcoholate. Examples are given of the production of 2-hydroxy-4-quinolinecarboxylic acid diethylaminoethyl ester, 2-chloro-4-quinolinecarboxylic acid diethylaminoethyl ester, 2-ethoxy- and 2-methoxy-4-quinolinecarboxylic acid diethylaminoethyl esters, 1-methyl-2-ketodihydro-4-quinolinecarboxylic acid diethylaminoethyl ester, 2-diethylaminoethoxy-4-quinolinecarboxylic acid diethylaminoethyl ester, and 2-diethylaminoethoxy-4-quinolinecarboxylic acid Et ester. The properties of the bases and their salts obtained from 2-chloro-4-quinolinecarboxylic acid diethylaminoethyl ester and Me, Pr, allyl, isoamyl, *n*-heptyl, *n*-octyl, cyclohexyl and benzyl alcoholates are described. Cf. C. A. 23, 1217.

Aromatic esters of the α,α' -dimethyl- γ -hydroxypiperidine- β -carboxylic acid esters. FRIEDRICH STOLZ and WALTER KROHS (to I. G. Farbenind. A.-G.). U. S. 1,703,121, Feb. 26. These compds. are *local anesthetics* less toxic than cocaine and more effective than *p*-aminobenzoyldiethylaminoethanol. Production of the benzoic acid ester is described. Its hydrochloride m. 206°.

Compound from trichlorobutyl alcohol and 4-dimethylamino-1-phenyl-2,3-dimethyl-5-pyrazolone. JÜRGEN CALLSEN (to Winthrop Chemical Co.). U. S. 1,703,922, March 5. A homogeneous *analgetic compd.* is obtained by the reaction together of equimol proportions of 2,2,3-trichlorobutyl alc. and 1-phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone either by melting the components together or by mixing their solns. and evapg. and crystg. The product is an almost colorless cryst. powder, easily sol. in acetone, alc. and C_6H_6 , less readily sol. in ligroin and m. 61–3°.

6-Alkoxy-8-aminoquinolines. WERNER SCHULEMANN, FRITZ SCHÖNHÖFER and FRITZ MEITZSCH (to Winthrop Chemical Co.). U. S. 1,703,365, Feb. 26. These compds. are generally whitish cryst. powders forming sol. salts with HCl and having *antipyretic properties* and a strong action against blood parasites. The 6-methoxy-8-aminoquinoline b. 137–8° and forms an orange-colored cryst. dihydrochloride. The corresponding 6-ethoxy compd. b. 144–5°. These compds. are yellow oils which solidify and then m. 41° and 60°, resp.

Lecithin preparations. CHEM. FAB. GRÜNAU LANDSHOFF & MEYER A.-G. (Israel

Magat, inventor). Ger. 470,954, Oct. 24, 1924. Emulsions of lecithin in aq. glycerol, such as are used for subcutaneous and intravenous injection, are rendered more stable and less viscous by addn. of a small amt. of a mixt. of electrolytes. An addn. of 0.6% of a mixt. of NaCl with KCl or CaCl_2 , with or without Na_2CO_3 or NaHCO_3 , is suitable.

Quinine preparations. CHEMISCH-PHARMAZEUTISCHE A.-G. BAD HOMBURG. Ger. 470,955, Mar. 6, 1927. See Brit. 291,565 (C. A. 23, 1215).

Eugenol salts. V. H. KIRKHAM and L. W. RAYMOND. Brit. 294,735, May 24, 1927. Ca and Mg salts of eugenol and isoeugenol are made by treating eugenol or isoeugenol with the corresponding metal oxide or hydroxide in solid form. Oil of cloves may be prepd. for transport by mixing with its chem. equiv. of slaked lime; a fine powder is formed from which the volatile constituents of the oil soon evap. or are removed by washing with "methylated spirit."

Alkaloids. GEORG W. F. F. KNOTH. Fr. 644,692, Nov. 20, 1927. See U. S. 1,686,866 (C. A. 22, 4537).

Preparation of a glucoside from Adonis vernalis L. PRODUITS ROCHE. Belg. 348,223, Feb. 29, 1928. The glucoside is extd. from the material by means of a suitable solvent. The residue obtained on evapn. of the solvent is extd. with H_2O and Et_2O , the residual oil is redissolved, and the glucoside is pptd. by adding a liquid which is miscible with the solvent but in which the glucoside is insol. The glucoside is then purified by the usual processes.

Generating chlorine. KARL CONNELL. U. S. 1,701,727, March 12. A Cl-liberating material such as KClO_3 , having a portion of its surface coated with paraffin or other suitable material and another substantial portion of its surface uncoated, is caused to react with the inorg. acid such as HCl so that both an immediate and a further gradual and prolonged evolution of Cl occurs. The method is adapted for liberating Cl for therapeutic purposes.

Hormones. SCHIERING-KAHLBAUM A.-G. Brit. 294,650, July 29, 1927. In the prepn. from vegetable materials (such as ground wheat, residue of an ethereal ext. of wheat, or yeast) of substances similar to sexual hormones obtained from animal organs, the material is treated with an alk. earth such as $\text{Ca}(\text{OH})_2$ in suspension in water or in an org. solvent dild. with water. An inert binding agent such as kaolin or silica gel may be present. Several examples are given. Brit. 294,651 specifies a modification of the process for obtaining hormones described in Brit. 291,006 (C. A. 23, 1218) by treating the finely divided animal organs used with alk. earths without making a preliminary ext., e. g., placentas, testicles or prostate glands are finely divided and digested at a temp. of 60° with a mixt. of $\text{Ca}(\text{OH})_2$, silica gel and 40% MeOH, the material is filtered, the filtrate evapd. and the residue taken up in water and extd. with ether. Cf. C. A. 23, 483.

Surgical ligatures made from fresh muscular tissue. PAUL BOST. U. S. 1,703,385, Feb. 26.

Condenser construction suitable for peppermint stills. WALTER S. SHENEFIELD. U. S. 1,703,366, Feb. 26.

Anthelmintic. CARLISLE N. ANDERSON (to Parke, Davis & Co.). U. S. 1,703,377, Feb. 26. For use as an anthelmintic in veterinary practice, tetrachloroethylene is enclosed in gelatin capsules which are colored with an oil-sol. red dye or other suitable substance which protects the contents of the capsule from actinic light.

Cosmetics and soaps containing sorbitol and its derivatives. I. Q. FARBENIND. A.-G. Brit. 294,130, March 16, 1927. Sorbitol or its dehydration products or esterification or etherification products are used in various cosmetic or soap mixts., with or without the addn. of other polyhydric alcs. or of Na lactate.

Medicine for external treatment of foot-rot or similar animal diseases. W. EVANS. Brit. 294,734, May 23, 1927. Na thiosulfate and HCl (or HOAc) are used in a vehicle of sugar sirup, or treacle, with or without lard.

Apparatus for casing and preserving the natural color of leaf tobacco. RAMON FEBLES (one-third each to James Y. Brown and G. P. Gill). U. S. 1,704,597, March 5.

Sterilizing cut tobacco with ozone. UNIVERSELLE CIGARETTENMASCHINEN-FABRIK J. C. MÜLLER & Co. Brit. 294,537, July 25, 1927. Cut tobacco is pneumatically fed to a loosening and dust-removing plant by a stream of air contg. ozone. An app. is described.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

Liquid-phase operation of sulfuric acid chambers gains significance in Europe. PERCY PARRISH. *Chem. Met. Eng.* 36, (68-72(1929)).—By atomization of suitable strengths of nitrous vitriol in the first 2 tower chambers the activity of the last 2 as acid producers is reduced to a negligible quantity. It is possible to work the first 2 chambers at a rate of 40 kg. of 52° Bé. acid per cu. m. per 24 hrs., or a chamber space of 1.75 cu. ft. per lb. of S per 24 hrs.

E. M. SYMMES

Volumetric and thermal study of ammonia and its synthesis. R. NITZSCHMANN. *Chem. Listy* 22, 169-77, 199-202, 241-4(1928).—The relations between pressure, temp. and compn. of mixts. of N and H are detd. and, together with thermal exchanges and liquefaction after production of NH_3 , are expressed in a no. of equations and graphs, from which may be calcd., among other data, the optimum dimensions for the surface of exchange under given conditions. The values obtained for the calorific exchange are of a very high order.

B. C. A.

Barium chloride. ANON. *U. S. Tariff Commission*, Feb. 7, 1929, 21 pp.—A preliminary statement of information obtained for use in a hearing before the U. S. Tariff Commission, to det. rates of duty. It includes description and uses of BaCl_2 , raw materials and sources, domestic and foreign production, imports, exports, prices, costs of production, rates of exchange, marketing and transportation, and a comparison of domestic and foreign costs.

W. C. EBAUGH

Potassium permanganate. THOMAS O. MARVIN, *et al.* *Rept. of the U. S. Tariff Commission to the President of the U. S.* 1928, 14 pp.—A report on the costs of production of KMnO_4 in the U. S. and in the principal competing countries. It is shown that Germany is the principal competing country; the present duty of 4 cts. per lb. on KMnO_4 (tariff act of 1922) does not equalize the difference in costs of production in the U. S. and in the competing country; a duty of 6 cts. per lb. would equalize such costs of production.

W. C. EBAUGH

The manufacture of saltpeter from sodium nitrate and potassium chloride. F. CHEMNITZ. *Chem.-Ztg.* 53, 85-6(1929).—Operating details of the usual method are given.

E. M. SYMMES

Talc and soapstone in 1927. ANON. *Bur. Mines, Mineral Resources of the U. S.*, 1927, Pt. II, 181-6 (preprint No. 18 published January 10, 1929).

E. H.

Economical lime burning. B. VÉCSEI. *Tüzelétech.* 1, 3-5(1928).—A considerable part of the heat content of flue gases is lost in lime kilns. The max. ideal utilization of fuel is about 65%. A heat exchanger would give a saving of 16-20% in fuel.

S. S. DE FINÁLY

Lime kilns heated with powdered coal. L. NASZÁLYI. *Tüzelétech.* 1, 7-8(1928).—Description of a special kiln in a French carbide factory for heating with powd. coal (Tarentaise coal). Much saving resulted from the use of this coal mined in the neighborhood, as compared with heating by Lyon gas coke.

S. S. DE FINÁLY

Catalysts for the reaction $\text{CO} + \text{H}_2\text{O} \rightleftharpoons \text{CO}_2 + \text{H}_2$. WALENTY DOMINIK. Warsaw Agricultural High School. *Przemysł Chem.* 11, 557-62(1927); cf. *C. A.* 22, 4334.—The process of prep. the catalyst was based on the equation: $3\text{FeCO}_3 + \text{HNO}_3 + 4\text{H}_2\text{O} = 3\text{Fe}(\text{OH})_3 + \text{NO} + 3\text{CO}_2$. Its activity was still great at a temp. as low as 390° working with a gas composed of CO_2 7.5, CO 17 and H_2 55%. The hypothesis was substantiated that only metal which possesses the least alk. properties, and the sulfide of which is readily hydrolyzed by water vapor, can be a permanent activator in presence of S gases. Thus, it was possible to reactivate the Fe catalyst with Cr or Al, but not with Co or Mn.

A. C. ZACHLIN

Testing of sealing wax. R. NITSCH. *Farben-Ztg.* 33, 2794-6(1928).—Sealing waxes are graded by examn. of their combustibility, degree of non-adhesion to the seal, adhesion to paper and "flow" and "drop" points (Ubbelohde). Standard methods of testing and specifications for 3 grades are detailed.

B. C. A.

Cl and cellulose (POMILIO) 23. The decomposition of NH_3 on Fe (MITTASCH, *et al.*) 2. Vertical column scrubber suitable for extracting NH_3 from gas (U. S. pat. 1,704,518) 1.

Boric acid. W. E. BURKE and H. DE ROPP (to American Potash & Chemical Corp.). *Brit.* 294,236, July 22, 1927. In a cyclic process, borax (which may be partly or wholly dehydrated) is treated with H_2SO_4 , and H_3BO_3 is sepd. by crystn. Borax and water

are added to the mother liquor and the latter is cooled to sep. Na_2SO_4 . The residual liquor is further mixed with borax and H_2SO_4 .

Hydrocyanic acid. ALBERT R. FRANK and NICODEM CARO. Fr. 645,760, Dec. 15, 1927. See Brit. 282,379 (C. A. 22, 3743).

Nitric acid. HERMANN FRISCHER. Fr. 644,691, Nov. 29, 1927. See Brit. 281,691 (C. A. 22, 3744).

Nitric acid. HARRY PAULING. Fr. 645,269, Nov. 7, 1927. See Brit. 292,830 (C. A. 23, 1479).

Sulfuric acid. A. O. JABGER (to Selden Co.). Brit. 294,975, Aug. 3, 1927. A catalyst for oxidizing SO_2 to SO_3 contains at least one catalytically active non-siliceous base-exchange material in which at least one catalytically active component (such as V) is chemically combined in exchangeable or non-exchangeable form, with or without stabilizers or stabilizer promoters chemically or physically assocd. with the base-exchange material. A large no. of examples and details of prepg. the catalysts are described. Cf. C. A. 23, 936.

Sulfuric acid. SOC. GÉNÉRALE MÉTALLURGIQUE DE HOBOKEN. Fr. 645,373, Dec. 7, 1927. H_2SO_4 of 54–63° Bé and contg. oxides of N are injected into the usual Pb chambers from nozzles. The amt. of acid injected is such that the acid collecting at the bottom of the chamber still contains nitrous products and the acid in the last chamber contains more than that in the 1st. A regulating tower as described in Ger. 208,028, rinsed with nitrosylsulfuric acid, may be inserted before the Gay-Lussac tower.

Process for the manufacture of hydrochloric acid and resultant products. E. CONNERADE and G. LIEVENS. Belg. 348,137, Feb. 29, 1928. By-product Cl is made to react with CH_4 hydrocarbons with the formation of C or of chlorinated derivs.

Silicic acid sols. I. G. FARBENIND. A.-G. Brit. 294,264, July 21, 1927. A purified silicic acid gel is treated with a small proportion of NH_3 (which may be in dil. aq. soln. or in gaseous form) and then heated for 24–48 hrs., evapn. being avoided. Sols contg. up to 15% of silica may be thus obtained.

Carbon dioxide. DRYICE CO. OF AMERICA. Fr. 644,697, Nov. 29, 1927. The amt. of liquid CO_2 in cylinders is controlled by adding the CO_2 in the solid state and allowing it to liquefy after closing the cylinders.

Ammonia synthesis. RALPH S. RICHARDSON (to Nitrogen Engineering Corp.). U. S. 1,704,214, March 5. In passing a gaseous mixt. of H and N over a catalyst mass at high temps. under pressures below 400 atm., the gas mixt. is first passed through a sepd. portion of the catalyst mass and the cooler, H N mixt. is then introduced into the outgoing mixt. and the combined gas mixt. thus prepd. is passed through another sepd. portion of the catalyst of greater content than the first-mentioned portion; a substantially uniform pressure is maintained in both of these stages. An app. is described Cf. C. A. 23, 487.

Ammonia from gas. FRED OSBORNE (to Semet-Solvay Co.). U. S. 1,703,405, Feb. 26. Gas contg. NH_3 together with water and other condensable substances is (a) cooled by heat exchange with gases from step "b" of the process; (b) passed through an elec. pptn. app. and then cooled and freed from condensate; (c) passed in heat exchange with the incoming gas in step "a"; and then passed to a saturator for removing NH_3 . An app. is described.

Recovery of salt by evaporation. METALLWERKE VORM. J. ADERS AKT. Fr. 644,895, Nov. 30, 1927. See Brit. 281,726 (C. A. 22, 3746).

Alkali solutions of high concentration. FRANZ BENCKER (to I. G. Farbenind. A.-G.). U. S. 1,704,909, March 12. An amalgam such as that of Na is decomposed with water in the presence of an org. nitro compd. such as PhNO_2 which serves to facilitate production of solns. of high concn.

Alkali cyanides. I. G. FARBENIND. A.-G. Fr. 644,778, Sept. 21, 1927. Alkali cyanides are prepd. by causing CO and NH_3 to react with oxides, hydrates or salts of alkali metals at temps. between 400° and 800°. Indifferent diluents or catalysts may be added. In examples, a mixt. contg. NH_3 35 and CO 65% by vol. is passed over a mixt. of MgO and NaOH at 500°, and a mixt. of equal parts of NH_3 and CO is passed over a mixt. of NaCN and Na_2CO_3 whereby the Na_2CO_3 is transformed to NaCN with liberation of H.

Metallic chlorides. I. G. FARBENIND. A.-G. Fr. 645,335, Dec. 7, 1927. Anhyd. metallic chlorides, e. g., AlCl_3 , are obtained by treating the primary materials contg. the metal as oxide, such as clay, with CO and Cl or COCl_2 in a heat-insulated vessel and using only the heat of reaction to maintain the temp. once the reaction has started. COCl_2 may be formed by passing CO and Cl over a catalyst. A preliminary rapid treatment with COCl_2 to remove Fe and Ti may be given. Cf. C. A. 22, 3497.

Potassium and other salts. I. G. FARBENIND. A.-G. Fr. 645,620, Dec. 13, 1927. Crude K salts, etc., are treated with steam instead of liquid solvents to recover KCl, etc. In examples sylvinitic carnallite, artificial carnallite and crude saltpeter are so treated.

Purifying solutions of zinc chloride or other metallic salts. I. G. FARBENIND. A.-G. Brit. 294,259, July 21, 1927. Solns. such as those of $ZnCl_2$ obtained in the manuf. of parchment paper or vulcanized fiber are purified by treatment with O or an O-contg. gas (suitably under 20 atm. pressure and at a temp. of 200°).

Preserving mixtures of iodides with sodium chloride. FRANZ MENTER. Austrian 112,104, June 15, 1926. Mixts. of iodides with NaCl, such as are used for treating goiter or as bath salts, are protected against loss of I by addn. of $MgCO_3$.

Alumina. JEAN C. SEAILLES. Fr. 33,485, Jan. 11, 1927. See Brit. 283,509 (C. A. 22, 4211).

Alumina and calcium sulfide. METALLBANK UND METALLURGISCHE GES. A.-G. and CONWAY, BARON VON GIRSEWALD. Brit. 294,079, Jan. 27, 1928. Al sulfide or a mixt. contg. it, such as results from an electrothermic process for extg. alumina from aluminiferous materials, is caused to react with CaO or a Ca compd. such as $CaCO_3$ to produce Al_2O_3 and the Ca sulfide formed is leached out (suitably with dil. acid). The Al sulfide and CaO may be heated to about $800-900^\circ$ and stirred and the reaction allowed to complete itself by the heat thus developed. Other modifications of procedure also are described.

Calcium nitrate. APPAREILS ET ÉVAPORATEURS KESTNER. Fr. 33,438, May 6, 1927. See Brit. 289,370 (C. A. 23, 674).

Precipitating ammonium nitrate or other substances from solutions. FINN JEREMIASSEN (to Aktieselskabet Krystal). U. S. 1,704,611, March 5. A cooled supersatd. soln. of a substance such as NH_4NO_3 of substantially uniform temp. is passed through a mass of granules of the substance, a portion of the soln. is discarded, and there is added and mixed with the remainder of the soln. passing through the granules a soln. of the substance having a higher temp. and concn., the mixed solns. are cooled to the first-mentioned uniform temp. and reintroduced into the mass of granules in a cyclic system of operation.

Silica and titanium oxide. P. SPENCE & SONS, LTD., T. J. I. CRAIG and A. KIRKHAM. Brit. 294,681, April 28, 1927. Siliceous residues obtained in the acid treatment of silicates decomposable by inorg. acids with removal of alumina, Fe oxide, alkalies and alk. earths are dissolved in Na_2CO_3 or K_2CO_3 soln., at about 160° and 80 lbs. per sq. in. pressure if the carbonate and silica are about in equimol. proportions and at lower temps. and pressures if the carbonate is in excess. Ti oxide, if present, remains in the residue. The silicate soln. formed may be decomposed with CO_2 or bicarbonate to ppt. flocculent silica.

Hydrogen. R. BATTIG. Brit. 294,113, July 16, 1927. The methane fraction obtained in the fractionation of coke-furnace gas is converted, with steam or O or both, into CO_2 and H. CO_2 is sepd. from this mixt. by washing with water under pressure, and the gas is then cooled to -70° to remove the water and then further cooled by use of liquid N or by evapn. of constituents of the gas itself, to effect fractionation. The H fraction thus obtained is treated directly with liquid N to remove the last traces of CH_4 , O and CO, and by suitably controlling the pressure and temp. while scrubbing with liquid N, a mixt. of H and N suitable for NH_3 synthesis may be obtained.

Hydrogen. GASVERARBEITUNGS GES. Brit. 294,580, July 26, 1927. H obtained from CH_4 or from CH_4 -contg. gases is, after removal of CO_2 , treated with liquid N (preferably under pressure) to remove other impurities such as CH_4 , CO, CS_2 , As compds., O and A. The H obtained contains N and the proportion of H and N may be adjusted for use in NH_3 synthesis.

Hydrogen. KOKUKENKYUJO. Brit. 294,958, Aug. 2, 1927. Inflammability of H and risk of its explosion in admixture with air are diminished by adding a small quantity of a gas or vapor having a higher theoretical flame propagation temp. than H, e. g., C_6H_6 , toluene, MeOH, EtOH or other alic., ether, paraffin hydrocarbons, methyl cyclohexane, dimethyl or diethyl selenide and other org. Se compds., or Et_4Sn , Et_4Pb or other org. Sn or Pb compds. CO_2 , N, He or other inert gases also may be added. The H may be used in aircraft, in NH_3 synthesis or in "oil hardening" or other industrial processes.

Hydrogen. OXYHYDRIQUE FRANÇAISE. Brit. 294,150, July 18, 1927. Caustic alkali soln. is caused to react with Si or Si compds. such as ferro-Si, under pressure, in a closed generator (the construction of which is described).

Carbon from carbon monoxide and carbonyls. CASSEL CYANIDE CO., LTD., and

T. EWAN. Brit. 294,759, July 5, 1927. Decompn. of CO is effected in the presence of massive catalysts such as Fe, Ni, Co or their oxides (preferably iron or mild steel in sheet form). The steel may be activated by dipping in fused NaCN, washing in water, reducing in CO or H and prolonged heating at 500–700° in CO, or by repeated oxidation and reduction in CO at 600–700°. The C is removed from the catalytic metal by scrapers which do not touch the surface, and when Fe is used as a catalyst the C may contain 3–13% Fe. Fe carbonyl may be formed in or added during the process and other carbonyls also may be used. Numerous details and modifications of the process are described.

Activated carbon. EMIL F. SCHELLER. U. S. 1,704,765, March 12. By the interaction of carbonaceous material such as wood charcoal with Na₂O (suitably by heating), an activated C is obtained 0.1 g. of which will produce a decolorization of 60% in 100 cc. of standard molasses soln. according to a test method which is described.

Active carbon. SOC. ANON. DES CHARBONS ACTIFS E. URBAIN. Brit. 294,214, July 20, 1927. Vegetable materials such as box wood or coconut shell, preferably carbonized at a temp. below 600°, or used active C such as that employed in benzene recovery is treated at 500–700° with vaporized P and the P retained in the material is oxidized to phosphoric acid and removed by washing. Superheated steam may be used for the P vaporization and supply and HCl may be added to decompose the H₃P formed.

Active carbon. JOHANNÈS VAN LOON. Fr. 645,602, Dec. 12, 1927. Active C is prepd. by grinding charcoal at a raised temp. and at ordinary or increased pressure in the presence of a liquid. Thus, charcoal is ground with steel balls in a rotating drum in water at 90°, and bone charcoal is ground in water heated to 150–180° under pressure. Mixts. of water and alc., or water and C₆H₆ may also be used. Cf. C. A. 23, 1482.

Catalytic hydrogenation of carbon oxides. AUGUST EISENHUT and ALBERT AUERHAHN (to I. G. Farbenind. A.-G.). U. S. 1,704,732, March 12. The oily liquid obtained by the catalytic hydrogenation of C oxides under pressure, and contg. oxygenated org. compds. of a higher order than MeOH, is sepd. into fractions and the fractions are treated with condensing agents to obtain *motor fuels, solvents for cellulose esters or for natural or artificial resins, use as detergents*, etc. The residue from the fractionation may be purified and used as a *resin for lacquers and varnishes*.

Condensation products of formaldehyde and urea. LEONARD SMIDTH (to Edward G. Budd Mfg. Co.). U. S. 1,704,347, March 5. After reaction between urea and CH₂O at a relatively low temp. (suitably about 25–35°), thiourea is added and water is distd. from the reaction product at a higher temp. U. S. 1,704,348 also relates to condensation products of CH₂O and urea to which thiourea and an acid substance are added.

Urea-formaldehyde condensation products. L. SMIDTH (to E. G. Budd Mfg. Co.). Brit. 294,253, July 21, 1927. See U. S. 1,704,348 (preceding abstract). Brit. 294,254 also relates to similar processes.

Impregnating substances and adhesives. I. G. FARBENIND. A.-G. Fr. 644,965, Dec. 1, 1927. Impregnating substances and adhesives of excellent quality are obtained by heating residues from stearin or the like with animal or vegetable oils which may be oxidized or polymerized, and with S or substances yielding it, with the addn. before, during or after this treatment, of substances extd. from tar by suitable solvents, e. g., alc., and finally, natural or artificial asphalts, tar, pitch or resins. In an example stearin residues, wood oil, whale oil and S are heated to 160°, an ext. with alc. from lignite tar is added and the heating continued until the desired degree of viscosity is reached.

Plates, molded articles, etc., of fibrous material and binders. F. A. W. KÜHN. Brit. 294,515, April 25, 1927. Shreds or flakes of paper or woven material up to 50 sq. cm. in area are mixed with an excess of a binder such as a rubber, resin or glue compn. and allowed to stratify by gravity, drained and pressed, with or without heating. Fillers, coloring substances, etc., also may be added.

Materials for the working surfaces of ginning rollers. SOC. ALSACIENNE DE CONSTRUCTIONS MÉCANIQUES. Brit. 295,020, Aug. 5, 1927. Rollers are faced with material such as used in friction clutch disks and which may comprise textile fibers, either woven or unwoven, agglomerated and indurated with natural or synthetic resins, rubber, etc.

Vegetable glue. LAWRENCE BRADSHAW and HENRY V. DUNHAM. U. S. 1,703,133, Feb. 26. A wood-working glue is formed from a seed meal rich in protein such as peanut meal together with added starch and an alkali. U. S. 1,703,134 specifies the use together of seed meal rich in protein, starch, casein and sufficient alkali to serve as a liquefying agent for the starch and proteins when water is added.

Strong, cohesive, acid-resistant and insulating product. J. A. PICHON. Belg. 349,232, March 31, 1928. One part of coal-tar pitch is mixed hot with 0.5–1 part of very finely powdered mica.

Emulsifying agents. SOC. ROL, LISTER ET CIE. Fr. 645,044, Dec. 2, 1927. An emulsifying agent for tar, bitumen and the like is obtained by heating a mixt. of amylaceous and saponifiable substances with an alk. substance to obtain peptonization and sapon. Thus, residual vegetable oil from paper manuf. 4, maize starch 1 and water 25 parts are heated to 50° with stirring. A 7% soln. of NaOH (17 parts) is added, and the mixt. heated nearly to boiling. A clear resin and maize starch with or without grease from soap manuf. may also be used.

Porous material. SOC. ANON. POUR L'IND. CHIM. A BÂLE. Fr. 644,648, Nov. 28, 1927. Artificial porous material is prepd. by transforming solns. of the condensation products of carbamides and aldehydes, particularly of urea and CH_2O , of which the first phase of condensation, *i. e.*, that including the formation of methylols, has been passed, in the presence of catalysts into solid, insol. polymerization products, which, after elimination of the catalysts, are given a final treatment under pressure. In an example, a neutral soln. of urea and 40% CH_2O is heated until a sample does not become turbid. H_2SO_4 is added to the product which is then poured into molds and allowed to harden. It is taken out of the mold and put into dil. NaOH to neutralize the H_2SO_4 and washed to eliminate electrolytes. After drying an absolutely white porous mass is obtained. Other examples are given.

Adsorption agents. METALLBANK UND METALLURGISCHE GESELLSCHAFT AKTIENGESELLSCHAFT. Fr. 644,810, Oct. 26, 1927. Solid adsorption agents are directly heated before washing by a current of hot air, gas, etc., acting in a cycle through the adsorption layer. The gas used may be that in the free vol. of the adsorber after termination of the adsorption period.

Process and kiln for pulverulent material such as limestone, cement, etc. J. BELLAY. Belg. 350,355, May 31, 1928. The powdered rock, etc., is fed continuously into an annular vertical chamber surrounding another annular chamber containing the fuel. Below the fuel chamber is a grate, and at the top of the central space is a steam boiler, the steam from which is sent under the grate. Gas burners using producer gas generated in the fuel chamber are provided to heat the fuel chamber internally and the outer rock chamber externally.

Thermoplastic substances. CAMILLE DREYFUS. Fr. 644,935, Nov. 30, 1927. See Can. 285,231 (C. A. 23, 912).

Plagioclases. FÉLIX SINGER. Fr. 645,562, Dec. 12, 1927. Artificial plagioclases are made by mixing O compds. of bivalent metals (Mg, Ca, Sr) or of bivalent Ba, Zn or Fe, either singly or together, with Al_2O_3 and SiO_2 or appropriate compds. of Al_2O_3 and SiO_2 and heating the mixt. to a temp. below fusion. An example contains MgO 10–20, Al_2O_3 33–43 and SiO_2 40–50%. Cf. C. A. 22, 3745.

Wetting agents for animal and vegetable materials. SOC. ANON. POUR L'IND. CHIM. A BÂLE. Brit. 294,890, July 28, 1927. Wetting and penetrating effect of acid liquids such as those used in carbonizing, fulling, in hat-making, for bleaching and washing, dyeing and chrome tanning is improved by addn. of monoacylated diamines and the un-*sym* diacylated diamines such as those described in Brit. 219,304 (C. A. 19, 523) and the corresponding quaternary ammonium compds. An example is given of the use of a small proportion of oleyldiethylenediamine.

Coatings for "carbon papers" and the like. R. D. BAIN, F. G. NIXON and LAMSON PARAGON SUPPLY CO., LTD. Brit. 295,118, July 18, 1927. Color compns. suitable for transfer purposes comprise coloring substances together with artificial resins or cellulose products of sol. character (which are used instead of the usual oils, waxes and fatty substances commonly included in similar compns.). Various examples are given. Brit. 295,119 relates to "carbon papers," typewriter ribbons, etc., made by the application, without heating, of similar compns. on paper or other fabric used.

Projection screens. M. HARPER. Brit. 294,850, Jan. 26, 1928. Projection screens are colored with a mixt. in equal proportions of transparent red, yellow and blue dyes or pigments to give them a deep neutral tint; they may be formed of frosted glass, celluloid, hardened gelatin or translucent textile fabrics which have been treated with varnish, gelatin or the like. Aniline dyes are suitable and may be sprayed on the screen surface or embedded in the screen.

Material for projection screens. TELEVISION, LTD., and J. L. BAIRD. Brit. 294,671, Jan. 26, 1927. Screens suitable for the projection of images by use of invisible rays (either ultra-violet or infra-red) may be covered with quinine sulfate, BaS or Ba

cyanoplatinite, or may consist of a fluorescent liquid such as paraffin oil in a container transparent to the invisible rays used, or may consist of a fluorescent vapor such as Na vapor which may be used as a free cloud or in a container.

Preventing obscuration of transparent glass plates by moisture. OMER DEMARET. U. S. 1,705,453, March 12. See Brit. 267,428 (*C. A.* 22, 1220).

Paper drinking cup impregnated with a mixture of paraffin and carnauba wax. JAMES D. REIFSNYDER (to Tulip Cup Corp.). U. S. 1,703,638, Feb. 26.

Polishing and grinding composition. BERTRAND SZILARD. U. S. 1,704,308, March 5. A compn. suitable for use in grinding and polishing materials such as *metals, wood, glass*, etc., is prepd. by mixing TiO_2 and a Ti salt (both in unroasted condition), prepg. a colloidal soln. from this mixt. and producing a fine ppt. from the soln.

Prepared wadding for polishing metals. J. JACQUES. Belg. 547,590, Jan. 31, 1928. The wadding is soaked in a liquid contg. products such as NH_3 , olein, $\text{K}_2\text{C}_2\text{O}_4$, CaCO_3 and petroleum.

Composition suitable for sealing joints exposed to gasoline. RALPH H. REITER (to Cleveland Trust Co.). U. S. 1,704,446, March 5. Starch is mixed with about 8 times its wt. of glycerol; starch is used which is at least partially hydrolyzed, and a homogeneous mixt. of jelly-like consistency is obtained.

Sheet material containing synthetic resin. GORDON E. WIGHTMAN (to Bakelite Corp.). U. S. 1,703,414, Feb. 26. Sheets are formed from a mixt. of fibrous material suspended in water with a reactive resin, and after draining excess water from the sheet it is further dried by moving it through a zone of reduced pressure while heating sufficiently to expel moisture without effecting reaction of the resin or lessening its plasticity.

Printing plates. MAX ULLMANN (to F. Ullman G. m. b. H.). U. S. 1,704,523, March 5. See Brit. 282,474 (*C. A.* 22, 3748).

Magnetic materials in finely divided form. JOHN W. ANDREWS (to Western Electric Co.). U. S. 1,703,287, Feb. 26. In prepg. material suitable for cores of loading coils of telephone circuits, Ni 80 and Fe 20 parts are melted in the presence of O, the molten material is boiled until oxidized, allowed to solidify and then rolled while hot until it has reached a temp. below its temp. of recrystn. and is then reduced to finely divided particles. Cf. *C. A.* 23, 1105.

Dynamo brush composition. NELSON R. HAAS (to Delco-Remy Corp.). U. S. 1,703,191, Feb. 26. Brushes are formed of a mixt. comprising graphite, artificial resin and a rubber vulcanization accelerating compd., molded under heat and pressure; the accelerating compd. serves to increase the hardness and durability of the product.

Shoe polish. A. MARLIER. Belg. 347,831, Feb. 29, 1928. Shoe polish is composed of AmOAc , Me_2CO , CHCl_3 , shellac, MeOH , castor oil, cellulose acetate, celluloid, coloring matter in powdered form and Fe_2O_3 .

Shoe-bottom filler. ANDREW THOMA (to North American Chemical Co.). U. S. 1,704,547, March 5. Granulated cork is used with wax tailings tempered with Lima oil, sulfite pitch and powdered mica. Cf. *C. A.* 23, 1231.

Chewing gums. B. ARKELL. Brit. 294,299, May 2, 1927. MgO or $\text{Mg}(\text{OH})_2$ is added to chewing gums to neutralize acids in the mouth. Various chewing-gum compns. are described.

Dental and other amalgams. DEUTSCHE GOLD- UND SILBER-SCHNEIDANSTALT VORM. ROESSLER and F. SCHOENBECK. Brit. 295,163, Nov. 29, 1927. The whole of the Hg is mixed with a portion of other metals such as Au, Ag, Cu or their alloys and subsequent mixing is effected with the remainder of the metal to be used.

Cartridge for fumigating with hydrocyanic acid. HARRY W. HOUGHTON (to Safety Fumigant Co.). U. S. 1,704,607, March 5. A mixt. of a cyanide such as NaCN and bleaching powder is used in such proportions as to produce cyanogen chloride when acted on by moist air. Various structural features of the cartridge are described. Cf. *C. A.* 22, 1643.

Rat poison. ADAM REMPEL. Ger. 470,777, Mar. 16, 1927. Castor oil treated with cresol soap soln. is mixed with fern ext. and NaHCO_3 dissolved in wine-vinegar. Meal or fat may be added to make the compn. pasty.

Fire-extinguishing compositions. MINIMAX A.-G. and J. HAUSEN. Brit. 294,616, July 27, 1927. Substances such as CCl_4 are admixed with other substances such as NH_3 compds. to prevent formation of phosgene or like injurious gases, and also with a moisture absorbing material such as dehydrated crystal hydrates to prevent decompn.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON AND C. H. KERR

Fractionated crystallization of technically pure glass. H. JERSEN-MARWEDDL. *Naturwissenschaften* 17, 84(1929).—Most technical glass has a compn. close to 72% SiO_2 , 14% CaO , 14% Na_2O (Morey and Bowen), *i. e.*, in the ternary diagram it lies in the field of primary crystn. of β -wollastonite at 1100°. If crystn. takes place, the glass surrounding the crystal will become richer in SiO_2 ; in this case diffusion is too slow and cristobalite crystals will be formed as soon as the SiO_2 field is reached. This again may cause excess of base and wollastonite sepn. until finally, after repeated alternation of both crystal species, the eutectic mixt. at 725° is reached. From microscopic observations, 4 drawings being given, this is confirmed; the paragenesis of β -wollastonite and cristobalite gives needles of the former more or less surrounded by a felt of the latter, which often appears as an efflorescence.

B. J. C. VAN DER HOEVEN

Dependence of alkaline and acid condition of glasses on the concentration of hydrogen ions. O. K. BOTVINKIN AND A. M. TANCHILEVICH. *Z. anorg. allgem. Chem.* 168, 356–60(1928).—Two samples of glass were crushed to 20–30 mesh and treated with HCl and KOH solns. The p_{H} of the glass after treatment changed with the concn. of the reagent used.

H. F. K.

Change in the optical transparency of certain ultra-violet transmitting glasses after exposure to x-rays and ultra-violet light. G. M. SHRUM, C. G. PATTEN AND H. D. SMITH. Physics Lab. Univ. of British Columbia, Can. *Trans. Roy. Soc. Can.* [3], 22, 433–6(1928).—Samples of com. glasses said to be transparent to short-wave lengths were treated to ultra-violet and to x-ray radiation and the solarization and coloration examd. Heat treatment at 300° removed the ability to luminesce from glasses exposed to quartz Hg-arc radiation. Similar heat treatment was equally efficient with luminescence following exposure to x-ray radiation. The disappearance of the thermoluminescence was marked by the complete recovery of the glass optically to transmit all wave lengths equally as well as when new. Coloration observed in the glasses exposed to x-ray radiation faded when the glasses were maintained for a time at 100°. The coloration and decoloration are assumed to be due to oxidation followed by reduction of certain constituents in the glass.

J. W. SHIPLEY

Colloid technical review. I. Glass. RAPHAEL ED. LIESEGANG. *Kolloid-Z.* 44, 251–8(1928).—The phases reviewed are the dispersoid chemistry of the glassy state, polymerization, gel formation, devitrification during the mfg. process, and later, chem. activity, dye-stuff adsorption, frosted and opaque glasses, colored glasses, viscosity and surface tension.

H. F. K.

Brown silica bricks. V. E. GRUM-GRZHIMAILO. *Feuerfest* 4, 105–6(1928).—In the manuf. of SiO_2 bricks, the inversion of quartz to tridymite is not readily attained if pure, coarsely ground quartzites are used. The formation of tridymite is facilitated if a bearing material, such as furnace slag, is added to the brick mixt., together with a reducing agent (coal, coke, etc.). The slags provide the necessary lime-Fe flux "ready-made," and the addn. of powdered charcoal, coke, etc., ensures the formation of FeO and not Fe_2O_3 , the former having better solvent properties. The addn. of H_3PO_4 promises special advantages, but this awaits confirmation. Bricks were made in the usual way, but with the addn. to the quartzite of 2.5% of basic slag from a Martin furnace (grain size below 1 mm.), powdered wood charcoal and 2% of milk of lime. The bricks obtained were of a chocolate color; under the microscope the ground mass appeared as a network of interlocking crystals, only the coarser quartz grains being shattered and unconverted. The bricks showed no expansion or cracking in service in a Martin furnace; they proved much more durable than ordinary SiO_2 bricks, and were much stronger mechanically. The chem. compn. was: 93.68% SiO_2 , 0.19% Al_2O_3 , 2.31% Fe_2O_3 , 3.21% CaO , 0.25% MgO , 0.38% MnO (P_2O_5 not detd.). Similar experience was obtained with bricks made with the addn. of 2–4% of reheating furnace slag, 1.5% of clay, 1.5% of coke dust and 1–1.5% of milk of lime.

B. C. A.

(Quartz) inversion phenomena in silica bricks in the crowns of Martin furnaces. V. E. GRUM-GRZHIMAILO. *Feuerfest* 4, 125(1928).— SiO_2 bricks taken from the crown of a Martin furnace consist of 4 zones, and analysis of these zones shows a considerable accumulation of CaO in the third (brown) zone from the hot face. Before use, a SiO_2 brick contains colloidal tridymite in which quartz grains are embedded; these grains are, so to speak, "moistened" with the glassy $\text{CaO-Fe}_2\text{O}_3\text{-Al}_2\text{O}_3$ matrix. The colloidal tridymite constitutes the solid cement, binding the brick together. The quartz is con-

verted by the glass into colloidal tridymite, which subsequently changes into the cryst. form. The more fusible the glassy matrix, the more readily does quartz inversion take place. FeO in the furnace gases is absorbed by the bricks, and this increases the fusibility of the fluxes in the bricks. If Fe is absorbed in sufficient quantity to form the eutectic compd. $3\text{FeO} \cdot \text{SiO}_2 \cdot \text{CaO} \cdot \text{SiO}_3$, the glass has a softening point of 1030° , and its capacity to penetrate the brick by capillary action in an upward direction reaches a max. Ferrous silicate, on the other hand, has a softening point of 1190° , so that a glass of this compn. remains in the lower portion of the brick. This explains the accumulation of CaO in the upper portion. It is suggested that FeO and CaO should be added in the form of Martin-furnace or Thomas slag to the SiO_2 -brick mixt., together with a certain quantity of coke or coal dust, in order to ensure the formation of ferrous silicate.

B. C. A.

Permeability to gases of silica bricks, mortar joints and masonry in the Siemens-Martin furnace. HUGO BANSSEN. *Archiv Eisenhüttenw.* 1, 687-92(1928).—The permeability nos. for silica bricks vary between 0.11 and 0.27 and for dry mortar joints without cracks, between 7.48 and 12.8. The permeability no. is expressed by $v l / a t p$, in which v = vol. of gas in cu. m., l = thickness of material tested, a = cross section in sq. m., t = time in hrs., and p = pressure in mm. of water column. The quality of brick is of considerable influence on its permeability to gases, as is also the presence of fine cracks in the mortar joints. With silica bricks permeability changes linearly with the pressure, while it does not in mortar joints. With and without mortar joints the permeability nos. of masonry lose their significance. For a masonry wall 115 mm. thick, and a total joint length of 20 m. and crack breadth of 3 m. the permeability no. is calcd. to be 1, while for the same wall the exptl. value is detd. as 17.5. The difference is due to cracks in the joints. Polished stone, without mortar joints, gives 3 times the loss as shown by masonry with such joints. The gas loss in the gas and air passages is detd. from the CO_2 content of the air shortly before its entrance to the heating chamber.

J. BALOZIAN.

Hartmann spiral bricks. J. TORNBLAD AND W. B. MITCHELL. *J. West. Steel Iron Steel Inst.* 36, Pt. II, 28-34(1928).—The advantages of Hartmann spiral bricks installed in hot blast stoves, regenerator chambers, etc., over the ordinary checker bricks are pointed out.

G. SCHWOCH.

Fire resistance of hollow load-bearing wall tile. S. H. INGBERG AND H. D. FOSTER. *Bur. Standards J. Research* 2, 1-333(1929).—The work reported consists chiefly of a series of fire tests of wall construction built of hollow load-bearing tile of representative designs and clay materials. The first tests were made on wall sections 1 ft. wide and 6 ft. high that were subjected to fire on one side while working under load, the main object being to det. how fire exposure affects the individual tile units. This was found to vary with the type of clay used, with hardness of burning and design of units, from minor cracking of a few of the units in the specimen to failure under load a little after 2 hrs. The second group of tests was with wall specimens 4 ft. wide and 4 ft. high; they were tested when exposed to fire on one side, under load or restrained within the contg. frame, and were made to study the effect of changes in design of unit, and in the constituents and prepn. of the clay. Addn. of up to 2% of ground burned clay (grog) to the raw clay was found to be without effect, but higher % increased the fire damage, apparently because of initial shrinkage cracks radiating from the grog particles. Addn. of up to 15% by vol. of sawdust to the raw clay decreased the tendency to cracking when exposed to fire without seriously decreasing the normal strength of the tile. Finer grinding and increased pugging of the raw clay increased the strength of the tile and consequently its load-carrying ability when exposed to fire. Of modifications in the design of the unit, one with double outside shells improved the fire resistance for all but very dense tile in confining the cracking mainly to an outer thin shell. Increased shell thickness was also found to decrease the fire effects, as also fillets up to $\frac{3}{4}$ -in. radius at the junctions of shells and webs. The final series consisted of 167 fire endurance tests and four fire and water tests of typical wall constructions, 71 of which were made with walls between 10 and 11 ft. high and 8 and 16 ft. wide. The thickness ranged from 8 to 16 in., and plaster, stucco or brick facings were applied on a number of the walls. The walls were subjected to const. applied loads of 70 to 120 lbs./sq. in. during the fire tests, were restrained within contg. frames, or were tested unrestrained, the latter being representative of walls in low buildings or the upper story walls of higher buildings. The results are summarized as fire-resistant periods, which are detd. by the time the walls sustained loads under fire exposure and prevented av. temp. rise on the unexposed side from exceeding 139° or the max. rise at any point where temp. measurements are taken from exceeding 180.6° . Freedom from cracks or openings large enough to transmit flame to ignite

combustible materials is also required both in fire-endurance tests and fire and water tests. The final grouping of test results is, in 3 classes, detd. by the design of the tile. Fire-resistance periods are given for 8-, 12- and 16-in. walls in each class, the values varying with the thickness and design from $1\frac{3}{4}$ to 11 hrs. for unplastered walls and from 4 to 15 hrs. for walls plastered on both sides. Periods are also given for walls assumed to have combustible members projecting into them 4 in. from the exposed sides, these being detd. by the time required for temps. high enough to ignite wood to be obtained at the given depth in the wall. Fire-resistance periods for this condition ranges from 1 hr. with 8-in. unplastered walls to 10 hrs. with 16-in. plastered walls built of tile of the designs giving the highest results. The article contains a large number of tables, several pages of photographs and about 140 graphs.

O. A. NELSON

The relation between rigidity and temperature of refractories. H. HIRSCH. Chem. Lab. Tonind., Berlin. *Tonind.-Ztg.* 53, 2(1929).—Cylindrical test pieces 50 mm. in diam. and 45 mm. high were heated in a C resistance furnace. Load was applied by means of a screw. The app. is described in detail. The furnace was brought to a definite temp. and the crushing strength detd. Data were collected over the range 200° to 1400° for 6 fire-brick and for SiO_2 , MgCO_3 , chrome and Al_2O_3 refractories. The effects of the addn. of quartzite, CaO , MgO , TiO_2 and feldspar were also investigated. Clay brick reached a max. crushing strength between 1000° and 1200°. The max. appears to depend on the glass content of the mass. Fluxes lower the max. strength. The method of manuf. and burning also affects the shape of the curves. R. F. F.

Plasticity. V. Plastic masses of various inorganic substances and their ceramic utilization. O. RUFF AND A. RIEBETH. *Z. anorg. allgem. Chem.* 173, 373-94(1928); *J. C. I.* 22, 4031. All solids which are wetted by a suitable liquid which does not dissolve them will form a plastic mass of the second order with that liquid if they are in a sufficiently finely divided form. Silica, WO_3 and red phosphorus give good plastic masses with water alone; other solids require an acid electrolyte, and the strength usually increases with decrease of p_H . The formation of these masses is due to electrolytic disson of an adsorption complex with the generation of an elec. charge on the surface of the solid and the formation of liquid shells around the solid particles. Al_2O_3 when stirred in 0.05-0.1 N HCl forms a slip which, when cast in plaster molds, air-dried, and burnt at 900°, then at 1600°, yields dense, hard and strong ware. For making zirconia crucibles the pure oxide is fired at 1200° and ground for 20 hrs. in water; HCl is stirred in to 0.2 N, the supernatant liquor removed after 2 days' settling, the plastic mass dried at 120° to 25%, moisture and pressed into shape under 1000 atm. The shapes after burning at 2200° form a fine porcelain-like mass which will not fracture when quenched from a white heat. Good results are obtained from a zirconia slip made from oxide which has been calcined at 1400° and ground in 0.2 N HCl; the slip is cast in plaster, and the shapes are slowly dried, preheated at 1000°, brought slowly up to 1200-1500°, and finally fired at 1700°. Ceria and titania crucibles are made similarly, using V HCl and burning temps. of 1500° and 1400°, resp. Carborundum gives good results when ground with N HCl and the castings are fired at 1500°, but magnesia shapes obtained by any of the above procedures usually break on firing.

Sheet-glass manufacture. DOMINIC F. CANNON (to Pittsburgh Plate Glass Co.). U. S. 1,704,552, March 5. A blast of gas such as air is used for holding up the advance edge of a plastic sheet of glass as it passes from a forming roll onto a runway. An app. is described.

Apparatus for making sheets of glass. JEAN H. LEMAIRE. Fr. 644,874, Nov. 25, 1927.

Compound transparent sheets. HERBERT J. MALLABAR. Fr. 645,111, Dec. 3,

1927. Composite sheets of glass and cellulose acetate are formed by coating the surfaces to be united with a layer of gelatin, which when dry is softened with a dil. soln. of gelatin in volatile solvents; the sheets are then pressed together. The gelatin is treated with a soln. of water glass or a soln. of gelatin to which is added a small amt. of chrome alum neutralized with Na_2CO_3 to make it adhere to the glass, and the cellulose acetate is treated with ether before coating with gelatin. The sheets may be tinted as desired.

Vertical drawing of glass rod or tubing. R. SALOMON. Brit. 204,216, July 20, 1927. An app. and various mech. features of operation are described.

Glass-blowing apparatus. LEONARD D. SOUBIER (to Owens Bottle Co.). U. S. 1,705,341, March 12.

Annealing glassware substantially without loss of heat from the molding operation and while spaced apart in a single line. ROBERT L. FRINK. U. S. 1,704,502, March 5. An app. is described.

Oven and associated mechanical features for annealing glass plates. NAAMLOOZE VENNOOTSCHAP MAATSCHAPPIJ TOT BEHEER EN EXPLOIT VAN OCTROOIEN. Brit. 294,258, July 22, 1927. Various structural features are specified.

Glass-annealing leer (heated by liquid fuel and thermostatically controlled). HARTFORD-EMPIRE Co. (to British Hartford-Fairmont Syndicate, Ltd.). Brit. 294,775, Aug. 4, 1927.

Furnace for annealing glass and the like. THE UNITED GLASS BOTTLE MANUFACTURERS, LTD. Fr. 645,005, Oct. 27, 1927.

Glass-making furnace. THE GENERAL ELECTRIC CO., LTD. Fr. 645,157, Dec. 5, 1927.

Crucible for the melting and refining of glass. L. BRUHIÈRE. Belg. 350,091, April 30, 1928. The crucible comprises two open melting compartments, partially superposed and communicating with each other; also two completely covered refining chambers, one on each side of the lower melting chamber, with which they are connected by means of openings in the bottom of the sepg. walls. By this arrangement either of the melting chambers can be used, and the same or different temps. can be maintained in the two refining chambers.

Preventing clouding of glass by weathering. K. KAMITA and ASAHI GARASEI KABUSHIKI KAISHA. Brit. 294,391, Aug. 25, 1927. Clouding of glass by atm. influences is prevented by treating the glass, at about the annealing temp., with an acid gas such as air or furnace gas contg. SO_2 , SO_3 or HCl . The surface of the glass becomes covered with a white powder which is wiped off after the glass has cooled.

Apparatus for classifying clays or other materials by elutriation. LEONARD ANDREWS. U. S. 1,705,351, March 12.

Bricks and tiles. J. DUNLEVY and R. JOHNSON. Brit. 294,760, July 5, 1927. A plastic mixt. for making bricks and tiles is formed from glassmakers' waste sand 60, brickmakers' clay 35 and limestone 5%.

Sagger for supporting tiles to be burnt. ROBERT E. ANDERSON and DANIEL P. FORST (to Robertson Art Tile Co.). U. S. 1,704,070, March 5. Structural features.

Molding plastic substances. WILLIAM J. MILLER. Fr. 645,064, Dec. 2, 1927. A method of delivering the plastic substances by means of an Archimedean screw to molds in pottery manuf. is described.

Fuel charger for brick kilns. ERNST SCHOEPKE. Austrian 112,228, Sept. 15, 1928.

Charging and discharging ceramic furnaces automatically. SOC. D'EXPLOITATION DES PROCÉDÉS HIDOUX. Fr. 645,266, Nov. 5, 1927.

Apparatus for preparing and molding ceramic slip. THOMAS S. CURTIS (to Vitrefrax Corp.). U. S. 1,703,871, March 5.

Ceramic substances. FÉLIX SINGER. Fr. 645,614, Dec. 13, 1927. The coeff. of expansion of steatite or other compds. of Mg and products made therefrom is reduced by adding compds. of Al and heating until the formation of 3 phases. The first phase is a glass, n 1.53–1.555; the other 2 are crystallites, crystals of the sillimanite and crystd. silicates of alk. earths of the enstatite or forsterite type.

Ceramic products. FÉLIX SINGER. Fr. 645,726, Dec. 14, 1927. To prevent the aging of ceramic products, compds. (particularly the oxides) of Ce, Zr, Cr, Mn, P, W or V are added to the usual constituents.

Refractory materials. I. G. FARBENIND. A.-G. Brit. 294,552, July 25, 1927. Refractory materials of high thermal cond. suitable for lining vessels are prepd. with a high proportion of Si ("pure or ferrous"); e. g., finely ground Si 95 parts is mixed with milk of lime 5 parts and the mixt. is burnt. Sand, clay or fluxes such as cryolite, feldspar or waterglass may be added. By the use of a suitable binder and flux an acid-proof product

is obtained, and by burning at a temp. above 1200° the material may be rendered alkali-proof.

Refractory products from bauxite. SOC. ANON. DES MANUFACTURES DES GLACES ET PRODUITS CHIMIQUES DE ST.-GOBAIN, CHAUNY, ET CIREY. Brit. 294,179, July 19, 1927. Raw bauxite mixed with 0.5–2.0% of a fluoride or fluosilicate of an alkali or alk. earth metal is calcined and ground and further mixed, while moistened, with addnl. bauxite or refractory clay and an equiv. quantity of fluoride or fluosilicate. The final mixt. is molded and burned.

Refractory bricks. SOC. LORRAINE DES ACIERIES DE ROMBAS. Brit. 295,051, Aug. 6, 1926. Bricks for use in metallurgical furnaces are made from a dampened mixt. of blast-furnace mouth dust, coke dust and ferrous flux by pressing and then firing in a kiln such as is used for clay bricks. The flux may be ashes contg. ferrous oxide.

Apparatus (heated by electric arcs) for melting and casting highly refractory materials. HENRY L. COLES and JOSEPH G. DONALDSON (to Guardian Metals Co.). U. S. 1,703,658, Feb. 26.

Sintering granular refractory material for hearths, heating rings or the like of metallurgical furnaces, etc. WILHELM ROHN (to Vacuum-Schmelze G. m. b. H.). U. S. 1,704,902, March 12. Mech. features.

Enameled steel. WESLEY J. BECK and JAMES A. AUPPERLE (to American Rolling Mill Co.). U. S. 1,704,586, March 5. In forming enameled articles, steel is used which, except for Si, comes within the "mild steel" range and contains in addn. such quantity of Si (suitably about 0.15%) as to give a good bond with the enamel but not sufficient to spoil the deep drawing and spinning property in the steel prior to enameling.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Cement in 1927. B. W. BAGLEY. Bur. Mines, *Mineral Resources of the U. S.* 1927, Pt. II, 269–98 (preprint No. 24, published January 23, 1929). E. H.

Mechanism of the setting and hardening of cement. TUTOMU MAEDA. *Chimie et industrie* 21, 35–6(1929).—See C. A. 22, 3505. A PAPINEAU-COUTURE

The heating of rotary cement furnaces by individual apparatus using pulverized coal. L. MORIN. *Chaleur ind.* 9, 146–9(1928).—M. describes an arrangement and gives two photographs and one line diagram of the layout. A hopper receives the coal which is distributed, crushed, dried and injected. A few m. from the point of injection is the clinkerization zone where the temp. is about 1400–1500°. The clinker falls into a cooler where it gives up its heat to the air used for combustion. In most cases the coal is dried to below 1% moisture and then crushed in a ball or tube mill insufficiently ventilated. After being crushed the coal may pass through an air selector and it is then stocked in the feed hopper, the whole forming an individual piece of app., a kind of condensed central pulverization plant. A fan is added to supply air for combustion. This air as well as that for the grinder comes from the clinker box at about 200–250°. In this system power consumption is reduced, cost is less than in a central pulverizing station, the general working of the rotary furnace is not interrupted and poor coal and semi-lignite can be used. S. L. B. ETHERTON

Effect of temperature on the strength of concrete. C. C. WILEY. Univ. of Illinois. *Eng. News-Record* 102, 179–81(1929).—The effect of temp. on the strength of concrete was detd.; 6 × 12 in. cylinders were used and the results shown graphically.

One series specimens were stored at the following approx. temps.: 5, 35, 70, 100 and 205° F. Conclusions: (1) At 100° the same strength is obtained in approx. half the time required at 70°. (2) At 35° somewhat more than twice the time is required to reach the same strength as at 70°. (3) At all ages between 3 and 28 days the difference in strength is practically 30 lb. per sq. in. per degree F. (4) Frozen concrete shows practically no gain in strength. (5) Curing in satd. steam vapor (203–208°) has a deleterious effect, a slight increase in strength during the first few days being followed by a decided retrogression. Cylinders broken while still frozen at the age of 7 days had strength greater than that obtained at 28 days with normal curing at 70°. A 2nd series of cylinders was stored in a moist room at 70°, groups being removed and placed in a refrigerator at 5° for 4 days at the ages of 1, 3, 5, 7 and 10 days, then thawed and returned to the moist room. Conclusions: (1) Frozen concrete when thawed out again begins to gain strength. (2) Both the rate and magnitude of the gain in strength depend on the age at which the concrete is frozen and are materially less for

the early ages. (3) Concrete frozen before a certain age, which may be termed the critical age, suffers permanent damage. (4) The critical age is apparently that at which the cement paste has developed sufficient strength and adhesion to the aggregate that free water cannot collect around the rock particles and in freezing break the bond with the cement. (5) For the mix and materials used in the expts., the critical age appears to be between 7 and 10 days. The critical age is probably longer for leaner mixes and with coarser aggregate. (6) The strength of concrete frozen at the age of 1 day is less than half of that of unfrozen concrete. That frozen at 3 5 days has an indicated permanent loss in strength of 15-20%. The loss in strength at 7 days is small, if any, and at 10 days no ultimate loss occurs, but the rate of gain in strength is distinctly retarded. It is recommended that all concrete be protected from freezing for at least 1 week at a temp. of 70° F., or twice as long at 35°. R. E. THOMPSON

Automatic measuring and charging tank for calcium chloride. HARRY D. WELLS. *Eng. News-Record* 102, 193(1929).—A brief description of a device for automatically charging a measured amt. of CaCl_2 soln. into the drum of a concrete mixer.

R. E. THOMPSON

Aggregate moisture determination by specific gravity. W. M. DUNAGAN. *Eng. News-Record* 102, 285(1929).—Further discussion in reply to criticism of McCall (cf. C. A. 23, 1489). D. states that detn. of both free moisture and absorption by the sp. gr. principle has been thoroughly checked with the flame method and give results usually within 0.1%. This is well within the accuracy of the relations establishing the water-cement ratio curves.

R. E. THOMPSON

Action of water on tri-Ca silicate and β di Ca silicate (THORVALDSON, VIGFUSSON) 6. Fire resistance of hollow load-bearing wall tile (INGBERG, FOSTER) 19. The capillary structure of soft woods (STAMM) 11D. Plating non-metallic surfaces with metal (U. S. pat. 1,704,125) 4. Composite rubber flooring manufacture (U. S. pat. 1,703,312) 30. Process and kiln for pulverulent material such as limestone, cement, etc. (Belg. pat. 350,355) 18.

Handbuch der Holzkonservierung. Berlin: J. Springer. Edited by Ernst Troschel. 434 pp.

Cement. E. GOFFART. Brit. 294,111, July 16, 1927. A slow setting cement having high initial strength is formed by increasing the alumina content of portland cement and adding a protective colloid such as albumin, casein, gelatin, gum, algae or starch. Bauxite may be added to the raw materials or calcic aluminates may be added to the fired materials during or after grinding. The colloid may be added dry or may be added with the gaging water.

Cement. GERALD N. WHITE and SCOTTISH DYES, LTD. Fr. 644,842, Nov. 10, 1927. Incrustations on cement are prevented and the setting properties are improved by the addn. of substances, preferably sol. in water, such as $(\text{NH}_4)_2\text{CO}_3$, $(\text{NH}_4)\text{HCO}_3$, boric acid, ammonium phosphate, urea or a slightly sol. or insol. substance such as a salt of Ca, which will neutralize the lime and give insol. compds. Thus, 5% of $(\text{NH}_4)_2\text{CO}_3$ may be added. In cement washes the amt. may be 25-50%. The cement may be colored by an anthraquinone vat dye.

Forming mottled colored cement blocks. MARTIN HOFFMAN. U. S. 1,704,193, March 5. Mech. features of successively depositing differently colored materials in a mold are specified.

Burning cement material, roasting ores, etc. M. GENSBAUR. Brit. 294,191, July 20, 1927. Various mech. features and a rotary kiln construction are described.

Faced cement sheets or plates. P. LANGGUTH. Brit. 294,843, Jan. 12, 1928. Concrete sheets or plates formed with hydraulic cement are coated on both sides with a layer formed of equal parts of disintegrated wood and magnesite cement with which asbestos and talcum also may be mixed.

Apparatus and system for percolating sand with water before its admixture with cement. WILLIAM M. VENABLE (to Blaw-Knox Co.). U. S. 1,704,268, March 5.

Cementitious coating composition. LOUIS G. MAUER. U. S. 1,704,622, March 5. In prepg. a material suitable for coating buildings, etc., a cementitious and a siliceous material such as portland cement and finely divided silica are mixed with an excess of water contg. alum and an org. colloid such as glue and Japanese vegetable wax and an oil such as tung oil is homogeneously mixed with the materials; the mixt. is permitted to set sufficiently to give it a self-sustaining non-fluent form, agitated to release excess water, and, after removing the liberated water, the mixt. is dispersed in addnl. oil.

Treating concrete, etc., prior to enameling. P. RICHIR. Belg. 350,780, May 31,

1928. The surface to be treated is impregnated with a soln. of a nitrate or fluoride, e. g., $\text{Mg}(\text{NO}_3)_2$ or MgF_2 , and the enamel is then applied directly to the surface thus treated. A non-volatile mineral oil soap may be added to the water used in mixing the mortar.

Bituminous cement aggregate mixtures suitable for paving, roofing, etc. EUGENE H. HENLEY. U. S. 1,703,999, March 5. Preheated dry aggregate is mixed in a sealed receptacle with molten bituminous material and sufficient water is introduced into the hot materials to generate a desired steam pressure. An app. is described.

Admixing bituminous material with mineral aggregates. CRAIG R. ARNOLD. U. S. 1,703,864, March 5. An app. is described in which hot mixing is effected *in vacuo*, for prep. compns. for *paving, roofing* or other purposes.

Paving material. CHARLES A. MULLEN (to Amiesite Asphalt Co. of America). U. S. 1,705,333, March 12. Irregularly shaped particles such as those of broken rock are first treated with a liquid diffusion agent such as water which is not miscible with the liquefier subsequently used, then mixed with a liquefier such as kerosene and with an asphalt cement. Cf. C. A. 22, 3972.

Pavement. EUGENE V. SPENCE. U. S. 1,704,771, March 12. Structural features are specified of a pavement comprising graded layers of mud shell, fine mineral filler and an asphaltic binder.

Pavements. SAMUEL S. SADTLER (to Amiesite Foundation Co.). U. S. 1,705,066, March 12. A foundation course composed of clayey soil mixed with hydrated lime and water to form a compact cement-like compn. is overlaid with a sheet of fibrous material such as tarred paper and a superposed sheet of reticulated metal, these sheets are covered with a liquid asphaltic compn. and with a surface layer such as "Amiesite." U. S. 1,705,067 specifies a roadway with a foundation of compacted sandy soil, sheets of tarred paper over this with their edges overlapping to shed water, strips of metal fabric over this and coated with liquid asphaltic material and a surface course of stone aggregate coated with and bonded by the asphaltic material. U. S. 1,705,068 specifies a foundation course of sand wetted and compacted with a mixt. formed from Na silicate, H_2SO_4 and water, coarse woven textile material impregnated with liquid asphalt over the foundation, an overlying layer of open-mesh metal fabric and a surface course of stone aggregate, the stones of which are coated and bound with asphaltic material. The stones adjacent the metal fabric are larger than the mesh of this fabric.

Concrete pavements. PERCY A. HIPPLE. U. S. 1,705,088, March 12. In finishing concrete pavement slabs, fine particles of cement are forcibly introduced into the pores formed in the surface of the slabs by the rising water mixed with the material for effecting hydration of the cement, by directing against the surface of the material a fine spray of a fluid such as water not chemically deterrent to the setting of the concrete.

Rubber-surfaced pavement or flooring. MERWYN C. TEAGUE (to Naugatuck Chemical Co.). U. S. 1,705,273, March 12. A rigid base is formed of plastic material such as concrete, a comminuted binding material such as ground slate or cork is embedded in the base while it is still plastic, the base is hardened, and there is then applied to it an aq. dispersion of rubber contg. a sulfonated oil.

Roofing material. ANDREW H. IRVING (to The Paraffine Companies). • U. S. 1,705,015, March 12. A layer of asphalt-satd. felt is faced on its upper side with a coating of asphalt and is coated with coal-tar pitch on its lower side, and is used with an underlying layer of rosin-sized paper faced on the upper side with coal-tar pitch.

Plaster. JULIUS E. UNDERWOOD and CHARLES A. CABELL (to National Lime Association). U. S. 1,703,125, Feb. 26. A compn. suitable for use as a plaster, mortar or building block compn. comprises hydrated lime, hydrated Ca aluminate, a carbonate such as CaCO_3 , a sulfate such as $\text{Al}_2(\text{SO}_4)_3$, and sugar or other suitable retarder.

"Artificial plaster." LOUIS E. CHASSEVENT. U. S. 1,703,097, Feb. 26. A mixt. of plaster and water is subjected to such a high pressure that the quantity of water in the compressed plaster will be substantially that corresponding to the transformation of the plaster into gypsum.

Wall-coating composition. EDWARD E. STAHLHUT. U. S. 1,705,074, March 12. See Can. 283,881 (C. A. 23, 687).

Building or heat-insulating material. RHEINHOLD & Co., VEREINIGTE KIESEL-GEHR UND KORKSTREINGES. Ger. 470,846, Aug. 25, 1926. Fillers of any suitable kind are mixed with a plastic binder, e. g., a mixt. of bitumen with a solvent.

Composition board. GUSTAVE KLINKENSTEIN and GUSTAVE D. MAGNUS (to Maas & Waldstein Co.). U. S. 1,705,090, March 12. In order to render porous composition board such as that formed from cement and fiber mixts. impervious to water, it is heated to remove moisture and expel air from the interstices and then im-

parallel to the bedding plane, the coal must be mounted parallel to one side of the box to within 5°. Otherwise a stepped appearance very troublesome to remove will be obtained in cutting. If durain bands are comparatively rare and the box is not over 6-7" high, a band saw with 14 teeth to the inch will cut satisfactorily. For sections up to 12" a reciprocating saw can be used. When brittle, the coal is washed several times in a soln. of shellac in MeOH. A suitable milling cutter, at slow speed, will give a perfectly smooth surface. If the coal is very brittle and dry, an emery wheel is better than a milling cutter. The milling process gives a section about 1/8" thick. The radiographic technic is described by K. in *Trans. Inst. Mining Eng.* 67 (1924). Relatively, coal substance is, and inorg. substance is not, transparent. Nevertheless, areas are present where no differentiation can be detected. It is improbable that differences in compn. of the coal substance can be detected by ordinary radiographic methods. Six large plates are shown and there are 25 references. S. L. B. ETHERTON

New views on the chemical utilization of coal. CHARLES BERTHELOT. *Bull. soc. encour. ind. nat.* 1928, 822-54; cf. *C. A.* 22, 3759, 4225.—A general review of the coal question, the following being briefly considered. (a) General methods for the chem. utilization of coal including high- and low-temp. carbonization, hydrogenation, reduction of CO with Badische Anilin- und Soda Fabrik patents of 1913-4, synthesis of MeOH, Patart's patent, Fischer's synthol, Fischer's and Tropsch's hydrocarbons, Kling and Florentin's process, Bergius process, (b) N₂ question including prepn. of (NH₄)₂SO₄ from gypsum, mixed fertilizers, (NH₄)₂HPO₄, Claude's "potazote," (c) the general organization for fuel and synthetic ammonia manufacture, with some Norwegian, Italian, German and French financial data. S. L. B. ETHERTON

Drying of coal under pressure. B. DE MORY. *Chem. Rundschau* (Budapest) 5, 65-7(1928).—Lignites of low calorific value can be made more valuable by drying. The material falls to pieces if dried too rapidly. Temp. and pressure influence the drying. Expts. showed Hungarian lignites of 2000-3000 cal. could be dried successfully at 8-15 atm. pressure by steam and an undisintegrated product of about 4700-5000 cal. and 12-15% water content could be obtained. S. S. DE FINÁLY

Investigation on the ignition of coal—the ignition of pure carbon. L. DUNOVER. *Chaleur ind.* 9, 43-53(1928).—The slow combustion of graphite starts much below 650°, the temp. given by Moissan. The particle warms up and radiates heat and if the walls heat up slowly enough the particle may be completely transformed into CO or CO₂ without any incandescence. Grain size has no influence. D. describes his app. for controlling the temp. of a very small amt. of powd. C and gives 2 sketches. He worked with ashless Acheson graphite and found that the ignition point of graphite is 767° for particles 0.05 mm. Moissan had given the ignition point as about 700°. D. claims a degree of accuracy for his method equal to that for the m. p. under analogous conditions and checks up with KI. S. L. B. ETHERTON

Washability of low-grade bituminous coal. KICHIRO YAMAGUCHI AND YUJI SUGINO. *Imp. Fuel Research Inst. J. Fuel Soc. (Japan)* (English section) 7, 95-101 (1928).—By a modified Henry Tube method the authors carried out the expt. on several Japanese low-grade bituminous coals. The results of tests are tabulated and also illustrated by means of curves. The yield of washed coal with various ash contents, say 10, 15 and 25%, is summarized in the table which is directly obtained from the washability curves. F. I. NAKAMURA

Briquetting of coal powder without the use of binder. W. SWIENTOSLAWSKI, B. ROGA AND M. CHORAZY. *Research Inst. (Poland). Przemysl Chem.* 13, 2-12, 40-9 (1929).—When a binder is used the properties of briquets depend principally on the binder, but when no binder is used their properties depend on those of the raw material, e. g., plasticity, baking qualities, etc., and also on certain phys. factors in manuf. The raw materials were analyzed and then made up into 25 g. briquets under varied but well controlled conditions of temp., pressure, time of heating and fineness. These were then tested for resistance to grinding and to mech. shock by falling. Coking and non-coking coals from Upper Silesia and Dabrowa were studied. Briquets made of coking coals show low endurance to the mech. tests while non-coking coals show good endurance in these tests. The addn. of up to 30% of coking coals in non-coking coals improves briquets made without a binder. For 8 non-coking coals the optimum temp. was found to be 400-420°, which is considerably higher than that recommended in patent literature. Under the best conditions of temp. the min. pressure required is 400 kg./sq. cm. Usually the time of baking ranges from 30 to 45 min. and the best fineness is 0-2 mm. grains. It is shown that briquets without binder are useful in many respects as a new fuel material. Mechanically they are strong, and their fuel value is equal to that of technical briquets, and higher than that of the raw material. They have low

ignition temp. (cf. Swientoslawski and Roga, *C. A.* 22, 2047) and burn down without crumbling away to fine particles which might clog up the grate. In burning they produce less smoke than briquets with binder or coal. They are not hygroscopic and are not subject to the action of atm. factors. Numerous graphs illustrate the data. A patent review and bibliography are given.

Briquetting. JEAN BING. *Chaleur ind.* 9, 21-9(1928).—Coal for briquetting should not contain over 3% moisture; hence washery residues require preliminary drying. Rotary furnaces with one floor are generally used for this and if the coal contains over 10% moisture the furnace may contain several floors. The coal is turned over by radial arms and leaves at the center. The pitch requires fine grinding and the results depend on the fineness. The Carr grinder is very good, is robust, and does not lend itself to gluing of the pitch. The pitch is then incorporated with the fuel in an externally heated app. The material is then formed into briquets upon a horizontal plate and then pressed vertically at about 20 kg./cm.² The analysis of briquets comprises fusion pt., free C, insol. in various solvents, volatile matter and ash. B. discusses the method of Goutal, Taylor, Kraemer and Spilker, the cube method, Kraemer and Sarnow, and the American method for testing the strength of briquets. He then considers pitch substitutes, autoagglomeration, the future of briquetting and the briquetting of lignites and semi-coke. He adds production statistics for France, Germany, Belgium, Gt. Britain, Spain, Holland, Poland, Czechoslovakia and Hungary. A short discussion is appended.

Economics of powdered-coal firing for steam boilers. FR. SCHULTE. *Gas u. Wasserfach* 72, 33-9(1929).—An analysis is made of the cost of steam generation for various types of German coals.

Note on boiler heating with pulverized coal. WEISS AND MUNIER. *Chaleur ind.* 9, 105-16(1928).—The removal of ash in the molten state often means rapid deterioration of furnace walls and moreover with coals of high m. p. is rather troublesome. The method of the collection of pulverulent ash is costly because of the equipment required and other causes. With an air current of 25m./sec. complete combustion is obtained within 7-8 m. and with the preliminary furnace in the form of a tunnel the injected pulverized coal lights easily, all sorts of coal can be used and most of the ash falls into the lower portion of the furnace. To assist in the cooling of the ash, tube screens are used. A description of the pulverized coal installation is given together with 10 figures and photographs.

Boiler heating with powdered coal in France. N. SCHWERESCHEWSKY. *Chaleur ind.* 9, 85-98(1928).—Statistics show the extent of the use of powdered coal for heating boilers in France, especially in central power stations, in cement and metallurgical industries, and in marine and locomotive boilers. Coal fineness used is 100-200, sometimes 250, and more rarely 300. With the spread of powdered coal the vol. of the combustion chamber increases. The use of water screens is also increasing and more recently Murray tubes are being adopted; 34% of the total use preheated air. A table shows the disposition of the ash formed (a) in the combustion chamber, (b) in the economizer, and (c) through the chimney. German and U. S. data for powdered coal also are added.

Coal distillation in the scheme of fuel economy. G. CANTIENY. *Chaleur ind.* 9, 178-92(1928).—The paper is chiefly an account of the Kohlenscheidungs Gesellschaft process (KSG) at Karnap. The retort is an inclined rotary annular metal drum. The coal enters at the low end of the inner drum, travels upward by virtue of a helical screw and receives a preliminary heating. Distn. proper at 700-800° occurs in the outer drum in which the coal descends by gravity, emerging at the same end at which it enters. Vapors, etc., are withdrawn at the top of the drum; hence the solid and gas have a min. period of contact. Superheated steam is injected in the outer cylinder; this improves the quality of the tar. Gas heating is used and to keep the temp. down, cold inert gas is circulated. The emergent coke is dry-cooled and the fines are sepd. The original coal contained 3% moisture, 25% volatile matter, 14.8% ash, lower calorific value 6418 cal., upper calorific value 6671 cal.; in Fischer's Al retort the coal gave 8.4% tar, 83% coke, 82 cu. m. gas per ton (standard temp. and pressure), and in the plant it gave 82% coke, 5.3% primary tar of which 0.8% was benzene, and 83 cu. m. rich gas per ton dry coal. The resulting coke gave 18.6% ash, 74% C, 2.8% H₂, 1.35% N₂, 1.44% total S, 1.77% O₂, lower calorific value 6410 cal., upper calorific value 6563 cal., apparent sp. wt. (lumps) 400 kg./cu.m. (fines) 600 kg./cu.m. The primary tar gave 0.5-2.5% dust, 60% oil, sp. wt. 1.04-1.05, 5% moisture, upper calorific value 9530 cal. The debenzinated gas gave 6500-7500 cal., d. (air = 1) 0.75-0.78. C. gives brief accounts of installations at S. Met. Gas. Co. of London, Piscataway plant

of N. Brunswick (N. J.), Pont à Vendin, and the Barcelona plant, and then discusses economic and commercial factors. A discussion is appended. S. L. B. E.

Characteristics of various kinds of coal and nomenclature of brown coals. W. GOTHAN, K. PIETSCH AND W. PETRASCHKE. *Braunkohle* 26, 669-74(1927).—The distinguishing characteristics are enumerated. With the exception of the higher cellulose content of peat, chem. means of distinction are not applicable. F. S. G.

Hungarian brown coals. L. SÜMEGI. *Magyar Mérnök Építészegylet Közlönye* 72, 85-7(1928).—Expts. have been made on the behavior of S in brown coals during dry distn. at various temps. The data given show that nearly all of the Hungarian brown coals examd. behaved in the same way; the apparent differences have been caused by high ash content. The best method of detg. combustible S is to subtract the S in the ash from the total S content detd. by the Eschka method. No reliable data can be had when oxidizing S with Na_2O_2 ; this method can only be used for rapid control analysis. S. S. DE FINÁLY

The rapid determination of moisture in brown coal. H. HEZT. *Braunkohle* 28, 101-10(1929).—A review of known methods. F. S. GRANGER

Supplementary firing with brown coal dust. J. OELSCHLAGER. *Gutersloh-Westphalia. Chem. Fabrik* 1929, No. 4, 40-2.—Brown coal dust firing is suited to step and chain grates and gives better results than lump brown coal. The no. of burners, their arrangement and the furnace construction are important. A sketch shows the extra attachment for brown coal firing in augmenting the boiler output for step grates. Two sketches show the arrangement as applied to a chain grate installation. The dust flame because of its radiant heat assists in the combustion of the volatile constituents of the lump coal used. Excess air for combustion is reduced. A rise in temp. of the furnace may occur which may produce difficulties in a brown coal with an easily fusible ash; at the same time the burning coal in the furnace assists the combustion of the coal dust; hence dust of a lower calorific value can be used and the difficulties occurring with pure coal dust can be avoided. The increase in boiler output depends on the ratio of dust (S) to coal (R) and is approx. $S/R = 0.15-0.25$ or some 25-35%. The flexibility of the combination is very marked, some installations showing an increase in boiler pressure of 50% in 2 mins. and in other cases, of over 200%. S. L. B. ETHERTON

Peat as fuel. FERNAND LE MONNIER. *Chaleur ind.* 9, 54-62(1928).—M. considers general economic factors, particularly as they apply to France. Peat may contain some 90% water, and the economical removal of this is the crux of the situation. Under suitable conditions much of this water can be removed by suitable air drying. Various methods for doing this are described and M. refers to the processes of Eckenburg, Madruck, Kerrine and Roux. Owing to its great affinity for O_2 , peat helps the combustion of difficultly ignitable coals. In its natural state peat cannot stand distant transportation and it is preferable to consume it near the peateries. In Sweden, locomotives are run on powd. peat and in Canada peat is the fuel at some central power stations. In France peat briquets with 40% moisture and calorific value about 2800 are used. M. describes Norron's machine for peat utilization. Peat is considered a good fuel for producers. M. gives a schematic layout for peat consumption and adds a thermal balance. In the discussion that followed it transpired that 2 of the largest peat fields in Italy have stopped working. S. L. B. ETHERTON

Auto-agglomeration of French lignite. A. MOREAU. *Chaleur ind.* 9, 30-3(1928).—Dehydration and rehydration curves of Nouty and Laluque lignites are given. Treatment with HNO_3 , water, or benzene did not yield interesting results. Some lignites appear to suffer chem. changes when under pressure. The proportion of hygrometric water has no influence. Non-agglomerating lignites contain little O_2 while pressure plays a preponderating and temp. a secondary part. S. L. B. ETHERTON

Report on the Fischer process. HENRY OSCAR ASKEW. *New Zealand J. Sci. Tech.* 10, 101-10, 154-63(1928).—Review of the literature through 1927 covering 51 references on the catalytic reduction of CO when present in water, gas or similar mixts. A. S. CARTER

The efficiency of continuous vertical retorts. T. A. HARVEY. *Gas World* 90, 129-32(1929).—A description of construction, operation and results of the Woodall-Duckham continuous vertical retort plant at Birmingham. F. S. GRANGER

The working life of retort settings. R. L. GREAVES. *Shrewsbury Gas Light Co. Gas J.* 185, 225-8(1929).—A discussion of causes and effects based on 7 years' experience with Dempster-Toogood continuous verticals. Also in *Gas World* 90, 153-6(1929). F. S. GRANGER

Report of the Committee of the Privy Council for Scientific and Industrial Research for 1927-8. ANON. *Gas J.* 185, 410-11(1929).—The scope of the investigations on

low-temp. carbonization, high-pressure gas reactions, gas industry, hydrogenation of coal and illumination is briefly reviewed. Tar yields, as high as 20 gallons per ton, were obtained from vertical retorts using weakly or medium caking coals with no fines, whereas the highest yield from horizontals was about 14 gallons. Concerning hydrogenation, it is found that by a less drastic process than is necessary for the liquefaction of coal, a partial hydrogenation takes place which greatly increases the caking properties of the coal. Cellulose, oak sawdust, peat and a no. of coals, including anthracite, have been treated, and the resulting material in every case will yield a coherent coke on carbonization.

F. S. GRANGER

Influence of inorganic constituents in the carbonization and gasification of coal.

II. Liberation of sulfur. J. J. PRIESTLEY AND J. W. COBB. *Gas J.* 182, 951-4(1928).—Coal heated to 1000° in N₂ lost 42% of its S, mostly at about 500°, and, in H₂, 68%, largely at higher temps., as H₂S. Addn. of 5% Fe oxide to the coal reduced the S loss 9% in N₂ but in H₂ 64% was liberated, rapid decompn. setting in above 800°. With CaO, less than 3% was lost in either N₂ or H₂, while with Na₂CO₃ increased liberation occurred, up to 600°, the limit of the expt. because of formation of Na₂O. F. S. G.

Carbonization. III. Temperature, size of coal, blending with coke and inorganic compounds. ANON. 20th Rept. of Research Sub. Comm. of Gas Investigation Comm., Inst. Gas Eng. *Gas J.* 182, 883-8(1928).—Carbonization expts. showed no effect of grading on yields at temps. below 820°. At higher temps. larger coal gave higher tar yields and lower gas calorific value. The gas yield was not much affected by size but a longer carbonization time was required with small coal. 2.5 hrs. at 915° produced the same effect as 10 hrs. at 630° or 20 hrs. at 525°. Gas therms per ton fell from 75.8 at 979° to 4.8 at 344°. The CO₂ content decreases while H₂ and CO increase with rising temp. Unsatsd. hydrocarbons reach a max. at about 450°. Blending with coke showed no beneficial results. Addn. of Na₂CO₃, CaCO₃ or iron oxide, above 815°, increased the gas thermal and NH₃ yields. Lowering the carbonization temp. increased the reactivity and decreased the mech. strength of the coke but did not affect the ignition temp., unless inorg. oxides had been added. F. S. GRANGER

The carbonization of Ohio coals. D. J. DEMOREST. Ohio State Univ. Studies, *Eng. Expt. Sta. Bull.* 46, 54 pp.(1928).—Ohio coals were carbonized in an exptl. vertical one-ton retort; the products were collected and analyzed. Tests on Elkhorn coal were run for comparison. Conclusions: The coke produced is good for domestic or water-gas use; high ash (9 to 10%) and S (up to 4%) content of the coals may necessitate previous washing. The volatile content of the coal (35 to 40%) insures a good gas yield.

B. J. C. VAN DER HOEVEN

Low-temperature carbonization. PAUL DVORKOVITZ. *Chaleur ind.* 9, 193-200 (1928).—A description of the D. process and of the exptl. plant at Slough, Eng. There are two double vertical steel retorts, capacity 5½ tons each, the upper portion holding 2½ tons, each retort having an Archimedean spiral in the top portion. The gas is taken off at the bottom of each section. A 1918 table of yield is given, this being an extract from Guiselin "Combustibles liquids;" one photograph and two cuts of the retorts at Slough are appended.

S. L. B. ETHERTON

Low-temperature carbonization. C. H. LANDER. Fuel Research Board. *Gas World* 90, 133-4(1929).—A brief review dealing particularly with hydrogenation of coal.

F. S. GRANGER

Low-temperature carbonization of coal from the South-Muscovite field. A. CHAKHNO. Inst. thermotech. de Moscou. *Chimie et industrie* 21, 32-4(1929).—Analyses of 2 grades (so-called "kournoi" and "boghead") of coal from this field are given, together with the results of low-temp. carbonization tests, including the compn. of the cokes, the yields of the various products, the compn. of the tar and the calorific values of the products obtained. The "boghead" gave 45% of primary tar which could be either sepd. into various useful constituents (not specified) or used as fuel after sepn. of the benzine, the sepn. of the paraffin being uneconomical. The semi-coke has a high ash content and a relatively low calorific value, and is pulverulent and friable. The ammoniacal liquor contains too little NH₃ and is too highly contaminated with H₂S and other impurities to be of value. The gas has a very high calorific value and after purification (which causes a shrinkage of 10-20%) can be used for lighting, heating or enriching lean gases.

A. PAPINEAU-COUTURE

Design of the "K. S. G." low-temperature carbonization plant at New Brunswick, New Jersey. R. P. SOULE. Intern. Coal Carbonization Co., N. Y. *Can. Chem. Met.* 13, 45-7(1929).—This installation, which is to carbonize 650 tons per day, comprises 8 K. S. G. retorts, each constructed of 2 steel drums, 10' X 72' and 5.5' X 85', inclined slightly to the horizontal, with provision for external heating and rotation of 0.75 r. p. m.

Coal is continuously fed into the lower end of the inner drum and is carried up by helical flanges to the end, where it falls and returns in the outer drum by gravity; time of passage in the retort is 2 hrs. The double drum reduces the time the coal is in a plastic state, for it is below its softening point in the inner drum. The sudden temp. change upon entering the outer drum causes a hard cake to form on the outside of the lump, decreasing agglomeration when the inside becomes plastic. Steam injection cuts down caking on the walls and adhering C is removed by longitudinal chains. Stack gas is circulated for heating, the temp. being maintained at 1200° F. and 1350° F. at the lower and upper ends, resp., by introducing combustion chamber gas at intervals in the helical course of the hot gas along the drum. Hot gas passes out into the steam superheater. This plant produces gas of 800 B.t.u. which will be blended with blue gas to give 8000 cu. ft. of mixed gas per ton of coal carbonized, with an av. B.t. u. of 535. The min. production will be 3,000,000 cu. ft. of mixed gas, 15,000 gals. of tar and 1800 gals. of light oil per day. Operation details are given. A. S. CARTER

High-temperature carbonization. LANGROGNE AND BOULIN. *Chaleur ind.* 9, 153-9(1928).—To extend the range of coking coals experiments showed that a mixt. of gas coal and lean coal gave a utilizable coke without addition of coking coal, but a mixt. of the three coals gave better results. Mixing then becomes very important and requires special care. The coals should be crushed, measured, carefully mixed and then pulverized. The best proportions require careful exptl. investigation; indeed, lab. results are only of approx. value and it is desirable to use a test plant. Mixts. of very fat coals with lean coal give improved results with rapid heating and compression of the charge. The Sarre mines use a fat coal with a lean coal, the lean coal being the product of the low-temp. distn. of the fat coal; the resulting coke is very good. A general account is given of a modern cokery and the relation between a coking plant and gas lighting. S. L. B. ETHERTON

Oil production from coal. HARALD NIELSON. Sensible Heat Distn. Ltd. *Gas J.* 185, 286(1929).—It is shown that, although the oil quality is improved by using a large vol. of gas as the distg. medium, the improvement is not sufficient to justify the increased cost. F. S. GRANGER

The mechanical removal of ash from steam boilers. MICHEL SOHM. *Chaleur ind.* 9, 133-45(1928).—S. discusses methods as follows: (1) increasing the stokeholes, which he criticizes; (2) dry removal mechanically, which he considers to require much hand labor and to involve considerable plant deterioration; (3) removal by immersed mechanism, which he does not advocate, particularly if any pyritic material is present; (4) pneumatic removers, which he considers generally to absorb too much power and require excessive upkeep; (5) steam removal, as on board ship, a process rarely adopted on land; (6) hydraulic transportation, which he considers most desirable and gives reasons. The latter method was tried at Buray Mines and an account is given with many sketches and curves, of that experience. He discusses (a) the slope of the removal canal, (b) the form of the canal, (c) wear of canal floor, (d) vol. of water in circulation, (e) the form of the canal, (f) coeff. of dilution, (g) decantation from cinders, (h) effect of the addn. of lime. The layout of the Bruay arrangement is given for dealing with 2500-4000 tons of ash per hr. and drawings of important mech. details are shown. S. claims low cost of ash removal and after an experience of 2 yrs. advocates hydraulic removal giving as addnl. reasons, the improved hygiene and comfort of the personnel. The discussion that followed corroborated in general the claims made in the paper. S. L. B. ETHERTON

Determination of sulfur in benzene. W. B. DAVIDSON. *Gas J.* 185, 95-6(1929). A rather simple app. is described. Twenty cc. of benzene are diluted to 100 cc. with MeOH. Ten. cc. of this soln. are placed in the lamp which consists of a small flask in which a fine quartz tube is inserted as a wick, and burned smokelessly in the app. This consists of an inverted U tube under one widened end of which the lamp is placed. The other end delivers the combustion products into a wash bottle contg. neutralized H₂O₂ soln. The chimney end is closed under the lamp with an inlet for air, freed from SO₂ by passing through a scrubber contg. glass packing moistened with NaOH soln. The air is aspirated through the app. as the lamp burns, after ignition either before introduction into the app. or afterward through a hole in the side of the chimney. The S is then titrated as H₂SO₄. F. S. GRANGER

Natural gas in 1927. G. R. HOPKINS AND H. EACKUS. Bur. Mines. *Mineral Resources of the U. S. 1927*, Pt. II, 129-37 (preprint No. 14 published December 17, 1928). E. H.

Some applications of chemistry in gas making. H. HOLLINGS. Gas Light and Coke Co. *Gas J.* 182, 924-35(1928).—The free C content of tar is a good neg. index

of tar quality and yield, which improve, along with other economies, with increasing retort charge and also with decreasing unit retort size, within practical limits. This is attributed, in the former case, to shorter heating of tar vapors because of the higher gas velocity resulting from less free space in the retort as well as from the larger quantity of coal undergoing carbonization. A parallel effect is also seen in the higher % of hydrocarbons, other than benzene, in the light spirit stripped from the gas, as shown in its distn. curve. Analysis of this spirit as an index of carbonizing conditions is shown strikingly in comparing horizontal with continuous vertical retort products. Less than 20.5% CO₂ in the waste gases, leaving the combustion chambers of retort settings, after deduction of excess air, is an indication of leakage from the retort into the combustion chamber. The leakage, so measured, can be calcd. as therms per ton of coal carbonized, and is periodical, being greatest after charging. This should be met by a corresponding control of pressure conditions in the retorts individually, *e. g.*, by a sep. governor, or an adjustable overflow weir or dip pipe in the hydraulic main, for each retort. A device of the third type is described. Temp. differences, etc., being known, the vol. of waste gas can be calcd. from the steam produced in the waste heat boiler, which thus acts as a waste gas meter. Comparison with the fuel consumption of the producer gives another measure of retort leakage and a means of distinguishing between coal-gas and water-gas leakage. Sample calcns. are given. The calcn. of the portions of the total therm yield due, resp., to coal gas and to water gas, from steamed verticals, which is important in any analysis of results, is facilitated by means of a monogram or slide rule. $T_c = (T_m H_c (H_m - 320)) / (H_m (H_c - 320))$ or $\log (T_c/2) + \log (1 - (320/H_c)) = \log (T_m/2) + \log (1 - (320/H_m))$, where *c* denotes coal gas and *m* mixed gas, both on an inert-free basis. Thus the scale of therms, *T*, is $\log (T/2)$ and that of calorific values, *H*, is $\log (1 - (320/H))$. Inverting one scale, in the slide rule, and placing the therm yield of mixed gas opposite its detd. calorific value, the therms due to coal gas alone are read opposite the calcd. or assumed calorific value of the coal gas. Equil. concns. of NH₃ in gas and liquor at various temps. have been detd. and plotted. From these it is found, *e. g.*, that 4.5 gallons of water, per ton of coal, are theoretically sufficient, at 60° F., for complete extn. of the NH₃ from gas contg. 100 grains per cu. ft., whereas 17 gallons are required at 90° F. The efficiency of NH₃ extn. is improved by fractional condensation. Such a plant is described. The calcn. of the enrichment effect from the gain in thermal yield of carburetted water gas, above that assumed for blue water gas, is explained. By this means, the efficiency of oil cracking has been studied. The thermal yield of gas, per gallon of oil, decreases as the rate of oil injection is increased.

F. S. GRANGER

Rational mixed gas production with respect to complete gasification. E. LANGTHALER. *Gas. Wasserfach* 72, 31-3(1929).—An analysis of the possible cases for prep'g mixed gas from coal gas diluted with flue gas, generator gas, water gas and straight and carburetted complete gasification gas.

R. W. RYAN

Chemical control of gas producers. G. LOOSE. *Ing. chim.* 16, 142-69(1928).—The nature of the coal is one of the most important factor in the running of a producer. L. gives the formulas used for the calcn. of the producer's yield. The phys. and chem. characteristics of different coals are studied in regard to their effect on the working of the producer. The influence of the O content on the compn. of the gas is given in a table; two others show the effect of the volatile matters on the calorific power of the coal. L. gives a procedure to det. the causes of abnormal running. A detailed table shows the influence of temp., air pressure, compn. of the coal, draught, cleanliness of the producer on the compn. of the gas.

P. THOMASSET

Removal of sulfur from illuminating gas by activated carbon. E. W. TODD. Dalhousie Univ., Halifax, N. S. *Proc. & Trans. Nova Scotian Inst. Sci.* 17, Pt. 2, 12-3 (1928).—When illuminating gas at 16.7° and 76.2 cm. pressure was passed over rotite or norit, the S in the gas was reduced to about 1/4 or 1/5, resp., of its original value. When an excess of gas was used, the activity of C was considerably lessened. The activity could be partially restored by heating the C in open Fe crucibles over a Bunsen burner for about 2 hrs.; the "revivified" C was able to reduce the S in the gas to about 1/4 to 1/5.

G. SCHWOCH

Products of combustion from typical gas appliances. III. Appliances using free-burning flames. ANON. 19th Rept. of Research Sub-Comm. of Gas Investigation Comm. Inst. Gas Eng. *Gas J.* 132, 880-2(1928).—The CO produced by various burners was detd. by the I₂O₅ method, after removal of N oxides, which interfere. These were condensed out by liquid air, since the CO₂ absorbents did not remove them completely. Parts of CO produced, per 10,000 of gas burned, at the rates given in cu. ft. per hr., were as follows. Argand burner, 0.5 at 6.1, and 0.1 at 8.3. Union jet

flat flame, 1.1 at 2.7 and 0.6 at 6.4. Geyser flat flame, 2.5 at 0.6 and 1.0 at 6.8. Meker (air/gas = 2.6), 0.8 at 8.8. Lab. Bunsen, 0.9 with a 2.48 air-gas ratio, and 2.1 with air shut off, both at 5.3. Domestic appliances. Flueless heater with Argand burner, 0.1 at 6 or at 8, and 0.5 when overloaded at 10. Water heater with 4 geyser burners, 2.0 at 2.0, and 0.1 at 18.3. Geyser with 36 burners, with 5 ft. of flue pipe below the baffle, 0.1, and, with 1 ft., 101, both at 136. Junkers calorimeter with Bunsen burner, 0.6 at 6.7. Gas oven, 2.7 at 10, and 0.2 at 40. Gas fire with 9 radiants, 74.9 at 79% of normal gas rate (air/gas = 1.13), 73.3 at normal rate (air/gas = 1.42), 27.2 with flames shortened by increasing the proportion of water gas, and 6.2 parts at 82% of normal rate, with radiants removed.

F. S. GRANGER

Radiation of heat from gas-lighting burners. H. J. HODSMAN. *Gas J.* 184, 794-6 (1928).—Ninety-nine % of the energy of a gas-lighting burner is dissipated as heat. The portions radiated downward were found to be, for a bat-wing burner, 7.1%; incandescent burner, upright, without chimney, 19.7%; inverted, without globe, 25.9%; with globe, 16.2%; with reflector, 37%.

F. S. GRANGER

Steam boilers heated with gas. Zs. VITÉZ GÁLÓCSY. *Magyar Mérnök Építészegylet Közönye* 62, 5-9(1928).—A discussion of the relative merits of burning raw coal and gases from coal.

S. S. DE FINLAY

Disposal of liquor effluents from gas works. ANON. 2d Rept. Inst. Gas Eng. Liquor Effluents Research Comm. *Gas J.* 182, 1016-8(1928).—In a vertical retort plant at Hinckley, the content of higher phenols in the effluent was reduced by introduction of a tar extractor in the foul main. Thiocyanate and thiosulfate contents in the liquor were greatly increased by contact with air in storage or at the condenser inlets. The final effluent of the NH_4 sulfate plant was about 1% of the total dry weather sewage and could probably be reduced $\frac{1}{2}$ by balancing tanks. Carefully controlled disposal of effluent into sewage is considered satisfactory and can be further improved by sep. disposal of devil liquor, by chimney spraying, etc.

F. S. GRANGER

Improvement of the calorific value of coke-oven gas. R. SCHÖNFELDER, W. RIESI AND W. KLEMP. *Ber. Ges. Kohlentech.* 2, 250-8(1927).—The gas is passed successively over catalytic material at 700° comprising Ni pptd. on magnesite to destroy org. S compds. and to break down heavy hydrocarbons, and, after removal of H_2S , over pieces of clay contg. reduced Ni at 420° to reduce CO and CO_2 to CH_4 and water by means of the H in the gas. The calorific value is raised, *e. g.*, from 4136 to 5368 thermal units.

B. C. A

Modifying coking and gasification processes to low-temperature carbonization. J. SAINTE-CLAIRE DEVILLE. *Chaleur ind* 9, 173-7(1928).—With internal heating by inert gases or steam at 500 - 600° the thermal yield is good but there is a loss of light products and gas. External heating may be used with a rotary or mixing furnace. With 10% moisture the coal will require 50% more heat to be added when carbonizing at 525° ; hence all processes involve an independent drier. Low-temp. tar is very different from by-product tar and the author gives some of its properties and constituents. Only 50-70 cu.m./ton of gas is obtained and it has about 6000 cal./cu.m. The author gives some methods of treatment and states that the gas contains much S and smells strongly.

S. L. B. ETHERTON

Hydrogenation of coal tars. G. HUGEL. *Can. Chem. Met.* 13, 5-7(1929). Hydrides of alkali and alk. earth metals are used as catalysts in the hydrogenation of coal tar. The activities of these are unaffected by the usual poisons, though to some extent they disappeared in consequence of reaction with the impurities. The catalytic activities were comparable to that of Ni. C_{10}H_8 was reduced to tetralin (I) over NaH at 230 - 50° and 10-20 kg. pressure in 2-3 hrs. The catalyst was prepd. by heating Na with H_2 under pressure to 270° ; at 100 kg. over 1.8 atoms of H_2 were absorbed. $\text{C}_{14}\text{H}_{10}$ was hydrogenated to 9,10-dihydroanthracene, which was further reduced to 1,2,3,4-tetrahydro-, then hexahydro-, and finally octahydroanthracene. C_6H_6 cannot be reduced. If the hydrides are formed directly in the reduction mixt. the products are different, thus decalin is formed in small quantities from C_{10}H_8 as well as I. With 7-10% of catalyst, coal tar was hydrogenated at 80 - 100° kg. and 300° to give 30% of green fluorescent oil (II) and a black solid. By preventing flocculation, 80% yields can be obtained. At lower temps. (250°) the first product is a benzene-insol. "hydrotar," $d_{15} 1.16$, flash point 130° , fire point 215° , viscosity (Engler) 3.5 at 50° . The final stage represents the absorption of very little more H_2 with cracking to give II, $d_{15} 1.06$, flash point 64° , fire point 84° , viscosity 10.4 at 20° , 2.5 at 50° , 1.3 at 100° . This contains I and polyaromatics such as chrysene, picene, etc., which throw some light upon the colloidal structure of coal tar.

A. S. CARTER

Preparation of high-quality coke. ERNST SCHUMACHER. *Gas Wasserfach* 72,

97-102(1929).—Methods are discussed of increasing coke quality such as grinding the coal, blending, careful handling of the coke and adaptation of coke to specific uses.

R. W. RYAN

Modern coke plants in the Ruhr territory. WALTER GOLLMER. *Stahl Eisen* 49, 129-38(1929).—Technical improvements are reviewed.

J. A. SZILARD

Alternative methods of coke-oven heating. ERNST WEISE. *Gas Wasserfach* 72, 73-8(1929).—Theoretical flame temps. and the combustion temps. corrected for dissocn. are given for coke-oven gas, blast-furnace gas and various mixts. of the 2 with air in ratios from 1 to 1.3 with the air preheated at several temps. up to 900°, and the percentage of useful heat calcd. for each case. It is not economical to secure temps. over 2000° with blast-furnace gas unless its cost is extremely low but such gas is good for heating coke ovens and releases an equiv. amt. of coke-oven gas for super-gas systems and high-temp. heating.

R. W. RYAN

Heat insulation of the coke oven and the regenerator with Sterchamol. ARTHUR KILLING AND KLAUS THEIS. *Stahl Eisen* 49, 65-73(1929).—Sterchamol, a naturally occurring infusorial earth in Denmark, was first used to insulate the coke ovens and regenerators of the Vereinigte Stahlwerke A. G. Division Hörderverein in 1926. Sterchamol can be obtained in the form of bricks, with 12-120 kg./sq. cm. resistance to compression. From the operating experiences gained during the last 2 years the following conclusions are deducted: The insulation of the back walls of coke ovens with half-sized Sterchamol bricks resulted in a decrease of the heat losses of 48%; with full sized bricks, the decrease was 68%. The insulation of the upper part of the oven, undertaken in 3 different ways, was not satisfactory, because of the high temp. of the Fe armatures, built in the brick work; furthermore the doors show considerable heat losses. The heat balance of a plant with the coke ovens insulated showed an efficiency of 65%, as compared with a plant where the ovens were not insulated, showing an efficiency of 60%. The insulation of the regenerators was carried out in 2 ways. First, one layer of Sterchamol bricks and one layer of Sterchamol mass were used. The heat losses by radiation decreased from 6 to 2%, increasing the yield of useful heat from 83 to 87%. The amt. of fuel gas saved paid for the cost of insulation in 8 months. The use of Sterchamol filling mass instead of bricks is less expensive, though its insulating effect is lower; on regenerators so insulated temps. observed on the dome ranged from 50 to 60° and on the side shaft from 35 to 40°.

The new Brooklyn by-product coke-oven plant. J. J. GARLAND. *Brooklyn Union Gas Co. Gas Age-Record* 63, 272-4, 276(1929).

E. H.

The properties of coke coals and the processes of their coking. PAUL DAMM. *Archiv Eisenhüttenw.* 2, 59-72(1928); cf. C. A. 23, 1495. —The coking power of coals (Backfähigkeit) (I) and the pressure required to suppress the free expansion of the coal while changing into coke (Treibdruck) (II) are of special importance in the coking of coals. From I a measurement of those constituents of the coal, which when soft do not unite with the nonfusible, are obtained; while from II, conclusions are obtained on the pressures which the molten coal experiences due to the gases in the degasifying zone. The idea that II is undesirable in coking is shown to be false. According to their content in volatile matter, 3 zones are differentiated during the degasification in the coke oven, before, in and after the softening. The first 2 zones are important for estimating the power of a coal to coke and the coking process, while the last gives conclusions on the nature of the coke produced. The steeper the degasification curves, the greater the loss of the semi-coke formed during the resolidification of the fused coal. The influence of the properties of coking coal on the coke produced is studied, exptl. curves obtained showing that the less the reactivity of the coke the stronger the degasification of the coal and the greater its II. The results of the investigations are applied to large-scale production

STUART, MURRAY. *Low-Temperature Carbonization Explained*. London: Mining Publications, Ltd. 4s. net.

Briquetting fuel. MASCHINENBAU A.-G. VORM. BREITFELD, DANEK & Co. and GEORG PLOCHMANN. Ger. 470,928, May 8, 1925. Water-resistant briquets are prepd. by treating dried fuels with fuel distn. gases or vapors at a temp. not exceeding 80° and then pressing the fuels, if necessary, after addn. of a binder.

Fuel briquets. SOC. DE RECHERCHES ET DE PERFECTIONNEMENTS INDUSTRIELS. Fr. 645,226, Sept. 10, 1927. In making briquets by heating powd. coal mixed with oil coming from a Trent purification, a certain quantity of anthracite or other powd. nonbituminous coal is incorporated with the mass of coal and oil before heating. Cf. C. A. 23, 959.

Carbonizing fuel briquets. E. GEVERS-ORBAN and J. PIETERS. Brit. 294,581, July 26, 1927. Sticking together of briquets during carbonization is prevented by embedding them in a dust which may either be that of the raw fuel or of coke breeze from a previous distn.

Ovens for drying fuel, briquets, etc. ERNEST W. BOWEN. Fr. 645,685, Oct. 28, 1927.

Manufacture of powdered fuel. WALTHER & CIE. A.-G., WILHELM OTTE and MAX BIRKNER. Ger. 471,010, May 6, 1925. Addn. to 443,111. Ger. 443,111 describes the manuf. of powd. fuel by grinding it, in the absence of air, immediately after a complete or partial destructive distn. This method is now modified by grinding only the smaller pieces.

Combustion system for utilizing pulverized fuel. JAY G. COUTANT (to Furnace Engineering Co.). U. S. 1,703,814, Feb. 26.

Gaseous and liquid fuel. SOC. D'ÉTUDES ET D'EXPLOITATION DES MATIÈRES ORGANIQUES. Fr. 645,724, Dec. 14, 1927. To increase their calorific value or to prep. liquid fuel, natural or industrial gases contg. H, CH₄, and CO are submitted to incomplete combustion by passing them, mixed with insufficient O, through a catalyst of Pt black, oxides of Fe, Cu, Ni, Cr, V, Ag, Co, Ce, etc., for the production of unsatd. hydrocarbons.

Fuel for internal-combustion engines. C. J. SIMS. Brit. 294,129, April 14, 1927. Fuel oils for use in "compression-ignition" engines have added to them a small proportion of a primer which will explode on rapid heating at a temp. below the ignition temp. of the untreated oil. Among the substances which may be used are: trinitroresorcinol, nitrous and nitric esters such as Me nitrate or Am nitrite, azo compds. such as diazoaminomethane, halogen compds. such as CHI₃, chlorates and perchlorates such as hydrazine diperchlorate, acetylenic compds. such as Cu acetylide, superoxides such as benzene ozonide, nitroamines such as picramide, Hg fulminate, phenylnitramine and phenylselenious acid. Five per cent of Me nitrate may be used.

Liquid hydrocarbons suitable for use as power fuels. C. EPNER. Brit. 294,100, July 16, 1927. Gases contg. hydrocarbons are subjected to the action of dark or silent elec. discharges, preferably of high tension and periodicity. The reaction is effected at a sufficiently high temp. that the products are removed in vapor form and may be condensed or absorbed in active C or in a wash oil. The unsatd. products may be hydrogenated by use of a catalyst.

Filter for liquid fuels for internal-combustion engines. R. J. O'CLAREY and SOLEX, LTD. Brit. 294,706, May 2, 1927. Structural features.

Automatic mixing apparatus for gas-producer fuel. PORTER, G. M. B. H. Fr. 33,408, April 27, 1927. Addn. to 625,570.

Briquetting powdered substances. ALFRED UELMANN. Fr. 645,541, Dec. 10, 1927. Powd. substances such as coal, coke, etc., are briquetted by damping and submitting them to a high-frequency field of force.

Briquetting coal. EDOUARD GOUTAL and HENRI HENNEBUTTE. Ger. 470,746, Nov. 6, 1924. A binder for coal briquets is prepd. by mixing an oxygenated tar, e. g., tar from wood, brown coal or peat, or tar oxidized at a moderate temp., with a non-oxygenated tar, e. g., ordinary coal tar or petroleum tar, and heating the mixt. at 180-250°, in presence or absence of an oxidizing gas, so that copious amts. of steam are evolved, the product still retaining, however, the phys. properties of tar. Examples are given.

Briquetting carbon, coal, etc. F. L. SCHMIDT. Brit. 294,879, July 30, 1927. In briquetting with a binder of molasses or cellulose pitch, the sugar substances in the binder are removed at least partially by fermentation and the residue is concd. by evapn. at a temp. above 100° until a test portion sets on cooling. Acetone, acetaldehyde, alc., glycerol, etc., may be obtained by the fermentation.

Drying coal. ČESKA OBEHODNI SPOLEČNOST, APOLLO RUŽICKA and BŘETISLAV ŠIMEK. Fr. 645,073, Dec. 2, 1927. Coal such as lignite is heated with water to 150–200° under pressure to destroy its colloidal properties, and the water allowed to run off. The remaining moisture becomes evapd.

Drying coal. ČESKA OBEHODNI SPOLEČNOST. Fr. 645,972, Dec. 2, 1927. Coal such as lignite in lumps is dried in a container by passing in superheated water under pressure and evacuating after the coal becomes sufficiently heated, and the heat retained is sufficient to vaporize the water in the coal.

Apparatus and gas-circulation and heat-exchange system for drying peat or other materials. O. SODERLUND, T. GRAN and TECHNOCHEMICAL LABORATORIES, LTD. Brit. 294,289, April 23, 1927.

Apparatus for continuous drying or distillation of brown coal or other materials in fine, granular form. LUDWIG HONIGMANN. U. S. 1,704,796, March 12. The material is treated in a horizontal drum and heat-transfer plates mounted on a rotating shaft extend into the material and during their rotation are heated by hot gas or other heating medium in pockets surrounding the upper portion of the heat-transfer plates.

Low-temperature distillation of coal, lignite, etc. SOC. DE RECHERCHES ET DE PERFECTIONNEMENTS INDUSTRIELS. Brit. 294,568, July 26, 1927. Previous to distn. fuel contg. about 26–38% volatiles is agglomerated with an oil such as anthracene oil, petroleum or coal tar, which give little or no pitch on distn., at about 500°. The residue may be subjected to further distn. at a higher temp. (suitably 700–1000°) to produce a *metallurgical coke*.

Distillation of coal. HENRI DUPUY. Fr. 33,409, April 27, 1927. Addn. to 552,349. In the app. of the prior case the circulation of the steam is produced by a vapor pump.

Regenerative vertical retort battery for distilling coal. JOSEPH VAN ACKEREN (to Koppers Co.). U. S. 1,704,685–6–7. March 5.

Rotary horizontal tapering retort suitable for coal, shale, wood, etc. THOMAS A. W. DWYER (in part to Hans O. Schundler, Willis H. Botsford and Archimedes J. James). U. S. 1,703,418, Feb. 26. U. S. 1,703,419 also relates to the use of a similar still for distilling coal, wood, shale, etc., in such manner that different volatile products are evolved successively at different points along the length of the still while vapors stratify in the upper portion of the still and are led off to a suitable recovery app.

Apparatus (with helical fuel feeding devices) for distillation of coal or other carbonaceous materials. FREDERICK D. MARSHALL. U. S. 1,704,092, March 5. Various structural details are specified. U. S. 1,704,093 also describes an app. for simultaneous production of gas and coke.

Determining ash in coal, etc. KARL KEGEL. Fr. 645,665, Dec. 14, 1927. See Brit 290,913 (C. A. 23, 959).

Apparatus for cooling dried brown coal prior to pressing. PHILIPP FASSBENDER. Ger. 470,929, May 28, 1926. The cooler comprises a column fitted with plates so that the coal travels from side to side as it descends the column. Suction pipes are arranged at convenient points in the column.

Carbonization of coal. ČESKA OBEHODNI SPOLEČNOST. Fr. 645,071, Dec. 2, 1927. Coal, particularly of more recent geological formation, is carbonized by the direct action of superheated steam at a temp. and pressure at which carbonization will take place.

Carbonizing coal. TRENT PROCESS CORP. Fr. 645,227, Sept. 14, 1927. Finely powd coal is heated slowly before its fusion temp., the heating being continued for a time sufficient to obtain a max. initial volatilization before the fusion temp. is reached and afterwards raising the temp. above this point without causing an agglomeration of the carbonized particles. Cf C. A. 23, 1250.

Vertical retort apparatus for carbonizing coal. RICHARD L. RODGERS (to Charcolite Corp.). U. S. 1,704,103, March 5. Vertical retort chambers are surrounded by annular heating chambers contg. a fusible salt-heating-medium comprising CaCl₂ 75 and NaCl 25%.

Process and apparatus for fractionating the distillation products of organic matter as they are evolved from the still. J. GONZE and J. GRAY. Belg. 350,914, May 31, 1928. Fractionation is obtained by means of superheated steam, which is produced

in the distg. app. and superheated by the heat imparted to it by the distn. products. After the fractionation, the sepd. steam is sent back in counter-current flow to the mixt. to be fractionated, whereby it is superheated, and again mixed with the fresh distn. products. The app. comprises a scrubber, a pitch separator, 2 oil separators, a heat exchanger, and a vertical tube condenser.

Extracting carbonaceous material. JOSEPH W. H. AINSWORTH. Australian 10,517, Nov. 22, 1927. Vaporizable oils are extd. from oil shales, coal and other carbonaceous material by conveying the material in a continuous stream through a long retort, applying heat so as to grade the temp. from a min. at the entering end to a max. at the outlet, the gaseous products being led off at intervals of its length by vents in the retort wall.

Destructive hydrogenation of coal, oils, etc. ARNO DEBO (to Internationale Bergin-Compagnie voor Olie en Kolen-Chemie). U. S. 1,704,792, March 12. In order to maintain a definite liquid level in an app. (which is described) for effecting destructive hydrogenation under high pressure, the materials are converted into a paste-like mass which is subjected to a pressure of a "few atm." and then forced into the high-pressure chamber, and subsequently the gaseous, liquid and solid reaction products of the reaction are drawn off at a point somewhat below the top of the reaction chamber. Various details of the app. are described.

Destructive distillation and hydrogenation of bituminous materials. KOHLENVEREDLUNG A.-G. Ger. 470,726, Mar. 18, 1924. Finely divided bituminous materials are treated with a stream of heating gas so as to become suspended therein, and H or a substance generating H is passed in. The process may be combined with water-gas generation, the water gas serving for both heating and hydrogenation. The process is preferably carried out at superatm. pressures. Cf. C. A. 23, 1251.

Burning liquid fuel. AUTOCOMBUSTORE. Fr. 644,816, Oct. 27, 1927. The fuel is atomized by steam, the app. being arranged to act as automatically as possible.

Gas producer. COMPOUND GAS POWER CO., LTD. Fr. 645,632, Dec. 13, 1927.

Double-effect gas producer. A. H. R. J. BOISSIÈRE. Belg. 349,383, April 30, 1928. The hearth is divided into 2 portions in which combustion and gasification take place successively, and also purification by combustion of the heavy tarry products. The hearth is surrounded by a jacket, which may serve for the generation of steam, and is surmounted by a fuel tank, which closes hermetically and from which it can be isolated. The clinkers are discharged through a 2-seat valve; and devices are provided for rotating the producer, raising the central portion of the hearth and operating the 2-seat valve of the ash-pit, the 3 operations being carried out simultaneously if desired.

Gas producer construction. W. I. BATTIN and C. S. CHRISMAN (to Humphreys & Glasgow, Ltd.). Brit. 294,523, July 25, 1927.

Gas producer operation. AKTIESELSKAPET NORSK STAAL ELEKTRISK-GAS REDUKTION and E. EDWIN. Brit. 294,838, Dec. 20, 1927. CO₂ and water vapor in gases contg. them are converted into CO and H by heating in a high tension elec. arc and passed at a temp. of at least 1400° through a layer of incandescent coke or like material. Molten slag which is obtained may be used as "ciment fondu" if bauxite, Al silicates and lime or limestone are added to the fuel layer. An app. and details are described.

Down-draft gas producer (suitable for use on vehicles). R. M. A. E. CEZANNE and SOC. D'APPLICATION DU GAZ AUX MOTEURS S. A. G. A. M. Brit. 294,773, Aug. 3, 1927. Numerous structural features are described.

Down-draft gas producer for use with wood, lignite or other fuels of high volatile content. D. J. SMITH. Brit. 294,373, July 20, 1927. Structural features.

Electrically heated producer for manufacturing combustible gas from hydrocarbon materials such as crude oil. WILLIS S. YARD and EARL N. PERCY. U. S. 1,703,566, Feb. 26.

Gas production. I. G. FARBENIND. A.-G. Fr. 33,382, Apr. 2, 1927. Addn. to 631,948. In the production of gas from powdered fuel in which gasifying agents such as air or steam are passed in such a way as to keep the fuel in motion, part of the air or steam is directed with great speed on to the surface of the fuel. Cf. C. A. 23, 1252.

Gas production. THE H. H. GAS PLANT SYNDICATE, LTD. Fr. 645,572, Dec. 12, 1927. Powd. or liquid fuel is injected along with air into a combustion chamber where it is submitted to a partial combustion in the presence of a metal in a fine state of division. Steel filings are particularly suitable, but brass may also be used.

Gas manufacture. HUMPHREYS AND GLASGOW, LTD. Ger. 470,654, Aug. 4, 1925. See Brit. 242,226 (C. A. 20, 1316).

System for controlling admixture of different gases to obtain a gas of definite desired heating value. CLARENCE S. PINKERTON (to Cutler-Hammer Mfg. Co.). U. S.

1,704,101, March 5. Admixture is controlled in accord with calorimetric tests. An app. is described.

Heat exchange system for separating gases by liquefaction. GES. FÜR LINDE'S EISMASCHINEN A.-G. Brit. 204,611, July 27, 1927. Sepn. of constituents of coke-oven gas is described. Water gas may be washed with liquid CO to produce a quant. mixt. of H and CO. An app. is described.

Use of liquefied air, peroxides, etc., in supplying gases to internal-combustion engines of submarines, etc. H. O. DRAGER. Brit. 294,169, July 19, 1927.

Desulfurizing gases. FIRMA CARL STILL. Ger. 471,043, Mar. 6, 1927. In removing H_2S from gases by a cyclic process in which a neutral aq. suspension of Fe-O compds. is used to wash the gases and is then regenerated by treatment with air or O, the regenerated soln. passing back to the washer is treated with an amt. of free alkali sufficient or nearly sufficient to neutralize the acid produced in the regeneration.

Gas purification. UNION CHIMIQUE BELGE. Belg. 349,321, April 30, 1928. A practically satd. $(NH_4)_2SO_4$ soln. is fed at the top of the scrubber, the gas to be purified is introduced near the bottom, and free NH_3 is introduced at a pt. slightly below the gas inlet. The free NH_3 ppts. $(NH_4)_2SO_4$, which is washed once with the original soln. The soln. drawn off near the bottom of the scrubber is triturated with powdered gypsum, the ppt. is filtered off, and the filtrate is distd. to liberate volatile acids and recover free NH_3 . Belg. 349,820, April 30, 1928. The $(NH_4)_2SO_4$ is pptd. from its almost satd. cold soln. by passing in NH_3 ; the soln. decanted from the ppt. is put through a distg. column to remove free NH_3 which is re-used; the neutral soln. is cooled and sent to the gas scrubber through which it is passed in counter-current flow to a mixt. of the gas and NH_3 ; the liquor from the scrubber is triturated with powdered gypsum, filtered, put through a distg. column to remove free NH_3 and finally evapd. Belg. 350,558, May 31, 1928. Ammoniacal liquor having already been used for gas purification is sulfated with gypsum; free NH_3 is added to complete pptn. of the $(NH_4)_2SO_4$; the soln. is decanted from the ppt. and the free NH_3 distd. off; an amt. of liquid equal to the H_2O in the gypsum + the wash water is withdrawn from the distg. column and treated with $Ca(OH)_2$ aq. to recover NH_3 ; the rest of the liquid from the distg. column is cooled and utilized again for scrubbing the gas.

Purifying gases. SOC. ANON. HOLLANDO-BELGE POUR LA FABRICATION DU COKE (Theodoris P. L. Petit, inventor). Ger. 471,042, July 4, 1928. In removing H_2S and HCN from gases by treatment with an alkali carbonate soln., expelling the gases from the soln. with CO_2 , and heating the bicarbonate soln. so obtained to recover the CO_2 , the CO_2 present in the expelled mixt. of gases, after removing H_2S , is re-used. Preferably, the CO_2 from the expelled gas mixt. is re-used to treat only the upper layers of the soln., the lower layers being treated with the CO_2 recovered by heating the bicarbonate soln. Suitable app. is described.

Purifying coal gas and recovering by-products. S. P. MILLER (to Barrett Co.). Brit. 204,106, July 16, 1927. The gas is cooled to 200–250°, according to the desired m. p. of the pitch, and the heavy tar and pitch particles in suspension are pptd., creosote oil vapors are condensed, NH_3 is extd., and the light oils and benzene are removed. An app. and various details of procedure are described.

Mixed oil gas and producer gas. WILLIS S. YARD and EARL N. PERCY. U. S. 1,703,506, Feb. 26. A deep bed of fuel is maintained at incandescence in a producer by admission of air; oil is introduced periodically and successively into the producer at different fixed points above the fuel bed to replenish the latter in different portions by deposition of C formed by the cracking and distn. of the oil in producing oil vapor and gas and this replenishment is controlled so as to render it uniform over the fuel bed and maintain an optimum temp. in the producer. An app. is described.

Production of steam for water-gas generator. FRANZ SCHÜSSL. Fr. 645,057, Dec. 2, 1927. Constructional details of heat interchanger.

Carburetted water-gas plant. HUMPHREYS & GLASGOW, LIMITED. Fr. 644,969, Dec. 1, 1927.

Lighting and heating gas plant. SYDNEY J. B. TULLY and OLIVER E. YEO. Fr. 645,090, Dec. 3, 1927.

Burning explosive gaseous mixtures. SIDNEY P. VAUGHN (to Surface Combustion Co.) U. S. 1,704,875, March 12. The mixt. is driven with a velocity greater than the rate of propagation of flame through the mixt. against the surface of a corrugated combustion bed and parallel with the corrugations, so that in the grooves of the corrugations the velocity is reduced by friction to the rate of flame propagation and combustion is effected in the grooves of the corrugations.

Apparatus for distilling tar. THE BARRETT CO. Fr. 645,156, Dec. 5, 1927.

Coke with a distinctive flame coloration. ALLISON A. KOHR (to Koppers Co.). U. S. 1,705,020, March 12. In prepg. coke which is to have a distinctive flame coloration (intended to indicate its manuf. or origin), the freshly made hot coke is quenched with water contg. and serving to deposit on the coke flame-coloring substances, *e. g.*, compds. of Cu, Ba, Li, Sr, Mg, Hg, K or Na.

Coke adapted for being heated by preheated lean gas. E. COPPEE ET CIE. Brit. 294,561, July 26, 1927. Structural features.

Apparatus for cooling coke (by circulation of air or an inert gas through the coke and a steam generator). S. PEARCE and A. R. M. B. COBBART. Brit. 294,516, April 25, 1927.

Gas and coke plant. FREDERICK D. MARSHALL. U. S. 1,704,094, March 5. Various details of construction are specified.

Regenerative heating system for coke ovens, etc. JOSEPH VAN ACKEREN (to Koppers Co.). U. S. 1,704,229, March 5.

Recovering waste heat from coke ovens. H. E. G. J. J. HELIN. Belg. 350,907, May 31, 1928. The air is preheated in a heat exchanger by means of the gases coming from the oven; and the combustion gases after passing through the regenerator are used to heat a steam generator.

Fuel-gas-distributing system for coke ovens. JOSEPH BECKER (to Koppers Co.). U. S. 1,704,239, March 5.

Coke oven. HEINRICH SCHWARZ. Fr. 645,045, Dec. 2, 1927. A method of charging so as to prevent disintegration of the coal blocks is described.

Coke-oven construction. C. OTTO & Co., Ggs. and C. OTTO. Brit. 294,992, Aug 3, 1927.

Coke-oven construction. AUGUST PUTSCH (to Koppers Co.). U. S. 1,705,029, March 12.

Coke-oven-valve construction. NATHANIEL G. PARRY (to Koppers Co.). U. S. 1,704,209, March 5.

Coke-oven battery. JOSEPH BECKER (to Koppers Co.). U. S. reissue 17,224, Feb. 26. See original patent No. 1,556,749, issued Oct. 13, 1925 (*C. A.* 20, 106).

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

The bearing of base exchange on the genesis of petroleum. E. MCKENZIE TAYLOR. *J. Inst. Petroleum Tech.* 14, 825-40(1928).—T. shows that the origin of petroleum is due to the bacterial decompn. of org. matter, probably oils and fats, under anaerobic conditions which exist under shales contg. sodium clay hydrolyzed in fresh water. The original calcium clay in the presence of fresh water is converted into sodium clay. Sodium clay in water yields NaOH which neutralizes the toxic acidic products of bacterial action. The hydrolyzed sodium clay layer is impermeable and the bacterial decompn. forms reduction products, the gases being retained under pressure. Ten Rumanian and West Indies shales were alk., the sodium base predominating over the calcium base clay in each case. Glycerol, the oils and fats tested, and sugar and starches under a sodium clay layer yielded practically pure methane. LEONA MARSH

Crystallization of paraffin. I. Crystal forms of paraffin from shale oil. YOSHIO TANAKA, RYONOSUKE KOBAYASHI AND SADAYUKI. *J. Faculty Eng. Tokyo Imp. Univ.* 17, 275-82(1928).—Crude shale paraffin from Fushun oil shale was purified by washing with cold alc.-ether soln. and fractionated by sweating. Well-defined crystal forms were obtained from each fraction and their physical properties detd. Most of the shale paraffin melts at 57-64° and consists of normal hydrocarbons. The interlaced needle crystals were generally produced from alc.-ether soln. at high concn. and high cooling velocity, while the plate crystals were obtained at lower concn. and cooling velocity. The plate arrangement is thought to be more stable. Viscosity of the solvent medium is important in crystal formation. Low viscosity favors plate crystals while high viscosity favors needles. The viscosity of the paraffin distillate used was extremely low and the crystals obtained were, therefore, laminar. Mutual transformation of the two types of crystals can be easily effected by controlling the viscosity of the paraffin distillate, or by the cooling velocity. Typical photographs of the crystals are given. II. Crystal system of paraffin from shale oil. *Ibid* 283-8.—The fundamental form of the crystals is a rhombic plate, having angles of 110° and 70°. They

exhibit double refraction and parallel extinction. All plate crystal forms of shale paraffin are produced by parallel growths of the fundamental rhomb. Needle crystals are formed by successive growths of the orthorhomb parallel to the direction of the 70° angle. Needle crystals of paraffin belong to the rhombic system. III. Crystal forms and system of petroleum paraffin. YOSHIO TANAKA AND RYONOSUKE KOBAYASHI. *Ibid* 289-92.—Petroleum paraffins crystallize as needles with few exceptions. Formosa petroleum yields plate crystals of paraffin. The difference depends largely on the viscosity of the distillates and not on the chem. nature of the paraffins. Increasing viscosity favors needle-crystal formation. The cryst. form of the paraffin gives an indication of the suitability of the pressed oil for lubricating purposes. Results of examn. of petroleum paraffin crystd. from alc. soln. were similar to those obtained with shale petroleum.

D. F. BROWN

A study of the less volatile oils in Salt Creek (Wyo.) crude. H. M. SMITH. Bur. of Mines, *Tech. Paper* No. 428, 28 pp. (1928).—Carefully sampled Salt Creek crude oil was distd. in a current of natural gas at 100° to remove gasoline (33.8%). The residue was dissolved in acetone at 50°, poured into more acetone at 5-10° and filtered, the ppt. being reëxtd. twice more in the same manner and then discarded (21.5% of original crude). The acetone was removed from the filtrates and the remaining oil (44.7% of original crude) distd. with superheated steam, an electrically heated fractionating column being used. Four cuts were made, the column temps. being 174°, 195°, 213°, and 257°, resp. Cut I, which was chiefly kerosene and gas oil, was not investigated nor was the residue (16.9 and 9.6% of original crude, resp.). Cuts II, III and IV were considered to contain all the lubricating stock and amounted to 8.8, 4.8, and 4.6% of the original crude, resp. These were individually treated with successive portions of acetone at 0° which were removed from the residues by decantation. The sol. fractions were examd. separately after removal of acetone, while the insol. residues were fractionally distd. at 40 mm. pressure and the various cuts including the residues examd. Viscosity, density, n , Menzies-Wright mol. wt. detns., and C, H and S analyses were made on all fractions. C:H ratios, empirical and series formulas were calcd. from the ultimate analyses and the mol. wt. detns. The fractions from each of the steam distn. cuts arranged themselves into 2 very distinct groups. The acetone-insol. portion in each case had a low viscosity-gravity ratio and a low C:H ratio (*i. e.*, relatively low unsatn.) while the acetone-sol. portion had a high viscosity-gravity ratio and a high C:H ratio (*i. e.*, relatively high unsatn.). The following table gives the average of the properties of these 2 groups for the 3 steam distn. cuts combined (acetone-insol. total = 10.16% and acetone-sol. total = 34.5% of original crude):

	Viscosity centipoises	Sp. gr.	C:H ratio	Mol. wt.	n_D^{20}	Formula	Series
Acetone sol.	43.2	0.934	0.639	247	1.5280	$C_{18.5}H_{38.5}$	$C_nH_{2n-7.9}$
Acetone insol.	12.2	0.858	0.523	261	1.4740	$C_{18.5}H_{36.9}$	$C_nH_{2n-1.7}$

These values were compared with Cabin Creek petroleum, a Penn. oil, and Sour Lake crude. The acetone-insol. fraction corresponds very closely in almost every respect to the Penn. oil while the acetone-sol. fraction corresponds very closely to the Sour Lake oil.

ELLIOTT J. ROBERTS

Natural gasoline in 1927. G. R. HOPKINS. Bur. Mines, *Mineral Resources of the U. S. 1927*, Pt. II, 199-208 (preprint No. 20, published January 10, 1929). E. H.

Studies on characteristics and classification of gasoline. TADEUSZ NOWOSIELSKI. Libusza Refinery Standard-Nobel in Poland. *Przemysl Chem.* 13, 16-23, 66-78 (1929).—After considering the normal Engler-Ubbelohde method of distn. N. concludes that corresponding to the American method 13 points have to be stated, namely the temps. of initial boiling, and end points, those at 5 and 95% as control points, and for each 40% of the distillate. Instead of stating the "dry point," which is never certain, the temp. at which 98% distils is to be considered as the end point. The application of the "average b. p." has been useful to N. in detg. and comparing different sorts of gasoline. There does not exist any near relation between the sp. gr. of gasolines and the limits of their b.-p. temps. Expts. prove that sp. gr. of gasoline fractions is a function of their quant. and qual. compn. and that for gasolines of different origins, obtained under the same conditions of fractioning, it generally represents different values, and is, therefore, of small importance. N. exams. a large vol. of exptl. material on rectified gasoline collected by himself in control work of rectifying app. in different manufactories and during a prolonged period and concludes that sp. gr. is entirely useless for detg. the quality of gasoline, which should be evaluated exclusively from the characteristic qualities of the b.-p. curves. He shows that the "av. b. p." of a mixt. can be

calcd. from the av. of the b. ps. of its components on the basis of the rule of mixts. He proposes the following form for obtaining a short characteristic of a gasoline:

% distg. at av. b. p. $\frac{\text{"av. b. p."}}{\text{distn. range}}$. The application of this formula presents the

following advantages: (1) Not taking into account, the sp. gr. one is free to make use of gasolines of different origins and is not restrained as to the method of their production. Moreover, the wrong method of detg. the volatility of gasolines on the basis of their sp. gr. practiced until now is thus eliminated. (2) The relation of parts of smaller volatility to those of greater volatility in gasolines of the same av. b. p. is const. It is, therefore, the measure of the av. volatility of gasolines, and as such it is their real and essential characteristic. (3) The prepn. of a blend of a certain b. p. from gasolines of known qualities can be calcd. beforehand and presents no difficulties. (4) The av. b. p. together with the initial b. p. and end-point dets. the position of the boiling curve and its character with an exactness possible to attain in every manufactory and from every raw material. This exactness is likewise necessary and sufficient for qualifying a given brand of gasoline for a certain purpose. Finally N. briefly describes the methods of gasoline classification practiced until now and shows their defects. Conclusion: The classification of gasoline ought to be effected from the standpoint of its application and based on an objective and uniform method of characterization of its sorts

Lubricating oils. I. Specifications. ANTONY SETON. *Chemistry & Industry* **47**, 1142-3(1928). **II. Lubricants for medium- and high-speed bearings.** *Ibid* 1143-5. **III. For special purposes.** *Ibid* **48**, 54-8(1929).—A discussion of the lubrication of cylinders of steam engines, gas engines, crankcases, pneumatic and refrigerating machinery, air compressors, O compressors, hydraulic machinery, cutting lubricants, roller chains and roller bearings. S. gives a table of suggested specifications for each type. **IV. The gumming of lubricating oils.** *Ibid* 81-2.—Oils are thickened by metallic soaps and by "gumming" because of oxidation or perhaps polymerization. In mineral oils the readily oxidized portion is insol. in ether, is highly colored and consists of asphaltenes formed from the asphalt resins present more or less in all crude oils.

EUGENE C. BINGHAM

Treatment of bitumens with sulfosil. V. TOKMANOV. *Neftyanoe Khozyaistvo* **15**, 73-4(1928); cf. *C. A.* **22**, 4786.—Unsatd. compds. and aromatics, tars and asphalts are sepd. from mazout by treatment with sulfosil (activated silica gel) at elevated temps. Pitches and asphalts are mixed with gasoline and sulfosil and heated in an Erlenmeyer flask with a reflux condenser on a water bath for 1 hr. followed by a Soxhlet extn. of the unsulfonated residue. Comparison is made between this method and the pure adsorption method with silica gel and fuller's earth, the last giving some polymerization products from high-mol. oils and tars. An analytical method is proposed which consists in using silica gel for the detn. of neutral tars and soft asphalts followed by a treatment with sulfosil, whereby the unsatd. compds. and aromatics are extd., leaving paraffins and naphthenes. The reaction of sulfosil has been checked with the method of Lach-Holde on montan wax; it gives identical values. A. A. B.

Investigation of wood tar. I. YA. POSTOVSKII AND B. G. PERETZ. *J. Chem. Ind (Moscow)* **5**, 625-8(1928); cf. *C. A.* **22**, 4787.—1,150,000 tons of wood are yearly carbonized for the production of charcoal required for the manuf. of cast iron in the Ural area. This wood yields on the av. 3% of tar as a by-product which has hitherto found no utilization. The tar produced in a Russian wood gas generator where 64% of the wood subjected to distn. was pine, the rest being chiefly aspen, was examd. by P. and P. The tar presented a black substance of the consistency of honey and had a weak odor of creosote. Freed from water the tar gave, by elementary analysis, 79.95% C, 6.23% H, 13.82% O, the N content being insignificant. 300 g. of the tar were treated with ether; the latter dissolved 86% of the substance, leaving behind a residue consisting chiefly of charcoal dust. The ethereal soln. was first washed with Na₂CO₃ soln. to remove fatty acids; the latter consisted of a mixt. of formic, acetic, propionic, butyric and valeric acids. The total fatty acids content is negligible (2.1%). The ethereal soln. of the tar was further washed with aq. NaOH soln. to ext.

the *phenols*, and the phenolates obtained were acidified and subjected to fractional distn. The total amount of phenols was 30% of the tar, 6% being liquid (phenol, cresol, creosote, etc.) and 24% solid. Only the liquid phenols are valuable as chemicals, the solid phenols being highly polymerized asphalt-like products for which no utilization can be found. After the removal of the acids and of the phenols the ethereal soln. of the wood tar was washed with dil. H_2SO_4 to ext. the *pyridines*. The pyridine content of the tar, however, was insignificant (0.1%). The ethereal soln., which after these treatments contained only *neutral substances*, was evapd. and steam-distd. Only 5% of the neutral substances passed with steam, the remainder consisting of high mol. wt. products of hydroaromatic character which could not be distd., even *in vacuo*, at 300° . The portion which distd. with steam was apparently a *fulvene*, probably naphthylfulvene, $C_{18}H_{12}$. About half of the wood tar consisted of *water* (48.8-55%); *inorg. substances* (ash) were contained in the tar to the extent of 0.1-0.3%. The fact that the tar contains only 6% of liquid phenols excludes the possibility of its utilization as a sterilizing material, nor in the manuf. of bakelite. Neither can it be used as liquid fuel for internal-combustion motors, nor as raw material for obtaining chemical products. The most logical utilization is for *fuel*. Its calorific value is only 3970 cal. on account of its large water content; when, however, this water is removed by heating, the calorific value increases to 7550 cal.

Cracking emulsified petroleum oil. GUSTAV EGLOFF and HARRY P. BENNER (to Universal Oil Products Co.). U. S. 1,703,103, Feb. 26. The oil is heated to a conversion temp., evolved vapors are passed to a dephlegmator and reflux condensate is subjected to further treatment at a temp. above the b. p. of water; dephlegmated vapors are subjected to an initial condensing action at a temp. above the b. p. of water, water vapors and light hydrocarbon vapors are united, sepd. from the reflux condensate and from the vapors undergoing initial condensation, and these mingled vapors are subjected to a further condensing action. An app. is described. Cf. C. A. 22, 498.

Treating "pressure distillate" from petroleum oil cracking. RALPH A. HALLORAN (to Universal Oil Products Co.). U. S. 1,704,246, March 5. Pressure distillate contg. over 0.2% S is washed with water directly after condensation without releasing the distillate from the pressure evolved in the cracking distn. operation substantially below the degree of pressure reduction requisite for evolution of the wet gases from the pressure distillate, and then, without substantial release of pressure, is treated with an alkali soln. An arrangement of app. is described.

Distilling petroleum oil. JOHN C. BLACK (to Pan American Petroleum Co.). U. S. 1,704,588, March 5. In prepg. a crude petroleum for distn., a crude oil contg. emulsified water and corrosive metallic salts is mixed with an aq. soln. of an alkali such as NaOH or Na_2CO_3 in sufficient quantity to convert the corrosive metallic salts into noncorrosive compds., the mixt. is heated to facilitate this conversion, most of the water and noncorrosive compds. formed are sepd. under pressure from the heated oil, and the latter is mingled with hotter residual oil in quantities sufficient to raise the temp. of the mixed oils above the b. p. of water at the pressure employed, and water and hydrocarbons of low b. p. are vaporized and condensed. An app. is described.

Distilling crude petroleum, coal tar, etc. A. ALEXANDRE. Belg. 350,953, May 31, 1928. The liquid is passed successively downward through a series of superposed elements, each consisting of a pan, through which project a number of pipes extending

to a height greater than the level of the liquid. At the bottom is a suitable source of heat, and the different elements are heated by the ascending vapors. Part of the vapors is condensed in each element and may be either withdrawn therefrom or refluxed back.

Refining petroleum oils. OTTO DIECKMANN. U. S. 1,703,615, Feb. 26. Topped crude oil is washed with concd. H_2SO_4 and the acid sludge formed is sepd. and washed with refined petroleum oil, the oil thus used is mixed with the main body of acidulated oil, and the latter is then neutralized and fractionated.

Refining petroleum oils. THE SHARPLES SPECIALTY CO. Fr. 644,840, Nov. 9, 1927. The proportion of cryst. paraffin in the oil is regulated so that on cooling the mixt. the paraffin obtained as a ppt. is sufficiently plastic or amorphous and has a sp. gr. sufficiently high to sep. from the oil by centrifuging. Amorphous paraffin is added to the oil thus treated so that on cooling a ppt. is obtained which may be centrifuged. It is advantageous to retain or add substances generally sepd. from the oil (other than hard asphalt) by treatment with acid or clay, so that the substances are present during the centrifuging. The paraffin obtained by the centrifuging may be used in industry. The process is particularly applicable to the prepn. of lubricating oils.

Apparatus for dehydrating petroleum emulsions by electric treatment. JAN H. C. DE BREY. U. S. 1,704,463, March 5. Various structural features are described.

Cracking hydrocarbon oils. GUSTAV EGLOFF (to Universal Oil Products Co.). U. S. 1,703,617, Feb. 26. Oil is heated in a plurality of independent units, the evolved vapors are dephlegmated and reflux condensate is continuously returned to each unit for retreatment; vapors from the dephlegmation are condensed and the resulting distillate is collected and uncondensed gases produced in each unit are passed to a common header from which they are not permitted to return to any of the units. The gases are compressed in the header and returned in regulated quantities to the raw oil treated in each unit. The app. used is described. Cf. C. A. 23, 273.

Cracking hydrocarbon oils. EUGENE C. HERTHEL and HARRY L. PELZER (to Sinclair Refining Co.). U. S. 1,703,528, Feb. 26. In the operation of a pressure-still cracking system in which the charge of oil is circulated from a bulk supply tank through an externally heated tubular heater and back to the bulk supply tank, a bed of material contg. uncombined metallic oxides such as oxides of Fe and Cu is maintained in the bulk supply tank submerged in, directly exposed to, and extending across the charge of oil and so carried on a support as to permit free passage of the still charge; oil is supplied to the heating tubes from below this bed of material and discharged from the heating tubes above it. The app. is described in detail. U. S. 1,703,529 specifies a similar cracking system and app. in which a body of fuller's earth is placed in the pressure still so as to extend across the charge of oil. Operation of the app. is continued until the pitch content of the still charge builds up at least to satn. Cf. C. A. 22, 1468, 3288.

Cracking hydrocarbon oils. GEORGE H. TABER, JR. (to Sinclair Refining Co.). U. S. 1,705,077, March 12. Gas-vapor mixt. from a cracking operation is fractionated and the remaining gas and vapor are passed to a condenser; gas and vapor still remaining uncondensed are scrubbed with a relatively high b. p. oil from the fractionation, and the oil with its absorbed constituents is reintroduced into the fractionating operation. An arrangement of app. is described.

Cracking hydrocarbon oils. I. G. FARBERIND. A.-G. Brit. 294,557, April 21, 1927. Vapors of hydrocarbons to be cracked are passed over a heating device which is arranged in a single plane and of relatively small dimensions in the direction of flow of the vapors (suitably Ni-Cr tubes heated to about 700° by passing hot gases through them). Partially decomposed products are condensed, maintained at 100° and returned for further treatment, and "light benzines" are condensed in a final condenser. An app. is described which may comprise an enameled still, and the heating elements may also be formed of C, Si carbide or graphite, electrically heated and protected from splashing of liquid oil by a baffle.

Apparatus for cracking hydrocarbon oils. WILLIS F. SIMS (to Universal Oil Products Co.). U. S. 1,703,550, Feb. 26. In operation of an app. comprising a heating coil, reacting chamber and dephlegmator, arranged in series, vapors from the dephlegmator are condensed and the resulting distillate is collected, regulated quantities of the distillate are returned to the dephlegmator and subjected to redistn. but out of contact with vapors undergoing dephlegmation; incoming charging oil is supplied to the dephlegmator (the temp. of which is controlled); unvaporized oil is withdrawn from the reaction chamber, and a lower pressure is maintained on the distillate undergoing redistn. in the dephlegmator than on the vapors undergoing dephlegmation.

Thermal decomposition of hydrocarbons. STANLEY M. NORWOOD (to Electro

Metallurgical Co.). U. S. 1,703,949, March 5. Decompn. of hydrocarbon material is effected in contact with an Fe alloy contg. Cr 15-40, Ni 2-15, Si 0.7-3.0, Mn 0.7-3.0, and C not more than 1.0%, which is readily worked and resistant to corrosion.

Hydrocarbon oil conversion. GUSTAV EGLOFF (to Universal Oil Products Co.). U. S. 1,705,181, March 12. Materials such as fuel oil and kerosene are separately heated and then discharged into an expansion zone common to both, vapors are removed from the expansion zone and dephlegmated; reflux condensate is passed to a sep. heater and then returned to the common expansion zone, and superatm. pressure is maintained on the oil and vapors under treatment. An app. is described.

"Converting" hydrocarbon oils. CARBON P. DUBBS (to Universal Oil Products Co.). U. S. 1,703,100, Feb. 26. Oil is subjected to cracking temp. and pressure in a heating zone (such as a pipe coil in a furnace) and evolved vapors are passed to a dephlegmating zone into which refractory distillate is also introduced of such a character that it will almost completely vaporize without much cracking under the conditions prevailing in the dephlegmating zone; dephlegmation is further assisted by passing a less refractory oil in a closed circuit through the dephlegmating zone and thence to the heating zone. An app. is described. Cf. C. A. 22, 4788.

Catalytic "conversion" of hydrocarbon oil. GUSTAV EGLOFF and JACQUE C. MORRELL (to Universal Oil Products Co.). U. S. 1,705,180, March 12. After oil is heated to a cracking temp., there is injected into it regulated quantities of HCl, and the heated oil and HCl are passed into an enlarged zone contg. disintegrated Al; vapors are led off from this enlarged zone for condensation and collection, and the conversion of the oil is effected under superatm. pressure. An app. is described.

Distilling hydrocarbon oils. JAMES M. MCCLAVE (to Conservo Co.). U. S. 1,703,158, Feb. 26. Mn oxide and HCl are added to oils such as natural oils or waste crank case oils, etc., before or at the time of distn., in order to facilitate distn. and sepn. of light products from sludge, etc.

Apparatus for distilling hydrocarbon oils. MAX F. DE BAJLIGETHY. U. S. reissue 17,233, March 12. Reissue of original pat. No. 1,542,864 (C. A. 19, 2410).

Apparatus for distilling hydrocarbon oils. CHARLES B. BELKNAP. U. S. 1,704,277, March 5. Liquid oil is subjected to pressure by a pump and heated under this pressure while temporarily preventing liberation of vapors; it is subsequently allowed to liberate vapors and the latter are condensed, *e. g.*, to obtain gasoline.

Apparatus for refining hydrocarbon oils with acids and alkalis and centrifugal separation of the reagents from the oil. AKTIEBOLAGET SEPARATOR-NOBEL. Brit. 294,539, July 25, 1927.

Arrangement of stills and fractionating columns in a series for distilling hydrocarbon oils. STANDARD DEVELOPMENT CO. Brit. 295,142, Sept. 8, 1927. Structural features.

Safety device (including a fusible plug) for oil-cracking apparatus. LYMAN C. HUFF and ARTHUR G. BOGARDUS (to Universal Oil Products Co.). U. S. 1,703,624, Feb. 26.

Treating residual oil from oil-cracking processes. JACQUE C. MORRELL (to Universal Oil Products Co.). U. S. 1,705,199, March 12. Highly heated residual oil is withdrawn from a conversion zone of an oil-cracking process, agitated with an acid pptg. agent such as H_2SO_4 , and the mixed oil and acid are then transferred to a settling zone where pitch-like C-forming particles coalesce and ppt. as a homogeneous pitch-like mass. An arrangement of app. is described.

Treating oil-soaked carbon from oil-cracking processes. GUSTAV EGLOFF and HARRY P. BENNER (to Universal Oil Products Co.). U. S. 1,705,179, March 12. Oil-soaked C is heated sufficiently in a still to distil off liquid constituents, by heat radiated from the central portion of the still, while continuously agitated. An app. is described.

Purification of oil. RUDOLF WISCHN. Fr. 644,647, Nov. 28, 1927. Oils used in internal-combustion engines are purified by mixing cold with concd. H_2SO_4 , heating gradually to obtain 50-60° after several hours, passing through a mud separator, filtering with kaolin or the like and finally passing through them superheated steam.

Distilling oil shale. MILTON J. TRUMBLE. U. S. 1,704,956, March 12. Raw shale is preheated by indirect heat-exchange with hot spent shale and distd. by contact with highly superheated steam; volatile products are recovered and residual C is burned from the spent shale during the preheating heat-exchange mentioned and resulting products of combustion are passed through the raw shale. An app. is described. Cf. C. A. 22, 2836.

Distilling oil shale. CLAYTON O. WHITE. U. S. 1,703,413, Feb. 26. A retort is described in which the shale passes by gravity from one section to another of a series

of sections having inclined bottoms offset from each other so that the velocity of descent of the material is checked somewhat as it passes from one section to another.

Digestion and distillation of products from bituminous shale. WILLIAM H. HAMPTON. U. S. 1,703,192, Feb. 26. After digestion in an NH_3 -liberating base such as lime and with a mineral oil such as "Congo cylinder oil," at a temp. not substantially above 370° , the volatilized products are recovered. An app. is described.

Device (with flexible metal elements) for removing carbon deposits from the interior of oil stills. LYMAN C. HUFF (to Universal Oil Products Co.). U. S. 1,703,623, Feb. 26. Structural features.

Reclaiming crude oil. HARRY V. MEATHERS. U. S. 1,705,370, March 12. Structural details are described of an app. which is suitable for heating and washing basic sediment oil.

Treating mineral oils containing acids. S. P. COLEMAN (to Standard Oil Development Co.). Brit. 294,892, July 30, 1927. Oils contg. acids naturally or artificially produced are treated with alkali to convert the acids to salts, and the oil is distd. and the acids are recovered from the salt residue. An example is given of the production of naphthenic acids from Gulf Coast oil or like oil and an app. and numerous details are described.

Desulfurizing mineral oils. GUSTAV EGLOFF (to Universal Oil Products Co.). U. S. 1,703,616, Feb. 26. Cracked distillates are mixed with a drying oil such as tung oil and the mixt. is heated sufficiently (suitably at a temp. of about 260 – 315°) to cause a rapid combination between the drying oil and the S compds. present; the mixt. is then distd. under pressure and the overhead product formed during the distn. is recovered.

Gasoline from natural gas and hydrocarbon oil. LESTER S. WORTHINGTON (to C. L. Thompson). U. S. 1,705,348, March 12. Oil supply to a combined feeding and mixing chamber is controlled to leave a vapor space in the chamber, oil is passed from the chamber and heated to vaporize at least a portion of the oil, atomized and mixed with a hydrocarbon gas such as natural or casing-head gas and the mixt. thus formed is then introduced into the vapor space above the oil in the feeding and mixing chamber to permit condensates to fall into the oil in the chamber; gas and vapors from the vapor space are led to a condenser. An arrangement of app. is described. Catalysts such as V, Ti, U or Mo may be used.

Filter for gasoline. ABRAHAM BABITCH (to A C Spark Plug Co.). U. S. 1,705,042, March 12.

Filter for gasoline. JOSEPH W. JONES (to General Motors Corp.). U. S. 1,705,019, March 12.

Filter for gasoline. FRANK A. STRUCK. U. S. 1,704,847, March 12. Structural features.

Lubricating oil. KENNETH G. MACKENZIE and RAYMOND HASKELL (to The Texas Co.). U. S. 1,705,298, March 12. A hydrocarbon oil is used with a small admixt. of oxidized paraffin of neutral saponifiable character.

Acid treatment of lubricating oils. GEORGE F. OLSEN (to General Petroleum Corp. of Calif.). U. S. 1,704,206, March 5. An annular stream of acid is brought into contact with a confined stream of oil by means of an injector nozzle device which is described.

Synthesizing hydrocarbon lubricating oils. C. EPNER. Brit. 294,099, July 16, 1927. Methane or gases rich in CH_4 , gases obtained in cracking hydrocarbons or C_2H_6 or C_2H_4 from coke-oven gases are subjected to the action of an a. c. elec. field, preferably of high frequency and high voltage. The products may be hydrogenated.

Rectifier for the oil of internal-combustion engines. CHARLES L. STOKES. U. S. 1,705,317, March 12. The operation of the app. is controlled by the pressure of the oil.

Device for heating and refining oil in circulating lubricating systems of internal-combustion engines. FRED E. ASeltine (to General Motors Research Corp.). U. S. 1,705,041, March 12.

Purifying used lubricating oil. CHARLES VAN BRUNT and PHILIP S. MILLER (to General Electric Co.). U. S. 1,703,648, Feb. 26. The oil is caused to flow downwardly as a fine network of small streams over a vertical evaporator having numerous capillary spaces while progressively heated from 120° at the top to 150° at the bottom and a current of air is passed upwardly over the oil film to carry away vapors of lower b. p. materials. An app. is described which is suitable for reclaiming crankcase oil.

Device for reclaiming crankcase oil. CHARLES VAN BRUNT and PHILIP S. MILLER (to General Electric Co.). U. S. 1,703,644, Feb. 26. The oil is passed in constant regulated flow over a plate-shaped evaporator having a reticulate surface, in order to evap. admixtures of low b. p.

Treating used crankcase oil. CHARLES VAN BRUNT (to General Electric Co.). U. S. 1,703,645, Feb. 26. In order to facilitate removal of solid matter from used crankcase oil by the employment of an aq. water glass soln., rosin is dissolved in the oil previous to the treatment. An app. is described. U. S. 1,703,646 specifies adding an oil-sol. heavy metal resinates such as Cu, Zn or Pb resinates and then treating the oil with an aq. soln. of an alk. agglomerating agent such as water glass. An app. is described. U. S. 1,703,647 also relates to the use of an aq. alkali metal silicate soln. and describes app.

Chlorine and cellulose. Some theoretical and industrial aspects of the problems of production. Possibilities of introducing the industry into Argentine. HUMBERTO POMILIO *Anales asocn. quim. Argentina* 16, 75-116(1928). E. M. SYMMES

The constitution of nitrated cellulose. F. D. MILES AND J. CRAIK. Nobel Research Labs., Ardeer. *Nature* 123, 82(1929).—M. and C. prepd. a complete range of samples of nitrated ramie (I) using different mixed acids, and the corresponding denitrated products, all of which were examd. by x-ray diffraction methods. The fiber diagrams of the nitrates are frequently lacking in definition and are difficult to interpret, but whenever measurements were possible they have been found to afford only the slightest basis for the theory of Herzog and Naray-Szabo (cf. C. A. 22, 3043, 4244). The diagram of I contg. less than 7.5% N shows the same spacings as are shown by corresponding denitrated products, but different relative intensities; it is much weaker. The spacings remain const. with increasing degree of nitration. The diagram (type B) resembles that of fully mercerized cellulose, but is sharper. The diffractions characteristic of the trinitrate do not appear, although from a mixt. of unnitrated ramie with comparatively little of the highly nitrated fiber it is easy to produce them. In I contg. 7.5-10.5% N the fiber structure is more or less lost; diffuse diffraction rings appear, but the denitrated product still gives sharp lines. With I contg. higher than 10.5% N, nitration with acids of technical compn. always results in diffuse spots, the higher HNO₃ content giving better definition. As the N content falls to 11%, certain spots from planes parallel to the fiber axis are altered in spacing through small ranges in which confusion with diffractions of remanent cellulose of either type is not possible. The denitration product from highly nitrated ramie is practically indistinguishable from that of pure cellulose (type A diagram), but as the N content decreases to about 12%, the denitrated ramie shows diagram B. It appears, therefore, that by the action of the mixed acid, the cellulose residue is converted to type B for all but the highest degrees of nitration, and that the lines obtained in the range, 10-12% N, do not coincide with those given by the trinitrate or by cellulose of either type.

FREDERICK C. HAHN

Metallic complexes of nitrocellulose. J. DUCLAUX. *Rev. gén. colloïdes* 6, 222-4 (1928).—A study was made of industrial filters of nitrocellulose in which inefficient filtration takes place. Analysis of the material on the filter shows the presence of heavy metals. It is believed these form complexes with the nitrocellulose, thus giving a mucilaginous substance which clogs the filter. A high percentage of Pb present, mostly in the insol. part of the material on the filter, is believed to cause most of the trouble. This concn. is inexplicable by entrainment of leady mineral compds.

RAYMOND H. LAMBERT

Nitrocellulose diffusion experiments. R. O. HERZOG AND D. KRÜGER. Kaiser-Wilhelm Institut für Faserstoffchemie. *J. Phys. Chem.* 33, 179-89(1929).—Diffusion coeffs. for nitrocelluloses from celluloses of various botanical origins in various solvents were detd. The nitrates were prepd. by 3 hrs. of nitration at 0° with 71.7% H₂SO₄, 18.65% HNO₃ and 9.63% H₂O. The coeffs. at different temps. for solns. in acetone,

Me Et ketone, Et formate and methanol are equal when calcd. to the coeff. at 20° in H₂O (D_{w20}). The coeffs., D_{w20} , lie between 0.015 and 0.021 for the nitrated natural fibers. The values for the nitrated alkali cellulose (ripened 28 days) are not different from those of nitrated viscose silk, which indicates that the decrease in particle size in the manuf. of artificial silk occurs chiefly in the "preripening" process. The coeffs. vary with conditions of nitration, e. g., D_{w20} for nitrated cotton increases from 0.016 (above conditions) to 0.028 when nitration is at 20° with 61.5% H₂SO₄, 20% HNO₃, and 18.5% H₂O. The nitrate from α -cellulose has a smaller diffusion coeff. than that from β -cellulose. Mech. treatment (Hollander mill) increases the coeff. Most of the detns. display deviations from Fick's law of diffusion. The conditions upon which the validity of the law is based, i. e., that the soln. is homodisperse and that the coeff. is independent of the concn., are not fulfilled. Disaggregation during diffusion is indicated. The nitrocellulose soln. in contact with the solvent does not swell. The particle sizes of the nitrocelluloses calcd. from the diffusion coeffs. are approx. equal to those of natural and nitrated cellulose obtained from the width of x-ray interferences

J. E. SNYDER

Viscosity and cellulose acetates. MAURICE DESCHIENS. *Chimie et industrie* 20 1023-33(1928).—The various types of viscometers are described, together with the viscosity tests for cellulose acetate, which are official in France and in Great Britain. Results are given showing the variation in viscosity with variations in the nature and proportions of the solvents and diluents used; the practical deductions which can be drawn from the measurement of the viscosity of cellulose-acetate solns. are briefly discussed.

Measurement of sizing strength of paper. B. SCHAPIRA. *Papier-Fabr.* 26, 608 17(1928).—Methods of detg. the sizing strength of paper are collected, described and classified according to the factor on which the method depends, thus, (1) absorption of ink, (2) absorption of interacting liquids, e. g., FeCl₃ and tannin solns., (3) electrolytic cond., and (4) the action of water, e. g., in capillary rise or in causing the curling up of floating specimens of the paper. Distinction is made between surface and interior sizing strength; the methods of detg. the latter are criticized. The best relative values are given by the dry indicator method of the Bur. of Standards, although, with few exceptions, good agreement is obtained between the results of this method and of the curling method. The method of Stöckigt gives fairly uniform results, but its error increases in magnitude with increasing sizing strength on account of selective adsorption. The electrolytic and ink-floating methods are too unreliable.

Cellulose. OTTO C. STRECKER. U. S. 1,705,424, March 12. Vegetable fibers such as those of resinous wood, straw, or bamboo are decomposed by boiling in a soln. of a metallic compd. of a sol. hydroxy compd. of the isocyclic series, such as Na cresolate, naphthols, cyclohexanol, or oxysulfones. Cf. C. A. 22, 4815.

Cellulose. BéLA DORNER. Fr. 644,599, Oct. 28, 1927. See Can. 284,755 (C. A. 23, 979).

Hydrating cellulose fibers in a "Jordan engine." JUDSON A. DeCraw (to Process Engineers, Inc.). U. S. 1,704,533, March 5. See Can. 282,228 (C. A. 22, 3528).

Threads and films of cellulose esters and ethers. I. G. FARBENIND. A.-G. Brit. 294,485, July 23, 1927. The process for improving the strength of threads, films and other products made from cellulose esters and ethers, described in Brit. 293,350 (C. A. 23, 1780), is modified by incorporating the resin or the intermediate material from

which the resin is formed, with the cellulose ester or ether, before the latter is converted into the threads, films, or other desired products. An example is given of the use of cellulose ethyl ether with a cresol- CH_2O condensation product or with urea and $(\text{CH}_2)_6\text{N}_4$ for thread or film manuf.

Drying cellulose films or filaments. E. MÜLLER. Brit. 294,676, April 25, 1927. See Swiss 127,275 (C. A. 23, 1268).

Drying cellulosic films, filaments and like materials by passing over internally heated driven rollers. E. MÜLLER. Brit. 294,675, April 23, 1927. An app. is described in which heated rollers are arranged in a series without any free spaces between them.

Treating regenerated cellulose. I. G. FARBENIND. A.-G. Brit. 294,551, July 25, 1927. • The process of diminishing the tendency to swell shown by hydrated cellulose, as described in Brit. 278,684 (C. A. 22, 2663), is modified by conducting the treatment of the hydrated cellulose in a feebly acid soln., preferably with the use of a buffer mixt. Various solvents, softening or wetting agents may be added to the aq. soln. of the condensation product used. Examples are given of the treatment of "viscose silk" and of "cuprammonia silk."
